SOLARS

FOR AUTOS CYCLES OR LAUNCHES

Mr. Dealer, why not handle a line that you know will satisfy your customers instead of taking chances on "Just as good" lamps. Your profit is as much or more on Solars and your customers "stick."

Write us to-day for prices on our 1906 line.

BADGER BRASS MFG. CO., Kenosha, Wis.
NEW YORK OFFICE: 111 Warren Street

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should *not* buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the *two* cycle two cylinder Elmore engine.

Understand—the *two* cycle two cylinder Elmore engine produces *two impulses every time the fly-wheel turns.*

As you know, the two cylinder *four* cycle furnishes only *one* impulse every *fourth* time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached ts climax this season after five years of steady improvement.

MICHELIN

TIRES OF THE HIGHEST CLASS.

MR. WILBERN SENDS THE FOLLOWING UNSOLICITED TESTIMONIAL.

Mr. E. D. WINANS, Sec'y and Gen'l Manager,
Michelin Tire Co. of New York.

Cincinnati, O., Nov. 3, 1905.

Dear Sir:—Thirty thousand miles on Michelin Tires covering twelve Countries in Europe, above the clouds in Switzerland, below the sea in Holland, from Bull Fights in Spain to Chicken Fights in England, down Historic Rhine, and back again to the "land of grind organ and Monks." I have bought all kinds of tires, every known make; but the MICHELIN are the best, last the LONGEST.

With pleasure I can recommend them to all tourists. Will tour again next Spring and Summer in Norway, Sweden, England, Ireland and Scotland, and will wear nothing but MICHELIN Tires on my 40 H. P. Hotchkiss. Very truly,

(Signed) EDWARD V. WILBERN,
Director "Provident Savings Bank and Trust Co.," Cincinnati, O

If you want the best, follow Mr. Wilbern and buy MICHELIN TIRES.

MICHELIN TIRE AMERICAN AGENCY, Inc.,

Oldsmobile Palace Touring Car, Model "S," Price $2250.

It is only necessary to enumerate the different features of our Palace Touring Car to convince the man who knows automobiles of the sound judgment and thorough experience upon which its construction is based. To convince the most skeptical of its touring qualities, a practical demonstration is irresistible. In every line, at every point it is "there with the goods."

The four-cylinder vertical water-cooled motor easily develops 24 to 26 horsepower. Cylinders 4¼-inch bore by 4¾-inch stroke. All pistons are carefully ground and "run in" with a belt to insure accurate fit. The silent running qualities of the car are made possible by the perfect working of the motor, the careful adjustment of all parts and the muffler arranged longitudinally beneath the side of the car. The steering is through worm and nut mechanism, and has been thoroughly tested, and every possible weakness strengthened in order to insure absolute safety in this all-important part. A few of the other features are the careful balancing of parts, transmission, brakes, bevel gear drive, axles, etc. We invite your further inquiry.

MODEL "B," PRICE $650, is our familiar Standard runabout with various new features. Speaking of the runabout, did you notice the record of one of these machines made in the economy test of the New York Motor Club? Although it did not win on gasolene consumption because it was not run through the test at a very moderate rate of speed, purely for the purpose of cutting down the consumption of gasolene, it did make the best showing of any car in the matter of repairs, and demonstrated its ability to cover country roads under a load of four people at a good average speed. There was not a breakage of any part during the trip of 682 miles, and the car was universally commented upon as being the car which was always ready to start every morning with a turn of the crank. We would like to have you investigate this further.

The Oldsmobile exhibit at the Lewis & Clark Exposition was awarded a gold medal, the only award made an automobile exhibit by the Exposition authorities.

Rambler Cars of steady service for 1906

IN SELECTING our line for the coming season it was early decided that Surreys, Types One and Two, were beyond any question of retirement and that but few improvements were possible. Therefore, these models with some slight alterations will be continued. To these are added Type Three, which is practically an elaboration of Type One, the power plant and chassis remaining the same, except somewhat lengthened to accommodate a larger and longer body.

These models are equipped with the tried and proven Rambler power plant, comprising our double opposed motor and planetary pattern transmitting gear, and are too well known to the trade and public to require extended description at this time.

Prices: Type One $1,200, Type Two, $1,650, Type Three $1,350, all with full equipment of lamps, horns, tools, etc.

"The Latest of the Ramblers," the strictly 1906 product, comprises four models. Model fourteen is a modern medium weight touring car equipped with a four-cylinder vertical motor 20-25 horse power, with sliding type transmitting gear, giving three forward speeds and reverse.

Final drive is by propeller shaft and bevel gear to the differential on the rear axle.

A notable feature is the method of connecting and bracing this shaft in which the universal joint is at the forward end and is entirely enclosed, running in an oil bath.

The external design is along most modern lines, with a wheel base of 106 inches.

The selling price of this model is $1,750 with complete equipment.

Model Fifteen is a heavier car with similar but more powerful equipment, the motor being 35-40 horse power and the final drive by individual chain to each rear wheel. The body is practically the same as in Type Fourteen but longer and larger, the wheel base being 112 inches. Price, $2,500.

Model Sixteen is a most luxuriously appointed Limousine on the Model Fifteen chassis, selling at $3,500.

The Rambler runabout for 1906 is a fitting heir to the reputation gained by the earlier Ramblers of this type. It is equipped with a double opposed motor of 10–12 horse power, placed longitudinally in the frame and driving through the Rambler planetary gear. As a Runabout with 3 inch tires it will sell at $800 and with detachable tonneau and 3 1-2 inch tires at $950.

Catalogue and full descriptive matter will be mailed upon request, but a careful personal examination of these cars at our various branches and agencies, will convince you that whatever may be your requirement, in service or price, the Rambler is the car you need.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, November 30, 1905. No. 10

MATHESON BUYS A LICENSE

Elected to Membership in the A. L. A. M.—Two Others also Admitted, One an Importer.

Three new members this week joined the ranks of the Association of Licensed Automobile Manufacturers, viz.: The Matheson Motor Car Company and the Walter Automobile Company, who were elected to full membership, and the De Deitrich Importing Company to membership in the importing branch.

The Matheson Company, which shortly will shortly remove from Holyoke, Mass., to Wilkesbarre, Pa., obtained admission by purchase of the Selden licence, held by the Commercial Motor Company, under which the Walter Company had been operating. The Commercial Company, as may be recalled, is the evolution of the checkered Automobile Company of America, who formerly made the Gasmobile. The Walter Company produces the car of that name and is backed by American Chocolate interests. The De Deitrich Importing Company comprises a syndicate formed by Walter C. Allen, of the former firm of Allen, Halle & Co., who imported the Mercedes. The De Deitrich concern has just secured quarters on Fifth avenue, opposite Sherry's.

The three new licensees already have been alloted space in the Madison Square Garden show.

Old Hands in Big, New Company.

Detroit, Mich., is to be the location of one more automobile factory of magnitude. Although the company that will operate it is not yet fully formed, the plant is already in course of construction, and space in the name of H. H. Thorp has been secured in the "independent" show in New York.

The interested parties are Alex Malcolmson, the wealthy coal operator who is now treasurer of the Ford Motor Company, which office he probably will resign; W. G. Morley, formerly with the Olds Motor Works, and H. H. Thorp, formerly with the H. H. Franklin Manufacturing Company. While not definitely settled, it is likely that the new concern will be titled the Aérer Motor Company, after the French word signifying well aired, or well ventilated, and also characteristic of the four-cylinder air-cooled car which will be marketed.

That the new company means to do business on a large scale is indicated by the size of their factory. It will be of three stories, 400 by 52 feet.

Philadelphians Get Hill's Lock Valve.

E. Hill, Jr., Norwalk, Conn., has placed the sole American agency for the Hill gasolene lock valve with Janney, Steinmetz & Co., Philadelphia, who will, of course, now market that useful and ingenious device. Mr. Hill's interests in the Norwalk Iron Works left him insufficient time to devote to the lock valve, but notwithstanding its sale has been remarkable, having mounted well up into the thousands.

Fire Destroys Amesbury Bodies.

Fire destroyed the woodworking shop of Haywarth & Rogers, Amesbury, Mass., last Saturday night, 25th inst., causing a loss of $25,000, with $20,000 insurance. The fire is believed to have started from spontaneous combustion. The building was filled with automobile and carriage bodies, of which the firm makes a specialty.

Schwartz Buys into Wayne.

Arthur E. Schwartz, formerly of the firm of W. M. S. Schwartz & Co., of Paris, France, has purchased an interest in the Wayne Automobile Co., of New York. Mr. Schwartz is a graduate of the Vienna Institute of Technology, and has had a number of years' experience in automobile construction abroad.

Olds's Orders Near Two Million Mark.

It is announced on authority that up to Tuesday night, November 21, orders amounting to $1,800,000 have been booked by the Olds Motor Works for their 1906 product. It is naively added that the agents' convention was one of the most successful they ever held.

Chicago Plant Changes Hands.

The plant and buildings of the bankrupt Chicago Motor Vehicle Co. have been conveyed by trustee to Jacob Newman, of Chicago. The consideration was $35,000.

FULL HOUSE AT GARDEN

Those Who Secured Space at A.L.A.M. Show—Scenic Artists to Make Garden Bloom.

In all, the Association of Licensed Automobile Manufacturers have allotted space to 220 exhibitors in the show in Madison Square Garden, New York, January 13 to 20. There are twenty-one others on the "waiting list."

The only unlicensed cars admitted are the electrics, which will be "segregated" in the restaurant, or exhibition hall, as it will be styled for the occasion. This disposes of the report that the White steam car would be in evidence.

Reports of the beauty of the setting of the show continue to percolate, but its exact character is carefully guarded. It is known that a large number of scenic artists are at work on the "staging." One man in position to know let fall this interest-sharpening remark:

"It will be the most beautiful show ever held in the Garden, bar none."

The following is the list of those who have secured space and the numbers of the spaces alloted, which, however, cannot be regarded as final until the acceptances are received:

FOR CREDIT PROTECTION

Jobbers and Accessory Makers Join Hands for the Purpose—Scope is National.

The Automobile Trade Credit Association, which, as its name suggests, is a co-operative effort on the part of its organizers for credit protection, was brought into being in New York yesterday forenoon. It was the outcome of an informal meeting held about a week previous. At the meeting, which was held in the rooms of the Crockery Trades Association—a similar credit and collection bureau—F. J. Alvin, of the American Electrical Novelty Co., occupied the chair as provisional president. Others present were E. J. Willis, New York; G. W. Nock, Philadelphia; J. E. Murray, New York Sporting Goods Co.; H. B. Meyrich, National Electric Supply Co., Washington, D. C.; L. L. Halley, Sibley & Pitman; L. C. Burnet, Hartford Suspension Co., New York; A. H. Strickland, National Car Wheel Co., New York; F. A. Lemal, Continental Caoutchouc Co., New York, and A. F. Randolph, Spicer Universal Joint Co., Plainfield, N. J.

The president further stated that he had assurances of support and in many instances proxies from about twenty other accessory concerns, among them the Excelsior Supply Co. and the Beckley-Ralston Co., of Chicago; the Hartford Rubber Works and Post & Lester, of Hartford, Conn.; Briscoe Mfg. Co., Detroit; National Carbon Co. and Parish & Bingham Co., Cleveland; R. E. Dietz & Co., New York; Hess-Bright Co., Philadelphia; Pennsylvania Rubber Co., Jeanette, Pa.; Swinehart Tire & Rubber Co., Akron, Ohio; Auto Supply Co., Chicago; Herz & Co., New York; Acetylene Gas Illuminating Co., New York; Packard Electric Co., Warren, Ohio; Noera Mfg. Co., Waterbury, Conn.; Auto Top & Cover Co., New York; Jersey Brake Co., Newark, N. J.; Sprague Umbrella Co., Norwalk, Ohio; Gray & Davis, Amesbury, Mass.; Jones Speedometer Co., New York; Veeder Mfg. Co., Hartford, Conn.; Atwater Kent Co., Philadelphia; Pittsfield Spark Coil Co., Pittsfield, Mass.; Motor Accessory & Supply Co., New York, and others. A communication was also received from President Chapin of the Motor and Accessory Manufacturers expressing the good wishes of the latter for the success of the new association and also inclosing a complete list of the members of his own body.

This and a number of other letters were read for the benefit of those present by Franz Neilsen, an attorney, acting provisional secretary. A short discussion as to the various forms of dead beats and chronic kickers ensued, and was followed by a reading of the proposed bylaws and constitution, which were adopted with slight amendments suggested by the experience of different members.

The association is patterned after others of a similar nature that have been established in kindred trades for several years and have proved very successful, and its only object for existence is the collection of credit information, dunning bad debtors and the like.

In order to avoid the liability attendant upon its incorporation as a membership organization or one not for profit, under the laws of the State of New York, it is to be organized as a corporation to do business for profit, with a capital stock of $1,000 divided into 200 shares of $5 each. But one share is to be allotted to any member. The initiation, to be waived in case of charter members, is $10, and dues $40, payable semi-annually. In case of dissolution the capital stock is to be refunded, it being expressly stipulated that the certificates are not negotiable except by the consent of the association.

The following directors were elected: For three years from January, 1906, the date of the annual meeting, F. J. Alvin, E. J. Willis and G. W. Nock; for two years from the same date, J. E. Murray, New York Sporting Goods Co., and L. L. Halley, Sibley & Pitman, New York; for one year, Carl Kaufman, the Motor Accessory and Supply Co., New York, and H. B. Meyrich, National Electric Co., Washington, D. C. The power of electing officers devolving upon the board of directors by the terms of the constitution, a subsequent election was held, resulting in the choice of F. J. Alvin, president; L. C. Burnet, treasurer, and Franz Nielsen, No. 80 Wall street, secretary and counsel. Mr. Neilsen serves an electrical trade credit association in the same capacity, and in consequence "knows his book."

It was decided that in order to make the association national in its scope, instead of purely local, four vice-presidents be chosen, three of whom should be identified with the trade in other cities, such as Detroit, Boston and Chicago. Selection of these officers was deferred until such time as the association membership shall have increased to a point where they shall be representative of the trade in their sections of the country. It is anticipated that the membership will be increased to one hundred or over at the coming New York shows.

Witherbee Gets Larger Factory.

The Witherbee Igniter Co. is to-day removing from its Thames street address to its new factory at 541 West 43d street, New York. The new building is of five stories and will afford the Witherbee people facilities for the production of 1,000 storage batteries per week.

Miller now Meeting American Prices.

Charles E. Miller, the New York importer of Brampton chains, is now meeting the quotations of the American manufacturers. He did so well with the Brampton that he was able to place an order of such magnitude as permits of the price reduction.

Locomobile Men Go Abroad.

A. L. Riker, vice-president, and A. L. Schulz, chief designer, of the Locomobile Co. of America, sailed to-day for Paris to visit the automobile show. Joseph Tracy sailed on the same steamer, the Kaiser Wilhelm der Grosse.

MEXICO'S FIRST FACTORY

Government Grants Brown Big Concession—His Plans Suggest Even Tire Manufacture.

Mexico, the land of sage brush, chaparrell, sand dunes, cacti and lizards, is to have a "mammoth automobile and bicycle factory." It is to be established in Mexico City. The Motor World gave space to the earlier reports of the project and it now appears that the concession, which carries with it many privileges and franchises, has been granted by the Mexican Government to L. C. Brown and his party of St. Louis (Mo.) capitalists, whoever they may be.

Judging from the following extract from a Mexican paper Mr. Brown has done his advance work well:

"The Mexican Automobile and Bicycle Manufacturing Company is now being incorporated in the United States to exploit the concession, and the company expects to begin the construction of its factory within a short time. The large amount of capital that will be expended on the construction and equipment, according to the concession, indicates that the company proposes to erect one of the largest plants in the world, as it will have the capacity of turning out about ten automobiles and as many or more bicycles per day.

"Mr. Browne said that the factory is to be erected in the vicinity of this city and the equipment, all of which will be electrically driven, will be as complete as money can supply, and that nearly every part of the machines will be built in the factory here from the raw material.

"Though nothing definite is announced on the point, it is understood that even the tires will be made here and from a native material. It is also understood that the car bodies will be constructed of aluminum, to be supplied by the company recently organized to manufacture that article in the republic.

"A finely equipped repair shop is projected in the plan of the factory. Expert repair men will be brought here from abroad.

"The personnel of the Mexican Automobile and Bicycle Manufacturing Company includes some of the most prominent and wealthy men of the city, which is good assurance that the industry will be one of the most important that has ever been established in Mexico.

"When the industry is established the people of the republic will be able to obtain the highest grade machines at a cost very greatly reduced over what they are now compelled to pay, says Mr. Browne. Besides this, the purchaser will have no high duty or transportation charges added to the cost of his machine and he will have an opportunity of seeing and trying it right here at home before purchasing."

SO EASY, SO RELIABLE, SO SATISFACTORY, SO SAFE, SO DURABLE—
SO DIFFERENT

is the verdict of all users of

FISK
MECHANICALLY FASTENED TIRES

Make your automobile run smoothly—to your mental, as well as your physical, satisfaction—and maintain it economically by equipping it with FISK TIRES.

They have an individuality of design—recognized by every experienced driver to-day as being in every way superior; a nicety of workmanship—that works wonders where wearing qualities are considered; and a design that is veritably "an accident insurance."

You cannot appreciate what can be recorded of these tires on a car until you have personally "tried them out."

THE FISK RUBBER COMPANY, Chicopee Falls, Mass.

CADILLAC SALABILITY

The following letter was recently received from the Wm. Galloway Co., one of the principal Cadillac dealers in the State of Iowa.

WATERLOO, IOWA, Nov. 6, 1905.

CADILLAC MOTOR CAR CO., Detroit, Mich.

GENTLEMEN:—We have just wound up our automobile season and in this connection wish to say that the trade has gone way beyond our expectations. The facts of the case are, we got all the trade there was in the town and around here.

Now, as I tell my customers, it is not because they are buying machines from us that we are doing such a big business. It is simply the machine. The Cadillac automobile is *right*. You have struck the happy medium. The trouble with the average man who buys an automobile is he is misled and thinks unless he buys a car with two cylinders and rated at from 16 to 40 horse power he will not get a satisfactory machine. This is exactly where he is mistaken. I was mistaken myself in this same way, because when I first got the automobile fever no man could make me believe anything was right but a double cylinder; but my mind has been changed and changed radically since I have handled the Cadillac.

What more does a man want than on automobile that will take him any place he wants to go, faster than he cares to ride, and will positively handle mud, sand and roads in a manner that machines of three times the horse power cannot touch? This is exactly our experience with the Cadillac automobile. We sold twenty carloads of them this year with not one single dissatisfied customer, and fully expect to sell 120 machines this coming season, but will only place our order for 50 as a starter.

I will tell you what sells Cadillac automobiles. First, it is the men who own Cadillacs telling their friends, and Second, the machine itself. I consider it the most valuable automobile agency in America without a single exception.

Very truly yours,
THE WILLIAM GALLOWAY CO.

Dictated by WM. GALLOWAY.

THE MOTOR WORLD

Published Every Thursday by

THE MOTOR WORLD PUBLISHING COMPANY

154 Nassau Street,

NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum (Postage Paid) $2.00
Single Copies (Postage Paid) . . . 10 Cents
Foreign Subscription $4.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING COMPANY.

General Agents: The American News Co., New York City, and its branches.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, NOVEMBER 30, 1905.

THE

NEW YORK

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 9th and 16th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

"Enclosed find my check for which please renew my subscription to the Motor World. I think I get about all the leading publications, but when I want the latest news first I get it from the Motor World."—W. E. Rudy, Lima, Ohio.

Concerning Kerosene as a Fuel.

While, for obvious reasons, foreign manufacturers have long been striving, more or less sucessfully, for carburetters that will permit of the use of alcohol, it is a trifle odd that American makers have devoted practically no attention to kerosene as a fuel.

Waving aside all questions of heat units, thermal efficiency and similar technicalities, we all know that kerosene long has been successfully employed for boat propulsion, and the average automobilist who has on occasion been "put to it" while his engine yet retained its heat, knows as well that the same fuel has admirably served in the emergency.

Knowing all this, it would seem that the purely commercial advantages of kerosene should merit for it far more attention than it has received. Its abundance, its low price, its practically universal availability, its comparative safety—each and all of these factors are of more than passing influence and importance. They make for safety and economy in every department, economy not alone in the operating of the car, but in its sale or handling, for the item of insurance as it is affected by gasolene is not a small one, and is felt by manufacturer, dealer, owner and even by the dealer's neighbors and the owner's also.

It would also appear that the use of kerosene would be of influence in the increase of export trade; for it is in the far away countries that gasolene is scarce and its price steep. The use of gasolene propelled automobiles in such countries is an expensive luxury and an uncertain one, as, for instance, in Panama, where the owner of one wrote the Motor World that he for several weeks had been unable to use his car because gasolene was not available and the arrival of the next ship was sometime removed.

Of course, ready starting with kerosene is the chief stumbling block, or the only one. If it were possible to readily and quickly supply the requisite amount of heat necessary to immediately generate the gas all would be easy. The advantages that would accrue from it appear great enough and sufficiently far reaching to merit more serious and more general inventive effort to attain that end. Economy and safety are worth striving for to the end of time.

How Weight and Price Compare.

Probably it is because the automobile has been evolved and not designed by engineers, as many skeptics are at considerable pains to explain, and because, by the same token, the men who have been responsible for its development have been too much occupied with the labor of perfecting its mechanical details to delve into theory far enough to deduce formulae and ratios of a general nature, that the field is singularly barren of the sort of data which is to be had in other lines. Thus, the ratios which have been used for many years in the development of the steam engine, the weight per horse power for any given type, the fuel consumption, and the first cost, as well as the costs of maintenance and operation, have no exact counterparts, either in the hand books of the automobile designer or the memoranda of the salesman.

Material of this sort represents the result of a careful study of machinery which has been refined to a point where a uniform performance may be expected of any unit under normal conditions. It serves the designer as a criterion of the relative proficiency of his own product as compared with that of other designers. It serves the purchaser as a basis upon which he may exactly formulate his needs and determine at the outset just what sort of machine will be necessary to perform the work which he has to be done.

In the automobile field it is too early, for the most part, to expect authentic data of this sort in regard to the final performance of motors and complete machines. Certain ratios of weight to horsepower and carrying capacity have been worked out, but there is as yet hardly sufficient settlement of the questions involved to permit them to be considered as final. Thus, although a year ago, the proportion of one horsepower for every hundred pounds of weight in the car was considered as well established practice, the new year will see several cars in which this ratio is greatly reduced, and in at least one instance nearly cut in half.

One point, however, which is of paramount interest to both sides of the market, still vague and variable as are all other considerations in the trade, seemed last year to be approaching a settlement. That is to say, the ratio of cost to weight, though widely divergent throughout the whole range of the machines offered at the beginning of this season, yet showed a conformity to a certain standard throughout the range of medium priced cars, which was truly remarkable, when considered merely in the light of a coincidence, and which, taken as an indication of a trend, following along natural lines, pointed to a definite average rule. Thus, of the sixty-one cars priced within the limits of $1,200 to $2,000, which were staged in Madison Square Garden last January, no less than seventeen, or 28 per cent, of the entire num-

Digitized by Google

ber were assigned weights by their makers which made the cost figure out a dollar a pound. The average cost of the entire number, taken on the same basis, was 97 cents per pound, but slightly less than the dollar rate.

In the range of the low priced cars of the runabout order the cost per pound was considerably less on the average, running down to 75 cents in one instance, while among the more elaborate productions in which nothing was sacrificed to excellence and luxury in mechanism and fitting, the cost was considerably greater, running as high as $2.60 in one case.

It is not irrational to suppose that since the weight of the car has a definite relation to the capacity, and since the cost of manufacture and sale can be reduced to terms of the weight also, that such a ratio can be definitely evolved in process of time. Also, the same value may be expressed in terms of the carrying capacity of the machine, so that ultimately the purchaser may inform himself of the probable cost of a machine for any sort of duty, so long as it be of standard construction.

The crusade for more power and less weight per horsepower which is being waged this year, with the reduction in price of certain standard types of machine for popular use, are not unlikely to work together to keep the cost per pound very nearly constant, certain of the cheaper grades of car running below the average, and certain other types designed more luxuriously exceeding it by an amount which is dependent upon the degree of their elegance. Of course, it is impossible to make an fair estimate of the result which will be revealed during the coming Winter, but it is safe to assume that this result will not materially affect the figure which has held good this year for the majority of medium priced cars of standard construction.

To adjust the right height of the gasolene at the jet, says one of those "rocking chair" advisers, speaking of a carburetter, weight the float equally—that is to say, so that it will retain its erect position—with solder until the gasolene stands in a bead on the top of the jet without overflowing. This is the best height for efficient working. All of which is very well by way of experiment, but do not place too much faith in the rule, as not all carburetters have the same working level, and the result might be a permanent flooding of the cylinders with a mixture too rich to burn.

AT THE AUCTION SALE

"Grand Manufacturers' Clearance" Lacking in Grandeur—Auctioneer the Real Feature.

"If you're here to buy cars I'm here to sell them; not to answer questions," said the auctioneer at the 'grand manufacturers' and agents' clearing sale" at No. 309 West Forty-first street, New York City, Tuesday morning when the Motor World man asked him what manufacturer or agent was disposing of his stock. Further inquiries failed to reveal anything, and as a last recourse a grease-stained helper was appealed to. He said he did not know that any manufacturers or agents had a car in the place; that some of them belonged to the company—the West Side Auto Transportation Co. was on the sign over the door—and some of the cars had been brought in by individual owners to be disposed of at auction.

The Motor World man had, like one hundred and fifty others, been attracted to the place by the alluring advertisements in the daily newspapers, and wanted to "snap up" the "chance of a lifetime." There were plenty of chances, but the takers seemed to value their lifetimes. One of the chances came when a 1902 Oldsmobile was put up. It was probably the auctioneer's fault that it was not sold. He said he did not know whether it would run; in fact, he did not know if it even had an engine in it. When an inquisitive small boy "nosed" around to find the motor he was gently informed that his presence was not desired. Exit small boy.

Excepting some of the old cars—relics they were—the most interesting thing in the establishment was the auctioneer. He was one of the persuasion who was recognized as a man with a past who had "done things" in the bicycle business years ago and who were recently mingled with Grinbergs, Morrises and others of the "storage set." Clothed in a frock coat and wearing a hat that was a cross between a derby and a "tile," he mounted each car in turn and extolled its virtues. Nobody seemed to care when he gave as the list prices of some of them, figures $200 or $300 above catalogue lists. He had the happy faculty of gazing at the ceiling and getting a bid therefrom. Several times when some venturesome soul with money to burn risked a bid at $100 the auctioneer would lift his eyes heavenward, or rather ceilingward, and sing out:

"Do I hear $200? Ah, yes. Thank, you."

Apparently there were numerous straw bids, so it is not known just how many cars were actually sold.

The first—a 1904 Stevens-Duryea—went for $370, and starting from $150 a last year's White steam car was finally knocked down for $500. A four cylinder side entrance Ford was bid up to $800. The auctioneer himself started the bidding on a 1905 Richard-Brasier at $3,500, and disposed of it at $4,300. An Olds runabout sold for $325. Some person timidly ventured $200 on a 1904 Marion, which the auctioneer said had just been overhauled at the factory and repainted. The man with the queer hat said he liked the bidder's nerve, but just to show him that the average New Yorker is no fool would accept the bid. Then the calls came fast and furious from apparently nowhere, until at last the person with the questionable hat said: "Sold at $650!" The bid on a 1904 Rambler, with canopy top, was not high enough to suit his highness, so it was pushed back in the corner. There were no bids on a Northern runabout, and a 1904 Cadillac, with tonneau, brought only $300. The auctioneer requested the crowd to go upstairs. Said he thought if they went up their bids might go up also. It was not so ordained, however.

A schoolboy—he must have been that, for he had a neat pile of books under one arm—ventured $50 on an old cobwebbed Gasmobile, and the bidding was quite spirited in $2.50 raises until it was knocked down for $80. A dusty steam delivery wagon—no one knew its name or pedigree—received two bids, $50 and $55, respectively. It was sold for the latter figure. A 1903 Olds runabout brought $200, and a 1903 Mors started at $700 and finished at $1,175. A Centaur electric runabout sold for $275, and a last year's Rambler was not bid on. The last machine offered was an unpainted electric brougham, minus batteries. No bids were offered. There were lots of other cars, but as the damp atmosphere seemed to have a depressing effect upon the bidders the sale was declared over.

Kansas City is "Coming On."

The Kansas City (Mo.) Motor Car Company has leased the property at 310 West Ninth street, on which it will erect a three-story building, to be used as its retail establishment. The estimated cost is $60,000. The company will also build three brick structures on the Independence road, Kansas City, where it purposes building motor cars.

Chauffeurs Join Teamsters' Union.

Chauffeurs of Los Angeles, Cal., believe that "where there is union there is strength," and have accordingly organized as the Automobile Drivers and Helpers. It will be a typical trade union, as the new club has allied itself with the International Brotherhood of Teamsters.

Deere-Clark Erecting Big Plant.

The recently incorporated Deere-Clark Motor Car Co. has already started to build its plant at East Moline, Ill. A one story building, 100x300 feet, is being erected at First avenue, near the Grinnell road.

Reid may Leave Detroit.

The Reid Mfg. Co., Detroit, Mich., manufacturers of the Wolverine car, are seeking a location for the removal of its plant. Elkhart, Ind., is contemplated.

TIRE THAT FITS ITS TITLE

Goodrich's "Quick Detachable" Proves a Revelation—Just How it Works.

If the B. F. Goodrich Co.'s new Quick Detachable tire, as it is styled, does not score an immediate "hit," it will be surprising indeed. A sample tire reached the Goodrich branch at 1625 Broadway, New York, on Monday last and demonstrations amply proved that never was a tire more truly named. To see the tire removed from the rim in less than thirty seconds is a revelation; to see it attached, tightened and made ready for inflation in less than a minute—and all this without special effort—serves to heighten the wonder.

A clear idea of the mechanical details of the new method of fastening, as well as of the modus operandi involved in its use may be readily had by a glance at the accompanying photographic illustrations. In Fig. 1, which represents the rim stripped of all incumbrances, it will be noticed that this is of the usual clincher section, but is almost flat at one side, with the exception of a very slight retaining bead, which in no way impedes the entrance or exit of the tire to the hollow of the rim. At the left hand side of the rim, as shown in the illustration and within a fraction of an inch of the outer or unprotected edge, will be seen an opening of peculiar shape, extending along the rim for about two inches and going clear through the metal. About six inches below this and in a line with the opening referred to will be seen a small metal projection, while on the stand supporting the wheel and just to the left of the valve cover shown there, is a small piece of metal bent at right angles and having one end drilled with a half inch hole. These and the removable section of the rim shown leaning against the wheel in Fig. 2 comprise the fastening entire.

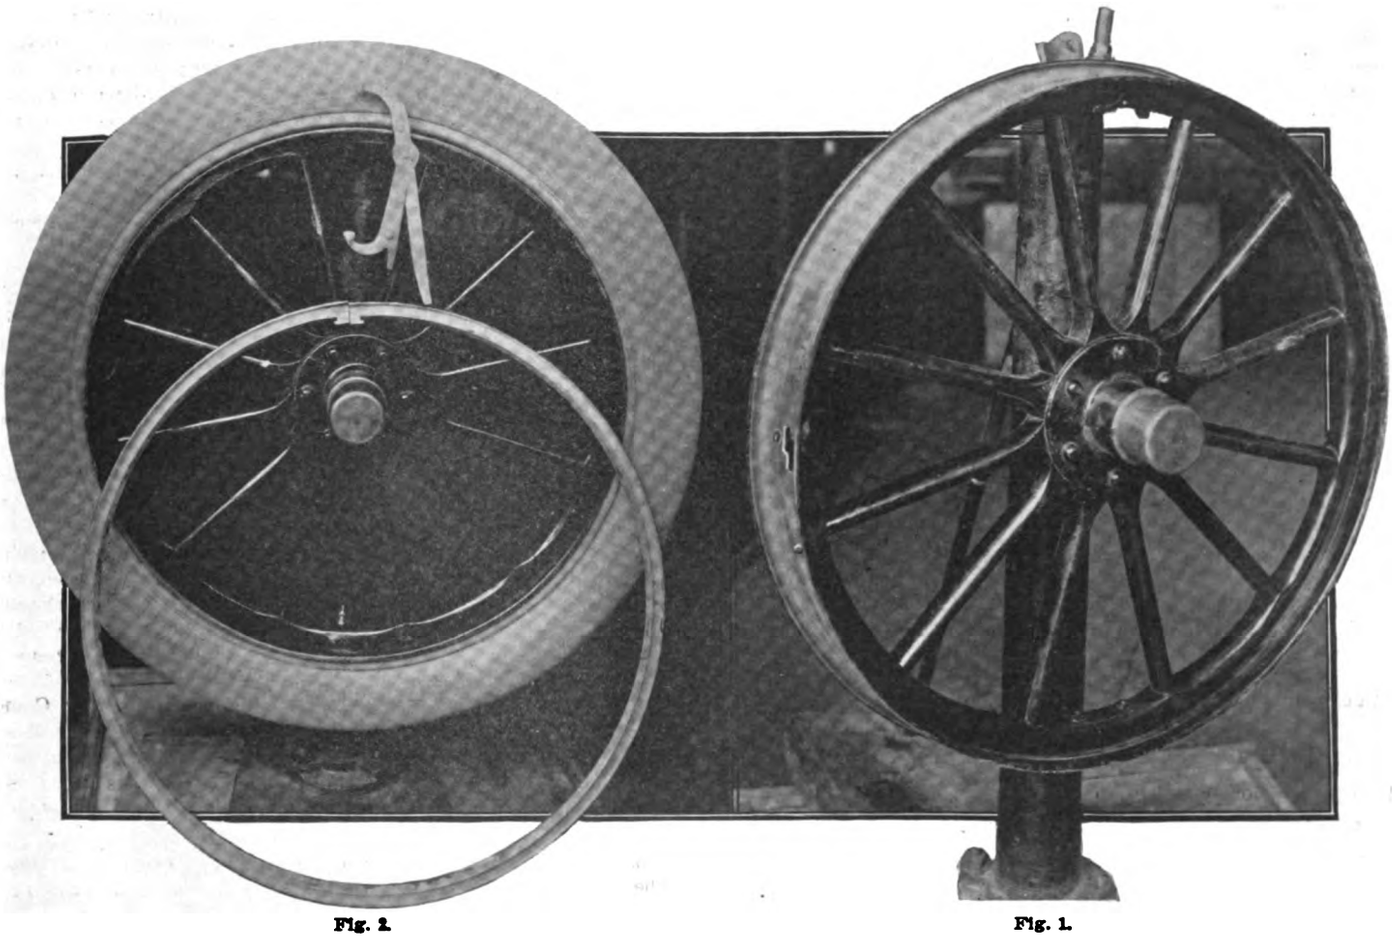

Fig. 2. Fig. 1.

Starting with the rim bare as illustrated the method of putting the tire in place ready for inflation is as follows: The valve stem is inserted through the corresponding hole in the rim, which is situated directly behind the opening already referred to in detail. One tongue of the removable rim section, as shown in Fig. 2, is then inserted in the left hand side of the latter opening and a recess in this movable piece is settled down over the small projection along the rim proper and about six inches below, as previously described. This prevents any lateral movement. The remainder of the removable section is then settled into place behind the raised bead extending around the entire wheel and which serves to grip it in place. This brings the other tongue of the latter opposite the opening which is so shaped as to permit of its insertion only by forcing the tire back on the rim for some distance and which can naturally only be done when deflated. After being inserted here it must be moved forward and outward a short distance to bring it into line with the other projection and the outside of the wheel.

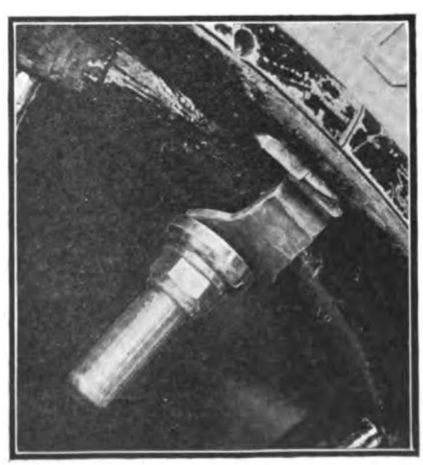

Fig. 3.

Both these projections then stick through the rim at a point that practically coincides with the center of the valve stem, but do not lie flush against the felloe. Here is where the small extra piece referred to comes in. By means of the hole mentioned it is slipped over the valve stem and forced behind the two tongues, the faces of the latter and that of the piece being so arranged as to tightly grip one another, the function of the piece

Digitized by Google

being to hold the ends of the removable rim down, although one of these—the left hand one, as illustrated, cannot move in any direction and the other can only move inward, which is impossible except when the tire happens to be deflated. Further security is insured by screwing the valve cover home tightly on its seat. The appearance of the entire construction in place with the tire inflated is clearly shown in Fig. 3. The recess shown in the removable rim just to the left of the joint in this illustration is for the reception of one end of the tool shown in Fig. 2 leaning against the wheel. This is the only tool necessary and is employed merely to start the removable section or the tire itself from its bed after having been in place for some time. As described the operation of removing or replacing the tire ready for inflation may appear lengthy, but it is as a matter of fact quite the reverse and takes far less time than is necessary to explain it. In short, if facility for repair is a vital factor—and it is—then the Goodrich Co. has taken a giant's stride forward.

Features of Fosdick's Garage.

In the "Motordrome," as the Harry Fosdick Company, of Boston, style their establishment on Stanhope street, there are incorporated several innovations that make for advanced service.

The building itself is of brick, five stories high, the whole of which is occupied by the Fosdick company. The top floor, purposely inaccessible, is devoted to a machine shop, admission to which will be strictly limited to the workman. Chauffeurs will not be allowed there under any circumstances.

On the floor below is the tool and stock room, where spare parts and extra tires, etc., may be checked, for which a receipt will be given. This, as Mr. Fosdick laughingly explained, is to assure a customer that he will not be sold the same tire or part a second time. Part of this floor is used as a private garage, and will contain separate charging stations for electrics, etc. Space therein has already been secured by a couple of prominent Bostonians.

The third floor is the repository and salesroom proper, where new cars will be shown, and everything that will lend attractiveness to their display has been installed; chief among which are the arrangement of lights, which give a sort of picture gallery effect, being strung along the sides of the wall and shaded so that the light is thrown directly on the cars. On this floor also are the business offices, attractively finished in green and white.

On the second floor is the garage for regular "boarders," which contains expanding metal lockers and other conveniencies.

The ground floor is cemented. It has an entrance on Stanhope street and an exit leading to Dartmouth street and the automobile testing track. It will be used for washing, etc. In the cellar will be the electrical equipment for charging batteries, and a feature is to be made of the care of commercial trucks.

In the Retail World.

Percy H. Johnston & Co., Newark, N. J., have taken the agency in that city for the Grout car.

The Austin Automobile Company, Newark, N. J., has taken the agency for the Ford cars.

The Keystone Automobile Company, Pittsburg, Pa., has taken the agency in that city for the Ford cars for 1906.

Guy Carlton has started in business at 528 North Main street, Bloomington, Ill. For the present he will handle the Buick.

John Charter and Russell George have begun business at Sterling, Ill. They will handle the Thomas car and do a general storage and repair business.

Munsing & Chapman is the style of a new firm formed to handle the Grout cars in New York. They have established themselves in the fine new building No. 1,855 Broadway.

Fire last Wednesday, 22d inst., in the garage of Thomas Northway, at 92-94 Exchange street, Rochester, N. Y., did $1,000 worth of damage. Several cars were damaged by water.

Hecht & Friedman, who will operate as the St. Louis Motor Car Co., of New York, have established salesrooms at No. 1,843 Broadway. They will, of course, handle the St. Louis car.

The Kane-Champlin Company, Buffalo, N. Y., has taken possession of its new establishment at Tupper and Ellicott streets. The garage is two stories high and its dimensions 57x100 feet.

The L. C. Gilson Automobile Co., Portland, Me., has contracted for the erection of a modern garage at 883,889 Congress street. It will be one story high, with basement, and measure 100x100 feet.

These officers have been elected to serve the Automobile Transit Co., of La Crosse, Wis.: President, A. J. Stephenson; vice-president, Fred Hartwell; treasurer, Philip McMahon; secretary, Warren Brayton.

F. Blomberg is erecting a $25,000 brick garage on Madison street, Memphis, Tenn. It will be two stories high, triangularly shaped, measuring 110 feet on new Madison street and 110 feet on old Madison street.

S. F. Randolph, of the Autocar Company of New York, has disposed of his lease on the building which was being finished for him at 62d and Broadway, and will seek a new location on his return from Paris. He sails for the French metropolis on Saturday.

Charles E. Lane has purchased a 50-foot lot on the south side of Olive street, near Vandewater avenue, St. Louis, Mo., on which he will erect a modern fireproof garage, to cost $25,000. He will handle St. Louis and Reo cars.

A four-story and basement brick garage will be erected at 28-30 Howard street, Albany, N. Y., by the Albany Garage Company. The concern has taken the agency in that city for the Thomas, Peerless, Autocar and Stevens-Duryea cars.

The Jackson Automobile Company, Jackson, Mich., has established salesrooms in Newark, N. J., through which the New York, New Jersey and Pennsylvania output will be handled. The branch is in charge of C. W. Oathout.

The recently incorporated Douglas-Andrews Co., New York City, which has contracted for the entire output of Berkshire cars, will establish a garage in Pittsfield, Mass., before January 1. The Mills Building has been leased for the purpose.

The Newark Garage and Repair Company, recently incorporated, has purchased the livery stable property at 213-215 Clinton avenue, that city, and will remodel it to suit the required needs. George Paddock has been elected president, Leonard B. Zusie treasurer and Andrew Schwind secretary and general manager.

L. D. Morris & Bros., automobile dealers at Plainfield, N. J., will move into the brick building on East Fourth street, formerly occupied by a large manufacturing concern. The firm is negotiating for the purchase of the property and, if acquired, will remodel it as a modern garage.

Excavations at 5,909-'15 Center avenue, Pittsburg, Pa., the site for the new garage to be erected by the Hiland Automobile Co., began last week. The building will consist of two stories and basement, 88x115 feet. When completed, the building and real estate will have cost more than $50,000. It will be heated by steam and the plant will be complete in every detail. There will be a separate building for the storage of gasolene in the rear of the main structure. The floor space will occupy 21,000 feet. The offices will be on the first floor, reception rooms and air-tight glass-inclosed salesrooms on the second floor.

Special Plant for Automobile Products.

The Standard Roller Bearing Company of Philadelphia has purchased for about $100,000 the property of the Pennsylvania Iron Company at 49th and Merion avenue, which adjoins their present property.

The realty secured consists of a lot 95 feet wide by 200 feet long, including a four-story brick building. This gives the Standard Roller Bearing Company 926 feet facing upon the Pennsylvania Railroad main line near 52d street station, making a total of over five acres, with several factory buildings, having a total floor space of 145,000 square feet.

The Standard company will move their annular ball bearing and automobile axle department and brass foundry into this Pennsylvania Iron Works building in about thirty days.

The Standard Roller Bearing Company also recently purchased from the American Ice Company a plot of land adjoining their property on the east, upon which they are erecting a foundry for making crucible steel castings.

The factory for two years has been running day and night and is employing nearly one thousand hands.

POINTS FROM PARIS

Prices, Light Cars, the Tire Test and Traffic Regulations all Subjects of Discussion.

Paris, Nov. 17.—The French makers have always prided themselves upon the exclusive character of their vehicles, and by catering for the wealthy classes are making a considerable profit out of the industry. While they could get high prices for big and highly finished cars they were not disposed to go in for the building of smaller and cheaper vehicles, upon which they would not get more than half the return with the same production. The popular type of car has been a little beneath them.

During the last year this somewhat supercilious attitude toward the cheap car has considerably changed as the result of new developments in the industry. As nearly all the firms had been specializing themselves in high priced cars, the supply has now fully met the demand, with the result that it is by no means so easy to get such big prices for cars as formerly. Several of the leading makers have found it necessary to revise their price lists and quote the new cars at lower figures. This is partly due to the competition of big engineering firms like Delaunay-Belleville, Hotchkiss and De Dietrich, who manufacture cars as a stop-gap and take up this branch of the business merely as a means of providing employment for their plants when not otherwise engaged. As the working costs are very low, they have it in their power to cut down prices whenever they find it to their interest to do so, and this is a standing menace to other firms who turn out nothing but cars and have therefore to take into account an exceptionally heavy working cost.

TENDENCY TOWARD LOWER PRICES.

This tendency toward the lowering of prices of high grade cars is being accompanied by a revival of interest in the popular car, which, beginning in the United States, where the runabout met with a good deal of success, has spread to England, and this popularity of the small car abroad has compelled French makers to look to this branch of the industry for fear that it will be monopolized by foreign manufacturers. Moreover, in this country also there is a strong agitation in favor of the cheap car among that almost unlimited class of buyers who feel that they have been waiting too long in the cold until makers should condescend to look after their requirements. For one buyer who will pay $3,000 for a car there are hundreds who are looking out for reliable vehicles that can be purchased for something less than $500, and there is no doubt that good little cars can be supplied for this figure. Of course, it is hopeless to expect to turn out cheap cars which are merely small imitations of the big vehicles, for in neither case can the quality of workmanship be sacrificed, and in proportion to the selling price the small car costs much more to produce than the big vehicle. The only way out of the difficulty, therefore, is to design special types of popular cars in which the mechanism is reduced to the simplest form possible.

Buyers have been stating their views through the motor press, from which it is clear that they have no particular preference for any type of mechanism so long as it is cheap and reliable. The popular car is not influenced by fashion in the same way as the big vehicle. The maker can employ any kind of engine and propelling gear, so long as the car gives satisfactory results, and having such a wide latitude in the designing of motors and transmissions there ought to be no difficulty in turning out suitable types of cheap cars. The only danger lies in little firms glutting the market with ramshackle affairs, as was the case five or six years ago when automobiling was thrown back by the disgust with which the public rejected the cars offered them. With the experience now gained in the industry, it may be hoped that this will not be repeated, and that the trade will settle down to types of little vehicles that will prove serviceable to their owners.

As a means of further stimulating this movement in favor of cheap cars a test of voiturettes is to be carried out this month, when we shall see what makers have already done in the way of catering for the unlimited demand for small cars. The example of Peugeot and Renault in designing light vehicles is having a good effect on the trade, and there is no doubt that 1906 will be chiefly remarkable for the revival of the popular car.

CARS FOR PROFESSIONAL USE.

Evidence of the growing use of the motor vehicle among people engaged in professional and business occupations is seen in the report which has just been presented by a member of the Extra-Parliamentary Commission of Inquiry upon the progress of automobilism during the last five years. In this country owners who use their cars for business are only required to pay one-half of the usual tax, and as their professions are given when declaring the vehicles a complete record is kept of the various occupations in which the motor car is regarded as an "instrument of work."

During the last four years the number of cars upon which the half tax is paid has been steadily increasing, until this year the 3,485 cars coming within this category represent 31.8 per cent of the total number of vehicles declared. One-third of this number—that is to say, 1,109 cars—are owned by doctors, and then come factory managers, engineers, architects, etc., with 359, followed by commercial travellers with 254. It is significant that nearly all the doctors using cars live in the country, and those in towns form only an infinitesimal proportion of the whole. It is strange that commercial travellers are not making a greater use of the motor vehicle, but this is one of the classes which are looking out for the cheap car which the trade is now preparing to supply. More than any one else the commercial traveller needs a car that is reliable as well as cheap, and he is hardly likely to spend a lot of money on a vehicle unless he is sure that it will prove a good investment. It is to be hoped that in the coming year the trade will bring suitable cars within reach of this as well as of other classes of would-be users who are anxiously waiting for a type of vehicle that will fully satisfy their requirements.

HOW THE TIRE RACE WILL BE RUN.

The details of the tire race have now been settled. The sporting commission of the Automobile Club of France had a great deal of difficulty in meeting the objections raised by the tire firms, who do not seem at all pleased at the idea of being required to take upon themselves the responsibility of a race. In the past they have been deriving enormous profit in the way of publicity from races in which car makers have had to bear the cost, and they can hardly gybe now at being invited to take part in a race organized specially for themselves, the more so as such a contest is expected to do a great deal in the way of improving the pneumatic tire. It is certain that the tire makers will have to exercise their ingenuity and experience in turning out the very best tires possible if they are to show up successfully in the race, for not only are they competing among themselves, but also with a category of solid tires and spring wheels which will for the first time be tested under exactly the same conditions as the pneumatic tires. Altogether the race promises to be unusually interesting.

The contest to be run off next year by the Automobile Club of France will be known as the Coupe du Bandage, or Tire Cup, and is limited exclusively to makers of wheels and tires of all kinds. Each maker will be allowed to enter a maximum number of four cars, for each of which a fee of $600 has to be paid. For entries that are received after February 15 the amount of the fee is doubled. The distance to be covered will be from 620 to 930 miles, and this may be run off in two daily stages, if necessary. The chassis must have a maximum weight of 1,200 kilos, with the usual tolerance of 7 kilos for magnetos. It must also carry a box to contain 400 kilos of dead weight behind the seats. The same systems of tires must be fitted to all four wheels.

The tires will be divided into two categories—that is to say, first, pneumatic tires, and second, all other kinds of tires and elastic wheels, or a combination of solid tires and springs. Each car will be allowed to carry four extra air tubes, which must be marked, as well as the tires on the wheels, and any repairs on the road can only be carried out by the driver and his mechanic with the tools on board. In sending entries the maker must forward a drawing of the tire, a complete tire, the parts which he wishes to have the option of changing during the race and a full description of the work and the time occupied in renewing such parts. The commission will inform the competitor if he will be allowed to change these parts, and if, in the event of the commission refusing to allow the parts to be changed, the maker

The Men Who Sell the Oldsmobile.

THE OLDS' AGENTS GROUPED AT THE SPECIAL TRAIN WHICH CARRIED THEM FROM LANSING TO THE MICHIGAN-WISCONSIN FOOTBALL GAME AT ANN ARBOR.

wishes to withdraw he will have returned to him one-half of the entrance fee if he notifies of his withdrawal within a week. The results will be based solely upon speed, but the tires or wheels must be in fair condition at the end of the race. There will also be a classification for regularity according to the aggregate times of the four cars running with each make of tire.

REGULATION OF MOTOR TRAFFIC.

The question of regulating motor car traffic is very much to the fore on this side. In England a royal commission of inquiry is sitting to lay the foundation of a new motor act to replace the one which is reaching the term for which it was passed, and in France the government has been obliged to take hasty measures to give satisfaction to that section of the public which is clamoring for protection. These measures aim at eliminating reckless drivers as much as possible by laying down all sorts of restrictions in the granting of driving certificates, notably in fixing a limit of age at which people can drive cars of stated horsepowers. For instance, between sixteen and eighteen years of age the applicant for a certificate can only ride a motorcycle of 2 horsepower; between eighteen and twenty-one he can drive cars up to 35 horsepower, and beyond the latter age he is qualified to drive any car subject to his getting a certificate. To obtain this he must present duly authenticated certificates showing that he is of good moral character and that his health and eyesight are good, and the driving examinations will be much more severe than they have been heretofore. It has been decided also to suppress the use of the horn in towns, which must be replaced by a bell, but the horn may be employed on the country roads.

If no serious protest has been raised against these new regulations—which, by the way, will not be enforced until they have passed through the Chamber—it is because it is understood that they are to be of a merely temporary character. The regulations that are to permanently guide motor traffic are being drawn up by the Extra Parliamentary Commission, which has now been sitting for close on three years. The task set this commission is of so complicated a character that it finds it hopeless to hit upon any cut and dried regulations which can be passed into a permanent law, and it is therefore proposed to create a motor code and then transform the Extra-Parliamentary Commission into a permanent consulting commission which will take automobiling entirely under its wing. The new commission will consider questions and problems relating to the different phases of automobiling as they arise, and will send on recommendations to the Ministers, who will legalize them by decrees so that they will be incorporated into the motor code. Motor traffic is growing so rapidly that the changing conditions of automobiling must require constant modification in the law, and the only way of meeting the questions that will continually arise will be by the formation of a permanent commission similar to that in operation in this country.

Italians Extend Forgiveness to Hemery.

Evidently the officials of the Automobile Cluub of Italy are of a forgiving nature or do not mind being told to go to hell two or three times over, for that body has reinstated August Hemery, the sour-visaged son of France, who won the Vanderbilt cup race. Hemery was suspended for one year for using th se torrid remarks to the officials in the Florio cup race, and the French organization recognized the action of the Italian club. Although he again consigned the Italians to the hot place when news of his punishment reached him when in New York, Hemery sent a written apology to the Italian club upon his return to France, according to Robert Coquelle, a Parisian race promoter now in this country, and was restored to its good graces, not however without paying a heavy fine.

Ohio Farmers as Frothing Motorphobes.

Farmers living between Urbana and Mechanicsburg, Ohio, are waging an unrelentless warfare upon the automobile. They have circulated a petition to the county commissioners asking that the roads be closed to motor vehicles, which has been signed by every farmer on the route. For some time past an automobile stage has been plying between the two cities and the motorphobic tendencies of the ruralites have taken the most virulent form, several attempts having been made to actually wreck it by placing logs across the road.

PENNSYLVANIA'S NEW LAW

Assesses Residents and Non-Residents and Requires Big Numbers—Licenses are Revokable.

All motorists who reside in Pennsylvania or who contemplate using the highways of that State must now make ready to comply with the new law which goes into effect on January 1 next. In some respects the law is slightly less burdensome to the residents. It vests authority in the State Highway Commission and exacts a charge of $3 per year for use of what are erroneously supposed to be the public roads. The old law required that $2 per year be paid to the county prothonotary for kindly consenting to issue a certificate of registration and $3 additional to the city or county treasurer for handing out a license.

By forbidding the display of other than Pennsylvania numbers the new law is made to more specifically apply to non-residents. Two of these numbers, which are five instead of three inches in height, will be supplied by the Highway Department, and must be displayed one on the front, the other on the rear of the vehicle. The display of these numbers, however, is not sufficient, as the operator of the car, who must be more than 18 years of age, must carry his license with him at all times, and whenever any cornfed constable feels like looking at it he must "produce," just as the Czar's subjects must "produce."

The speed limits are practically unchanged —20 miles per hour in the country, ten miles —instead of eight—in the corporate limits of cities and boroughs.

The penalties are made heavier and more specific. The old law gives courts the option of inflicting fines "not exceeding $100" or jail sentences "not exceeding 30 days." The new law makes the penalty for a first offense not less than $10 nor more than $25 or "not more than 10 days," and for a second offense not less than $25 nor more than $100, jail sentences being possible only in the event of non-payment of fines. For a second conviction the mortorist's right to use his property on the common roads of the State will be revoked for a period of not less than six months.

The full text of this precious law is as follows:

Section 1. Be it enacted, etc., That no motor vehicle, whether propelled by steam, gas or electricity, shall be operated or driven upon any public street or public highway in any city, borough, county or township in this commonwealth until the operator thereof shall have procured a license from the State Highway Department of this commonwealth, as hereinafter provided.

Section 2. Every applicant for a license shall set forth, in writing, verified by oath or affirmation, the name and residence of the applicant. No license shall be issued to any person who is under eighteen years of age.

Section 3. It shall be the duty of the State Highway Department to enter every such application in a book to be kept for that purpose, and, if all the requirements of section 2 of this act have been complied with, to issue a license to the applicant, and to furnish therewith two tags, containing the license number, not less than five inches in height, and the number of the year; for such license the applicant shall pay the sum of three dollars, which sum shall be appropriated to the use of the said State Highway Department.

Section 4. Every such license issued shall contain the name of the licensee, the date of license, and the number of the license under which the said vehicle is licensed, together with the number of the book and page in which the same is entered. The license shall not be effective until the license number is posted in a conspicuous place, both in back and front of the said vehicle. Not more than one State license number shall be carried upon the front and back of the said vehicle while operated or used on any of the public streets or public highways, as aforesaid; and a license number obtained in any other place or State shall be removed from said vehicle while the vehicle is being used within this commonwealth.

Section 5. No person or persons shall be allowed to use, operate or drive any motor vehicle, as aforesaid, upon any of the public streets or public highways of the cities, boroughs, counties or townships of this commonwealth at a speed greater than a mile in six minutes, within the corporate limits of any of the cities and boroughs thereof; outside of the corporate limits of any city or borough, as aforesaid, the lawful rate of speed shall not exceed one mile in three minutes: Provided,, That in townships of the first class the commissioners thereof may, by ordinance, fix a speed rate of not less than one mile in six minutes, in such sections of said township as they may deem such rate necessary for public safety: Provided, however, In the sections where such speed limit is fixed, the commissioners shall cause signs to be placed, at distances of not over one-half mile apart, which signs shall be readable from the highways, and shall set forth the speed limit and the penalty for the violation thereof: Provided further, That this section shall not permit any person or persons to drive an automobile at a greater speed than is reasonable, regarding traffic, danger, or injury to property or person, at any time or at any place.

Section 6. Any person using or operating a motor vehicle upon the public streets or public highways, as aforesaid, shall have displayed in a conspicuous place on the front and back of said vehicle, the tags furnished by the State Highway Department, accompanying the license for that year; and one hour after sunset he shall have the number in the back of the machine sufficiently lighted, so as to be plainly distinguishable. Every such motor vehicle shall carry, during the period, from one hour after sunset to one hour before sunrise, at least one fixed lighted lamp, showing a white light, visible at least one hundred feet in the direction towards which the vehicle is proceeding, and shall also exhibit one red light, visible in the reverse direction. Every motor vehicle shall also be provided with good and sufficient brake or brakes, and shall also be provided with bell, horns or other signal device. Every operator or user thereof shall sound the gong or other alarm when approaching a street crossing or road crossing; and shall have no more right of way, or preference as to the use of such street or road, than the driver of any horse or other animal, until the animal or animals have passed or have been passed by said motor vehicle.

Section 7. Every person so licensed shall carry with him, when using or operating such motor vehicle upon the public streets or the public highways aforesaid, his license, and when so required by any constable or police officer of this commonwealth shall produce the license for inspection. No license issued shall be valid for a longer period than one year. It may be issued on the first day of January, or at any time thereafter, but shall expire on the thirty-first day of December next ensuing.

Section 8. The constables and police officers of the cities, boroughs and townships of this commonwealth may arrest, upon view and without warrant, any person or persons violating any of the provisions of this act: Provided, That in the event of an arrest for violation of any of the provisions of this act, if the defendant is unable to give sufficient bail for a hearing or for his appearance at court, the magistrate before whom he is first taken, shall, in lieu of such bail, hold in custody the motor vehicle found in possession of the defendant; and the court, after the trial of the defendant, if no sufficient bail according to law has been given in the meantime, shall make such order as to the disposition of such motor vehicle as to it shall seem just and proper.

Section 9. All civil actions for damages arising from the use and operation of any motor vehicle, as aforesaid, may be brought in the city or county in which the alleged damages were sustained, and service of process may be made by the sheriff in person, or by his deputy, in any part of this commonwealth, in like manner as process may now be served in the proper county.

Section 10. Any person violating any of the provisions of this act shall be subject to a fine or penalty of not less than ten dollars nor more than twenty-five dollars, to be collected by summary conviction before any magistrate or justice of the peace, as like fines and penalties are now by law collectable; or, in case of non-payment of the fine within forty-eight hours, to undergo an imprisonment in the county jail for a period not exceeding ten days. Any person or persons who, having been previously convicted before a magistrate or justice of the peace

Digitized by Google

of this commonwealth of any violation of the provisions of this act, upon commission of the second or a subsequent offense shall be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be sentenced to pay a fine not less than twenty-five dollars nor more than one hundred dollars; or, in case of non-payment of such fine, to undergo an imprisonment in the county jail for a period not exceeding thirty days. Upon conviction of a second violation of the provisions of the act, certified to the State Highway Commissioner, the license issued to such person, so convicted, shall immediately be revoked by the State Highway Commissioner, and shall not be reissued for the space of six months after such revocation.

Section 11. All fines and penalties collected under the provisions of this act shall be paid to the city, borough or township treasurer, wherein the offense is committed, and the same shall be expended by said city, borough or township for the benefit of the public roads.

Section 12. This act shall not apply to any racecourse or private road, nor to any passenger railway or steam railroad confined to tracks, nor to steam or other street rollers, nor to any of the motor vehicles which any manufacturer or vendor of automobiles may have in stock for sale, and not for hire or for his private use.

Section 13. This act shall take effect on the first day of January, Anno Domini one thousand nine hundred and six.

Section 14. All acts or parts of acts inconsistent herewith are hereby repealed.

Will Buy Licenses En Bloc.

Although Philadelphia has long been called the "slow town," the automobile club of that city is showing a spirit of progressiveness that makes the name seem misappropriate. When the new automobile speed law goes into effect on January 1 next all members of the Philadelphia Automobile Club will not be put to the inconvenience of individually securing licenses. The club will stand sponsor for all the applications and will obtain the licenses from the Secretary of State by one application.

Vernor Would Require Aprons.

Alderman Vernor has introduced an ordinance in the Detroit (Mich.) council making it necessary for all automobiles in the city to be properly aproned. It likely will be tabled, however, for the Detroit Automobile Club has filed a protest against the passage of the measure, claiming that aprons create a dangerous condition, which sometimes results in the collected oil catching fire and burning up the car.

Albany Will Offer Touring Trophy.

At the annual meeting of the Albany (N. Y.) Automobile Club it was announced that the organization will offer a $250 cup to be offered in competition in a touring contest to be instituted next year. At this meeting the following officers were elected: President, Archibald J. McClure; vice-president, J. P. Randson; secretary-treasurer, C. D. Hakes.

FOR THE GLIDDEN TROPHY

Date Set and Route Outlined for 1906 Contest—Toronto the Destination.

The 1906 touring competition for the Glidden trophy will not, as heretofore, start and finish at New York City, but from Buffalo. The journey of some fourteen hundred miles will, however, end in New York. The route will be a circuitous one, taking in the best roads of Canada and New England, but withal the test will be a severe one as the roads to be traversed are particularly hilly. The date and details of the 1906 tour were given out late last week by the runs and tours committee of the American Automobile Association which, of course, has the affair in charge.

The start will be made from Buffalo, N. Y. —by invitation of the Automobile Club of Buffalo, of which Percy Pierce, winner of this year's contest, is a member—on the morning of July 23, and Niagara Falls will be visited en route to the Canadian border. The A. A. A. have started negotiations with the Canadian customs authorities so that no delay will be experienced at the border. From Niagara Falls the route will be over a fine old gravel road through St. Catherines, Grimsby and Hamilton to Toronto, where the first night stop will be. The tourists will be the guests of the Toronto Automobile Club.

For the second day the run will be over the famous Kingston road, the best macadamized highway in Canada, passing through Whitby, Oshawa, Bowmanville, Port Hope, Cobourg, Belleville and other old Canadian towns to Kingston. Here it is only a short distance to the Thousand Islands in the St. Lawrence River, and it is probable a day may be spent in the neighborhood.

Dirt roads of inferior quality will be ridden over on the third day, via Brockville and Prescott, and thence north to Ottawa, the Canadian capital. Here will be a night stop before beginning the short but tedious journey over dirt and rock roads to Montreal, the largest city in the Dominion. Better roads and a more interesting run will be had on the fifth day along the south shore of the St. Lawrence to Quebec, one of the oldest and most picturesque cities on this continent.

From this point the itinerary is not so well fixed in mind, but will include a run south over the uncertain Maine roads to Poland Springs, thence west through New Hampshire and the White Mountains to Bretton Woods for a day's rest, then traversing Vermont to Lake Champlain; thence to Saratoga and Albany and along the Hudson River to New York.

Calls "Lightning Conductor" a Libel.

An example of what may very aptly be termed "literary prostitution" has just been brought to light through the beginning of an action for libel against the English publishers of the two automobile novels written by the Williamsons and entitled "The Lightning Conductor" and "My Friend the Chauffeur," by the makers of the Benz cars.

In both of these books what is known as the "German Horror" is represented by an old 3 horsepower Benz of the vintage of 1898, which the American heroine is inveigled into buying at a high price from a scheming English nobleman. The hero is the owner of a new Napier, and gallantly rescues the heroine from the innumerable breakdowns of her lumbering vehicle. It all turns out to be a clever dodge to advertise the Napier car, which during the remainder of the books—the old German Horror is killed off early by burning itself up or in similar fashion—performs magnificently, and as every good and true automobile, whether bearing a hero and heroine or otherwise, should. The novels have had a large sale, and the Benz Parsifal Co. is accordingly seeking financial balm.

Allen Duly Authorized to Automobile.

After wandering through a labyrinth of laws and red tape the Comptroller of the Treasury last week rendered a decision that William C. Allen, electrical engineer of the District of Columbia, can have an automobile instead of a horse and thus save the District $300 a year. Allen discovered that he could travel much cheaper by motor car than by horse and communicated the fact to the Comptroller. No laws were found to bear on the subject, but the Comptroller, with more judgment than others of Washington's officialdom have shown, concluded that the use of the automobile was not contrary to law.

Speedway Yarn from Winnipeg.

Some energetic publicity promoter of the northern country has circulated the report that at the next sitting of the Manitoba Legislature application is to be made for authority to construct, operate and maintain a toll road or track of oval shape for the exclusive use of automobiles, with one end touching Winnipeg and the other Portage la Praire, the total distance to be covered by the course being 158 miles, according to the preliminary surveys. The course will be constructed of asphalt and oil, with a sand surface. Naturally "an effort will be made to have the big automobile races run on this course."

Vagaries of Batavian Law.

A motorist in Batavia has had to appear before the authorities at Munich on the ground that he had used a trumpet to give warning of his approach, instead of the more usual horn, blown by a rubber "pear." He argued that, though the law stated that a horn was necessary, it did not define how the born was to be blown. After a long discussion he was acquitted.

Burgoynes to Tour Egypt.

C. G. Burgoyne, ex-president of the Florida East Coast Automobile Association, has purchased a 1906 Thomas car, in which he and his wife will tour Egypt this winter. Mr. Burgoyne effected the purchase of the Thomas car very quickly after seeing the new model.

AN EVENING OF ALCOHOL

A. C. A. Hears All About it and a Full House Absorbs it, Mentally, of Course.

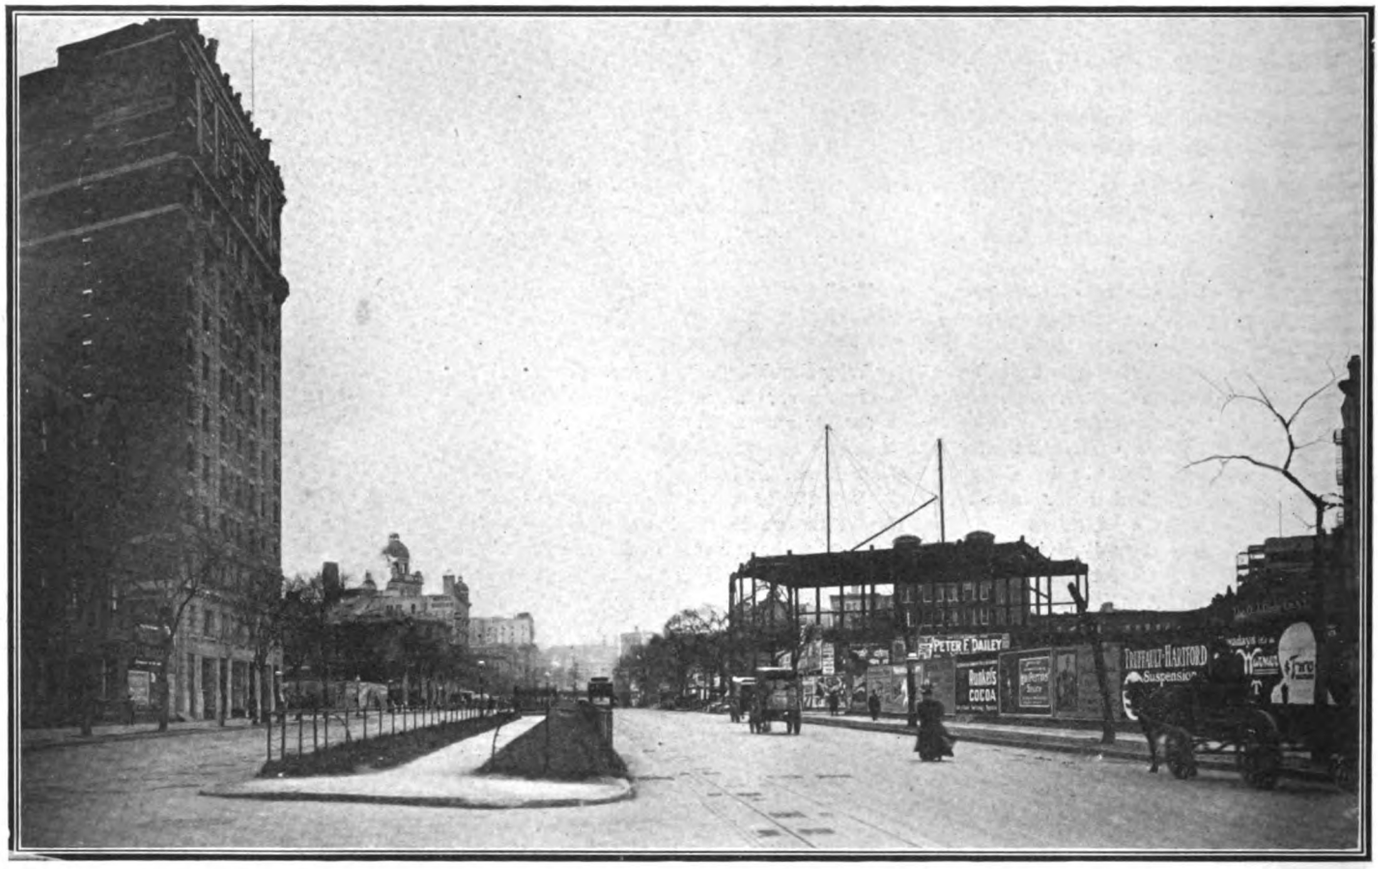
"Alcohol as a Motor Fuel" was the subject of the first monthly lecture of the season held at the rooms of the Automobile Club of America on Tuesday night last. This topic was interestingly treated by Whidden Graham. It must be explained, however, that Mr. Graham is not a mechanical expert, but rather a statistician who has made an extended study of the economical aspect of the question, and not the technical, and his treatment of the subject was from this point of view. As the Motor World stated some months since, there has been a tremendous propaganda afoot in this country for the last three years, having been carried on with a view to the passage of a bill by Congress exempting denatured alcohol for industrial purposes from taxation.

The United States is the only civilized country in the world that does not make a distinction between alcohol as a beverage and the same substance for commercial uses. It is something that reflects lasting discredit on the much vaunted progressiveness of the Americans as a people that this is so, for fifth rate nations which are compelled to resort to revenue raising measures that would not be tolerated in this country find it exceedingly profitable to exempt industrial alcohol from taxation. This has resulted in rendering the manufacture of a great many articles economically impossible in this country despite the almost prohibitive tariff barrier that the foreign maker must surmount. Mr. Graham has been in charge of the propaganda, backed by some of the most powerful industrial interests in the country, such as the General Electric Co., the International Harvester Co. and others, and it was the purpose of his lecture to demonstrate the bearing that the success of their efforts in procuring legislation to this end would have upon the automobile industry.

"There are always those who are ready to raise a cry that certain products are becoming scarcer," he said, "but their reason for so doing in the majority of instances is merely a blind behind which to advance prices. Many have accordingly classed the cry of the increasing scarcity of gasolene in this category, but quite the reverse is true. Fifteen or twenty years ago gasolene was so cheap that it was not considered worth marketing, and was accordingly used under the boilers in the refineries throughout Pennsylvania and Ohio. Then it began to be used industrially in a small way, and was to be had at six to eight cents a gallon; probably its price at retail did not exceed 10 cents for a number of years. Since then it has become double, and it takes no great amount of foresight to see that with each succeeding year it must soar unless something be done to relieve the demand, which has now become pressing.

"Contrary to the generally prevailing impression, the automobile is not responsible for more than a fraction of the latter. The gasolene stove and the small stationary engines used by the farmer are the largest consumers in the land. According to the fire underwriters' returns for last year, there are no less than 800,000 gasolene stoves of all kinds in use, and something like 200 000 stationary engines, practically all of which take their quota. Besides this an enormous quantity is used for lighting in rural districts, small plants for household requirements being largely marketed, the liquid being vaporized and burned as gas. But more than all these put together, the export demand at better prices is so large as to absorb more than half of last year's total supply, no less than 24,000,000 gallons of a total output of 40,000,000 gallons going abroad.

"Why should gasolene become scarcer? is, of course, a very natural question, and one that is readily answered. The grades of petroleum that are the very richest in light hydrocarbons do not produce on the average more than 5 per cent of gasolene. These are the oils found in the Pennsylvania and Ohio fields, thought to be the best in the world. But the production of these wells has been steadily on the decline for a number of years, and according to expert geologists there is little or no prospect of the discovery of others, either in the same territory or elsewhere in this country. Production in the East has now dropped to a point where Texas and California supply the greatest fraction of the annual output, but unfortunately the oil is of a character totally lacking in the lighter hydrocarbons such as gasolene, or containing them in such extremely small quantities as to be a negligible factor. Borneo and Sumatra produce high grade petroleum rich in gasolene, but the supply is very small; as for the great Russian oil fields, their output does not begin to supply the demands of Europe, as witness the tremendous quantities sent to the Continent and England by American refiners. The world's supply is accordingly limited, and there is little or no prospect that any discovery of the future will alter matters in this respect. As for making gasolene synthetically, I am not a chemist, although I have no doubt it could be done. Like artificial diamonds, however, the quantity would not be a drop in the bucket and it would come rather high. Then why will the advent of a perfected kerosene motor not solve the problem? For the same reason. It is getting scarcer every year, and any great increase in the demand would instantly jump the price.



"Now, alcohol has been demonstrated to be a fuel par excellence for the internal combustion motor. The only problems its use in this capacity presents to place it on a par with, if not above, gasolene are slowness in starting, half a minute or more being necessary to vaporize it, and the designing of engines of higher compression as well as carburetters especially intended for its use. None of them insurmountable difficulties. The efficiency of alcohol as a fuel is 38 per cent, as compared to not more than 20 per cent for gasolene. How can this be when gasolene is credited with a very much higher number of British thermal units per pound is a very natural question that is answered by the authorities responsible for the above efficiency figures with the statement that, owing to the very much greater compression permissible with alcohol, without danger of spontaneous ignition—almost double that allowable with gasolene, as well as the much slower and more uniform expansion that extends throughout the entire stroke—a far more complete utilization of every atom of fuel is possible. More than that, as 90 per cent alcohol—that is, alcohol containing 10 per cent water—is found to be best adapted for motor use, this amount of water acts as an effective cooling agent, so that a motor run with alcohol requires far less provision for cooling and a much smaller fraction of the heat or energy developed is wasted. As you are doubtless all familiar with the extended experiments that have been so successfully carried out in Germany and France there is little need to dwell longer upon this phase of the subject except to refer to the many other advantages of alcohol. First and foremost comes its safety; whether a pint or a thousand gallons be spilled it will not generate an explosive mixture with the air in a room or similar place; if ignited it will only burn freely and may be put out very readily with water, whereas nothing short of sand will extinguish gasolene. It does not produce an offensive odor, and, moreover, does not carbonize; it is completely consumed, leaving no residue. It possesses other advantages which it would take too much time to detail.

"To come back to the economic aspect of alcohol, there is no country on the face of the earth so favorably situated to produce it as the United States. Anything containing starch is capable of being converted into alcohol by very simple and cheap processes; its very simplicity accounts in one way for the prevalence of moonshine whiskey, and it will doubtless surprise you to know that there is more moonshine whiskey made within ten miles of the New York City Hall than all the rest of the country put together. A bushel of corn that sells in the market at 35 to 40 cents will yield two and a half gallons of 90 per cent alcohol, thus making its cost very low. As a matter of fact, alcohol at 31 cents a gallon has been found to be cheaper for illuminating purposes in France than kerosene at 15 cents. Potatoes are likewise a most prolific source of alcohol, Germany's production last year amounting to 75,000,000 gallons, of which the greater part was consumed for motive power. Now, last year Maine had such a bumper crop of potatoes that they were scarcely worth 30 cents a barrel, and hundreds of tons of them were thrown away. This could never be with tax-free industrial alcohol, as the latter may be stored and kept indefinitely without deterioration, thus imposing an economic check and effecting a balance between lean and fat years agriculturally.

"There is one charge in connection with the use of alcohol for motor purposes that causes me to revert to that subject for a moment, and that is that it rusts the motor badly and consequently is not fitted for such use. This has never been found to be the case except

Where New York's "Row" is Extending Itself.

BROADWAY, NORTH OF COLUMBUS CIRCLE.

where wood alcohol has been used as denaturent. Wood alcohol contains formic acid and tends to generate formaldehyde, both of these being corrosive agents.

"The substances used for denaturing the alcohol—that is, rendering it unfit to drink—are naphthalin, pyridin, which is very offensive; benozol and sulphuric ether."

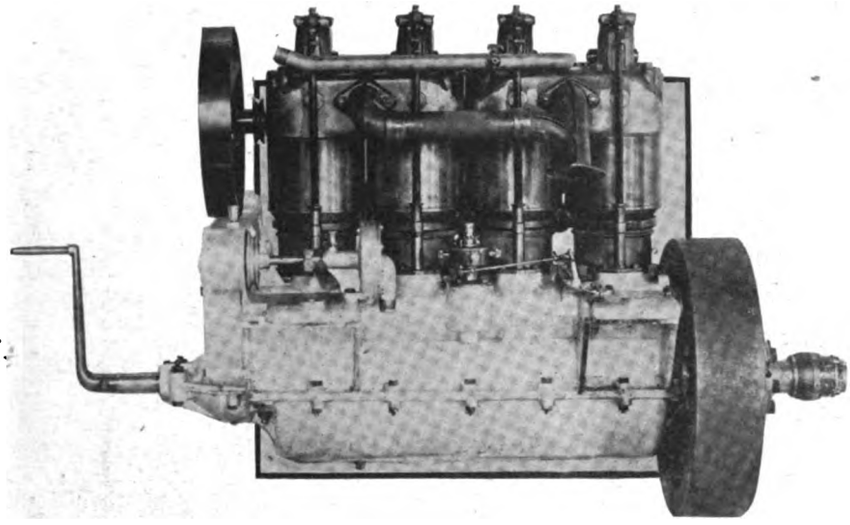
John Jacob Astor was an interested listener, though his attention appeared to be confined principally to thinking up questions in regard to what substances other than alcohol could be employed as a motive power for the automobile, although one of his interrogations was as to whether alcohol could be produced from coal. Illuminating gas, acetylene and hydrogen gas were also objects of his search for information in the same direction in spite of the fact that Mr. Graham had acknowledged himself as incompetent to speak technically prefatory to his remarks.

The Extension of "Automobile Row,"

New York's "Automobile row" is gradually stretching itself out along both sides of Broadway above and below Columbus Circle, the preemption of the territory north of that dividing point being a recent development, although there have been establishments, such as that of the White salesroom and garage, scattered in various parts of that territory for some time past. Automobiledom, as a whole, has taken a substantial step northward, and out of side streets to a great extent to line Broadway from 44th street up in the past year, probably the only reason for its not having passed the Circle hitherto being the utter lack of accommodation. Not alone have suitable buildings been wanting; there were none at all.

How great the desire of agents to get into that particular part of the city has been, is well illustrated by the rental of the entire Broadway front long before it was ready for occupancy, of a large apartment hotel that has recently been completed on the southwest corner of 61st street and Broadway. From north to south these stores now form the home of the Grout, Stoddard-Dayton and the Elmore, the last named being handled by A. E. Ranney & Co., who will devote themselves entirely to the two models turned out by the Clyde, Ohio, factory during the coming year. These will be the two-cylinder, two-cycle model already familiar, and four-cylinder, two cycle motor placed vertically under the connet as is customary. Details of this latter car have not as yet been forthcoming, and as it is not alone to be in every respect a modern piece of automobile construction, but is claimed by the makers to be the equal of a car equipped with a six-cylinder, four cycle motor, its advent is looked forward to with interest by many.

This particular spot seems destined to become a nucleus in the near future for diagonally opposite but one block away, on the southeast corner of 62d street, is being erected the new building intended to house the Thomas interests in this city, while right across the way, on the northwest corner of Broadway and the same cross street, there is a building nearing completion which rumor has it, will shelter the Panhard cars when completed. Near the other end of the same block upon which the three agencies already mentioned have located, will be found a newcomer in New York—the St. Louis. This car, which is about to make its debut in Gotham, will be handled by the St. Louis Motor Car Co., of New York, of which Messrs. Hecht & Friedberger will be the proprietors. They have located at 1843 Broadway, and will devote their energies to the two St. Louis models, the 22 horsepower horizontal opposed and 60 horsepower four cylinder vertical.



Salt Lake City, Utah—Math Day, of Fillmore, Utah, proposes to establish a line from Kanosh to connect with the Salt Lake route. The intention is to supplant the present stage line and reduce the time between the two points.

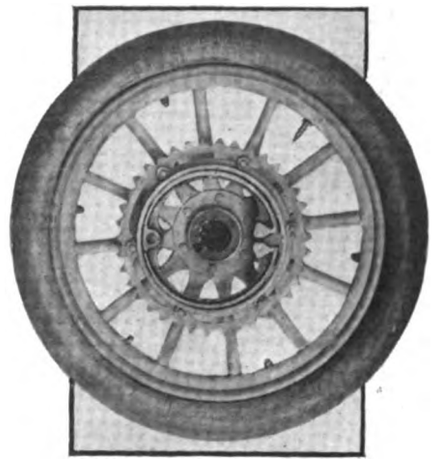
ABOUT THE POPE-TOLEDO

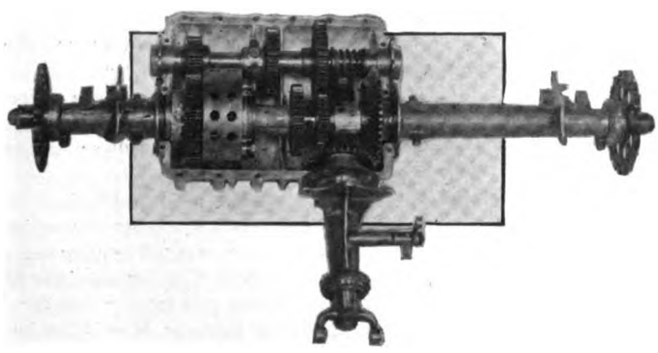
Characteristics of the 1906 Model and Wherein it will Differ from Previous Ones.

Fuller particulars of the Pope-Toledo Type XII, which was outlined in last week's Motor World, show that the car is a Pope-Toledo from the ground up, yet a new car in every point, and thoroughly modern to the last fibre. In the construction of this machine, the designer's aim has been, first of all, to produce a car in which the engine



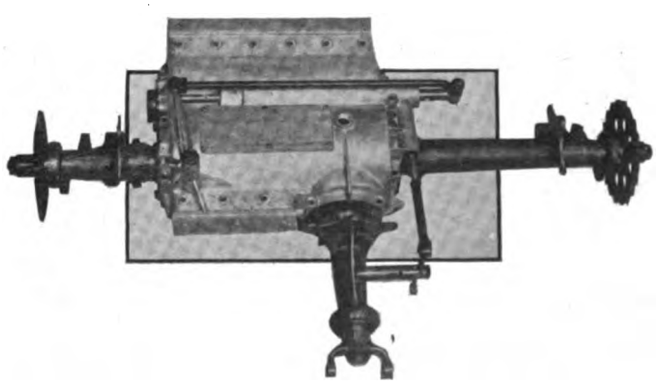
1906 POPE-TOLEDO ENGINE.

should not be unduly hampered by its full rated load. That is to say, the intention was that of increasing the ratio of motor power to weight to a point which was beyond parallel. Of the two ways of accomplishing this, the more difficult, and that involving the greater nicety of detail, was chosen, and, instead of increasing the power of the motor to an unnecessary degree, the weight of the car itself was reduced by the adoption of new materials of construction and refinement of detail, thereby securing the disideratum without endangering the staying qualities of any of the parts.



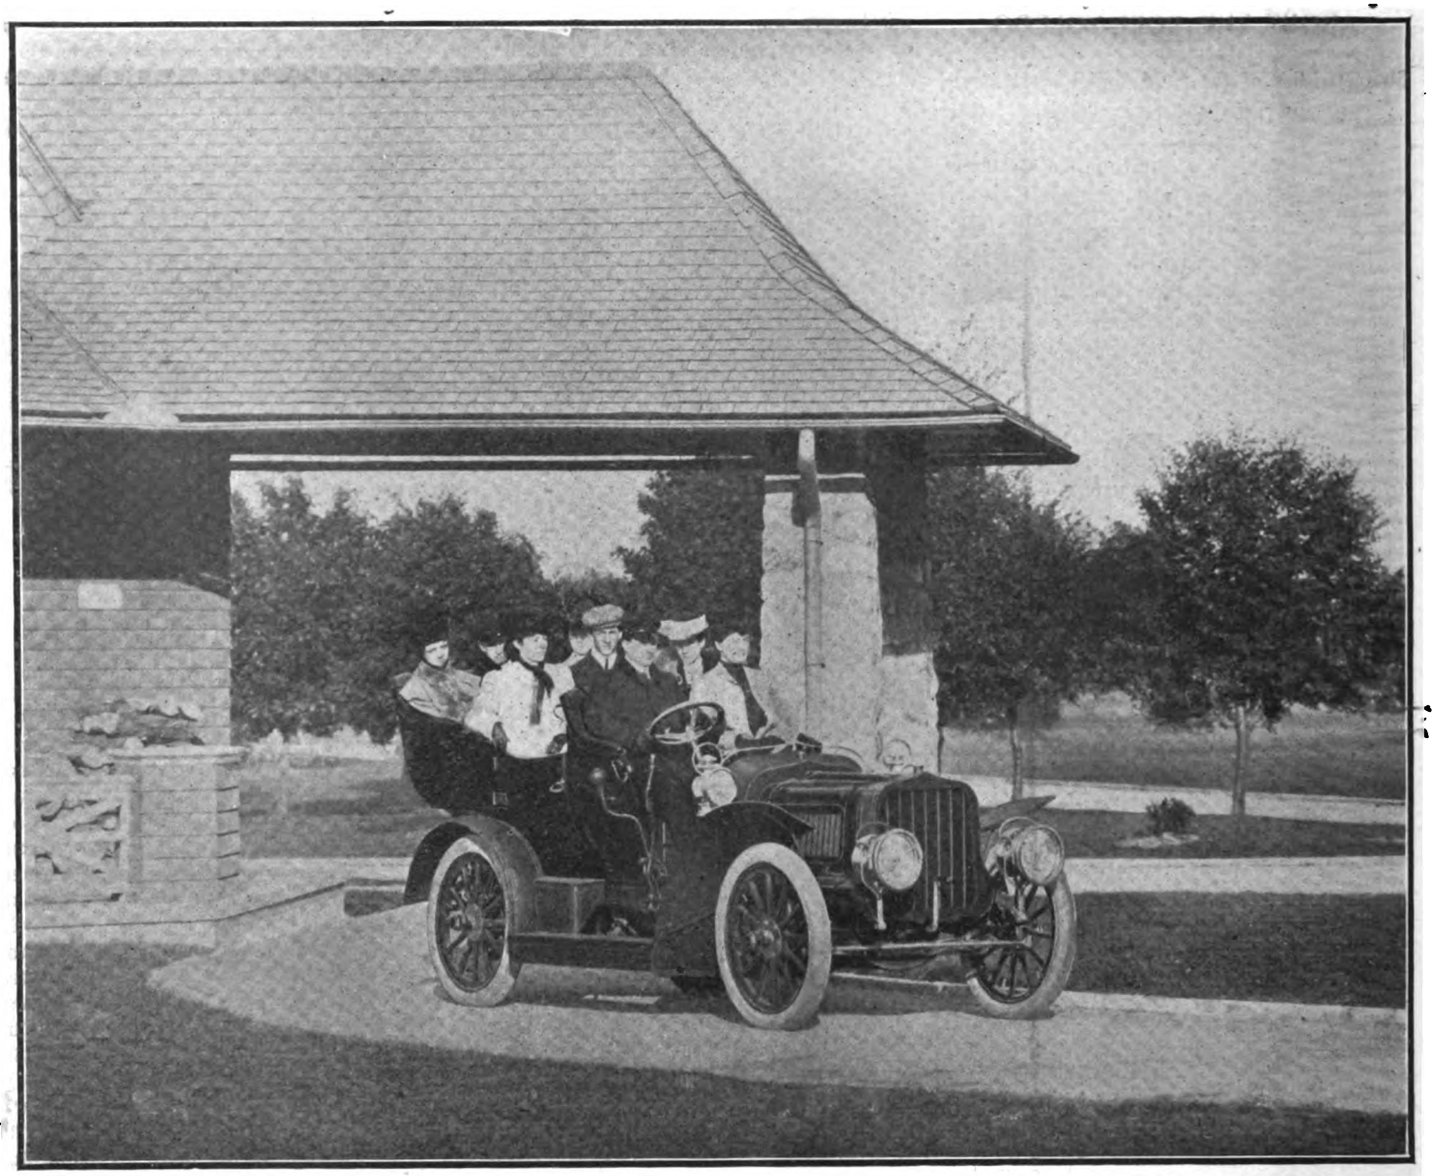
In working toward the desired end, however, the comfort and convenience of the passengers was sought after quite as much as the main object, and, as a result, the machine is equipped with a body capable of carrying five persons in absolute comfort, with extra room for the "two more" who are sure to be in evidence; the latter being taken care of in a lift seat which, when not in use, folds away out of sight under the driver's seat in front. In the finish and equipment of the body as much care has been taken as in the working out of the more essential details, even to the extent of the provision of protection strips between the mud guards and body, which secure an absolute closure of the entire under side of the car from the road.

The frame has been designed with an eye to the elimination of parts as far as possible, the fewest number of elements consistant with structural excellence having been untilized. I-beam axle construction is used, the material employed having a tensile strength of 110,000 pounds per square inch. The braking equipment consists of two sets of internally expanding brakes, acting upon drums attached to the rear wheels, each set being interconnected with the clutch mechanism in such a manner that the application of either serves to release the engine. A noteworthy point in connection with a study of the car is that the wheels are assembled entirely at the Pope-Toledo factory, and are given the same care and supervision in the making as are all other portions of the machine.



In the illustration of the motor here presented, the new method of constructing the cylinder heads in pairs is well shown. By this means, the advantages of unit cylinder construction are maintained, while at the same time the regidity of the structure, which is to be had with the multiple cylinder casting, is secured by the bridging effect of the heads. The ports are siameesed, thus simplifying the piping and doing away with unnecessary outrigging. As will be seen from the cut, the exhaust valves are in an inverted position, and are actuated by long tappet rods, in conjunction with short walking beams mounted upon the heads themselves. The carburetter, which is an improvement over the type used last year, and is fed by gravity from an auxiliary tank mounted on the dash and fed by a hand pump from the main supply tank, has an average consumption of one gallon for a distance of 17 to 18 miles.

POPE-TOLEDO BRAKE.



ARRANGEMENT OF POPE-TOLEDO GEARS

GEAR CASE SHOWING INTERLOCKING PIN.

A point in the mounting of the machine which should not be overlooked in this connection, is that the mechanical oiler, instead of being placed on the dash, as in many types of machine, is placed on an arm of the engine base, in close proximity to the exhaust line, thereby ensuring an even tem-

PASSENGER CAPACITY OF THE 1906 POPE-TOLEDO WHEN FITTED WITH "JUMP" SEAT.

perature to the lubricant under all conconditions of climate. The feed of oil is positively regulated by a system which is without a check-valve, and is entirely automatic. Separate sightfeed glasses are placed upon the dash as a means of indicating to the driver the rate of the various feeds.

In the transmission, the unique arrangement adopted last year has been retained, the lay shaft being placed parallel to the countershaft, and alongside of it, thus throwing the gear case abaft the mid section of the car. As will be seen from the accompanying cuts, the arrangement is extremely simple and compact; this fact, and the method of strengthening the casing by the use of cast webs serving to insure long life to the gears and freedom from distortion to the shafts. The drive from the clutch is to a bevel gear, mounted upon a sleeve which rides freely upon the differential shaft.

Upon this sleeve, and forced to turn in unison with it, is the sliding member with which the changes are effected, while a gear fixed with the differential mechanism meshes with the driving gear on the lay shaft. The lay shaft also carries two other gears with which the sliding member meshes, one of them being slidable, and though normally held in one position by a spring capable of being moved into engagement with an idler in securing the reverse. The high gear is obtained by uniting the sleeve upon which is fixed the driving bevel gear with the shaft upon which it rides, thus securing a direct drive to the sprockets.

The gear case is mounted upon transverse members of the frame, and the suspension is rendered more rigid by the fixing of the counter shaft brackets upon the side members of the frame. The sliding member of the transmission is controlled by means of a transversely working rod, which is drilled out at intervals to permit of the engagement of a pin, actuated by a clutch mechanism to lock the gears in full mesh whenever it is engaged. The action of this mechanism is shown in the illustration of the outside of the case. The more vital parts of the transmission mechanism are constructed of a special steel which yields a tensile strength of 225,000 pounds per square inch upon test.

That the weight ratio is all that could be desired is shown by the figures which give 1 horsepower for every fifty-four pounds of car. That the action of the fabric is all that it should be is shown by the fact that upon recent trial the test car, which has been put over 8,000 miles of road, first and last, carrying a dead load of 800 pounds in addition to two persons,, made a run of 782.7 miles on a consumption of 49¾ gallons of fuel, while the latter portion of the trip, which was over exceptionally good roads, was made on 9.8 gallons for 210 miles, the average being 15.8 miles to the gallon for the entire trip and 21.5 miles to the gallon for the last stretch—a showing that is the best evidence of the well-calculated relation between weight and power.

WHAT LONDON'S SHOW DISCLOSED

No Startling Innovations but Certain Well Defined Tendencies are Made Plain.

Friday, November 17, marked the opening of what is conceded to be England's most successful show season, judging from the number of exhibits and the quality of the wares staged. As in former years, two separate exhibitions are held—one, at Olympia, in West Kensington, being devoted chiefly to the display of motor cars and chassis, while the Stanley Show, at Agricultural Hall, is given over chiefly to the cycle exhibits, and the cars and masses of sundries for which there is no room at Olympia. This opening of the British season in advance of the Paris Salon, is an innovation, doubtfully regarded at first by many, on account of the fear that many of the foreign exhibitors would not care to reveal their new models until the Paris event, but the sequel proves these fears to have been groundless, and stamps the affair as being beyond expectation.

At the Olympia exhibition, where the Society of Motor Manufacturers and Traders has placed some three hundred exhibits, there is far more of novelty to be seen than was to have been expected, considering the general tendency toward a standardization of types. Although that tendency is growing largely from year to year, there is a considerable showing of originality both in detail and general design; so that, as a local journal puts it, "there is not the slightest indication consequently of any approach to rigid uniformity or stagnation of inventive faculty." Of the general tendencies, the most noticeable are a more general adoption of ball bearings, a strengthening of the position of the Cardan drive, an increase in the size of tires to cope with the now generally adopted types of closed body, and a corresponding increase in engine powers. A greater number of six-cylinder motors are to be seen than ever before, and two makers show eight cylinder machines, one type being of the vertical order, the cylinders being arranged in tandem position, and the other being of the V type, with four cylinders in each group.

Of the three hundred exhibitors occupying the space in the hall and its annex, fifty-one represent foreign manufacturers. Over a hundred are showing pleasure cars, thirty-five commercial vehicles; twenty-six motor boats, and the remainder, display bodies, parts and accessories. Some four hundred and fifty cars and chassis are to be seen, of which all but a scant dozen are propelled by gasolene power, the remainder being perhaps equally divided between the steam and electric types. Some 65 per cent of the gasolene cars are equipped with four cylinder motors, 20 per cent with two cylinder motors, 8 per cent with single cylinder motors, and 4 per cent with three cylinder motors. The balance have either six or eight cylinder engines, there being something like a dozen of the former type on view, and four of the latter.

As formerly, the vertical position of the motor is the greatest favorite, although a few cars are shown having horizontal engines, and one make in which the V type is employed. As was predicted in The Motor World recently, a number of cars are shown in which the engine, though placed well toward the front of the chassis, is covered by the driver's seat, and the bonnet is done away with. The machines of the latter type are, for the most part, intended for landaulette or cab bodies, and in some cases for commercial work.

As for the ignition problem, the jump spark is still largely in the majority, something like 85 per cent of the cars shown being equipped with one of the jump spark systems, either singly or in combination. About 52 per cent of the cars have the primary battery as a source of current, 11 per cent the high tension magneto and a good 10 per cent the low tension type of magneto. Twenty-three per cent of the cars have both high tension magneto and batteries, and something like 2 per cent have the low tension magneto, with batteries and spark plugs fitted as a standby.

In the matter of clutches, there is a good deal more variety than was to be seen a year ago, the common type of leather-faced cone clutch being forced to give way to the disc type in both the single and multiple forms, and, too, there is a good representation of the hydraulic type, a distinct innovation with this season. On the whole, there would seem to be a trend away from the orthodox type, and a leaning toward the multiple disc pattern, though before a large adoption of this, the development of the hydraulic principle may prove it to be the more desirable of the two.

The sliding gear type of transmission is holding its own. As a rule, four speeds are provided, though a large number of makers furnish but three. "Direct drive on the high" is the order of the day. In the matter of the drive from the transmission to the rear wheels, the method of the Cardan shaft has a majority of 57 per cent, something like 40 per cent of the cars shown having the chain drive of the single or double type, while there is a sprinkling of other types, including the new worm drive, which has been described in these columns. A few makers give an option between the chain and shaft systems. In wheel base and weights there is an increase in the large types of machine, the more prevalent length for cars of fifteen horse power or more being one hundred inches and upward to one hundred and twenty inches, while the weights within this range run at somewhere in the neighborhood of eighteen hundred pounds for the chassis alone, two thousand pounds being a not uncommon weight for the chassis in the case of a twenty horse power car.

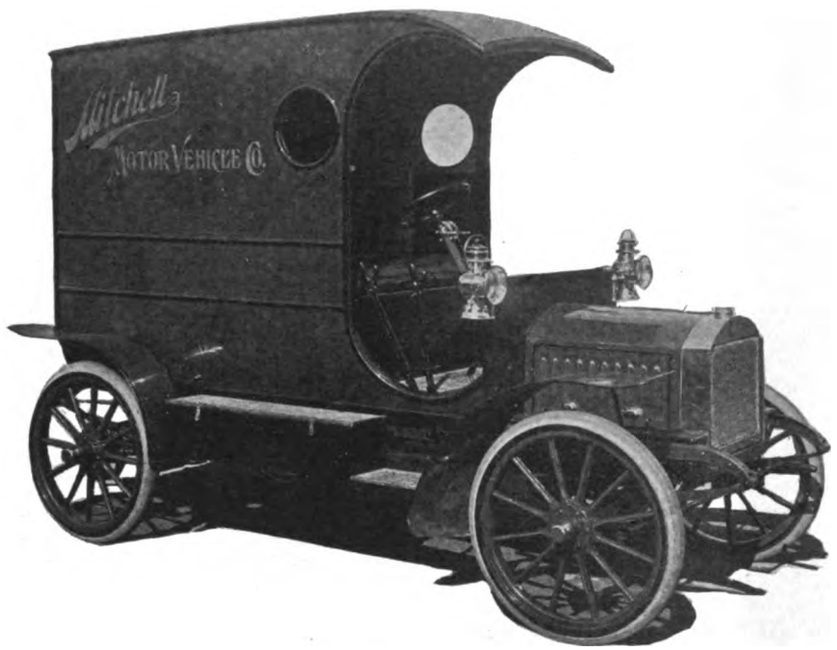
Body design, as far as types alone are concerned, shows but little variation over last year. The side entrance principle is by far the most popular, and the closed pattern of body shows a rapid increase in favor. There are numerous improvements in the way of a softening of the lines and an increase in the comfort of the quarters given to the passengers. There are a number of different types of convertible body shown, the landaulette type being greatly in evidence. One firm showing cars equipped with this type of body, gives a variation in an arrangement whereby the removal of a portion of the body structure and the addition of a second top, converts it into a victoria, the change being easily accomplished without loss of time. Arrangements for the comfort and convenience of the traveller are more in evidence than ever, both in the way of more roomy accommodations, and in the provision of more elaborate fittings.

Nearly 13,000 Miles Without Tire Trouble.

In these days one hears quite enough of the poor performance of tires on the road, and of the performance of poor tires on the road, and but little, strange though it may seem, of the really satisfactory service which may be got from a set of tires under favorable circumstances, complaint coming more freely from the lips of the discontented one than praise from those of him who has had "better luck." V. L. Emerson, general manager of the American Auto Car Company, of Cincinnati, O., is of the latter class, though not as silent about it as the average, for he says that he has a set of tires on a 690-pound car of twenty horse-power which have run 12,600 miles in the aggregate without the expenditure of a penny for repairs. They are three and one-half inches in size and of American make, and although they have been used until the rubber facing is entirely worn from the surface of the tread, they have in no other way depreciated and have not cost a penny for repairs.

New Dust Layer fr m Greece.

United States Consul Horton is responsible for the statement made in a recent report to the Bureau of Commerce and Labor that a newly discovered substance which boasts of classic Greece as its place of origin, and is known by the name of "akonia," is quite as effective as oil as a dust preventive on roads, and has the added advantage of being much cheaper as well as not possessing the objectionable characteristics of the latter.



Writing from Piræus, Greece, he says that the Mayor of that extremely ancient city is authority for the statement that one ton of akonia dissolved in 500 gallons of water will sprinkle a 30-foot roadway for half a mile so effectively that no dust whatever would arise from it, either through the wind or travel. As employed there, a second coat is administered fifteen days after the first, the composition of this dose being one fourth of a ton of akonia dissolved in 400 gallons of water. The solution is said to form an impervious coating over the surface of the roadway.

FOR COMMERCIAL CARS ONLY

Novel Venture in New York—How the Manager "Sizes Up" the Situation.

One of the most surprising year-end developments to make its appearance is the establishment of the Mitchell Motor Vehicle Co., in New York City, under the management of Charles P. Skinner. On the face of it this announcement does not appear to have any particular importance except to those directly interested, but upon closer examination it will be found to represent a development the appearance of which has not generally been regarded as due for some time to come—that is, the establishment of a firm to handle gasolene commercial vehicles exclusively.

This concern will devote its entire time and attention to handling in New York and adjacent territory the commercial vehicles built by the Mitchell Motor Car Co., of Racine, Wis. A recently added specialty to the line of this company is a light delivery wagon with a capacity of one ton, and this will be supplemented by one of larger capacity at the opening of the year.

The palm of being the pioneer entrants into a field which has thus far only been considered as a side issue, must certainly be accorded the new firm. Sharing the general opinion that this move appears somewhat premature, and that the prospect of building up sufficient business in auto trucks alone, is not alluring, a Motor World man called on Mr. Skinner to obtain his views on the subject. His enthusiasm is apparently not of the boil-over and evaporate-quickly class, but is of the stay-at-it order, and his only surprise was that any one should question the ability of a firm to keep in the swim by devoting itself exclusively to the commercial vehicle in view of the great expansion for which the latter is due during the coming twelvemonth.

"It is, of course, a totally different proposition from the pleasure car, and has to be gone about in a different manner, but there are features of it which make it a more encouraging thing for the future than the purely pleasure car end of the business," he said when appealed to. "Large firms who are desirous of having as efficient a delivery service as it is possible to obtain, will not stop short of one car, or ten, for that matter; so that where we sell one we more than reasonably certain of receiving duplicate orders for some time to come.

"Of course, we realize that we are in for a considerable siege of missionary work, but from what we have done so far, I think we will find plenty of profitable business to occupy our attention right here in the city. The outlook is far from discouraging, although in the opinion of many in the trade 'we are up against it.' We do not consider matters in that light and see no reason why there should not be enough commercial vehicle business in this city to support a concern giving its attention exclusively to that end."

At present the quarters of the Mitchell Motor Vehicle Co. are in the Arcade, at 49th street and Broadway, but shortly after the end of the year they expect to occupy quarters of their own somewhere in that vicinity. So far their only stock in trade consists of a light delivery wagon of one ton capacity, the chassis of the Mitchell light touring car being employed as the foundation. This is equipped with a two cylinder vertical motor of 14 horsepower under the bonnet, the transmission being through a friction clutch, sliding gear change speed and propeller shaft to the live axle. This is equipped with a delivery body to suit the requirements of the purchaser. The selling price complete, differs with the nature of the latter's wants, but averages about $1,500. After the first of the year the line will be increased by the addition of a gasolene truck.

Sweden a Small Car Country.

According to a consular report the business in motor cars in Sweden is almost entirely in the hands of the Germans. Five or six Swedish firms have started to manufacture low priced cars, and a certain number of runabouts are imported from America. As they have had no experience with high grade cars, users in Sweden have come to regard $600 as about the limit that should be paid for a vehicle, but as the wealthy classes are beginning to purchase vehicles, it is thought that a good business could be done by a firm who would send a few high grade cars in charge of a representative capable of showing off the points of the vehicles and giving lessons to intending purchasers. It is absolutely necessary that a depot should be established in each town with spare parts, repair shop and garage. At present there are no garages in Sweden, and the towns where most of the trade can be done are Stockholm, Malmo, Gottenburg, while Norrkoepping is a rich industrial centre with good roads that offer an excellent chance to the enterprising maker.

In Stockholm there were recently 151 motor cars, excluding the ten owned by members of the royal family. This number is said to be increasing every day. As nearly all towns and villages in Sweden have electrical generating plants, there might be an opening for electric vehicles.

French "Essence" is Overrated.

That the claim so frequently put forth by unthinking motorists as to the superiority of French "essence" over plain gasolene is all "leather and prunella" is the experience of one who has given it a trial. It is more expensive in France than here or in England, but according to the story, once a carburetter got a whiff of one of the fancy brands of "essence" with a Pullman car name, the engine would give a snort and race away at double speed. More than once has this skeptic taken his car in and out of France, but has failed to note any superiority of push, and sums up by concluding that the claim is prompted by that moral deformity from which certain individuals in all countries suffer—an irresistible craving to exalt all other countries and their products above their own.

One of the novelties which British ingenuity has prepared as a "surprise" to the public is a protecting apron which, rising from the dashboard, bends back over the lap of the driver and his companion on the front seat, covering the steering wheel and levers and completely enveloping the occupants of the fore part of the car. When not in use this device can be rolled up and stowed away in the car, or left behind.

CONVERSION OF A MOTORPHOBE

The Little Incident that Won Him and that also Aptly Illustrates Human Nature.

"Did I ever tell you how I converted a farmer up in Sussex County to the use of the automobile?" casually inquired the Occasional Attendant as a number of us sipped our demi-tasses and puffed our Havanas at Carburetto's the other night. "No? Well, it just goes to show that nearly every man —there are but few exceptions—possesses the innate desire to get ahead of his fellow man, and to attain the object of his desires will frequently do things which previously he would have scoffed at.

"This fellow—Jimson, I think his name was —underwent such a chage of heart as regards his attitude toward anything that is propelled other than by horsepower that even he must have marvelled at the transformation. Jimson was an arrant motorphobe, one of those kind that'll sit by the fire at night and damn automobiles and everything connected with them and during the day, if perchance he should meet one of the blasted things on a narrow road, would walk his horses mile after mile in the middle of the road to prevent the motorist from passing. I have heard that he used to throw broken bottles in the road to cut the tires. Anyhow, that is another story.

"I ran across Jimson one afternoon last spring. I then had a motor bicycle and left Manhattan one morning intending to tour to Lake Hopatcong and get back in time for dinner. It is only a trifle over forty miles, fine roads, although somewhat hilly. There is one noticeable difference between New York and Jersey. The sun may be shining as brightly as it knows how here, but cross the river and you will likely find it raining cats and dogs—that is, if you are contemplating a trip.

"I started out bright and early that morning with just such conditions as these. Found it had been raining when I got to Montclair, and between there and Dover the roads were almost as slippery as the Vanderbilt course two days before the exterminating trials. Naturally, my little motorcycle had a hard time of it, but I determined to get to Hopatcong. To make a long story short, by the time I was ready to point my nose toward Manhattan it was growing dusk. At that time of the year none of the summer hotels are open, and I wondered what I would do for a bed. I remembered a promising looking farmhouse on the road which skirts the southeast end of the lake, so I determined to apply for shelter.

"A garrulous type of scythe wielder was drawing a bucket of water from a well in the yard when I shut off the power and rode up. I told him my quandry and asked for shelter overnight. He looked me over, and after damning my 'engine bisickle,' as he called it, said 'he reckoned he'd eat me and sleep me.' I was not particular about offering myself as a living sacrifice to appease his appetite, but discovered later the expression was only one of the idioms of that part of Jersey.

"The farmer proved rather interesting, and told me lots of stories of the fun he had been having with the automobilists who came through that section. Rather devilish fun, I think. I asked him for my bill the next morning, and was informed that it was nothing for food and bed, but that he would have to charge me five 'bucks' for letting my motorcycle stay in his shed. Said he had taken chances on its blowing up. That was his way of getting even with one of the genus who wear leather coats and always have dirty fingernails. I paid it.

"The next time I dropped in to see Jimson I held the reins over a piece of horseflesh. He was delighted this time, and gave me a 'corking' good dinner, fed my horse and had his boy rub him down and lots of other things. That was the only way to travel, according to his motorphobic notions. I told him the next time I came to the lake I expected to have an automobile (in fact, I was only waiting for the dealer to get it from the factory) and would take him out riding. Said he'd be dummed if he'd go.

"I got my car in August, and soon learned its good points. It was a beauty, too. Could run forty or better on the high and could simply eat up the hills. One Saturday I determined to run up to the lake over Sunday. Autumn is the best time of the year there. Just cool enough to make touring a pleasure and not enough vehicles on the roads to raise any dust to speak of. And the scenery is well worth the trip. Seems almost sacreligious to speak of it.

"Went up fine and breezed into Jimson's farmyard just in time for supper. He looked glad enough to see me, though sorry to see the 'bubble.' Wouldn't even let me run it in the carriage shed overnight for fear it would blow up. The weather promised to stay clear for that night at least, so I did not raise any objections, and satisfied him by running it down close to the lake. I spent all the evening arguing with him, and I expect his slumbers that night were rudely disturbed by a conglomerated mixture of spark plugs, coils, levers, radiators, pumps, tires and all the other component parts of a machine. I finally extracted a half promise from him to let me take him for a little ride in the morning, if I would not go faster than three miles an hour. Think of it, and fifty nearer my gait!

"The next morning, after watching me run the car up and down the road several times to see that it was all right, Jimson climbed in and we started toward Dover on the low. We had gone two or three miles when Jimson turned to me and said: 'Is this as fast as your old trap can go? Why, my old sorrel mare can do better.' I did not say anything, but shoved my lever up another notch. She responded beautifully, and we were soon making fifteen or sixteen. A family carryall, with apparently the whole family snugly tucked in the seat, was laboriously being pulled up the hill ahead of us. I gave the wheel a sharp turn, and we went by them as nicely as you please. Jimson glanced around, and I inquired if he knew them. Yes, that was Neighbor Brown and his family going to church. We passed two or three more of Jimson's friends, and I thought I detected an exultant look on his usually impassive face.

"About two miles before you reach Dover there is a broad, wide boulevard where every Sussex farmer who possesses a horse that he thinks can 'go some' is wont to try him out of a Sunday morning. It was rather early when we sighted the western end of the speedway, and a horseman was just turning his animal around for a brush down the pike.

"'That's Si Harkin and Mary Ellen!' shouted my companion.

"'Who in blazes is Mary Ellen?' I jerked out, not being very familiar with every old nag in the country.

"'Mary Ellen, sired by Kentucky Millie; can do a mile in 2:03 flat. There he is starting her up. Ah, you'll never catch her. See, she's is running away from you!'

"There was no mistake about it. Mary Ellen was 'hiking it' up the pike. But I knew my car. Up to then I had been running on the second speed, but I now moved it up another one. It was easy to see we were gaining on the horse and sulky. Si Harkin or whatever his name was looked back about this time and saw we were trying to overtake him. He gave a defiant yell and plied the whip.

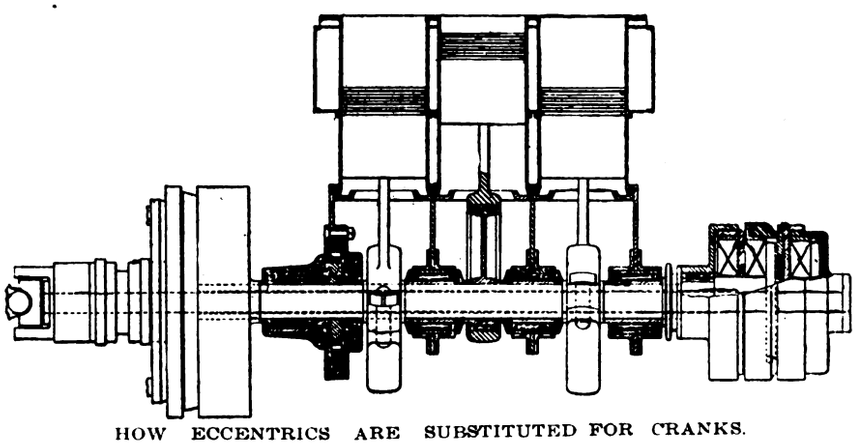
"Suddenly a change came over Jimson. We were doing then about thirty. He jumped to his feet, jerked off his hat and yelled like a crazy man. 'Go on! Don't let that critter get away from us. He did me on a hoss deal. Sick it to her, boy! Go on! Go on! Faster! Faster! You'll get him yet!'

"All this time we were overhauling Si and Mary Ellen at a rate that an express train would look coming on if you walked to meet it, but Jimson could not see that. I threw the throttle open all the way, and with a jerk the car bounded forward. My companion sat down even more suddenly than he had gotten up. We went by Mary Ellen like a shot out of a gun, and when we finally slowed down sufficient to look around with safety Jimson's enemy and his piece of horseflesh were hardly visible back down the road.

"We went back home on the high all the way, and Jimson never remonstrated once. He seemed to be thinking deeply."

The Occasional Attendant struck a match and lighted his cigar, which had long since gone out.

"I accidentally picked up a Dover paper the other day and read in the Hopatcong items that 'Mr. Robert Jimson, one of our respected townsmen, was arrested in Dover yesterday and fined $10 and costs for exceeding the speed limit with his new automobile.'



"Funny thing, this human nature, isn't it?"

W. A. Mills has been elected president of the Nichols Auto Transit Co., a Connecticut corporation, organized at Nichols to conduct a stage line. The other officers are: E. E. Norton, vice-president, and N. B. Curtis, secretary-treasurer.

Lanchester's Substitute for Cranks.

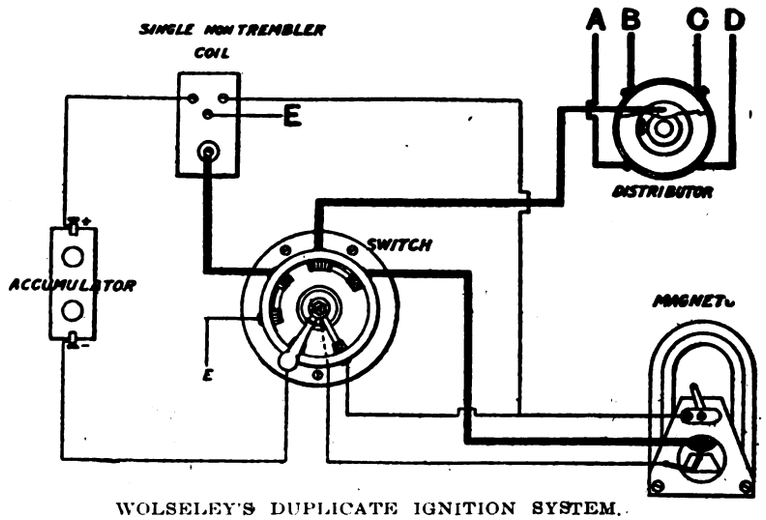
Probably the most novel if not the most practical modification of motor design is that conceived by F. W. Lanchester, an Englishman, better known as the builder of the Lanchester car, which has been on that market for several years. A patent has recently been granted to cover the idea and it is worth while noting that the inventor

HOW ECCENTRICS ARE SUBSTITUTED FOR CRANKS.

states therein that his creation has for its object "improvements in the construction of combined motor and change speed mechanism, by which greater simplicity, compactness and directness of transmission has been obtained." How closely the invention itself fulfills this description of its raison dêtre, as shown in the accompanying part sectional drawings may be judged from the following:

As will be apparent at a glance, the chief difference consists in the use of eccentrics in place of cranks. They act upon a large hollow shaft through which a transmission shaft runs and is so arranged as to be coupled to the motor shaft itself either by a direct clutch or a planetary gear, this transmission shaft being employed for the propulsion of the vehicle. "In one mode of carrying the invention into effect, a motor is constructed of the ordinary reciprocating type, but in lieu of crank shafts a large hollow shaft and eccentric straps are employed," reads the specification, from which it will appear that the inventor has some other changes in the motor itself in mind. Excessive friction between the eccentric straps and the shaft is prevented as far as possible by the use of rollers held in position by a cage between the eccentric and its strap in the manner of a roller bearing. This is shown in detail in the small cut.

The friction clutch employed is of much the same type as that generally in use and is placed at the flywheel end, as is customary. Its function is likewise the same, that is, of coupling the main and transmission shafts together except that in the present instance one encloses the other.



But instead of being placed behind the clutch, as is usual, the change speed gear which is of the epicyclic or planetary type, is placed at the opposite end of the shaft. This gives two or three speeds forward and reverse.

On the whole, after careful consideration of all the features of the invention it is difficult to agree with its creator's claims as to greater simplicity, compactness and directness of transmission, particularly in view of the fact that none of the steps employed in the ordinary form of transmission have been eliminated and one of doubtful efficiency has been added.

Wolseley's Duplicate Ignition System

Duplicate ignition reduced to its lowest terms terms would appear to be the most fitting title for the ingenious combination of wiring adopted for their 25-horsepower Sidely car by the Wolseley Tool and Motor Co., so as to render a high tension magneto and accumulator system instantly interchangeable without undue complication.

It will be at once noticeable from the accompanying diagram of the connections that they involve a minimum number of leads whether from one side of the system or the other. The employment of a single non-trembler coil on both sides represents an innovation which, while probably not to be credited to the concern in question as original, is one that will doubtless find many followers—in fact, the entire duplicate system represents as close an approach to the millennium of simplicity, combined with reliability, as has thus far been made.

WOLSELEY'S DUPLICATE IGNITION SYSTEM.

A Simms-Bosch high tension magneto is employed, but modified to suit the requirements of the case by the omission of its distributor. A high tension distributor, common to both sides of the system, is fitted to the cam shaft, as is customary. The make and break contact on the magneto is used both for its own and the battery circuit, and thus enabling a non-trembler coil to be used.

To start the engine the driver places the switch handle over to the side marked battery; this operation puts the battery in circuit with the magneto make and break and a single-cylinder non-trembler coil, at the same time breaking the magneto low-tension circuit; it also joins up the single high-tension terminal of the coil to the feeder on the four-cylinder distributor. The engine starts readily on this ignition, and when once running the switch is brought over to the magneto position. In doing this the battery is cut out of circuit, together with the coil, and the magneto armature windings are joined up to the make and break, and its high-tension wire to the distributor. This the makers claim can be done on full speed without missing a single explosion.

When a Pocket Magnet Proved Handy.

A motorist, relating some of his unpleasant experiences, tells how he was puzzled for some little time to extract from a cylinder the broken fragments of a valve which had gone to pieces on the road. Finally, after fishing about for a time with a bit of wire and succeeding in removing all but a couple of small bits, he was about to give up in despair and leave them to the tender mercies of the piston, trusting to luck to get him home without having them to stave a hole in it or the cylinder, when he bethought him of the action of a magnet. Purchasing one of the toy kind at a nearby store, he succeeded in removing the pieces of metal without further trouble. All of which simply goes to show that at times it is of considerable value to one to have in the kit a screwdriver which has been magnetized.

HERE'S THE HORSELESS BUGGY

St. Louis Lawyer Responsible for it and He Prefers it to a Touring Car!

While a large part of the world has been awaiting and talking about the "popular priced automobile," John C. Higdon, a patent attorney in the Missouri Trust Building in St. Louis, Mo., believes he has hit upon that very article.

The accompanying illustration shows it to be a pure and unadulterated horseless carriage; in fact, Mr. Higdon's device is rather a motor attachment for application to buggies and light wagons from which the shafts have been removed. It comprises a vertical single cylinder, two horsepower Merkel motor and a planetary transmission affording two speeds forward and a reverse.

HIGDON'S HORSELESS BUGGY.

Higdon, who has been dabbling with automobile inventions since 1896, styles his creation the Success automobile and is arranging to market it at $250. He has used it for two months and states that it has proved equal to all the hills in his vicinity and capable of a speed of 25 miles per hour. He attributes this to the large wheels and steel tires. There is nothing diluted in the inventor's faith in his rig. Hear him:

"Although I can take my choice of large touring cars, yet, for my own private use, I actually prefer this small runabout on account of its extreme simplicity and lightness, as well as economy in operation."

Old Tire in New Guise.

Here is the latest addition to the ranks of the absolutely non-puncture, never-wear-out rubber tire that is as good as the pneumatic, described in the usual laudatory, arrival of the tire millennium style accorded every new invention by the daily scribe:

"The weight of the car comes on the tread of the outer tire, the rubber plug is forced upward and compresses the inner tube. The resiliency resulting from the motion is claimed to be free from all elements of friction and to be as great as that obtained through the use of the pneumatic tire.

"A set of tires constructed after this plan has been run something like 7,000 miles, and shows little signs of wear. It is claimed that cuts in the outer tire make le s impression than on solid tires, and punctures, which would ruin pneumatic tires, cause no damage. In addition to the other advantages claimed, it has the peculiar advantage that its user will always be able to get home. Even should anything occur to put the pneumatic part of the tire out of commission, the outer tire and the plug form an excellent cushion tire."

To Start from the Seat.

Although the "self-starting engine" is yet to be seen, and the motor which can be started from the driver's seat has only made its appearance in limited numbers, and that in the case of the low powered machines, the public is still ready to accept anything looking toward the desired result. Hence the device of the British maker who has transferred the starting handle from the front of the car to the dashboard should be received with favor. The machine is a light four cylinder car, and the arrangement permits the driver to "crank up" without leaving his seat, though the amount of labor usually involved in the process is in no way lessened and suggests a rather awkward position for the man doing the cranking.

New Arrangement for Brakes.

A novel arrangement of the rear wheel brakes has been perfected by a foreign manufacturer who is exhibiting at the Olympia show, in which the brake drums, which are of the usual pattern, are affixed directly to the wheel hubs instead of being attached to the driving sprockets and the spokes. They are placed inside the sprockets next to the wheels, and the studs which support the former pass through holes in them which are drilled out to a size larger than that of the studs, so that the strain of the brakes is taken on the hubs and not on the spokes.

CONCERNING CARBIDE

Some Interesting Facts About its Discovery, Production and Peculiarities.

It is erroneously supposed by many people that calcium carbide, as commonly known, is found in a natural state, as is a product of mining operations, but there is apparently no record of a natural product in any way closely resembling carbide of calcium ever having been discovered, says the Motor Review. It is true that the French chemist Bertholet—who in 1862 first discovered acetylene—has publicly stated that it may have been the action of a kind of carbide produced naturally, which led to the formation of petroleum deposits, but this, of course, is a theory which up to the present has received no practical substantiation.

That mining accidents have been brought about owing to the action of water on natural calcium carbide is quite out of the question. The gas found in coal mines and to avoid the danger from which Sir Humphrey Davy invented his safety lamp, is quite a different gas from acetylene. It is represented by the formula C4, and, according to Newth, "it is one of the products of the decompositions which have resulted in the formation of the coal measures." Acetylene is symbolized by the formula C2 H2. As furthermore showing the erroneous nature of such a supposition, the Davy lamp behaves quite differently when acetylene surrounds it and when fire damp is in question.

The molecular weight of firedamp is only 16, and its density only 8, as compared with 26 and 13 respectively for acetylene.

The chemical name of fire damp is methane, and some chemists state that fire damp may have been caused by the action of water for centuries upon carbide of aluminum.

Sir Humphrey Davy was a chemist of the first magnitude, and if he had found acetylene in a mine he would have given it its proper chemical formula, whatever name he might have called it by.

Calcium carbide is formed by the fusing of unslaked lime and carbon in an electric furnace, and at a sufficiently high temperature to render both into a molten condition.

Commercially speaking, the manufacture of calcium carbide has not been a profitable venture, but few of the manufacturers having reaped much benefit from this commodity except so far as regards the last two years.

Huge sums of money have been lost upon it, due really to professors in the early stages of the industry arguing that rough slag usually found around pit mouths was suitable, and that carbide could be produced for from $20 to $25 per ton. Taking the cue from these professors, works sprang up in various parts of the country where the raw material was to be found in great profusion. One of these factories started near Birmingham,

Digitized by Google

England, and had a very short life, indeed, the material in the district being found quite unsuitable, coupled with the fact that steam power had to be employed for generating the electric current for fusing the materials, soon sealed the fate of the company.

Another factory which enjoyed a much longer existence was formed at the Falls of Foyers, in Scotland. Here the founders argued that not only had they the raw material in profusion, but water power also. It was soon discovered that here again the materials of the district were unsuitable for the purpose. The company then fell back on coke procured from the corporation, but finally the raw materials for this factory were drawn from South Wales.

As a commercial speculation the venture was also a failure, and the manufacture of carbide was ultimately abandoned.

The United Alkali Co. also turned their attention to carbide manufacture, and, although the concern ultimately succeeded in making carbide of very good quality, the manufacture of it has been abandoned, so that at the present moment there is actually no carbide manufactory in Great Britain. One or two works have been started in Ireland, but these do not appear to be in a flourishing condition.

In proof of the error contained in the statements of those professors, it has been found that only the very best qualities of coke can be used for the purpose—in fact, the carbon used in the manufacture of calcium carbide should be absolutely free from all impurities whatsoever.

Throughout the whole of the carbide industry only two firms have so far succeeded in paying a dividend, one a firm in Italy and the other the Wilson Carbide Co., of America, calcium carbide being first brought into commercial use by Wilson's discovery in 1888 of the modern method of preparing this commodity. The firm that bears this discoverer's name harness the power for their works from the falls of Niagara.

The Wilson Co. were the original patentees of calcium carbide, all other firms having to manufacture under license from them, and, although the Fallsl of Foyers firm was one of the licensed factories, they claim to have been the first to produce a marketable product. As a matter of fact, they did succeed in producing the finest carbide in the world.

This unfortunate state of affairs was due, no doubt, to the fact that the professors had educated the minds of the public to the idea that carbide could be bought at a price at which it was ulitmately proved it was impossible to produce it.

Carbide in its raw state is most sensitive to atmospheric action, and even when packed in airtight tins. Air is, of course, present with the carbide in the packet, and generation of gas is practically always going on, so that the longer that carbide is kept in stock after manufacture the more it deteriorates.

With a view to overcoming this serious defect various more or less successful attempts were made to minimise this action by coating carbide with certain preparations which would neutralize and protect it from the action of the air.

Among these preparations paraffine and sugar mixed are the most generally adopted mediums used for this purpose, though in the case of one or two well known firms secret formulæ of their own are employed to effect the same object.

There is no doubt that the coated carbide has an advantage over the raw article. Coated carbide can be kept in stock without any perceptible deterioration, and great economy is no doubt effected by its use, as by reason of the protective qualities of the medium with which it is coated, water only attacks the surface of the carbide, instead of passing straight through it, as in the case of the raw carbide. Thus, owing to water having a much slower effect on the coated carbide, decomposition is much slower and ceases within a very short time after the water is turned off, and its economic properties are shown by the fact of being able to relight the lamps repeatedly so long as any of the carbide remains.

In the raw or uncoated state it is impossible to realize economy, for it so rapidly and easily absorbs moisture, that even after the water supply has been turned off, generation of gas still goes on until all the moisture has been used up, which, as a rule, only ceases when the whole contents of the container have become utterly decomposed, and, of course, of no further use for the generatiton of acetylene gas.

In using calcium carbide to provide illumination for bicycles or motor vehicles, and where there is no means provided of immediately shutting off the gas from the burners, in conjunction with shutting off the water supply, it is common knowledge and a cause of great annoyance that the light still goes on and only dies out very gradually, and that not until the burners have become carbonized or sooted up, necessitating taking out and cleaning them before the lamps can again be used.

Carbonizing of the burners and its cause is readily explained by the fact that immediately the water is turned off and ceases to act on the carbide pressure also ceases, not suddenly, but gradually, so that the light gradually dies down to a mere glimmer, and all the time owing to lack of proper pressure the gas does not rise and burn off, but instead clings to and condenses on the burners, where it is but half burned up, and in that way carbonizes in the passage of the burners.

Pressure plays a most important part in acetylene lighting, owing to the fact that acetylene gas is about the same density as the atmosphere, in which respect it is very different to coal gas. The latter being lighter, always rises to the highest point. Therefore, to insure keeping the burners clean, some safe and suitable means should be adopted whereby immediately the lamps are finished with, the lights may be put out and the course of the gas diverted from them. Ignorance upon this important point as to weight and density of acetylene gas is often followed by serious consequences, illustrative of which is the fatality which occurred in Great Britain about a year ago. A householder, whose residence was illuminated by acetylene gas from a generator fixed in a room in the house, discovered a leakage caused by a broken joint in the receiver. He at once—as he thought—emptied the receiver and called in a plumber to s lder up the joint. Now, although every means of escape had been provided for the gas, yet, owing to its being of similar density to air, the gas had not exhausted itself beyond the air pressure, with the result that, while the plumber was at work the heat of his soldering iron ignited the gas, causing thereby a frightful explosition, which killed the man, and would also have claimed the owner had he not turned a moment before, being attracted by his child which entered the room.

Another case illustrative of this peculiarity of acetylene gas of lingering and ultimately exploding is that of an experiment carried out in Germany. Acetylene gas had been passed into a large iron tube for experimental purposes. The tube was afterward placed out in the open, and both ends left open for the escape of the gas. After several days had elapsed a lighted match was thrown down near the tube by a smoker, with the result that an explosion caused the death of one or two people near, who were struck by flying pieces of the burst tube.

May be First Gasolene Railway.

Frederick County, Md., will likely have the first railway on which gasoline motor cars will be used exclusively. The railway between Frederick and Thurmont, which the Washington, Frederick and Gettysburg Railway Co. proposes to build, was originally intended to be an electric road, but the use of gasolene motor cars has now practically been decided on.

The officials of the Washington, Frederick and Gettysburg Railway Co. have been in correspondence with the officials of the Union Pacific Railway Co., who have had charge of the manufacture and operation of the gasolene motor cars used on that road's suburban lines in Nebraska, and it has been decided that they are well adapted for use on the proposed road between Frederick and Thurmont. The use of the cars will make the road, both in construction and operation, much less expensive than a trolley line, the need of an electric equipment and power plant being obviated.

Garage is a French word, pronounced in various ways, according to the experience of the person wrestling with it, but in any guise it means a boarding stable for automobiles. The owner of a healthy garage is sometimes able to get his own board out of the business, and to have his washing done occasionally also—is the comment of one to whom the full meaning of the word is not entirely new.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our show rooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country, at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

The Week's Patents.

804,332. Gas Engine. Charles J. Moody and Victor E. Moody, Elgin, Ill. Filed Sept. 3, 1904. Serial No. 223,234.

Claim.—1. In a hydrocarbon-engine, the combination of a drum cylinder, inwardly extending abutments dividing the cylinder into chambers, a piston provided with blades extending into the chambers, a rocking or oscillating shaft on which the piston is mounted, a main rotating shaft and a connection between the rocking or oscillating shaft and the rotating shaft for transforming the rocking or oscillating movement into a rotary movement, supply and exhaust passages leading to the cylinder-chambers, valves controlling the supply and exhaust passages, a short rotary stud-shaft entered into and pivoted within the end of the oscillating shaft and cams on the rotary shaft for successively operating the valves controlling the supply and exhaust passages, substantially as described.

804,368. Resilient Tire. William F. Beasley, Plymouth, N. C. Filed Dec. 15, 1902. Renewed Jan. 9, 1904. Serial No. 188,405.

Claim 1.—A resilient core for a tire consisting of a sinuous band of rubber, having an independentely and separtly formed strengthening-wrapping vulcanized thereabout, the truss-walls formed in the band being unconnected at their sides except by the independently and separately formed wrapping, substantially as described.

804,369. Resilient Tire. William F. Beasley, Plymouth, N. C. Filed March 24, 1903. Renewed April 14, 1905. Serial No. 255,655.

Claim.—1. A resilient core for a tire, consisting of two separately-formed strips, each consisting of a series of trussed walls, the said strips being united at their inner faces whereby a core is formed having notches in its inner and outer surfaces ad apertures in its centre, substantially as described.

804,375. Steering Mechanism for Automobiles. Herbert H. Buffum, Abington, Mass., Assignor to Electric Vehicle Company, Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed May 7, 1902. Serial No. 106,246.

Claim.—1. In a steering mechanism for motor-vehicles, the combination of a rotating sheering-shaft having a screw, a rocker connected with a steering-wheel of the vehicle, a nut on said screw fulcrumed on said rocker, a bearing-guide, and a bearing for the shaft secured against axial thrust and having an axial thrust-resisting laterally-sliding connection with said guide.

804,421. Variable-Speed Transmission for Vehicles. George W. Marble and William R. Donaldson, Chicago, Ill. Filed Dec. 7, 1904. Serial No. 235,908.

Claim.—1. A reversible speed transmission device comprising a driven shaft, parallel friction-disks rigidly secured thereon, a pivotally-supported motor, a driving shaft therefrom projecting between the disks, a driving friction-wheel on said shaft, a bearing for the driving-shaft adjustably engaged on the driven shaft, and a level adapted to swing said driving friction-wheel into engagement with either friction-disk.

804,438. Transmission Mechanism. Charles G. Simonds, Schenectady, N. Y., Assignor to General Electric Company, a Corporation of New York. Filed June 23, 1904. Serial No. 213,777.

Claim.—1. In a transmission mechanism, two alined shafts, gears carried at adjacent ends of said shafts, a member journaled between said shafts and in line therewith, a shaft extending through and journaled eccentrically in said member, gears carried at the opposite ends of said shaft and engaging the first-named gears, and means for holding said member stationery and for locking it to one of the first-named shafts.

804,495. Differential Gearing. Joseph G. O'Kelly, Chicago, Ill. Filed Feb. 13, 1902. Serial No. 93,902.

Claim.—1. In a differential gear, a main shaft, an interior gear loose on said shaft, a circular plate loose on said shaft and adapted to revolve with the interior gear, means co-operating with said internal gear for revoving said plate when said interior gear is disengaged therefrom, comprising idle gears carried by said plate and engaged by said interior gear, and a king-gear loose on said shaft, in combination with devices for communicating the motion of said circular plate to said shaft.

804,577. Wheel for Vehicles. Joseph M. Boulanger, Revigny, France. Filed July 8, 1904. Serial No. 215,732.

Claim.—1. In a wheel, a hub provided at one end portion with a fixed spoke-retaining means and at the opposite end with exterior screw-threads, a spoke-retaining member moveable along said hub and provided on its outer face with indentations or recesses, an outer nut engaging said screw-threads and operable to adjust said spoke retaining member along the hub, and a washer interposed between said nut and said spoke-retaining member, said washer being provided with means for engaging the indentations or recesses of the latter.

804,489. Carburetter for Explosion Motors. Giovanni Enrico, Torino, Italy. Filed March 9, 1904. Serial No. 197, 211.

Claim.—1. In a carburetter for explosion-

AUTOMOBILE users, drivers, repairmen, chauffeurs and others wanted all over the country; 50,000 machines built this year in United States affording great opportunities for men trained in this coming business; six cents a day will qualify you for good wages in this field; in which the demand is such that ability counts ahead of pull and length of service. For full particulars, address THE CORRESPONDENCE SCHOOL OF AUTOMOBILE ENGINEERING, Suite 1357, Flatiron Building, New York City.

THAT WEAK STORAGE BATTERY

is apt to cause trouble when you least expect it. Insure yourself against all ignition troubles with an **Apple Automatic Battery Charger.** Battery kept charged. For information, Dayton Electrical Mfg. Co., 91 Beaver Bldg., Dayton O.

WANTS AND FOR SALE.

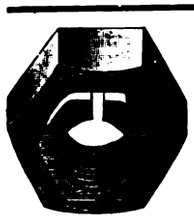
15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

A TEN PASSENGER wagonette; sample car, 1905-1906 model; steam; price and description on application. THOMPSON AUTO CO., Olneyville Sq., Providence, R. I.

FOR SALE—40 horse power, 1905 up-to-date Thomas Flyer. Used for demonstrating purposes. Very best condition. A bargain. C. A. COEY & CO., 1323-1325 Michigan Ave., Chicago.

WAVERLY electric runabout of the type styled "Speed Wagon"; new this season an in perfect condition; batteries, thirty cells of 9 p. v.: buggy top. Apply to WM. A. TUCKER, 53 State St., Boston, Mass.



VERY, VERY CHEAP—Orient 8 h. p. engine, with carburetor and muffler; Upton transmission; honeycombed radiator; circulating pump; Brown-Lipe steering outfit complete; front axle and wheels; Baldwin roller detachable chain; spark coil; all of above were bought by us new from manufacturers, and are practically new and perfect, having seen only about two months' service on an experimental machine. HENDERSON MFG. CO., Hampton, Ga.

1905 MARION, 4 cylinders, detachable tonneau; seats 5; Fisk tires; list, $1,500; fine condition; immediate delivery, $1,000. F. S NEWCOMB, New London, Conn.

GRINDING SKATES, is profitable during the winter months. It is easy with one of my holders. Clamps any size skates, on or off shoes. Price, $5.00. C. R. ZACHARIAS, Eagle Hall Block, Asbury Park, N. J.

FOR SALE—Garage, established with Winton and Cadillac Agencies for 1906, at Spokane, Wash. Fine location and a good storage business. Will sell at invoice or will consider partnership. Address G. W. MILLER, Broadway and Madison Streets, Seattle, Wash.

motors, a combination of an oil-reservoir, a closed vaporizing vessel for vaporizing oil in the absence of air, a plurality of tubes arranged in said vaporizing vessel, means for introducing the oil above the tubes above the level of the oil to prevent the latter from being siphoned into the vaporizing vessel, said means being in position to allow the oil to gravitate over said tubes, means for heating said tubes for maintaining the vapor thus formed at a high temperature, a mixing-chamber disconnected from said vaporizing vessel and outside the same, and a pipe leading from said vessel and terminating within said chamber and having a tapered perforated end.

804,605. Vehicle-Wheel. Guy G. Jackson, Allegheny, Pa. Filed March 28, 1905. Serial No. 252,457.

Claim.—1. In a vehicle-wheel, the combination with a hub having a polygonal exterior and as embracing-flange, of a corresponding adjustable flange, an outer wheel composed of disks located between said flanges and provided with internal polygonally arranged cushion-bearing elements, and a compressible cushion having inner and outer polygonal arranged faces adapted to bear against the hub exterior and said wheel-bearings, substantially as set forth.

804,613. Vehicle-Tire. Frank A. Magowan, Trenton, N. J. Filed Aug. 12, 1905. Serial No. 273,969.

Claim.—1. A pneumatic tire comprising an outer tube or cover, a series of inner tubes nested one within the other, and a set of inflation-valves one for each of said inner tubes; said valves having stem portions nested one within another.

804,701. Pneumatic Tire. Olin M. Bigger, Holt, Cal. Filed June 5, 1905. Serial No. 263,735.

Claim.—In a pneumatic tire, the combination of an outer tube, a plurality of independent inner tubes, a self-closing air valve for each of said inner tubes, a self-closing main valve, a plurality of tubes leading from said main valve one of which is connected to each of said first named valves, each said tube being separably connected to the valve to which it leads.

804,740. Variable-Speed Gearing. Columbus K. Lassiter, Schenectady, N. Y., Filed March 11, 1905. Serial No. 249,620.

Claim.—1. In a variable-speed gearing, a driving element, a driven element, change-speed gears driven by said driving element, a clutch for directly connecting the driving element with the driven element, a transmission-gear connected with the driven element and adjustable in two planes, said gear being adapted when adjusted in one plane to throw the clutch into or out of operation or to be positioned opposite one or the other of the change-speed gears and when adjusted in the other plane to be moved into or out of connection with the alined speed-gear, and means for adjusting said transmission-gear.

804,783. Circuit-Controller for Explosive Engines. Richard Varley, Englewood, N. J., Assignor, by Mesme Assignments to The Autocoil Company, a Corporation of New Jersey. Filed Oct. 31, 1904. Serial No. 230,692.

Claim.—1. A circuit-controller for explosion engines comprising a normally open circuit-maker and a normally closed circuit-breaker adapted to operate upon the same circuit, means whereby the same will be actuated successively by one shaft and means for simultaneously and unequally shifting the points in the rotation of the shaft where said devices shall be operated.

804,850. Article of Manufacture Comprising Leather and Rubber Bodies. Charles L. Ireson, Boston, Mass. Filed March 3, 1905. Serial No. 248,281.

Claim—1. The new article of manufacture herein described, the same comprising a composite product of tanned leather containing sulphur, rubber previously vulcanized by heat and a cold vulcanized uniting section between them combined with and knit into the section of the leather and the section of the rubber adjacent to it.

2. The improved article of manufacture comprising a body of leather containing sulphur, a body of rubber vulcanized by heat, and an intermediate, uniting body, cold vulcanized with the leather and with the rubber.

804,851. Method of Attaching Rubber to Leather. Charles L. Ireson, Boston, Mass. Filed March 3, 1905. Serial No. 248,282.

Claim—1. The method of uniting leather and rubber herein described, consisting in taking a tanned leather containing sulphur as one body, rubber previously vulcanized by heat as another body, coating the surfaces of each of the bodies which are to be brought into contact and united, first with a thin coating of ordinary rubber cement, and second with a vulcanizing agent adapted to vulcanize or assist in vulcanizing the rubber cement and its adjacent sections, when the two surfaces are brought together, and then subjecting both bodies and the intermediate vulcanizing elements to pressure at atmospheric temperature, whereby the vulcanization takes place under pressure.

804,853. Method of Attachment of Rubber and Leather. Charles L. Ireson, Boston, Mass. Filed March 17, 1905. Serial No. 250,561.

Claim—1. The method of uniting rubber and leather herein described, the same consisting in treating leather freed of the oil or other elements which attack or are injurious to rubber when the leather is combined therewith preparing such leather for the vulcanizing process and combining such leather chemically and mechanically, under heat and pressure, with a body of rubber or rubber compound by means of an interposed, independent sheet of vulcanizing rubber compound.

804,854. Art of Vulcanizing Leather and Rubber. Charles L. Ireson, Boston, Mass. Filed March 17, 1905. Serial No. 250,563.

Claim—1. The method of uniting leather to rubber, comprising the coating or covering of the leather with a waterproof and heat resisting envelope and then subjecting the leather and rubber with which it is to be united to pressure and to a moist heat in a vulcanizer.

804,867. Propelling Mechanism for Vehicles. Jefferson F. Knowlton, Canton, S. D. Filed January 23, 1905. Serial No. 242,433.

Claim—1. Propelling mechanism for vehicles comprising upper and lower frames, interposed springs connecting said frames and supporting the upper one, a motor and adjunctive parts and a steering shaft mounted upon the upper frame, steering wheels supporting the front of the propelling mechanism and connected with the said steering shaft, couplings for partly supporting the rear end of the lower frame and loosely connecting it with the vehicle to be propelled, a traction wheel mounted upon the rear portion of the lower frame and movable therewith and supplementing the action of the couplings in carrying the weight of the propelling mechanism, and connections between the motor and the said traction wheel.

804,891. Vehicle Tire. Arthur J. Slade, New York, N. Y. Filed July 19, 1905. Serial No. 270,383.

Claim—1. A vehicle tire having an elastic body composed of concentric alternate layers of rubber and fabric compressed from circular form into elliptical shape and secured on the wheel in such compressed condition, substantially as described.

804,892. Protective Tread for Pneumatic Tires. James M. Small, Piqua, Ohio. Filed February 6, 1905. Serial No. 244,287.

Claim—In a protective tread for pneumatic tires, the combination with a wheel rim and the pneumatic tire, of a tread protector consisting of a strip of material of a tenacious nature provided with tongues uniformly projecting from opposite edges thereof, a series of metallic plates secured to said tongues, said plates terminating in hooks which lie within the recess between the rim and the tire on each side of said tire, said hooks having their open sides lying outwardly, tightening rings engaging said hooks on each side of the tire, and means on said rings for contracting them to uniformly tighten the protective tread around the tire.

804,896. Vehicle Tire and Rim. Will C. State, Akron, Ohio, assignor to the Goodyear Tire & Rubber Co., Akron, Ohio, a corporation of Ohio. Filed June 26, 1905. Serial No. 267,133.

Claim—1. A vehicle wheel comprising a rim and a tire mounted thereon, said rim having an offset along one side thereof forming a seat, an annularly formed member constituting a tire retaining means mounted in said seat, means in said tire to compress a wall thereof against aid annular member, whereby said annual member is locked in said seat, said compressing means being operable irrespective of the inflation of said tire.

804,926. Radiator. Benjamin Briscoe, Tarrytown, N. Y., assignor to Briscoe Mfg. Co., Detroit, Mich., a corporation of Michigan. Filed March 8, 1905. Serial No. 249,071.

Claim—1. A radiator, comprising a plurality of assembled multiple unit tubes, each tube being formed of a sheet metal blank, having its opposite edges joined to each other and fashioned with opposite zigzag walls to form a plurality of parallel passages; said units being joined to each other at both ends and spaced to form intervening sealed passages between adjacent rows of units being cross-connected between individual units, whereby circulation across the radiator is permitted in directions at right angles to each other.

804,946. Running Gear for Vehicles. William T. Hanna, Cincinnati, Ohio, assignor to Martha A. Hanna, Cincinnati, Ohio. Filed March 27, 1905. Serial No. 252,418.

Claim.—1. In a vehicle-gear the combination of a flexible frame consisting of two longitudinal and two transverse members pivoted together at their meeting points, the longitudinal members having horizontal hollow stud-shafts secured to them, means for changing the relative positions of the members of the frame, a cross bar pivoted at each end to the longitudinal members and adapted to support the vehicle-body, a driving-shaft carried by the cross-bar, hubs journaled upon the stud-shafts, short shafts journaled in the stud-shafts, means for connecting the outer ends of the short shafts and the hubs, means for coupling the short shafts and the driving-shaft, and means for rotating the driving-shaft.

Builders of Machinery who have been using Gears exclusively during the past century are now commencing to replace many of them with Chains and Sprockets.

Nearly all the Manufacturers of Cream Separators are now adopting a Chain Drive, while Gears have been used exclusively in the past.

Our reasons for recommending the Chain Drive for Motor Cars are as follows:

Less weight—Less friction—Lower cost to manufacture—Lower cost to repair—Less time to repair—Ease of changing gear ratios to suit road conditions for various parts of the country—Saving of tires by less weight—

PATENTED

More reliable rear axles for rough roads and heavy loads—In case of an accident the chain driven car may be pushed off a railroad track or from the center of a road.—One pound added to the axle is harder on both tire and axle than many pounds added above the sp ngs.

We urgently request manufacturers to be careful in machining sprockets, to select chains of a suitable size, and to provide sufficient space for chain clearance. Thousands of chains are damaged by interferences and unfavorable conditions.

"Whitney" Chains on certain cars have given satisfaction for an entire season with practically no attention, but we recommend cleaning, inspecting and lubricating a number of times a year if best results are desired.

TO CLEAN A CHAIN soak it over night in kerosene or gasolene.

TO LUBRICATE A CHAIN (when clean and dry) soak it for 30 minutes in some heavy melted lubricant, such as best quality beef tallow mixed with a little graphite. The lubricant should be heated in a heavy pan nearly to the boiling point to insure its flowing freely, and the shape of the pan should be such as to permit the chain to be wholly submerged. After treating in this manner the chain should be allowed to cool and the lubricant will then set in the bearings.

It is absolutely impossible to properly lubricate a chain by applying oil from a can to the outside surfaces.

THE WHITNEY MFG. CO., Hartford, Conn.

Are you acquainted with

Willard W. Low ?

Mr. Low is president of the Electric Appliance Company, manufacturers of high grade electrical supplies.
Time was when automobiling was not a continuous round of unhampered pleasure to him.
State plainly, he enjoyed about the same measure of peace that a timid woman would on the back of a bronco.
He never knew just what was going to happen.
All of which was attributable to tire troubles that were as exasperating as they were continuous.
There is no telling just how long this thing would have gone on had it not been for—
But let Mr. Low tell it:

"I desire to advise you that automobiling is now a great pleasure to me. Some time ago it got to a point where I was afraid to take out my car on account of tire troubles. I could not take a drive of any account without having them. At last, one fortunate day a friend of mine recommended your tires, and I had my car fully equipped with them. From that time up to the present my tire trouble has been practically nothing.
I desire to congratulate you on the qua ity of auto tires you are turning out."

Pretty strong proof of the superior quality of our tires, isn't it?

The Incomparable WHITE

The Car for Service

Have you read in White BULLETIN No. 11 the account o the trip of Ezra H. Fitch and his party in three White steamers through the forests of Maine and Quebec? If a White car can be depended upon to traverse forest trails, to ford streams, to travel through a desolate region hundreds of miles from any base of supplies, can it not be relied on implicitly for such service as you require from a car?

If you have not seen Bulletin No. 11, you had better write for a copy.

POPE Toledo AUTOMOBILES

1906 Model Pope-Toledo

Type XII, 35-40 H. P. Price, $3,500

MORE POWER SPEED ROOM STRENGTH **LESS** WEIGHT EXPENSE TROUBLE COMPLICATION

The fastest and most powerful touring car in the world. **TYPE XII, POPE-TOLEDO,** marks the greatest forward step yet attained in automobile development. **Motor** has only **10 8-10 pounds of engine weight per H. P.,** and **only 54 pounds of total weight per H. P.,** and this, too, without in any sense sacrificing strength and wearing parts. The **POPE-TOLEDO Carburetor** is developed to such a point of fineness that it is self-adjusting to all conditions of speed, so that with the **Spark** and **Throttle** alone, and always on the high gear, you can drive a **POPE-TOLEDO** anywhere, taking all ordinary hills without rushing them and without shifting gears. **Transmission:** Sliding gear three speeds forward and reverse, and made of the best steel obtainable, thus enabling us to produce not only the LIGHTEST but the STRONGEST and most efficient TRANSMISSION ever placed in any automobile. **Frame:** All steel of few parts, light, flexible and strong. The **POPE-TOLEDO system of brakes** is incomparable, both foot and emergency brakes act on the hubs of rear wheels: very efficient and easily adjusted. **Design:** Entirely new and original. Double side entrance, large and roomy TONNEAU, specially easy of access. Car comfortably seats seven people.

ORDER NOW FOR EARLY DELIVERY. PRICE, $3,500

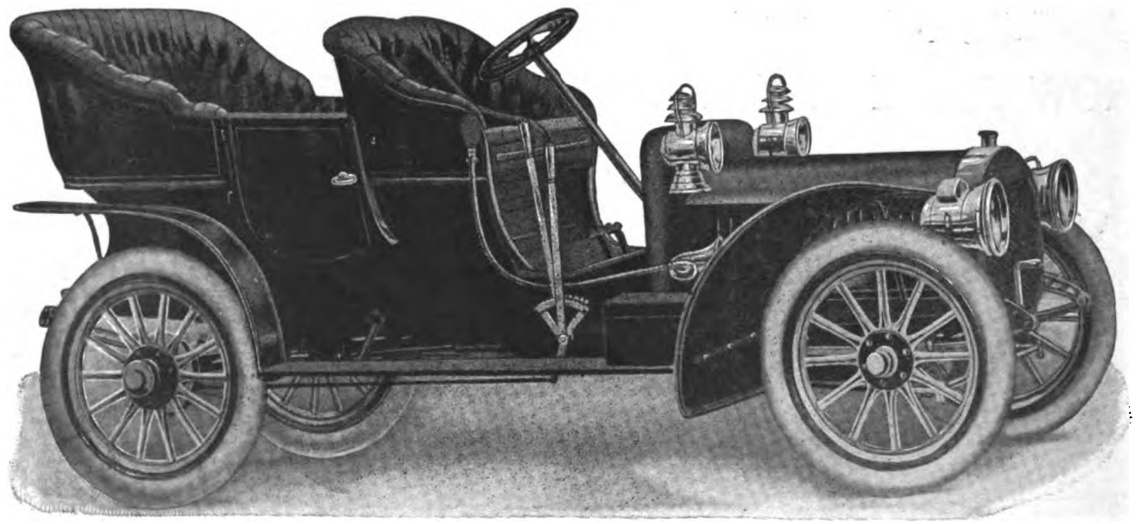
Wayne



An Introduction to the Wayne Cars of 1906

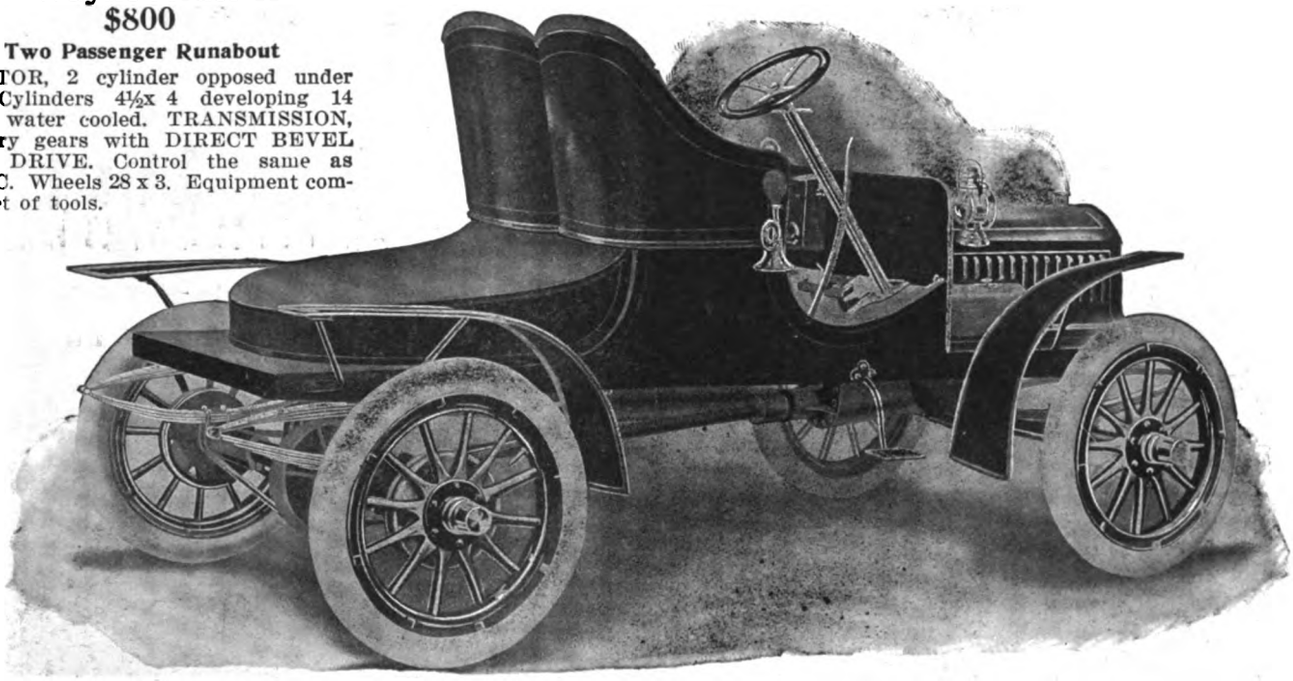
The appreciation accorded our cars last year warrants us in greatly increasing our capacity and in placing before the automobile trade improved types of Wayne cars. The four models we now present are the result of mature experience. They are not new and untried experiments. Each car is a distinct type of Wayne design and construction and each model has been built with a view to supplying the varied demand for high grade machines. In the Wayne cars of 1906 the automobilist will be sure to find a car suited to his needs.

Wayne Model F $3500

MOTOR, 4 cylinder vertical, cylinders 5½ x 5 cast in pairs. Cylinders and pistons ground. Engine develops by brake test 50 H. P. Water Cooled. IGNITION, jump spark with quad coil and storage battery. TRANSMISSION, sliding gear with three speeds forward and reverse. Hess-Bright ball bearings throughout. REAR AXLE, shaft drive floating type. FRONT AXLE, 1 beam drop forged, one piece, nickel steel. WHEEL BASE, 114 inches. TIRES, 34 x 4½. EQUIPMENT, includes all necessary tools of the best quality, 2 side lamps, acetylene head lights with generator, tail lamp and tube horn.

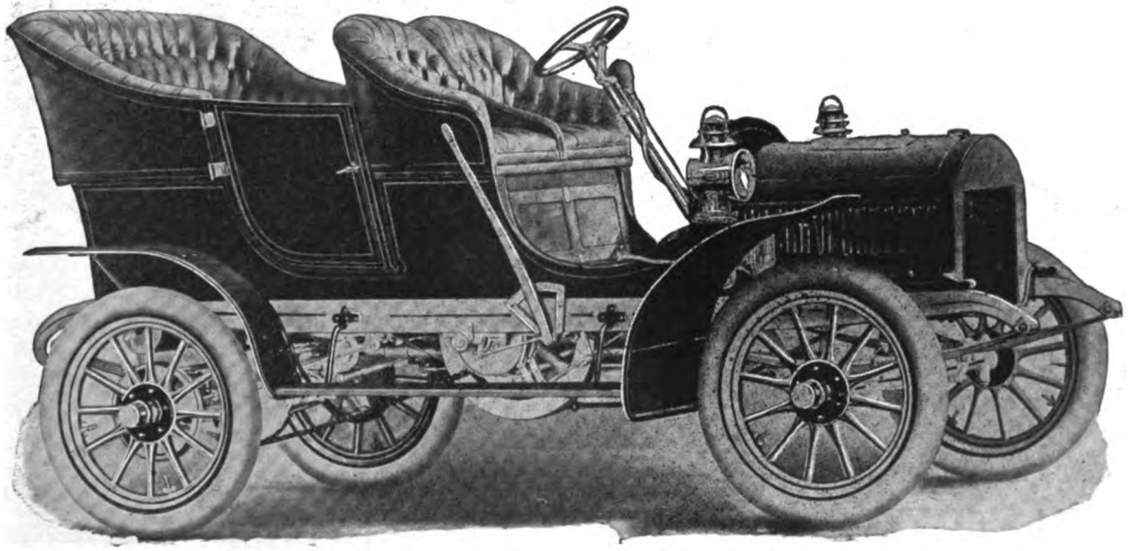
Wayne Model K $2500

MOTOR, 4 cylinder vertical, cylinders 4¾ x 5, cast in pairs and water cooled. Engine develops by brake test 35 H. P. Cylinders and pistons ground. IGNITION, same as Model F. TRANSMISSION and axles same type as Model F. TIRES, 32 x 4. EQUIPMENT, same as Model F.



Digitized by Google

Wayne



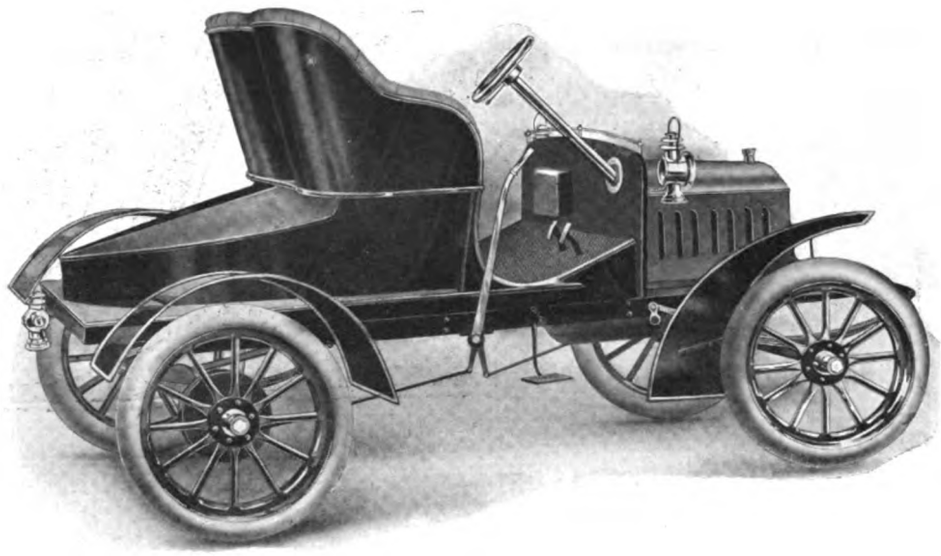
Wayne Model H
$800

Two Passenger Runabout

MOTOR, 2 cylinder opposed under hood. Cylinders 4½x 4 developing 14 H. P., water cooled. TRANSMISSION, planetary gears with DIRECT BEVEL GEAR DRIVE. Control the same as Model C. Wheels 28 x 3. Equipment complete set of tools.

The strong features of this car are the extreme simplicity and acessibility of the engine and transmission. The crank case and transmission case form one casting and the entire engine can be taken apart or assembled in half an hour.

Wayne Model C
$1250



MOTOR, double opposed, of the standard Wayne type, with cylinders 5¼ x 5. Engine is hung under chassis frame and develops by brake test 20 H. P. *This is the same type of car which proved so successful last season, brought up to date and with all new improvements.* TRANSMISSION, is of the planetary gear type with chain drive. CONTROL is by a single lever which engages the high speed clutch and reverse. The slow speed and brake are controlled by foot pedals. TIRES 30 x 3½. EQUIPMENT, complete set of tools, side oil lamps, tail lamp and horn.

We want agents to write us about the Wayne cars for 1906. Agency arrangements can now be made for unoccupied territory. Write while you think about it, for full particulars.

Wayne Automobile Co., Detroit, Mich.

Member American Motor Car Manufacturers' Association, Chicago.

The Ford 4 Cylinder Runabout

This car—Model N—is the biggest revelation yet made in Automobile construction. A car of this type for less than $500.00 seemed an impossibility, but here it is.

4 Cylinder—15 H. P. Direct Drive. Speed 40 miles. 78-inch Wheel Base. Weight 700 Pounds.

FORD MODEL K.

Six cylinders—40 H.P. 4 to 50 miles per hour on high gear. Perfected magneto ignition. Mechanical oiler. 114 inch wheel base. Luxurious body for 5 passengers. Weight 2,000 pounds. Price, $2,500.00.

No further particulars will be given until these cars are shown for the first time at the Automobile Club of America's show at the 69th Regiment Armory, New York, Jan. 13th to 20th.

DELIVERIES FOR MODELS N AND K WILL NOT BE MADE BEFORE MARCH.

1906 will be a "Ford Year." Agents who have closed with us can congratulate themselves.

Four-Seated
Runabout

REO

The extra seat carries two people facing forward, and when not in use is folded down snugly out of the way. 8 h. p., 1000 pounds, 25 miles per hour.

5 Prizes out of 7.

In the New York Motor Club's great six-day economy test

The Reo 8 horse power Runabout (shown above) carried 4 passengers 682 miles for $3.81½ per passenger.

By this feat this car won two medals—**The Gold Medal** for all cars up to $1500 in price; and the **MacMurty Medal** for least ignition trouble, having none at all.

The Reo 'Bus with exactly the same horse-power as the Touring Car referred to below carried ten passengers 682 miles for $2.93 per passenger (including ferriage).

And won three prizes:—The **National Trophy** for Economy per passenger; the **W. J. P. Moore Trophy** for Economy per mile, including tire charges, which were only 4 3-10 cents; and the **Morgan Trophy** for the least gasoline per passenger, which cost only $1.60.

Thus 5 prizes out of 7 went to the splendid REO capacity and power.

WRITE FOR REO BOOK THAT TELLS WHY.

"Every Stock Car Guaranteed to Show Sixty Miles an Hour Before Leaving the Shops."—E. R. THOMAS.

THOMAS

AN AFFIDAVIT THAT SPEAKS VOLUMES:

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

BUFFALO, N. Y., Nov. 10, 1905.

This is to certify, that we, the undersigned, this day rode at the rate of 60 miles per hour with five passengers over average roads, maintaining a speed continuously in regular stock model 1906 Thomas touring car, and went up a 14 per cent. grade with five people on the high speed and on very bad roads, increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation, and the clutch is extraordinarily sweet and effective.

This is the only American built stock car that within our knowledge has made 60 miles per hour on ordinary roads, even without passengers.

Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA."

15-20 H. P., $3,000. 30-35 H. P., $5,000,

Both with complete touring equipment.

TYPE E. 15-20 H. P. $3000.

Top and Luggage Carrier extra.

SPECIFICATIONS OF 1906 MODELS.

Type "E" Locomobile—15-20 H. P

PRICE, $3,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; extra wide doors; fitted with top irons; color and striping optional.
MOTOR, 4-cylinder, 3¾ inch bore, 4½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, placed underneath the machinery.
FRONT FENDERS, have inner wings extending to bonnet.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
RUNNING BOARDS, rubber covered and brass bound.
TIRES, 32 inch x 4 inch on all four wheels.
WHEEL BASE, 93 inches.
CONTROL, spark and gas levers on steering wheel.

Type "H" Locomobile—30-35 H. P.

PRICE, $5,000, ready for touring
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5 to 7; fitted with top irons; extra wide doors; color and striping optional.
MOTOR, 4 cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, is placed underneath the machinery.
FRONT FENDERS, have inner wings extending to bonnet.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
RUNNING BOARDS, rubber covered and brass bound.
TIRES, 34 inches x 4½ inches on all four wheels.
WHEEL BASE, 106 inches.
CONTROL, spark and gas levers on steering wheel.

An Investigation of GOODRICH TIRES

Mr. E. Shirts, cashier of the Citizens National Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new. His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with Goodrich Tires 3 in. x 30 in. I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and I found them in perfect condition, not even rim-rusted.

I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

QUEEN AUTOMOBILES FOR 1906

3 MODELS ALL WINNERS

4 Cylinders, 26-28 H. P.

Price, $2,000.

SPECIFICATIONS

Drive.	Shaft, bevel gear.
Frame.	Pressed Steel.
Wheels.	32x4.
Wheel Base.	101 inches.
Transmission.	Sliding gear.
Front Axle.	Solid-Forged.
Ground Parts.	All cylinders, pistons, piston rings, crank shafts, valves, universal couplings and transmission shafts.
Equipment.	Five lamps, horn, tools and storage battery.

We also have an 18 h. p. two cylinder car with detachable side door tonneau list a $1100.00, and a runabout 12 h. p. at $800.00.

Write us for complete details and agency proposition; it's so interesting that our factory is already a bee-hive of industry. Better get in line now.

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should ***not*** buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the ***two*** cycle two cylinder Elmore engine.

Understand—the ***two*** cycle two cylinder Elmore engine produces ***two impulses every time the fly-wheel turns.***

As you know, the two cylinder ***four*** cycle furnishes only ***one*** impulse every ***fourth*** time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached ts climax this season after five years of steady improvement.

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocket-book and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

Fig. 1

And the chances are ten to one that if you are forced to ride around the block on a deflated ordinary tire with ordinary rims your tire will be rim cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough.

Fig. 2

Fig. 3

Fig. 4

But if you take the strap like Fig. 2, with a little sawing you can cut it. That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire. But just as soon as it gets partly deflated or flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

Fig. 5

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

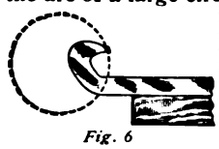

Fig. 6

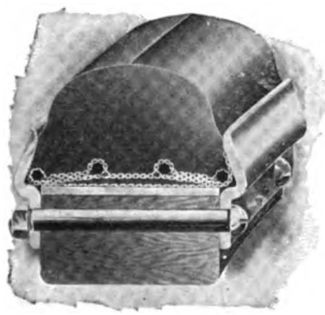
Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without serious injury to the tire. We have the evidence if you would like to see it.



This is only one reason why wise riders are specifying Gooodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manufacturers, Dealers and Riders seeking relief from tire troubles.

ANTI-FREEZE COMPOUND.

DIRECTIONS FOR USING.

The radiator should be thoroughly washed out with hot solution of caustic soda, which will remove any dirt, and then clean water should be put in to see if the radiator leaks any place.

If the radiator is found not to leak, put in the solution. To get a mixture that will not freeze at 15 degrees below zero Fahrenheit, add ten pounds of the compound to two gallons of water. To get a solution that will not freeze 30 degrees below zero Fahrenheit, add ten pounds of the compound to every six quarts of water.

The cover on the can should be kept closed tight at all times while it contains any of the compound.

OLDSMOBILE

Two-cylinder, Two-stroke Cycle Light Touring Car.

MODEL "L" Price $1250.

We have already announced in a general way our two-cylinder, two-stroke cycle car. Following we give a detailed description of this most attractive car—the smart appearance and "get up and get" qualities of which make it irresistible, once tried.

Model "L" has a marked individuality, though it approaches in general appearance the lines of several foreign machines very popular in America. The front axle is brought well forward and the rear wheels back, giving a very long wheel base and adding to the easy riding qualities of the car. The tonneau is so constructed that it is easily removable, and the "beetle back" luggage compartment is built for utility as well as for appearance. When thus equipped it becomes the most attractive of two-passenger or runabout outfits. The standard color will be pearl gray with black trimmings and red running gear.

MOTOR. The motor is two-cylinder, two-stroke cycle, vertical water cooled, placed under bonnet at front; cylinders 5-inch bore, 5-inch stroke, rating 20 to 24 actual horsepower, giving ample road efficiency. The cranks set at 180 degrees are counterweighted, reducing vibration to the minimum. Lubrication is by the Hill Precision oiler, bolted to brackets upon cylinders, and driven by eccentric. Pistons lubricated on both sides. Crank pins are oiled through middle main bearings. This system absolutely prevents smoky exhaust.

The cylinders and pistons are of best gray iron, made in our

Digitized by Google

OLDSMOBILE

own foundry. The crank case is of aluminum, the lower half being removable without disturbing bearings. The crank shaft is drop-forged and subjected to a special heat treatment, and finished all over and perfectly balanced. The brakes are of generous proportions and consist of bronze one-half shells with babbitt lining. Thus any bearing may be replaced from stock without trouble or rebabbitting.

Cooling is by water circulated by gear pump. Radiator of flat tube construction. Ignition, one storage cell, one set of six dry cells. Spark coil on dash. Commutator beveled gear driven. Spark plugs are set at an angle to prevent fouling with oil.

TRANSMISSION. The transmission is sliding gear, three speeds forward and one reverse. The gears are of special high carbon stock tempered and hardened. The control is of the selective type operated by a single lever, which cannot be thrown into reverse until prawl has been lifted, a precaution against accidental jamming of gears. The clutch cone sets into fly wheel, all strains self-contained. The clutch is thrown out by foot lever and also by emergency brake lever. The transmission case is of aluminum, the lower half being removable at top. Transmission is splash-lubricated from case through pockets packed with waste and screens. This precaution is taken to prevent steel chips getting in bearings. The transmission drive is through 1¼ inch shaft and Spicer dust-proof universal joints to the rear axle.

AXLES. The front axles are of our own special design, 2-inch tubing, ¼ inch wall. Steering connections have especially large bearings, all of which are equipped with "T" handled dope cups and protected by leather dust caps. The steering cross connection and steering link are adjustable, and the wheels may thus be lined up at any time. The axle is dropped in centre to protect fly wheel and other parts beneath car. The rear axle is equipped with Timken roller bearings throughout and with brakes, etc., of our own special design.

BEVEL GEAR DRIVE. The car has bevel gear drive, the ratio of the gear being 3 to 1 for standard equipment.

BRAKES. The brakes are of the internal expanding type, with toggle set-up, either camel's hair or metal lining being used, depending upon the section of the country to which car is shipped. The brake drum is of pressed steel, 12 inches in diameter, 2 inch face. The brake on the cardon shaft at rear of transmission is operated by foot pedal, while the emergency brake upon the rear wheels is operated by hand lever. The application of emergency brake throws out clutch, disconnecting transmission from motor.

SPRINGS. The springs are made of the very best obtainable stock, and are of the half elliptic type. The front springs are 36 inches by 2 inches and the rear 48 inches by 2 inches. The long spring hangers at front and rear permit lengthened wheel base.

FRAMES. The frames are of pressed steel channel section. A sheet steel plate riveted between side and sub-frame gives pronounced bracing effect. The dust pan attached to sub-member and extending from front cross member to the rear of transmission is removable. This dust pan makes inside of car absolutely dust, mud and water proof. Both the engine and transmission are aligned upon sub-frame and all working parts may be removed without disturbing hanging of crank and transmission cases.

CARBURATION. The carburetor is built for us after our own design, and is very effective and economical of fuel. The gasoline tank has 15 gallons capacity.

CONTROL. The steering is accomplished through a worm and nut mechanism. The nut is long and has a wearing surface babbitted so that same may be replaced at any time. The steering gear case is securely bolted between sub-frame and side member. The spark and throttle levers are placed upon steering post just beneath and at the right of 16-inch oval rimmed steering wheel.

MISCELLANEOUS POINTS. Wheel base 102 inches, the tread standard 55 inches; though 52 inches and 58 inches are furnished on special order. Wheels 30 inches, 10 spokes front, 12 spokes rear. Tires, 30x3½. The muffler is arranged longitudinally beneath the car, and entire construction is so enclosed that very little dust is disturbed by the passing of the car. Running board, mud guard irons, instead of being riveted on, are drawn into taper sockets upon side of frame and are easily removable. The lamp brackets are adjustable for different widths of lamps. We furnish tubular horn, two acetylene lamps, a generator and three oil lamps with this car.

Further specifications sent on reqeust.

Rambler

The cost of an automobile is not merely the original price of the car, but to this should be added the expense of daily upkeep. This expense is generally in proportion to the constructive complication of the car.

To this is due the acknowledged economy of the Rambler, in which simplicity, both in operation and design, is a paramount feature.

To this end has been devoted constant study and years of experience, resulting in a car of steady dependability that will serve you day after day, without the petty breakdowns that, while severally inexpensive, reach a high aggregate in a season's use.

The verdict of thousands of Rambler owners, or a personal examination at our branches or agencies everywhere, will bear ample evidence that the Rambler is the car of steady service.

Prices—Surrey Type One $1,200, Type Two $1,650, Type Three $1,350. All ready for the road with full equipment of lamps, horns, tools, etc. Our catalogue is at your service.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, December 7, 1905. No. 11

CHRISTENED THE AEROCAR

Detroit's Newest Company Chooses that Title —Staff Selected and Factory Being Rushed.

Aerocar Co. will be the style of the big, new company which has been formed in Detroit, and of which the Motor World last week gave the first news. It will be capitalized at $400,000.

The factory, which is already half completed, and which the contracts require to be finished within forty days, is located on Mack avenue, facing the Michigan Central Belt Line. As stated last week, it will be of three stories, 400 by 52 feet, and thoroughly modern in every detail, including two large electric elevators. It will be of solid mill construction, with fire walls dividing the structure into four sections, and further protected by the most approved sprinkling system.

According to his representatives, Alexander Y. Malcolmson, the wealthy and astute coal operator, who is the power and moving spirit in the Aerocar Co., will not resign as treasurer of the Ford Motor Co., as was reported, but will retain his office and interests in that concern, also. W. G. Morley, for so many years the purchasing agent and advertising manager of the Olds Motor Works, who resigned those positions, when the Olds offices were removed from Detroit to Lansing, will be Mr. Malcolmson's right hand man in the Aerocar Co. H. H. Thorpe, formerly with the H. H. Franklin Mfg. Co., will be general sales manager; E. J. O'Hagan, for seven and a half years with the Winton Motor Carriage Co., and later with an air-cooled concern in the East, will be superintendent. C. Pfahler will be the chief draughtsman. He is a graduate of the Technical University, of Berlin, Germany, and has had three years' experience in an American automobile factory.

The Aerocar will employ the Reeves air-cooled four cylinder engines, made by the gilt-edged Reeves Pulley Co., of Columbus, Ohio. The cylinders are arranged tandem and are cooled by a fan in front.

The initial output of the Aerocar factory will be 500 touring cars, although it is hoped to double this number.

Will Make a Pleasure Car, Too.

According to present plans, the Knox Motor Truck Co., Springfield, Mass., will shortly engage in the manufacture of pleasure cars, also. They have "taken on" the Sunset 10-horsepower two-cycle car, described in the Motor World of November 16. The car is now produced on a small scale by the Sunset Automobile Co., of San Francisco, a representative of which was recently in this part of the country seeking an Eastern connection. On the Coast, the car which incorporates a number of innovations has a big reputation as a hill climber, and sweet running vehicle.

Toppling of the Monarch.

Following the filing of a petition by creditars charging bankruptcy, J. O. Mason has been appointed receiver for the Monarch Automobile Co., Aurora, Ill. The liabilities of the company may reach $75,000, while the assets, it is claimed, are worth scarcely $20,000. The creditors allege that since November 29 the assets of the concern have been in the Sheriff's hands. Although the Monarch Co. carried full page advertisements in some of the automobile papers, that is the chief figure it cut in the industry.

Wayne Gets into Germany.

The Wayne Automobile Co., of Detroit, Mich., which apparently has become possessed of seven league boots, so rapid has been its progress in the last few months, is now reaching out for foreign trade. One of its very first European connections has been made in the country in which American connections are usually most difficult—Germany. The Wayne agency for that empire has been placed with Leopold, Robert & Co., of Frankfort-on-Main.

New Building for Rambler Branch.

The newly established Rambler branch in San Francisco is doing uncommonly well—so well, indeed, that contracts have been let for the construction of a building designed for its occupancy. The new place will be located at the corner of Jones street and Golden Gate avenue, with a frontage of 48 feet on the former and 38 feet on the latter thoroughfare. It will be of two stories, with a depth of 128 feet, and it due to be completed on February 1.

N. A. A. M. AGAIN IN SESSION

But There were not Many Transactions of Interest—Date Set for Annual Meeting.

Although a very full meeting—but two members were absent—there was little of interest transacted by the executive committee of the National Association of Automobile Manufacturers at their session in New York yesterday.

Passing on the applications for sanctions for a number of local shows and fixing the date of the annual meeting appears to have been the nearest approach to departure from dull routine. The annual meeting, at which, of course, officers will be elected, was set for Wednesday, January 16. It naturally will be held in New York, but not, as usual, at the association offices. Instead it will occur at some hotel—yet to be selected—convenient to the show buildings. There is said to be a possibility of two tickets being presented.

At yesterday's meeting a communication was read from the American Automobile Association suggesting a conference regarding next year's endurance or reliability contest, presumably the trial for the Glidden Trophy. After being read the communication was filed for future reference.

It is said that the local show situation in Cleveland was mildly referred to. In that city it appears that the Rambler agent who was barred from the last show planned a coup after it was over, and carried it out by obtaining an option on the only available building and on the most available dates in 1906. Recently when the givers of the option awakened to the situation they disregarded the previous transaction and leased the building to the dealers' association, which holds the sanction for the show. The association has offered membership to the Rambler man, but on terms that are not acceptable, and he is said to contemplate making things interesting, whatever that may mean.

Northern Names Its Prices.

For 1906 the Northern line will comprise four models, as follows: Thirty-horsepower touring car, $3,000; 20-horsepower limousine, $2,500; 20-horsepower touring car, $1,800, and the time-tried runabout, $650. These prices include lamp equipment in each case.

Digitized by Google

In the Retail World.

R. D. & C. O. Britton, the Allyn street carriage dealers in Hartford, Conn., are "going into" automobiles. They have taken on the Maxwell.

Schwender, Day & Co. have leased the buildings at Nos. 110 and 112 Main street, Mankato, Minn., and opened a garage. The firm will also conduct an automobile livery.

Harry M. Austin has bought the four story stable at the northeast corner of Sixty-third street and Park avenue, New York, and will convert it into a garage. It measures 50½x 100 feet.

Manley Bros., Harvard, Ill., have added automobiles to their business, and will devote most of their attention to the new department. They will handle the Mitchell cars exclusively.

A two story addition is being made to the Mitchell Automobile Co., salesrooms at No. 1,445 Michigan avenue, Chicago, Ill., which is to be completed this month. It will be used for a repair shop.

Dunlop & Easton, Los Angeles, Cal., will establish a branch garage at Hollywood, Cal. A lot has been purchased on the south side of Sunset Boulevard, near Cahuenga avenue, and a building will be erected at once.

Believing that the automobile is a better paying proposition than football, Harold Elmels, one of Purdue University's star players, will not return to that Indiana institute in the spring. Instead he will open a garage at Davenport, Iowa.

The American Automobile Storage Co., New York City, has taken the agency in New York and vicinity for the Premier air cooled car. Its territory includes Long Island, New Jersey, Connecticut as far as New Haven, and New York State as far as Poughkeepsie.

Joseph Troxhall, who was formerly with the old De Dietrich company, has become secretary and manager of the New Amsterdam Motor Co., No. 152 West Fifty-second street, New York City. The company has taken the agency for the Crawford car.

N. C. Mansir and C. R. Dunbar, who conducted the Holyoke Automobile & Repair Station on Division street, Holyoke, Mass., have sold out to Otto Nessman, the local agent for the Stevens-Duryea cars, and A. L. Witherell. The new proprietors took possession last week.

The Reliable Automobile Co., of Tacoma Wash., has opened a garage, livery and repair shop at Nos. 111, 113 and 115 Eouth Eighth street. W. O. Williams is its manager and G. O. Smith secretary and treasurer. The company has taken on the Packard, Cadillac and Winton lines.

Fire, which originated in the vulcanizing room of Isaac Kelzer's automobile repair shop and supply store, at No. 438 Ninth street, Washington, D. C., last Friday, 1st inst., caused damage to the extent of $10.000. Kelzer's loss was comparatively small, however—$3,500, the major part of which was covered by insurance.

The Youngstown Automobile & Repair Co. has started business in Youngstown, Ohio, with Charles T. Gaither, formerly with the Mahoning Motor Car Co., in charge. For the present the company has established itself in the Long Building, in Centre Square, but a new garage will be completed by February 1. The Reo car will be its leader.

F. L. Caulkins, of the Caulkins & Post Co., Middletown, Conn., has taken C. H. Brewster, of Springfield, Mass., into partnership in his automobile department, and will erect on Main street what is intended will be one of the largest and most completely equipped garages in the State. It will be of brick construction, three stories high, and will have a frontage of 42 feet with 150 feet depth.

50 Per Cent. for DeDietrich Creditors.

Meetings of creditors of the De Dietrich, American Branch, and of Frederick De Turckheim, head of that concern, were held on Tuesday before Stanley W. Dexter, referee in bankruptcy, at 71 Broadway, New York, at which the receiver, Lindsay Russell, reported that the affairs of both were so very much involved that he had found it impossible to distinguish the claims, so he prepared schedules which cover both.

They show liabilities of $140,974 and assets of $46,294, consisting of $37,306, proceeds of sale of automobiles; one automobile, $2,671, and outstanding accounts, $6,317. Baron Adrian de Turckheim, of Luneville, France, is the largest creditor, $131,462. Frederick de Turckheim, it was stated, owned all the stock of the De Dietrich, American Branch. He was not present at the meeting, and it was said he is in Paris. Technical objections were made to eight claims which were filed yesterday, and the election of a trustee was deferred.

Creditors were informed that a composition would probably be offered soon at 50 cents on the dollar.

Why Hartford Sailed for Paris.

E. V. Hartford, president of the Hartford Suspension Co., sailed for Paris on Wednesday of last week. He did not go wholly to view the French show—in fact, his mission was rather an unusual one. Although the Truffault-Hartford suspension or shock absorber is of foreign origin, Mr. Hartford has improved it to such an extent that his visit has to do with selling the original makers the license to use his several improvements.

The new Hartford suspension is now fitted with a self-adjusting device, which requires no tightening up as in the past. There is a five-prong spring washer, that takes up all of the inside wear, and the whole is held in place by a split nut of Mr. Hartford's own design. The sample which A. G. Hoffman, treasurer of the company, is now showing to the trade, has one double and one single arm, instead of two single arms. This makes it impossible for the arms to shear off, and, being self-adjusting, the device needs no attention after being placed on the car.

Another car from the land of garlic and spaghetti will make its debut in America. E. Paladini, New York City, has taken the agency in this country for the Zust.

The Week's Incorporations.

New York City, N. Y.—Metropolitan Auto Co., under New York laws, with $25,000 capital. Corporators—S. F. Randolph, H. H. Colbath and G. S. Kebibian.

Atlantic City, N. J.—The New Jersey Touring Co., under New Jersey laws, with $30,000 capital. Corporators—Daniel W. Hughes, William P. Bushell and Lowder T. Layton.

St. Louis, Mo.—Bagnell Automobile Co., under Missouri laws, with $10,000 capital, fully paid up. Corporators—Henry B. Graham, William F. Bagnell and James E. Morse.

New York City, N. Y.—C. A. Mezger, Inc., under New York laws, with $5,000 capital; to make spark plugs and motors. Corporators—Minnie Mezger, R. M. Owen and Zoe Owen.

St. Louis, Mo.—Colonial Automobile Co., under Missouri laws, with $15,000 capital, fully paid. Corporators—Frank B. Smiley, Charles E. Lane, Samuel J. Keffer, Henry C. Seabold and Lora E. Lane.

Salt Lake City, Utah—Gray Automobile Company, under Utah laws, with $5,000 capital; to deal in automobiles. Corporators and officers—William H. Gray, president; Sidney M. Bamberger, vice president; Joshua M. Bean, secretary-treasurer.

Three Seek to Forclose Mortgages.

William L. Wilde and wife, of Stamford, Conn., have asked the Superior Court to foreclose a mortgage for $6,000 upon property held by the old International Power Vehicle Co., of that city. It is claimed that the mortgaged property was conveyed to the defendant concern by W. P. Hatch. It is also understood that the Eastern Trust Co. and the Empire Trust Co., both of New York City, have each a mortgage of $250,000 upon property of the International company, the mortgage having been given after that of Mr. and Mrs. Wilde. The trust companies also ask for a foreclosure.

Four Acre Factory for Wayne.

The Wayne Autotmobile Co., of Detroit, Mich., is making ready to spread itself. It has acquired four acres of ground on Piquette avenue, between John and Brush streets, that city, on which they will erect a substantial factory building, the foundation for which was started last week.

Leaves Carriages for Cars.

Louis E. Burr has been elected president and general manager of the Woods Motor Vehicle Co., of Chicago, succeeding to the vacancy made by the death of the former president. Mr. Burr was for twenty years connected with C. P. Kimball & Co., the Chicago big carriage firm.

Bliss and Moon Join Independents.

The American Motor Car Manufacturers' Association has made two notable accessions to its membership—the E. W. Bliss Co., the big Brooklyn machinery house which has had a car under way for a year or more, and the Moon Motor Car Co., of St. Louis, an offshoot of the buggy company of that name.

JUST WHAT F. O. B. IMPLIES

Responsibilities That Shipping Condition Entails of Which Many Merchants Seem Unaware.

"One of the vexatious features in every-day commercial life is the wrangle shipper and consignee have about overcharge in freight expenses or damage and loss to goods," says Eugene V. Sharp, the author of "Sharp's Standard Rules of Shipping." "A shipper will sell a bill of goods to a country customer, and the customer, when settling, will deduct from the invoice the amount he believes was collected from him in excess of proper freight charges by the railroad. He does not know the exact freight rate, which should have been assessed on his shipment, but he knows that some time ago he received a similar shipment, for which the railroad collected $2.85, while this time he was made to pay $4.10, and he forthwith deducts $1.25 when paying the shipper's invoice, leaving to the latter to collect the overcharge from the railroad as best he can.

"It is not our intention to go into any discussion as to whether a claim for overcharge or damage really existed. We assume it did exist. What, then, should have been the proper course for the consignee to pursue; in other words, was he justified in deducting his claim against a railroad from shipper's invoice, or should the consignee have assumed himself the burden of collecting the claim from the railroad company?

"For the benefit of thousands engaged in business seemingly unable to determine this question correctly, a brief definition of the common law governing this subject will prove helpful.

"If A at Philadelphia sells to B at Cincinnati a bill of goods on terms "delivered f. o. b. (free on board), Philadelphia," the place at which the contract is to be filled is Philadelphia. This means that A tenders his goods to B at Philadelphia for acceptance, and if B of Cincinnati for convenience sake declines to come to Philadelphia and receive his goods, and instead instructs A to send him the shipment by railroad or otherwise, it is B of Cincinnati who thereby assumes all risk involved in shipping.

"If S at Kansas City sells W at Buffalo five carloads of corn delivered "f. o. b. Buffalo," the place for filling the contract is Buffalo. It means that S of Kansas City has to bring the five cars of corn, that is the quantity contained therein, to Buffalo at his own risk and expense, and there tender the goods to the buyer for acceptance. Should any of the cars have a leaky roof, causing damage to the corn by wet or some of the corn was lost in transit through a hole in the floor of a car, or an overcharge in freight expenses exist, it is S. of Kansas City who must assume the risk. If, however, Mr. S. of Kansas City is willing to pay the freight charges, but is unwilling to assume the risk involved in shipping, he can offer and sell his corn to W. at Buffalo, "delivered F. O. B. Kansas City, Mo., freight allowed to Buffalo." In this case the place of filling the contract is Kansas City, and W. of Buffalo will have to come to Kansas City, examine and accept there the corn, or assume himself all risk involved in shipping, should he elect to stay at home and order the corn forwarded to him to Buffalo."

Boston "Insiders" Clean Up $10,000.

The show situation in Boston has been given an unexpected turn. It will be recalled that after a certain few of the dealers and branch managers had made a huge success of the first exhibition and divided a tidy sum, the dealers and managers then on the outside also organized and raised such a howl and exerted such pressure that they were "let in" and a corporation formed, one share of the stock being alloted each member.

The show of last March was also a tremendous success, but after the profits had been divided the employers of at least a number of the branch managers called on the latter to pay over the "easy money," claiming it as theirs because it was their time and money and goods that had been used to earn the profit. They also ordered that the corporation certificates be transferred to them. Some of the managers complied with the best grace possible; others turned over the profits but not the share of stock, and there were those who transferred neither money nor stock. It was this situation that caused so many changes of managers in Boston during recent months.

It was supposed that the last had been heard of the matter, but this week the report comes from Boston that the original certain few "insiders" who had held onto the lease of Mechanics' Institute—the only desirable building—had subleased that structure to the dealers' association at a rental of $10,000, which, of course, they will now apportion among themselves and as these "insiders" will also obtain a share of the show profits, that they have cause for a satisfied "last laugh" is evident.

Detroit's Shrewd Departure in Demonstrations.

Competition is getting keener every day, and methods of salesmanship that landed orders a few years ago have long since been shelved. There are so many salesmen "after" each prospective customer that the latter no longer has to bother himself to visit a salesroom of his own accord. He must be hunted and carried there. Detroit dealers are said to be among the first to realize this, and they, moreover, appreciate the fact that a ride with some object in view is a better demonstration than a mere aimless run through a park, so one of the features of the trade in that city has come to be the number of cars that wait outside the big office buildings between 12 and 2 o'clock. They are there—a great many of them—to take prospective purchasers to luncheon at home and return to their offices in good season, demonstrating their fine points in the process.

EXPORTS STILL EXPANDING

October Figures Bring Up a Handsome Total —Great Britain our Biggest Customer.

As a sign of the great strides being made in the exportation of automobiles and parts the monthly report of the Department of Commerce and Labor for October is for the first time set forth in detail. Its compilers have, instead of lumping the aggregate, itemized the accounts, and as a result it is now possible to learn just where the goods are going and to follow the growth of the foreign business.

The details show that during the month more than a third of the total of $133,988 is represented by shipments to Great Britain, amounting to $50,136, a brave showing compared to but $2,190 to France and $1,740 to Italy, although Germany's showing of $8,162 and other Europe $8,903 are more favorable. The remaining items of respectable proportions are $12,274 to Other West Indies and Bermuda, $13,464 to Mexico and $18,715 to British North America. The total for October, 1904, was $130,891.

The detailed report for October and for the ten months ending with that month is as follows:

	October.	Ten months.
United Kingdom	$50,136	$604,782
France	2,190	254,030
Germany	8,162	101,998
Italy	1,740	154,325
Other Europe	8,903	222,817
British North America	18,715	501,765
Mexico	13,464	150,042
Other West Indies and Bermuda	12,274	124,552
South America	5,571	48,938
British East India	3,620	28,602
British Australasia	4,043	85,548
Other Asia and Oceanica	1,318	60,591
Africa	2,716	28,737
Other Countries	1,136	2,894
Totals	$133,988	$2,389,621

Willis to Have Uptown Branch.

The E. J. Willis Co. has taken the first step toward the establishment of an uptown supply house. They have leased the four story building No. 231 West Fifty-fourth street, New York, for a period of ten years, and after it has been altered to meet their requirements they will take possession, which will be about February 1. The Willis Co. will also maintain their downtown store at No. 8 Park Place, discontinuing, however, the one directly across the street, which was used chiefly for second hand cars.

Pitkin Wins Newark, N. Y.

Newark. N. Y., is going to have an automobile factory. By paying $1,000 a year rental for an old factory building in Newark, the Board of Trade has induced James M. Pitkin, of Rochester, to come to the village and build automobiles. He will bring fifty "families" with him. Mr. Pitkin naively tells the board that as soon as the factory is firmly established it will be able to turn out one car per day.

FISK MECHANICALLY FASTENED TIRES

are receiving more favorable comment to-day from competent judges of tire qualities than all other makes combined.

It is because we know how to build tires that will insure the user Comfort, Safety and Tire Economy.

No matter how much you have enjoyed your car in the past, FISK TIRES will surely add to your pleasure by physical and mental relief—and lessen your tire maintenance by half.

THEY RIDE EASIER, WEAR BETTER, AND HAVE BEEN PROVEN SAFER THAN ANY OTHER TIRE MADE.

HAVE YOU EVER TRIED THEM?

THE FISK RUBBER COMPANY, Chicopee Falls, Mass.

BRANCHES:

NEW YORK, 754 Seventh Ave.
BOSTON, 226 Columbus Ave.
SPRINGFIELD, 40 Bridge St.
PHILADELPHIA, 138 N. Broad St.
MINNEAPOLIS, 704 Henepin Ave.
ATLANTA, 103 N. Pryor St.
SYRACUSE, 423 S. Clinton St.
BUFFALO, 893 Main St.
CLEVELAND, 318 Euclid Ave.
LOS AGELES, 1034 Main St.
DETROIT, 254 Jefferson Ave.
CHICAGO, 1251 Michigan Ave.
KANSAS CITY, 1330 Main St.
ST. LOUIS, 3908 Olive St.
SAN FRANCISCO, 114 Second Ave.

YOU CAN DEAL WITH US FROM A DISTANT POINT THE SAME AS AT THE FACTORY.

CADILLAC UTILITY

THE SINGLE CYLINDER CADILLAC
Will climb any hill that any automobile will climb.

THE SINGLE CYLINDER CADILLAC
Will travel any road that any automobile will travel.

THE SINGLE CYLINDER CADILLAC
Will travel as fast as anybody ought to ride.

THE SINGLE CYLINDER CADILLAC
Costs less to operate. Costs less to Maintain.
Requires less attention than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined, and won for them the unquestioned distinction of

AMERICA'S LEADING MOTOR CARS.

CADILLAC MOTOR CAR CO. - - - - Detroit, Mich.

Members Association of Licensed Automobile Manufacturers.

WE WILL EXHIBIT IN NEW YORK AT MADISON SQUARE GARDEN ONLY, JANUARY 13-20, 1905.

NEW YORK, DECEMBER 7, 1905.

THE

NEW YORK

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 9th and 16th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

Pennsylvania's Vicious Provision.

In at least one respect Pennsylvania's new law, which becomes effective January 1 next, is more despotic than the Russian measure in force in Massachusetts. It says that after the penalty of fine or imprisonment following a second conviction shall have been paid, the offender's right to use his private property on the public roads shall be revoked; it is made imperative. In Massachusetts it is optional with the State Highway Commission.

It will be interesting to discover whether there is any more spunk in the motorists of the one State than there is in those of the other. It is bad enough to make the use of the public roads a special privilege, which must be paid for, but to hold that after that exaction or extortion has been satisfied and after an offender has also paid a fine or served a term of imprisonment, he shall be deprived of the right to use his personal property, is a condition of affairs that strikes at the fundamentals of personal liberty and constitutes a menace to republican institutions.

After he has paid its penalties, law, or justice, rather, cannot pursue an offender beyond the confines of a court or a prison, else freedom becomes a farce and a mockery.

The Detachability of Tires.

Of course, ther are those who have not as yet reached that stage, but it is safe to say that the majority of people who have to do with automobile tires have come to the conclusion that rubber is rubber, and nothing else. There is nothing else just like it, nothing that will take its place, and there is no hope of ever being able to manipulate it in a manner that will overcome its present shortcomings altogether. They may have done so at one time, but no longer cherish any fond delusions as to the arrival of the millenium in the shape of an absolutely non-puncturable, never-wear-out, just-as-good as pneumatic tire that is never anything else but a joy and source of delight to its owner. They have also come to the conclusion, usually after more or less costly experience, that while "just as good as pneumatic at a fraction of the cost" sounds very alluring, it is very deceiving and usually means nothing more than a shifting of the source of expense.

These experienced owners, and their ranks are constantly being recruited, look more to facility for repair—for improvement in the means of attaching the tire which will permit of its ready removal, when demanded by the necessity for repairs. Mechanical fastenings of many kinds are the outcome of this tendency, practically all of them having in view the elimination of a multitude of small parts for holding the tire in place, as well as the struggle in forcing the tire on and off the rim. Devices embodying these qualifications have been placed on the market previously, and have met with more or less success, but it is evident that they were not fully appreciated at the time of their advent, due to their own shortcomings probably. But some have survived and the number that will be on view at the coming shows will be strong evidence of the trend in this direction as well as the general recognition it is being accorded by manufacturers.

The Fuel Problem.

It is possible that a solution of the motor car fuel problem, which with the growing use of the motor vehicle and the apparently unavoidable shortage of the petroleum compounds in the future, is of the greatest importance, may be found in an adaptation of the by-products of the distillation of coal in the manufacture of illuminating as. It is a well known fact that the residual products of the gas retort are strongly analagous both in molecular structure and in their properties to the petroleum products. Indeed, so intimately are the two groups connected in every respect that many of the derivatives of each are used both in combination and as substitutes for one another with considerable success.

Something over a year ago it was said that experiments were being carried on in France by M. Serpollet, constructor of the steam car which bears his name, who was testing a fuel derived from a by-product of the gas house, which was subjected to a purifying process and which, with certain additions, served to considerable advantage and economy as a fuel in his own machine. Still more recently tidings have come from England to the effect that J. W. Brown, an engineer of the Nottingham gas works, has been at work upon a fuel which is a type of benzol having a specific gravity of .88 or thereabout, and a flash point of 56 to 60 degrees; also he has experimented largely with toluol, both of which are coal tar derivatives, and has found that either of them will work very satisfactorily either alone or in combination with gasolene. In the course of his tests he has come to the conclusion that one gallon of the

Digitized by Google

tar product is equivalent to about one and one-fifth gallons of simple gasolene.

One of the gravest features of the question of the limitation of the petroleum supplies of the world lies in its uncertainty. The well known characteristics of the oil well of flowing freely one day and going dry the next without apparent reason causes the scientist to have the gravest doubts as to the future. With the earth's supplies of coal, on the other hand, there is much less cause of alarm, for, though they are far from inexhaustible, and though the draught upon them is growing at a frightfully rapid rate, their extent and location is determinable with so great a degree of accuracy that there is, as we are told, little or no cause for uneasiness on that score. Hence if a combination of the true petroleum products with some of the elements of the coal distillation which now go to waste or have but a limited usage can be effected, or if the use of the latter alone can be made possible either by refinement or by effecting some sort of alteration in the present means of carburation, a great gain will have been effected.

On Taking Things for Granted.

It is a presumption of general currency that every person is in full possession of all his faculties, and it is a belief on the part of drivers that more or less often leads to accidents, and probably more frequently to very "close shaves."

There can never be any certainty that the man who chooses to amble down the centre of a one wagon country road, can hear and see as well as the average normal human being, though this is generally taken for granted. Tooting the horn is usually efficacious, particularly if the instrument in question happens to be a young pipe organ tuned well up in the higher register and blown by a forty horsepower engine, but there are cases on record where even this has failed to make an impression, and the driver, realizing his mistake too late, allowed the car to perform that service on the pedestrian—the man was not absent-minded, he was stone deaf. Like the majority of his kind, he had a habit of occupying the middle of the road.

There also is the man who is fond of doing the same thing, always proceeding to lose himself in his thoughts as utterly as if he were on another planet, the moment he achieves the coveted place in the middle of the road. He must be regarded as in the same class as the man who is lacking one sense. And the nearsighted individual should be included also. On the whole it is just as well not to take it for granted that every user of the road is sound and sane. Such a presumption might prove disastrous if indulged in near an asylum for the deaf, dumb and blind.

Tests of Tires.

Just what is to be learned from an official test of a number of tires, carried out under a lengthy code of strict rules and regulations and with the results calculated to a nicety, will be made known during the early part of the coming season, should well laid plans not miscarry. There have been tire tests before—one of side splitting memory held within a few miles of New York City but a few months ago. Up to now they have not been of the same serious import to the trade in particular and the automobile industry at large as the sponsors of the coming events would have it believed. These, indeed, be serious events of the first water, from which much is to be gleaned in the way of weighty statistics—that may be filed away for good.

France, having done her best to belittle the road racing game, principally because she was not permitted to continually have the biggest finger in the pie, finds that success in this direction has been attended with at least one unlooked for result. Her national prestige is well established, but it will not remain so long under attacks of foreign competitors, and a complete withdrawal from prominent events would savor too much of retirement.

The outcome is the "concourse d'endurance," which if certain elements gain the ascendant will be purely a French affair, a "circuit Francaise," or, on the other hand, a "circuit d'Europe." The former desire is still an outcropping of the same spirit that dominated affairs just prior to the Bennet Cup race, but regardless of the course over which the event is run, it is apparent that the French maker does not wish to be considered as having drawn into his shell, hence the Coupe de Bandage or tire cup. As if to go the French one better, the Automobile Club of Great Britain has quietly planned an event on a vastly more ambitious scale, and while their Gallic competitors across the Channel were wrangling over details settled the matter to their own satisfaction. Only one thing is lacking, and like the refusal of the inventor's dream to operate as calculated, it is a rather important detail—the consent of the tire manufacturers to supply the tires and pay well for having them worn out under official auspices. Should the latter gentry be sufficiently philanthropic to pay handsomely for the privilege of learning something which they already know far better than their would-be instructors, in the hope of attaining a doubtful measure of prestige for their product in case of success, the events in question will doubtless prove of considerable interest to the remainder of the automobile world at large.

Steam and Gasolene Engines Compared.

In the steadily increasing number of cylinders given the motor, a practice that has culminated in the design of the 1906 model by the use of as many as eight, in one instance at least, cast independently and placed single file, it is curious to note the great discrepancy between the internal combustion engine and the double acting steam engine as regards the number of impulses given the crank shaft per revolution.

All reciprocating engines, unfortunately, have two dead centers, and the four-cylinder gasolene motor has three strokes per cylinder during which the crank shaft receives no turning impulse, so that it is necessary to have at least four cylinders to equal a single cylinder, double acting steam engine in this respect. Consequently six cylinders are equivalent to a three-cylinder, single acting steam engine, and eight cylinders equal a two-cylinder, double acting steam engine, so that in the adoption of the latter number the internal combustion engine is brought on a par with standard locomotive practice in this respect. Naturally, the greater the number of cylinders employed the more perfect will be the turning and the less noticeable the dead strokes—the compression strokes and the dead centers—provided the impulses are equally spaced. It is merely a question of exceeding the point where the amount of mechanism involved exceeds the benefit to be gained as well as the space available.

Once upon a time there was a man who, being highly incensed at the great cloud of smoke which was to be seen pouring from the exhaust pipe of his automobile, said to his chauffeur: "Here, get down under there and let some of the oil out of that crank case. And take off that coat. I can't afford to buy clothes for you to rub in the dirt like that." The young man, having a mind of his own, promptly and firmly refused and was "fired" on the spot. In process of time his successor was elected, who, being told the tale of the other's undoing, thenceforth put no more oil in the engine at all.

TIRE TEST OF 4,000 MILES

Great Britain Goes France More Than "One Better"—The Rules that Will Apply.

Not to be outclassed by its French competitor, the Automobile Club of Great Britain has decided to hold a tire trial next season. It has gone about formulating regulations and conditions with a commendable lack of friction that unfortunately was not characteristic of the French article. While some French and most of the German manufacturers invited to participate have raised a complaint as to excessive distance, the Britishers have calmly jumped this disputed point to the unprecedented distance of 4,000 miles. The tests will be carried out under the following conditions, in accordance with the set of regulations just made public.

The subjects of the test are as far as possible to be ordinary stock tires such as are offered for sale daily and are to be selected by the club committee. They will likewise be used under ordinary touring conditions. Each entrant must provide cars meeting the approval of the club, for the purpose of the trial, and stand all expenses connected with their running. The club will supply official observers and award certificates of the actual performance of any set of tires entered for the trial.

A number of classes have been provided and are defined as follows: A set of tires in classes A, B, C and D shall mean four tubeless (single tube) pneumatic tires or four outer covers and four inner tubes. A set of tires in class E shall mean four inner tubes and four covers each with a protective device. Sets of tires in classes F, G, H and I shall mean four solid rubber tires, or six if double tires be used on rear wheels.

Competitors will be permitted to use extra tires, covers, tubes or protective devices, provided the latter be taken from a supply that the club committee has selected and marked before the opening of the trials, on the further condition that all such parts as shall be replaced are handed over to the club as worn out. Such replaced parts are not to be returned to the competitor during the course of the trials for any purpose. At the end of the trials all tires and other parts used be replaced during the trials are to become the property of the club to be dealt with as the committee shall see fit.

The entry fees are based on a sliding scale, decreasing with the number entered and as they are figured with a high factor of safety to cover expenses, the manufacturer of tires will find it no inexpensive game to play, counting the several hundred dollars' worth of material which he will forfeit in addition, unless the club committee should deem it proper to return the used tires after examination. If the number of sets of tires entered from all sources be not less than five, or more than ten, the entry fee for each will be $500 per set; if between ten and fifteen, $375 per set; up to twenty, $300, between the latter figures and thirty, $275, and over thirty, $250.

For the purposes of the trial the cars are classified as follows: Class A, light cars; the total weight in running order not less than 1,500 pounds, including two passengers, of an average weight of 150 pounds. Class B, medium cars; total weight not to be less than 2,400 pounds, including four passengers of the same average weight. Class C, touring cars, minimum weight, 3,000 pounds, including four passengers; class D, heavy cars, minimum weight with the same number of passengers, 4,500 pounds. None of the tires to be used on any of the four classes just enumerated may be protected by any device calculated to save the tire from wear.

Class E is limited to a group of combination tire and armored protective devices, and cars to which such protected tires are to be fitted are to be of a minimum weight of 3,000 pounds in complete running order, including four passengers. The remaining classes are confined to solid tires.

Classes F and G correspond to classes A and B, light and medium weight vehicles, for which the same conditions are prescribed in both cases. Class H is for medium weight commercial vehicles, which must tip the scale when in complete running order at not less than 6,000 pounds, including two passengers. Class I, the last, is for heavy comercial cars weighing not less than 14,000 pounds, with two passengers. All forms of spring wheels are entirely barred.

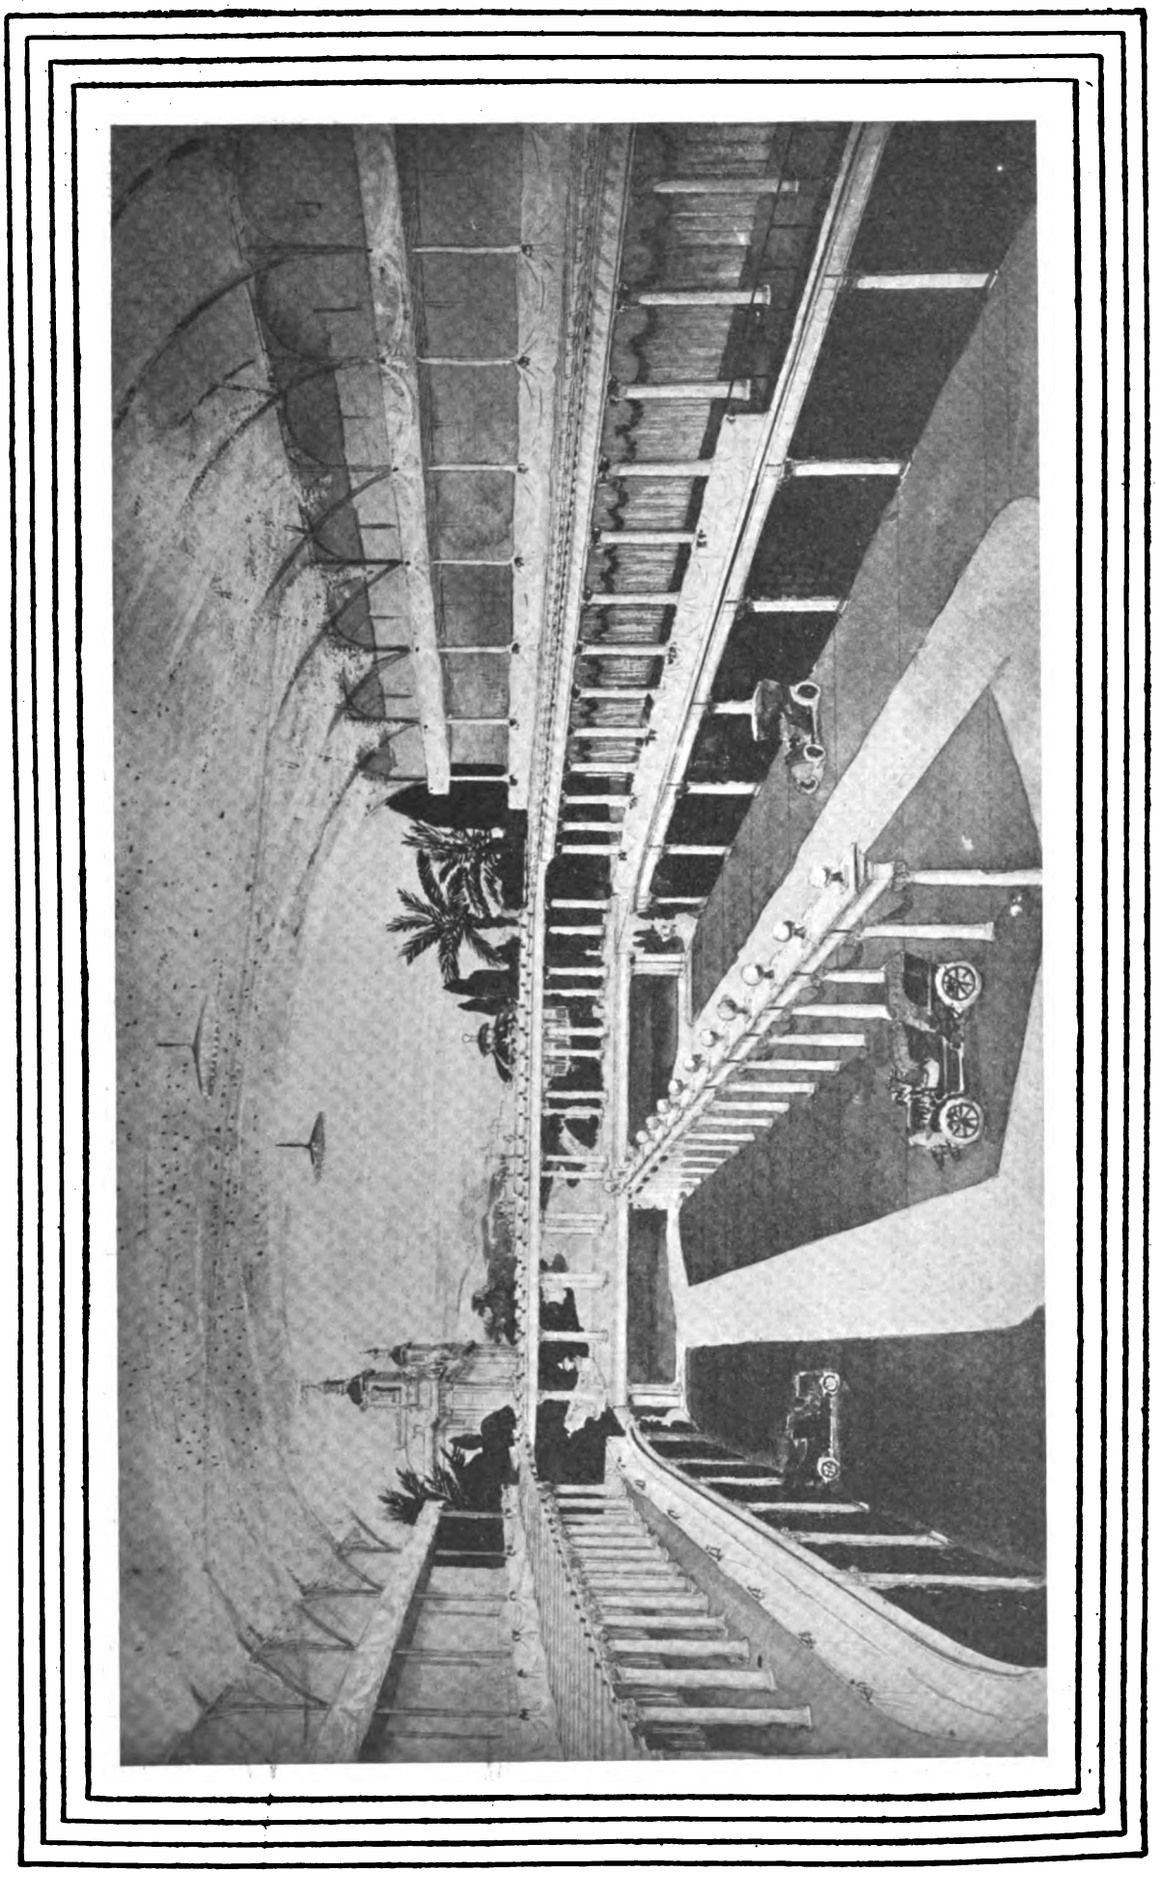
Entrants of pneumatic tires will be called upon to declare in the entry blanks the air pressure at which they will run their tires and the club reserves the right to test the latter where and when it sees fit, and to compel the entrant to adhere to his declaration.

As already stated, the distance to be run is 4,000 miles, to be divided into daily instalments of 200 miles each, the latter to be covered in 12 hours' continuous riding, at the expiration of which the observer must take it upon himself to see that the car is locked up. A set of tires failing to complete a day's run in 36 hours, or which is not ready to start on its run by 9 p. m. on any day, shall be deemed to be withdrawn. But this is not to be applied to delays arising from any cause other than tire failures. If any of the competitors are anxious to continue after having completed the 4,000 miles, he may do so by paying a fee of $10 per set of tires per day. A moderate speed is imposed, having due regard to other traffic on the road, and the driver must heed warnings of the observer, any disregard of the latter involving possible disqualification.

All stops of the "car wheels" are to be recorded, "voluntary" stops, being defined as those which the observer authorizes, such as stops of the car for legal requirements, traffic, meals, lighting lamps, repairs to car or mechanism, or for the convenience of observer or driver. The engine may be stopped when running down hill or during any halt. All involuntary stops are to be noted by the observer and recorded on the certificate. These are defined to be "any stop caused by failure of any part of the tires, or made for the purpose of carrying out any adjustment or repair which if not carried out might cause such failure. Adjustments and repairs to the tires are to be carried out by the driver and mechanic only and the length of time consumed will be noted and form part of the record on the certificate."

February 1, 1906, has been set as the date of the start, the routes being on main roads in the vicinity of London. They will be selected by the club, and the drivers will be given general particulars each day, and are to be held accountable for following them. If the day's route be missed, the driver is to return to the point at which he departed therefrom. Should the whole route for the day not be completed by any car, it must complete the same route on the following day.

The size, weight and price of the tires entered in relation to the weight carried are to be taken into consideration in making the awards, which will consist of a gold medal for the most meritorious performance, and a silver medal as second prize, provided there are at least four entries in a class. A certificate will accompany these awards, and will be granted other entrants, the club reserving the right to record thereon a list of the parts, which in its opinion exhibit an undue amount of wear at the end of the run, or any other observations of similar nature.



Every competitor in entering binds himself to accept the official records of the club as final, and further authorizes the latter to publish them as it sees fit. He further agrees to publish only the full and complete certificate issued by the club, besides binding himself not to publish any other matter relating to the trials and the performance of his tires therein without the written consent of the club, given after passing on proofs submitted for the purpose.

French Kick About Tire Test.

Although, as recently reported, it was considered that all obstacles in the path of the proposed French trial had been swept away by the agreement of the manufacturers and the French club regarding matters of detail, it would appear that everything is not yet serene. As originally outlined, the race was to be a "European circuit," and it is somewhat to be wondered at that the usual French spirit has not cropped out earlier. It is there, none the less, though a little belated, and now the demand is for a "Circuit Francais."

"Bring foreign contestants to France rather than expend French energy and money outside of the sacred dominions—the other side of the frontier," say these malcontents. There are, however, those who maintain that it would be more profitable for the French maker to exploit his product to the foreigner. Both sides of the question will be considered and a report made to the club.

DECORATIVE SCHEME OF THE MADISON SQUARE GARDEN SHOW.

Digitized by Google

BEAUTIFYING THE GARDEN

Forest, Fountain and Classic Decorations for A.L.A.M. Show—Telephones in Every Booth.

After a judicious whetting of appetite, the Association of Licensed Automobile Manufacturers has finally permitted to be released a definite picture and a definite idea of the decorative scheme that will prevail at the Madison Square Garden Show, concerning the beauty and effectiveness of which so much has been said. The illustration on the opposite page indicates that reports have been well founded and that the Garden will "bloom" as it has never bloomed before. Of course, the color effect is lost in the picture, and no description can do full justice to the appearance the Garden will present when the doors are thrown open on the night of January 13.

The color scheme is white and gold, with the proper enrichment by contrasting colors. Large plaster or staff columns ten feet apart, supporting the classic cornices, which will contain signs of each exhibitor, are to form a distinctive part of the show. The entire cornice will be illuminated by thousands of electric lamps contained in a reflector, and this, together with the new electroliers, especially made for the purpose, will make the Garden as light as day.

At the entrance will be the heroic emblem containing the figure that has been used as a poster. Under it will be a fountain of running water, on which will be played different colored lights, making a novel and attractive feature upon entering.

Many skilled sculptors and modellers are being employed in the figure work, the frogs and the other details that are to be used in the basin. These men will also look after the classic work. The staff composition is an especially prepared one, and has a brilliant whiteness that should contrast beautifully with the other materials used.

Upon the wooden flooring will be laid five thousand yards of thickly padded carpet of a rich golden bronze color. This is being especially woven for the show.

At the entrance to the lobby a forest effect will be in evidence, giving one the impression of natural, wild beauty, and this same forest effect is to be carried into the restaurant and basement.

The entire ceiling space of the Garden will be covered with a canopy of sky blue tone, in which stars will twinkle. For this portion of the decoration over twelve thousand yards of celestial blue material will be required and twenty-seven thousand stars.

Silkaline between pilasters of white and gold is to form the balcony decorations, and as the silkaline is to be made in box pleats, enriched by sprays of smilax, the effect is expected to be decidedly entrancing. The rear of the Garden will be covered with a special scenic painting representing an Italian garden, and it is here that the skill of the artist has been called into the most important service. The committee is now considering the advisability of adding heroic figures in plaster casts in the upper balcony.

The signs, which are to be made in white and gold, are on galvanized iron with wooden frames. The letters are in pure gold leaf with gold mountings and bevel edges.

This forenoon the press is to be conveyed in automobiles to where the work is being done and given a private view of the decorations themselves, after which the press men will be the guests of the A. L. A. M. at luncheon.

One other new feature that will be inaugurated at the Garden show will be the telephone service. There will be 150 telephones, with switchboard positions for eight operators. From the Garden to the Madison Square exchange will be sixty-five trunk lines, which is a greater number than is found at the Waldorf-Astoria, which has heretofore been the largest private exchange.

To properly handle the traffic twenty-three employes will be needed, to say nothing of the hello girls at the various booths. There will be a manager, two supervisors, eight day operators and seven night operators, with two relief operators and three messengers.

With this system in operation it will be possible for each exhibitor at the show to telephone to other exhibitors or to his office or factory, albeit it is a thousand miles away. There will be a special telephone directory for the Garden exhibitors.

McCrea Takes Up Trucks.

J. W. McCrea, former sales manager of the Royal Motor Car Co., has organized the McCrea Motor Truck Co. with offices in the American Trust Building, Cleveland, Ohio. He will not, however, build the vehicles but will have exclusive control of the sale of the product of the Champion Commercial Motor Vehicle Co., of Owego, N. Y., who have been making electric trucks for the last eighteen months. The factory has a capacity of 30 to 400 trucks per year. They are made in sizes up to twelve tons.

Purdue University Begins Work.

Purdue University's new automobile testing plant has had its initial tryout, and was found in perfect working order, according to reports from Lafayette, Ind. Tests were made on a 16 horsepower car, and the results came up to expectations. After a few minor changes in the apparatus tests will be given to several 1906 cars which are to be sent to Purdue for the purpose. The tests will be made by senior mechanical engineering students as thesis work.

Thieves "Lift" a Famous Trophy.

Just about twenty-four hours before it would have been returned from the Olympia show to the De Dietrich agency in London, the Pyrenees Cup was attached by some unknown member of the light fingered gentry, and probably not long after that consigned to the melting pot. Estimates of its gross value vary from $2,000 to $5,000, the silver alone being valued at $1,000.

REV. KURTZ WANTS A CAR

Quotes Scripture to Help Get it and Invokes Blessings in Advance—Preacher's Missive.

The Rev. Jacob Kurtz, of York, Pa., used to be a "drummer." But one day he heard a voice from Heaven, and as a result he is now in the preaching business. The Rev. Jacob has not, however, lost one of the chief requisites of the travelling salesman. He wants an automobile, and he is'nt afraid to ask for it. Jacob wants the car so badly that he had printed a circular letter making known his heart's desire.

If all the manufacturers who received the communication had felt in the mood of giving away such a trifle as a touring car—the Rev. Jacob is specific on the point; he evidently wants no little runabout—the Pennsylvania preacher might now be able to set up the largest automobile establishment in his State. At last accounts he was still wanting the car, and there is no news of an overwhelming rush of "liberal donations," which the Rev. Jacob also suggested.

As an interesting exhibit, Mr. Kurtz's letter is worth reading. Here it is:

THE LORD LOVETH A CHEERFUL GIVER.

I was a travelling salesman. The Lord called me, and I abandoned all occupations, and am obeying. My convictions are that my mission is to preach (or teach) Good News and Glad Tidings to the broken hearted, the poor, the captive, to get God's Word into the hearts of men, women and children, in the highways and the byways.

I have made four successful mission journeys, first, 1,000 miles; second, 200 miles; third, 150 miles, and fourth, 600 miles on these tours. The report would show an average of twenty one-minute sermons preached every day, at meetings varying from one to 500 or more hearers, composed of beggars, and working men, in waiting rooms, at trolley and railroad stations, open air meetings, walking along the street, to those going to work; gamblers, social card-players, poolrooms, bar tenders, lawyers, legislators, mayors of cities, teachers in the Board of Education, Philadelphia, Salvation Army, Bowery, New York City; idle men in Chatham Square, New-York City, market places, political conventions, and all those who would give their ears to the Word of Jesus. This was done by walking and riding, and kept going by small donations from the people. Many of the hotels entertained me, also Y. M. C. A.'s. I received donations from ministers of every denomination, and even Catholic priests. I gave them all the same story.

My experience teaches me that the good work in which I am engaged would be very materially advanced if I were able to make tours in an automobile touring car. I need to have a more attractive way of getting the attention of the people. The great General of the Salvation Army is making quite an extended tour in an automobile touring car. It is said he thus attracts the attention of people. The idea is fitting and proper. An automobile touring car fitted up as I see it, would help greatly to carry forth the message in the home mission field.

I kindly ask you for a liberal donation for the desired car, or the car itself. May God bless you, and help to give to the poor, and known that you are lending to the Lord.

REV. JACOB KURTZ.
No. 650 West King St., York, Pa.

The Man on the Front Seat.

DAVE HENNEN MORRIS, PRESIDENT AUTOMOBILE CLUB OF AMERICA.

'Frisco Creates a Record!

"Forty million dollars four miles in four hours" is an automobile record that is not apt to be approached for some time to come, if in fact there will be any desirous of emulating its performer. Upon the consolidation of the Wells-Fargo with the Nevada National Bank in San Francisco, $40,000,000 in currency was transferred in a car from one building to another.

Club Formed in Mormo land.

The Beaver County Automobile Club, of Beaver City, Utah, has organized by "taking out its papers" with $3,000 capital and electing these officers: President, J. D. Macauley; vice-president, W. H. DeWolfe; secretary, E. S. Sawyer, and treasurer, George B. Greenwood.

Three Ordinances in St. Louis.

Three bills affecting automobiles were introduced in the St. Louis City Council last week by Councilman W. A. Gardner. One provides for the reduction of license taxes on automobiles, as follows: Pleasure cars, $5; for business or trade, $10; motorcycles, $3. The second bill makes it a misdemeanor to operate an automobile at night without a light, punishable by a fine of from $25 to $500. The third bill provides for the licensing of chauffeurs.

A. C. A. to Enlarge its Limit.

A special meeting of the Automobile Club of America has been called for December 15 to consider raising the membership limit from 700 to 1,000. There are now over 100 names on the waiting list.

New York Make New Nominations.

The following ticket has been posted to be voted upon at the annual meeting of the New York Motor Club, which will be held on Thursday night, 14th inst.: For president, W. J. P. Moore; for vice-president, H. M. Swetland; for second vice-president, R. H. Johnston; for secretary, A. B. Tucker; for treasurer, Frank J. Griffin. For directors—W. J. Morgan, M. L. Downs, Robert W. Haff and R. G. Howell.

Clarke Heads the Monmouths.

At the annual meeting of the Monmouth Automobile Club, of Asbury Park, N. J., the following officers were elected: President, W. G. N. Clarke; vice-president, J. P. Hickman; secretary-treasurer, George Pittenger. The treasury is in a healthy condition.

KELSEY THE "WHOLE THING"

Visits Baltimore and Wins Everything in Sight —Good Going on a Treacherous Track.

C. W. Kelsey, of Tarrytown, N. Y., who has been driving the Maxwell cars with fair success in stock car events this season, was the particular attraction at the Electric Park automobile and motor bicycle race meet at Baltimore, Md., Thanksgiving Day, 30th ult. Kelsey won every event in which he was entered.

Over two thousand persons braved the raw northwest wind and vigorously applauded the contestants, more to keep warm than to vent their enthusiasm. The track was too muddy for speed, and this condition kept several big cars—"Big Liz" in particular—out of the contests. In a workout in the morning Robert Atkinson, 30-horsepower Pope-Toledo, skidded on one of the greasy turns and hit a telegraph pole. Neither he nor his mechanician was hurt, but the car was discommissioned.

Five cars started in the two-mile selling handicap. W. C. Hood, driving a 16-horsepower Rambler, had a handicap of 10 seconds, and led the procession for half a mile, when S. M. Smith, who was imported from Philadelphia to drive a Reo, with two and one-half seconds handicap, overhauled him. It was not until the bell lap that Kelsey swung into the lead, and then Smith gave him a hard chase to the tape, the former winning out by only a few feet. In a five-mile match between Hood's Rambler and Smith's Reo the latter made a runaway affair of it.

Kelsey won in a walk the two-mile horsepower handicap, and also in the five-mile open. The latter event would have been interesting had not Smith's car run out of gasolene.

Ray "Chic" Thomas, astride a 1¾-horsepower Indian, treated the crowd to a few thrills when he defeated Herbert Weber in the motorcycle pursuit race. Several times Thomas nearly skidded on the turns, but managed to keep his machine on the track and lapped his opponent at four and one-half miles. "Champion" Callahan was to have started, but his foreign motor refused to mote. Summaries:

Two-mile selling handicap—C. W. Kelsey, Maxwell, first; S. M. Smith, Reo, second; W. C. Hood, Rambler, third. Time, 4:16 2-5. Also ran—George Davidson and Charles Vincent.

Two-mile horsepower handicap—C. W. Kelsey, Maxwell, first; S. M. Smith, Reo, second; George Davidson, third. Time, 4:02.

Five-mile handicap—Walkover for C. W. Kelsey. Distance, four miles. Time, 7:30.

Five-mile touring car match—S. M. Smith, Reo, first; W. C. Hood, Rambler, second Time, 10:50.

Unlimited pursuit, motorcycle — Ray Thomas, first; Herbert Weber, second. Distance, four and a half miles. Time, 8:30.

Want Motorists to Pay Heavier Tax.

That highly enlightened body, the West End Improvement Association, of Newark, N. J., is going to tinker with New Jersey's automobile law, judging from the stand taken by the organization at a meeting last week, when it appointed a committee to draft and present to the coming legislature the amendments it thinks necessary.

The matter was brought up by Alfred Kaas, who declared that automobilists were not taxed enough, inasmuch as their machines endangered the lives of other persons using the roadways. They created dust, he said, which menaced the health of the public. He favored increasing the tax and having it collected and distributed by the State authorities. This money, Mr. Kaas thinks, could be used by the different municipalities in making good roads and keeping them in shape so that in the end, according to his views the automobilists would reap as much benefit as the cities and towns. The organization will seek the co-operation of other associations to assist it in agitating such a law.

New Havenites Ascend Mount Carmel

Somebody held a hill climbing contest up the side of Mount Carmel, near New Haven, Conn., Thanksgiving afternoon, but the affair was not a glowing success. It was the first attempt at this kind of sport, and there was no classifications, anybody and everybody being allowed to compete. There were only ten starters, however. A Mr. Potter, driving Mrs. G. P. Barners 40 horsepower Locomobile, won the loving cup, making the ascent of three-quarter mile slope in 3:17 2-5. W. F. Moran driving a 20 horsepower Stevens-Duryea, finished second in 4:01 3-5, and N. B. Whitfield, in a 10 horsepower Ford, was third. The latter made the ascent in 4:15½.

Woman, not Animal, Afraid.

Here is the latest tale of the skittish horse and the car that hails from the wilds of Iowa. The automobilist met an elderly couple driving a skittish horse attached to a buggy, and the animal exhibited a decided aversion to passing the unknown monster. The driver of the car stopped and dismounted to offer his aid in the solution of the difficulty, which was declined. "If you will please lead my wife by I think the mare and I can make it all right," was the old-man's comment.

"Thank You" Signs for Farmers.

An Appleton (Wis.) automobilist has introduced a new method of showing appreciation to the man who turns his team partly out of the road to make room for an automobile to pass. He carries a large sign with him, on which are printed in bold type the words, "Thank you." When he passes a friendly farmer he hoists the sign. The scheme is said to have pleased the farmers so mightily that several other Wisconsin automobilists are ordering the "Thank you" placards.

UP BOX SPRINGS CANYON

Californians Engage in a Four Mile Hill Climbing Contest—Timers Forgot to Tally.

With mufflers cut out and all but one stripped for the occasion, twelve light touring cars and runabouts raced up Box Springs Canyon, near Riverside, Cal., on Thanksgiving Day afternoon, 30th ult., in the initial attempt to locally popularize hill climbing. Only a few hundred persons viewed the contest, but this number was more than was expected, as in Los Angeles, close by, a new track was being opened and a football game was in progress, besides matinees in fourteen theatres.

Nearly four miles in length, made up of a splendid oiled road, upon which several thousand dollars was expended a few years ago, having only a few gradual turns and averaging an 8 per cent grade, a better course for a hill-climbing contest could not have been found than Box Springs Canyon. The start and finish was on the level, the distance between being exactly three and four-fifth miles. Communication between the points was held by telephone.

At 2:49:30 by the clock, W. K. Cowan, in a 20-horsepower Rambler, was waved off. Seven minutes later the green car flashed over the tape four miles distant. Cowan had a narrow escape when he struck the railroad track beyond the finish line. The jolt caused the driver to start heavenward, but he pluckily held onto the steering wheel until the car came to a standstill.

Next came a two-cylinder Tourist, with W. I. Moreland at the wheel. Eight minutes and fifteen seconds totalled its time on the road. Clarence Smith, in the Maxwell, third to start, attracted considerable interest, owing to the newness of the car on the coast. Eight minutes and two-fifths seconds was the best the combination could do, and then came Ted Crossley in the Wayne. His time was 8:25 3-5.

The only unpleasant feature of the day occurren when G. E. Bradbeer, in the air-cooled Premier, was sent up the incline. Bradbeer drove beautifully, and the hitch was when the timers gave out 6:43 4-5 as his performance. One man had this time—the others had forgotten to tally the minutes. However, Bradbeer's time will stand until it is proven otherwise. The only fully equipped touring car in the race was the Reliance, driven by J. Burt, so with this handicap it was not a disgrace to score the slowest time.

The performance of the cars that finished follows:

G. E. Bradbeer, 16 h. p. Premier	*6:43 3-5
W. K. Cowan, 20 h. p. Rambler	7:01
Honus M. Hanshue, 16 h. p. Reo	7:08
Ralph Hemlin, 12 h. p. Franklin	7:30 2-5
Fred Dufty, 16 h. p. Reo	8:01 2-5
Clarence Smith, 16 h. p. Maxwell	8:02 2-5
W. I. Moreland, 16 h. p. Tourist	8:15
Dr. Ferguson, 20 h. p. Moline	8:17
Theodore Crossley, 16 h. p. Wayne	8:25 3-5
J. Burt, 16 h. p. Reliance**	8:28 2-5

*Time questioned.
**With full touring equipment.

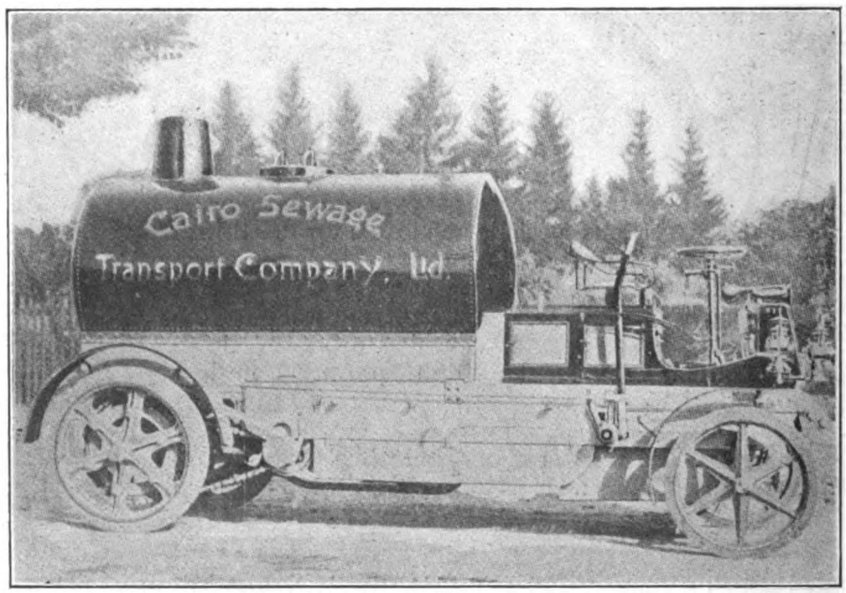
MOTORS IN UNUSUAL VEHICLES

How the Utilitarian Field is Being Cultivated—"Freaks" that Serve Good Purposes.

In any creative industry there are always to be found here and there specimens of the craft which are so out of the common run as to come under the harsh and unfeeling classification of freaks. There are, in the first place, the freaks which are produced in the regular line of the work, in the development of the stock forms which are in everyday use. They are the outre types which are cast out after they have proven their faults, and have been superceded by other and more worthy forms. Then, there are other freaks, which abide by no classification whatever, but have been made to fulfil a special need. With either class, the curious or unusual type of to-day, which is given that classification by the public—possibly, even by its makers—may to-morrow become exaulted to the position of first choice through its self-proven excellence, or it may be forgotten through its insufficiency. Thus, always, the freak of any type, is interesting, as a curiosity, because of its unusualness, and because it may be the prototype of a great line of models to come later on.

In the automobile industry which is distributing a widely divergent product over a rapidly increasing territory which embraces every land, and is bounded by every sea, the freak element of the first class is rapidly disappearing. For the design of the automobile has come to rest upon a thing of growing stability, which is called common practice, and the radical type of machine may well be said to be a thing of the past. On the other hand, the freaks of the second class, are growing in number—a thing which is as much to the credit of the industry as is the decline of the other class, for it is only in this way that newer types are to be founded and the broadening of the work go on.

This is particularly noticeable in the work of the builders of heavy commercial vehicles who are constantly being opportuned for motors to meet some new and unheard of demand. Thus, automobiles for peace and war are being produced side by side at the same factory, designed by the same men; machines for haulage of all sorts of materials; and machines for other uses as well, such as requisition the use of a portable power plant. A very good example of the breadth of the work in this special or freak line is given by the two illustrations here shown, both the recent product of the British industry, one of which is a gasolene road roller and the other a sewage wagon designed for use in Egypt.



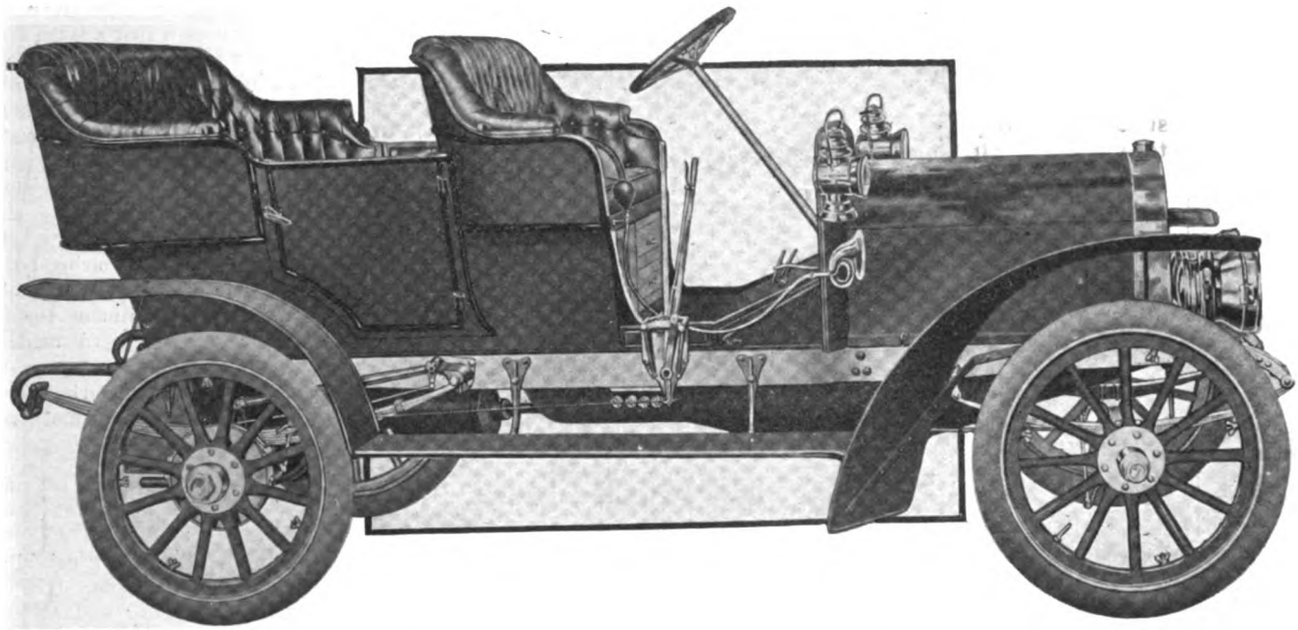
GASOLENE ROAD ROLLER.

The road roller which is particularly adaptable to light work, such as grading and lawn rolling, where the ordinary steam roller is far too clumsy and heavy for use, and where the common light horse rollers cannot be applied, consists of a heavy angle iron frame bearing upon a pair of solid rollers, the forward one of which is swivled to allow it to be used in steering. Between the two is mounted the motor transversely of the machine, set up and equipped as in an ordinary motor car. The transmissions of the power to the driving roll is made through a change gear mechanism and "side chain" drive.

The other vehicle—the garbage wagon—which, though possibly a trifle more ornamental and likely capable of making several more miles an hour than the roller, is intended for a less savory, though none the less important duty. As will be seen from the illustration the arrangement of the machine is not unlike that of the ordinary types of motor truck, the motor being housed in front under the driver's seat with the change speed mechanism directly behind it, and transmitting its power in the usual way by means of side chains to the rear wheels. A heavy iron tank is mounted upon its platform, which is fitted with special devices for filling and sealing up the openings during transit.

Aside from showing something of the possibilities of the automobile in unusual lines and proving its versitality, these freak missionaries are doing a vast deal of real profitable advertising for their makers in all sorts of odd and our-of-the-way corners of the earth, the sewerage wagon, for instance, being designed for use in Cairo, Egypt.

GASOLENE GARBAGE WAGON.



"This is not a bargain day in this court" was the response of a Chicago magistrate to the offer of an attorney to pay his client's fine if the latter were reduced from $15 to $10.

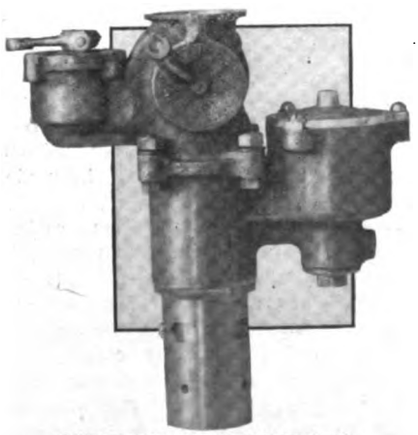
CONCERNING COLUMBIAS

One New Model Appears and Older Ones Contain Some Ingenious "Touching Up."



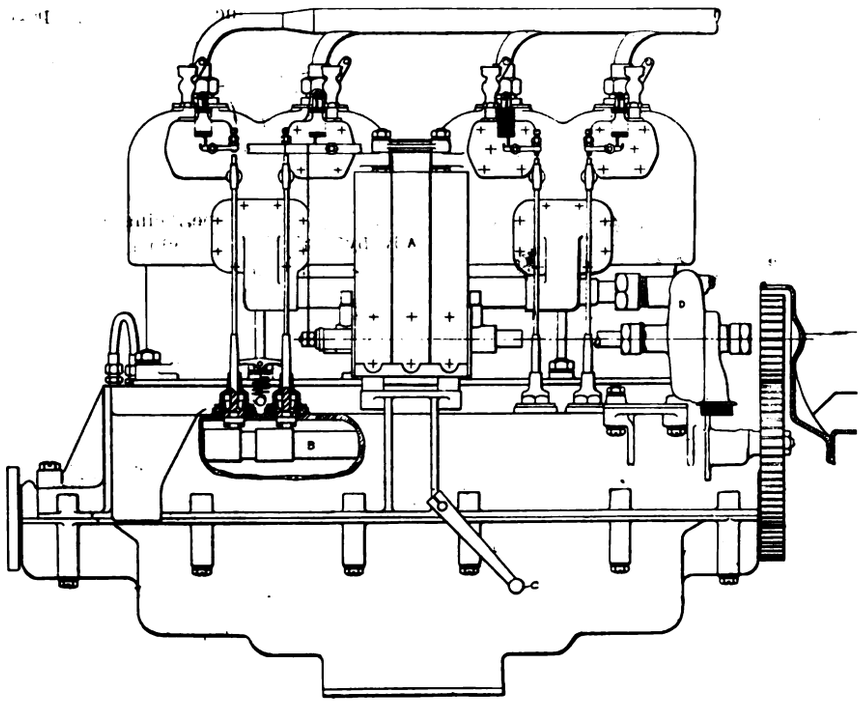
With the official title of Mark XLVI, there will be added to the Columbia line of gasolene cars for 1906 a medium powered vehicle which is in many respects a replica of the head of the list, Mark LXVII, more familiarly known as the "big car" and which is rated at 40-45 horsepower. The newcomer is likewise along practically the same lines as its heavier confrere, a fact that will be noticeable from the accompanying view of its exterior. It is, in brief, a car for the man who wants his purchase to represent the last word in the matter of advanced construction and refinements, but who is content with a moderate amount of power. Its rating is 24-28 horsepower, although this is said to be a conservative figure that has been considerably exceeded in practice.

COLUMBIA, MARK XLVI, 24-28 HORSEPOWER.

The engine is of the familiar four cylinder vertical type, the cylinders being cast in pairs with heads integral. The middle and lower sections of the motor are of aluminum, the weight being borne by a three point suspension attached to the mid section. Both sets of valves are located on the same side, one intake supplying each pair of cylinders. The valves are mechanically actuated, a novel convenience for their ready removal being provided in the shape of a lug cast on the cylinders and which admits of the insertion of a forked tool for compressing the spring. A gear driven paddle-wheel pump supplies water circulation, the arrangement being so designed as to maintain a uniform pressure in all cylinders. Lubrication is supplied by a continuous oil circulation, kept in movement by a rotary gear pump driven from the valve cam shaft. This pump has a capacity of fifteen pounds pressure, and forces the oil from a reservoir cast in the lower section of the crank case, through a conduit cast in the middle section, with leads to the main crank and cam shaft bearings and valve push rod guides. Dams around the overflow pipes maintain a constant level, and when the oil exceeds this it falls to the reservoir below, in the course of which it passes through strainers. Scoops splash the connecting rod bearings, the rods themselves working in a diaphragm, which serves to prevent an excess of oil in the cylinders, with a consequent fouling of the make and break hammer and anvil. An auxiliary oil tank piped to the reservoir is attached to the frame of the car and provides a supply sufficient for four hundred miles' running. Owing to the positive action of both the lubricating and ignition devices it is possible to speed the engine up as high as 2,200 r. p. m., so that the car may be geared low for hill climbing on the top speed without impairing its speed on the level.

In both the carburetter and ignition system the car makes radical departures from previous Columbia standards, these features being of particular interest. The former is of the float feed aspirating type, and is claimed to be the only automatic carburetter not embodying springs in its construction. Moreover, there is no needle, and, what is more peculiar, no place for adjustment, as none is necessary. The fuel enters the mixing chamber at the jet and meets the primary air supply. This primary intake is a one-inch hole pointing between the pairs of cylinders. Ordinarily this admits air at normal temperature, but is adapted to be lengthened by a pipe fitting connecting it with the exhaust for cold weather. In place of the customary spring actuated suction device for supplying auxiliary air, a series of small ports opened and closed by a barrel containing corresponding openings is substituted. This barrel is accurately made of the required size and weight to offer the proper amount of resistance to the engine suction as the speed increases. It thus rises slowly, opening the ports, and drops back easily of its own weight against the air cushion formed in the bottom of the containing chamber, as the speed and the demand for air decrease.

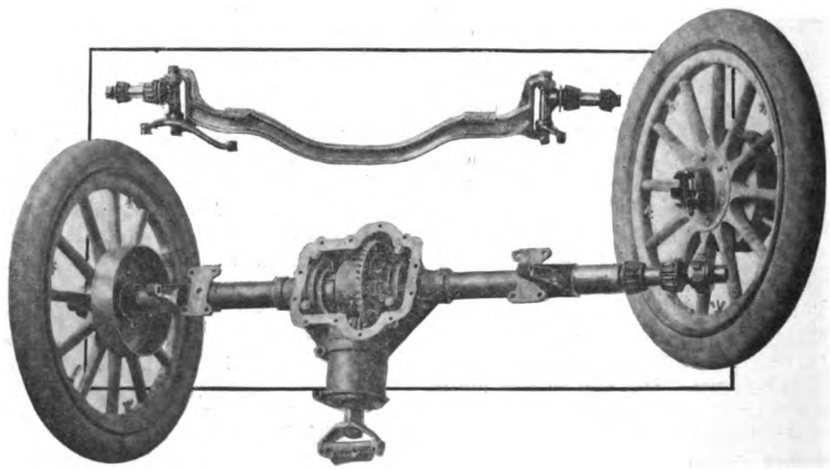
COLUMBIA CARBURETTER.



The throttle is also of the barrel type, set horizontally in the mixing chamber at the point where the gas intake pipe leaves the carburetter; it is actuated by a foot lever, and its function is confined to throttling the amount of mixture, there being no connection with the governor. The latter controls a by-pass valve, which is mechanically raised or lowered as the governor balls move in or out. An advantage of 25 to 40 per cent in fuel economy is claimed for this type, which with its lack of small parts and consequent absence of necessity for adjustment makes it a particularly desirable form. As fitted to both the medium and high powered cars, its external ensemble is pictured in the accompanying photograph.

A low tension Remy magneto supplies the source of current for the ignition system,

Digitized by Google



which, as already mentioned, is of the make and break type, actuated by roller cams. The details of this construction as well as of those of the engine generally are shown in the accompanying part sectional view from the ignition side.

The transmission is of the sliding gear type, giving three speeds and reverse, and in both this and the large car is the same as used in the latter during the last season, though various detailed changes have been made. Greater bearing surface has been provided for both the square and counter shafts, while a universal joint as well as a yoke take up any strains that may be transmitted from the clutch to the gear box. For all parts of this essential of the car, such as the gears, shafts and wheel pivots, a special chrome nickel steel is employed. It has an elastic limit of 135,000 pounds to the square inch and a tensile strength or breaking limit of 225 000 pounds. The sliding gears are also upheld by a three point suspension, the change gear lever working in a gridiron of selective spaces. It engages two short levers, right or left and forward or back, to secure the changes, with a spring ball and socket indexing device. The propeller shaft is of the telescoping pattern, bevel geared to the usual form of square live axle incased in a tube which extends through the hubs of the wheels. The wheels run upon roller bearings on this tube, and the square live axle carries at its outer end a square cap with dogs meshing with corresponding projections on the outside of the hubs of the driving wheels, combining to make a very effective form of drive. The entire construction of this car may be said to be upon the independent unit plan, cardan joints being interposed at each step or connection. Thus the motor is one, transmission another, telescoping shaft a third and the rear axle the final step, the use of universal joints between each allowing sufficient movement for torsional stress in any direction to prevent possible derangement of alignment. Brakes are of generous dimensions and powerful, operating with rods and rocker shaft except in the case of the emergency, in which a galvanized steel wire cable is used. Control is centred on a fixed sector, which is accordingly always in the same relative position to the driver's hand regardless of the angle of the wheel.

COLUMBIA ENGINE SHOWING MAKE AND BREAK IGNITION SYSTEM.

Practically the same description may be applied to the Mark LXVII, or "big car," which is in its essentials the same as the 1905 model. The use of the crank shaft cut from the solid block and turned true in a lathe, instead of the drop forging previously employed, and the substitution of a Lacoste distributor, as well as the type of carburetter already referred to in detail, summarize the only changes in the motive power. The features of the transmission dwelt upon in connection with the smaller car apply to the same item here, and constitute improvements made over previous practice. Roller bearings have been fitted to all wheels, and the rear axle construction has been redesigned to give rope and tire chain clearance. This as well as the front axle, which is a one-piece solid drop forging, are pictured in the accompanying illustration. The latter is the same on both cars.

COLUMBIA'S NEW FORM OF REAR WHEEL DRIVE.

The Columbia 18 horsepower two cylinder horizontal opposed car met with such success during the last season that a large number of the same class will be built for the coming season's business, practically without change. The frame has been lengthened 8 inches and the wheel base extended a corresponding distance, giving a roomier and more comfortable body. This also makes the car easier riding and provides a seating capacity of five without crowding.

Two distinct types of touring bodies will be made for the heavier car, one fashioned on the lines made popular during the last season and the other with accommodation for five persons in the side entrance tonneau. The royal and double victoria, as well as the brougham, limousine and landaulet bodies will also be continued.

Speaking of the 458 types of automobile which have been on exhibition at the Olympia show, a critic says:

"One of the most touching exhibits of the show was the motor hansom. It was just a hansom, with a radiator and an engine in the place that the horse used to fill, with all the old, delightful and honored inconveniences of entry and exit, with its driver perched at the back—a steering wheel in his hand instead of the reins—with (apparently) the same dear familiar privileges of falling through the front glass and gathering mud from the wheels. The new motor hansom could not copy the old one so closely, but it has a familiar and homely look, albeit it runs on four wheels instead of two—that will be the most persuasive and alluring inducement to the people of conservative order."

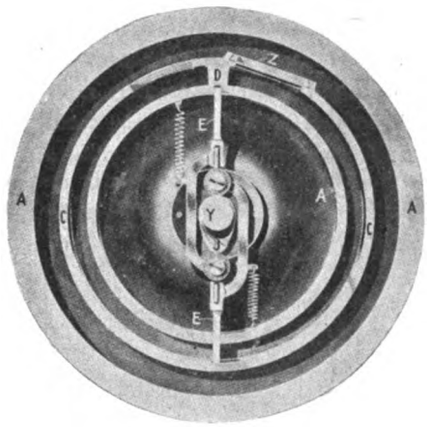
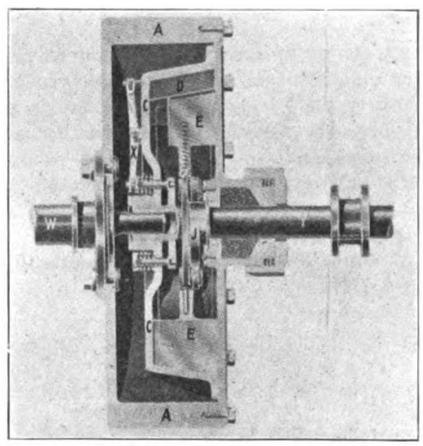
ABOUT HYDRAULIC CLUTCHES



Purposes Which They Serve and How They Operate—Two Types From Abroad.

In an effort to secure a method of connecting the engine and driving gear of the motor car in a manner which shall permit of a due amount of flexibility at starting, and shall at the same time be perfectly rigid when the machine is in motion, numerous principles have been applied which range from the popular type of leather faced cone clutch, through the whole gamut of mechanical contrivances, to the application of the electro magnet. Of an entirely novel principle, the hydraulic clutch has this year come to take a place which, judging from its appearance at the British show, where a type is actually mounted on a stock machine, and from the returns of the patent offices here, and in other countries, is destined to become one of more than passing importance.



The entire advantage of the hydraulic principle as applied to the construction of driving clutches rests in the fact that by its use an unlimited amount of slipping between the two elements of the mechanism may be permitted without the generation of an undue amount of heat or friction, with consequent wear of the parts, and that in a measure which is wholly at the option of the driver. Essentially, the hydraulic clutch when disengaged, or permitting the engine to run free of the driving gear, is nothing more nor less than a pump which is forcing the liquid contents of the device from one chamber into another and so back to the starting point, the only resistance being that of the friction of the ports and of the fluid in its passage. When it is desired to start the car, the flow of the liquid is restricted by throttling until one of the elements which serves the purpose of a pump, being attached to the driving member of the clutch, and the other containing the passages through which the fluid is being forced, being integral with the driven member, the resistance to the flow becomes sufficient to unite the two and start the machine.

At this point a balance is struck between the forces which constitute the car's resistance to motion and those of friction within the clutch, the work of the motor being partially absorbed in heating the liquid and partly in driving the car. Should the resistance to the car's motion become increased at this point through the striking of an obstruction in the road, for instance, the shock will be absorbed by the clutch, the fluid being forced through its passages with greater velocity than before, but without other result than the generation of an increased amount of heat. By reducing the area of the passages or ports through which the liquid is being forced, the tendency to drive the machine is proportionally increased, until a point is reached where the liquid is no longer permitted to flow at all, and the drive becomes fixed, the only possible slippage between the two parts being due to leakage in the driving member.

In the Sparks-Boothby clutch, which already has been described in these columns in complete detail, the entire mechanism is inclosed within the flywheel, which is filled with oil. The flywheel, A, is bolted to the motor crank shaft in the usual manner, and the opening in the cover plate through which

the driving shaft, Y, passes, is packed to prevent leakage of the oil. A concave annular member, C, is fast upon the driving shaft, but free to move longitudinally upon it at the option of the driver, its normal position being such that it forms a tight joint with the face of the cover plate of the flywheel.

Thus the interior of the flywheel is divided into two compartments, which are connected through two openings or ports. Wthin this is a pair of vanes, E, which are slidably mounted in the driving member and are controlled by two yokes which are actuated by a cam upon the driven member of the mechanism. A stationary web or vane, D, is located within the annulus, C, at a point midway between the two ports, one of which is always open, while the other is controlled by a valve, Z, actuated by the operator through the medium of the link, X.

The action of the vanes, E, is that of the blades in a rotary pump. When the engine is running free they force the oil around the casing out of the port, Z, and in again at the corresponding opening on the other side of the vane, D, the purpose of the cam movement being to lift them at the proper time to prevent them from striking against it. When it is desired to start the car the valve, Z, is partially closed by the action of a foot pedal, thereby restricting the flow of the oil and creating a resistance which presently becomes sufficiently great to cause a movement of the annulus, C, and the driven shaft. As the valve, Z, is closed more completely the resistance increases proportionately, until at the point of full closure the oil which is confined within the space included by the walls of the annulus, one of the vanes, E, and the vane, D, becomes simply a rigid connection between the two members of the clutch.

In manipulation the clutch is not unlike the commoner type, being controlled entirely by a foot pedal, which in its normal position holds the valve, Z, in the position of full closure. Depressing the pedal opens this, until at the point of full opening the annular casing, C, is drawn away from its contact with the cover plate, A, and there is absolutely no resistance to the free running of the motor.

Another clutch which acts upon the same general principle, consists of a series of three cylinders radially mounted about the driving shaft within the flywheel, each of which is fitted with a piston actuated by an eccentric mounted on the driven shaft. Thus, when the engine is running free from the car the pistons are in motion, being driven by the stationary driven, or clutch, shaft, about which the cylinders whirl. The cylinders are filled with oil, and this is allowed to circulate between the two ends through a by-pass, the opening of which is controlled by a series of valves which are under the control of the operator. When the engine is to be connected with the mechanism of the car, these valves are closed until the resistance of the by-passes becomes sufficient to start the machine. This is gradually increased at the will of the driver until the point of full closure when, the circulation being entirely checked, the parts revolve in unison.

It is evident that by either of the means described, it is possible to secure any desired amount of slippage while engaging the clutch, and that without bringing into requisition that most uncertain and variable quantity, friction. The point about which hinges the smoothness of action of all the more common forms of clutch, and upon which their success depends is that of securing a uniform coefficient of friction under all conditions of climate and treatment, and of controlling that friction at the will of the operator. This is wellnigh impossible, inasmuch as the coefficient of friction between two metals or between a metal and some other substance such as leather or wood, is extremely variable, not only in corresponding parts which undergo different treatment, but as well in the same part at different times and under different circumstances. Hence, not only does the ordinary friction clutch require careful handling under all cir-

Digitized by Google

cumstances, but it must have a proper amount of attention in order to secure from it its proper degree of efficiency.

In the hydraulic clutch, on the other hand, all variable conditions are done away with, and the action of the mechanism, whether under load or disengaged, is as certain as that of a pump, and, like it, is subject to the same causes of derangement or failure. With simple mechanism, however, and with well made parts, there should be little tendency to derangement or to slipping when in engagement, the only two apparent causes of disorder, while there should be no possibility of the organ breaking in such a way as to cause it to fail to release, as is sometimes the case with the friction clutch.

Liberality that Moved the Stage Line!

In solemn conclave, the directors of a motor stage company located not one hundred miles from New York, recently voted to devote a sum of money to a practical demonstration of the merits of a certain type of automobile which was said to be especially fitted for the work in hand. It was announced that the former demonstration fee of $100 had been rebated in this particular case to $25 by the liberality of the company handling the chosen motors, and that even that small sum would be deducted from the purchase moneys. The liberal company in question is one doing a so-called storage business, whose richly colored methods are not unknown to the reading public, and the cars referred to were made on the shores of the Hudson, not far from New York City, several years ago by a company whose name has ceased to be a byword. Accordingly, it is safe to prophecy that at least one stage line is due to obtain a large chunk of experience, and little else.

Marvelous Growth of Bus Service.

Some idea of the growth and present importance of the business of the London Motor Omnibus Co. may be gained from the statement which has recently been given out that between March of the present year and November the vehicles in use have travlled 480,473 mils in the aggregate, and have carried 4,680,345 passengers all told. The daily route of each vehicle amounts to about 130 miles, and the cost, including depreciation and all other factors, amounts to 19 cents a mile or thereabouts, which amounts to something like one and nine-tenths cents per passenger mile for the season. At the outset three 'busses were put into servic; now forty-six are in constant use.

Miller Gets an Anti-Freeze Compound.

Miller's Anti-Freeze Compound is the most recent addition to the wares of Charles E. Miller, New York. It is the result of considerable experiment by a chemist, a relative of Mr. Miller, and as the latter tried it on himself—that is, on his car—he is recommending it with the enthusiasm born of experience. Of course, the constituents of the compound are kept secret, but it is sold in 10-pound cans, enough for a winter's use, and is proof against temperatures of 30 degrees below zero.

JONES'S INGENUITY

It Evolves Some Strikingly Practical Improvements in his Speedometer-Odometer.

Probably the feature which will most strongly appeal to the user of the 1906 type of Jones Speedometer-Odometer, which has just made its appearance, is the arrangement whereby it is made to record the total distance traversed irrespective of the direction of motion. Thus a machine which, in the course of a day, covers fifty miles of actual distance on the road, and incidentally is driven backward for half a mile, all told, is recorded as having made fifty and one-half miles, instead of forty-nine and one-

half miles. The particular advantage of this arrangement, which may not be apparent at the outset, is, first of all, that the entire mileage adds up, and second, that the ambitious chauffeur who would spend all of his idle moments along side the car with the off fore wheel jacked up, industriously turning back the record of his clandestine use of the machine, now will labor not simply in vain, but very much to his personal disadvantage.

In principle and general construction, the new Jones instrument is not essentially dif-

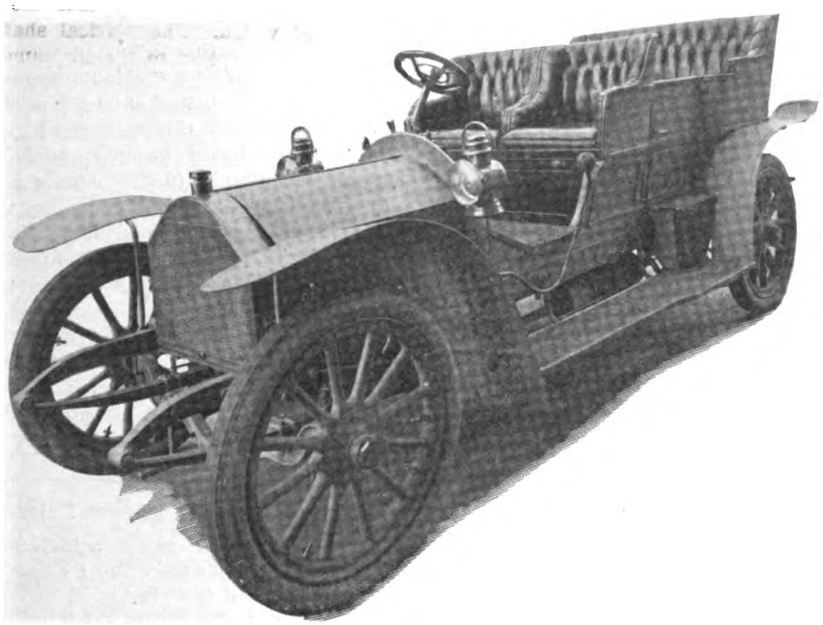
ferent from previous models. Several minor improvements have been made, however, which make for a more uniform performance under all circumstances, and enhance its value to the user on that account. The addition of a trip mileage dial, such as has been used on the Jones odometer is an innovation on the new speedometer-odometer. In this regard a noteworthy point is that the setback mechanism, instead of being actuated by a thumb screw and a motion analogous to that of winding a clock, is now instantly operated by a push button, which resets the indicator at zero, as in a stop watch. The push button is conveniety located at the side of the instrument, and is easily accessible.

The season's milage is recorded up to 10,000 miles, and the trip mileage up to 100 miles, while on both dials fractional miles are indicated in red figures—another innovation. The figures, both black and red, are perfectly legible at all times, owing to the special mounting which has been introduced this year, so that all indications can be read at all times. The bracket upon which the instrument is mounted on the dash is triangular, and occupies but little space, the instrument itself being attached by a swivel contrivance, so that it may be turned in any desired direction to come into the driver's range of vision. The vertical shaft which conveys the motion to the instrument from the wheel, is also provided with a swivel, so that it may be led up to the dash from any point, and to either side, thus permitting the passage of the flexible shaft under the bonnet and up through the floor, or in any other way that suits the fancy of the driver.

The mounting is, of course, perfectly dust and water proof, and the casing is handsomely polished, while all parts are self-lubricating, and so substantially made that they are but little likely to become deranged under even the most severe usage.

New Type of Accumulator.

More attention has been accorded the accumulator as a source of ignition on the other side than in this country, which probably accounts for the great number of cells intended specially for automobile use that are to be found on that market. One of rather odd construction that made its debut at the recent Olympia Show is given the somewhat misleading title of "Solid," owing to the very novel form of the electrodes. The latter are made of alternate layers of pellets composed of oxides of lead and of spongy lead.



Although extremely hard, the pellets are said to be very porous. This, together with the great permeability of the spongy lead, is claimed to give cells of this construction an unusually large current capacity as well as high conductivity. The separation of the positive and negative elements is accomplished by the use of containing jars of porous earthenware made very strong for this purpose. They are further made from special material which, while highly porous and freely allowing the passage of the acid, is proof against penetration by the lead oxides. The terminals are fitted with grease boxes to prevent corrosion due to creeping of the electrlyte and are insulated in a manner that is claimed to be a positive preventive of accidental short circuiting. The claims made for the new cell are many, among them that of there being no plates to buckle and no possibility of paste falling, as well as no deposit due to disintegration, constituting self-evident advantages.

CAR WITH THE QUEER NAME

Product of an American's Factory near Paris—Some of its Characteristics.

An addition to the list of imported cars offered for the delectation of the American buyer who is willing to invest $5,000 or more has recently arrived from the other side. Although of French origin, it has been given an American title, which, however, has a strangely foreign sound and appearance. It is termed the Viqueot, which is an abbreviated adaptation of the name of its sponsors, the Vehicle Equipment Co., of Long Island City, who have recently established a metropolitan sales-

THE 1906 VIQUEOT.

room on Forty-eighth street, just off Broadway, under the title of the Viqueot Co. This is in charge of L. S. Caswell, who was for a number of years connected with the sales department of the Electric Vehicle Co. in Hartford. In addition to the importation of the Viqueot car, the branch will handle the electric vehicles of the parent company and do a general storage business. It is comfortably housed in the three story building erected especially for this purpose.

The new car is being manufactured in the Viqueot Company's plant at Puteaux, near Paris, controlled by H. H. Havemeyer, who is vice-president and treasurer of the Vehicle Equipment Co. The car is not a new one on the other side, although a 40-45 horsepower model constitutes an innovation made for the coming season's business. Both this and the 28-32 horsepower models are now on the American market. As the cars are replicas of one another, barring the difference in size, one description will suffice for both.

The motor is of a type that embodies all those features which have come to be regarded as the highest form of current practice on the other side—that is, independently cast cylinders, of which there are four, arranged in the customary manner; oppositely disposed interchangeable valves, mechanically actuated from separate cam shafts. These are driven from a noiseless fibre pinion meshing directly with the cam gears at the forward end of the motor, the whole being semi-inclosed by an aluminum housing supported by studs extending from the crank casing. The cam shafts and cams are located in separate chambers at the side of the crank case, and the covers of the former are removable to permit of inspection. These upper halves, or covers, of the cam shaft chambers carry push rod guides, the latter being actuated by cam rollers. No sub-frame is employed, the upper half of the crank case being cast with heavy arms of II section, the ends of which lie in the channels of the main frame. The frame of the lighter car is of wood strengthened by trusses, with a third truss under the transmission, this being a rather unusual form of construction, although it has been used on other foreign cars. On the heavier car the frame is of pressed steel, the usual form of semi-elliptic suspension being employed in both instances.

The carburetter is of the usual float feed type, and is provided with a water jacket connected to the cylinder jacket circulation, but which may be controlled by means of a valve. It embodies the annular form of float that has already been adopted in more than one instance in this country and which is looked upon with much favor here. The throttle, which is located in a brass inlet pipe between the carburetter and the horizontal aluminum manifold, is of the sliding type. It is interconnected with the governor in such a manner that the action of the governor may be reduced to any extent desired by manipulating the throttle lever on the steering wheel.

High tension jump spark ignition is employed in both cars, with an Eiseman magneto as the principal standby. An entirely independent system supplied by accumulators is installed as a reserve and for starting from the seat. The distributor for the latter system is located on a vertical shaft driven from the after end of the inlet cam shaft. It is of the usual construction, and is inclosed with a plate glass cover so that its operation is visible without disturbing it. Generally accepted standards have been followed throughout in the designing of the cooling system. Features of interest, however, are to be noted in the clutch shaft, which is hollow and incases its tension spring, and in the lubricating system, which is a novelty. A reservoir attached to the motor side of the dashboard contains the supply, from which it feeds by gravity through five copper tubes to as many different points of the mechanism—three to the crank shaft and two to the cam shaft bearings, the crank pin bearings being oiled from the feed to the main bearings. From the bottom of the crank chamber the oil is elevated to the reservoir again through the medium of a small plunger pump driven from an eccentric on the exhaust cam shaft. Should gravity not prove sufficient to feed the oil fast enough the pump develops a pressure in the reservoir and facilitates its feeding.

A sliding pinion type of change speed gear controlled by a single lever supplies this essential in the transmission of the power, and is not characterized by any features differing from current practice covering this point, except in the employment of ball bearings on the change gear and countershafts. The change speed gears and differentials, as well as the bevel driving gears, are housed in the same aluminum case, resting on a three point suspension. The final step in the transmission is by means of side chains. Equalized internal expanding brakes, which are completely incased on both hubs, are provided, a novel departure in this connection being the fact that the disk shaped brake carriers are made integral with the chain tension rods. These brakes are controlled by the usual hand lever, and constitute the emergency stop, the pedal brake of the band type being located on the differential and is interconnected with the clutch, as is also the emergency brake, so that the application of either releases the clutch. The heavier car has a wheel base of 112 inches, and is fitted with 34-inch artillery wheels and Michelin tires. The price of the latter is $8,000 and of its lighter replica $5,000.

Extent of Export Trade.

During the year 1904 Great Britain imported automobiles to the value of $10,402,200, while the exports from that country amounted only to $2,000,000. On the other hand, France exported automobiles to the value of $14,260,000 and imported automobiles only to the amount of $727,000. The exports of German automobiles amounted to $3,134,000, as compared with $1,843,000 of imports. The exports of automobiles from the United States during the same period amounted to $1,997,000 and the imports to $1,446,000.

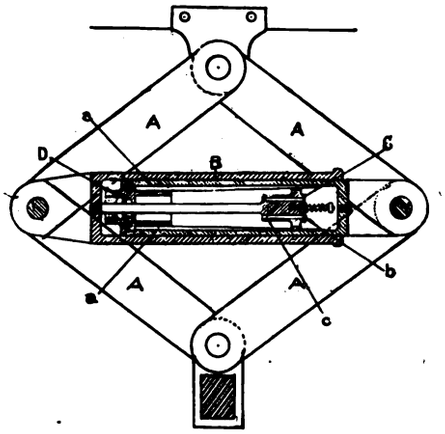
TO TEST ENGINE EFFICIENCY

Instrument that Renders this Possible in Respect to Fine Points Usually Lightly Considered.

For the most part, the constructor of the gasolene engine of the present day, is more intent upon securing uniformity of action and general proficiency in operation, than in studying the theoretical performance of the machine. So rapidly is the state of the art advancing, however, that a close study of the phenomena of the internal combustion motor is fast becoming a necessity in order to continue its advance. This, in turn, requires the production of new forms of machinery to cope with the high rotative speeds employed, and also, in some cases, to withstand the high degrees of heat which are to be encountered.

A new device for use in the observation of the speed variations of a motor, and hence, useful as a means of studying the questions of regulation and balance, has been produced within a short time by a firm of French instrument makers. Essentially, it consists of a pilot motor of fine regulation, which is connected with the shaft of the motor under test by means of a synchronising apparatus using the principle of the differential, and capable of showing by means of a pointer an accurate comparison between the relative speeds of the two.



The pilot motor, which is used as a standard of comparison, is in this case a spring driven machanism which is regulated to constant speed by accurate means. Driven by it are a pair of friction discs, which are mounted on a shaft and are in action with a friction roll, the point of contact of which may be shifted at the will of the observer toward or away from the centre of the driving members, thus varying its speed. The roller is in communication with one end of a differential mechanism, to the other terminal of which the motor under test is connected. An indicator is connected with the floating member of the differential, the movement of which over a graduated arc, denotes the difference in velocity of the two elements, and also the time and rate of any fluctuations which may take place.

Thus in use, the pilot motor being set in motion, the friction drive is set for the predetermined speed at which it is desired to run the engine to be tested, and the latter is then speeded until the pointer of the differential comes to rest or begins to vibrate regularly. Afterward, knowing the speed of the pilot gear, it is possible to calculate the velocity at which the test motor is running, and also to examine pretty closely into the nature and causes of the variations in speed which are observed in the test motor.

In its present form, the apparatus is so designed that an angular advance of 1-250 of the circle on the part of the test motor over the standard speed will be revealed by a movement of 0.12 inch on the dial, while it is possible to read down to 0.02 inch on the scale. Such an instrument should be of the greatest practical value in examining the evenness of the torque of a motor, in testing motors to show in a general way the effect of balancing the parts, with an eye to the reduction of vibration as well as in the efficiency of fly-wheel regulation, and also as a convenient and ready method of calibrating governors.

"Lazy Tongs" Idea Shock Absorber.

Now that the attention of the designer has been called to the problem of checking the oscilation of the springs of the automobile consequent on passing over an obstruction in the road, the user is apparently to have ample opportunity to select the type which is most to his liking out of a long

and constantly growing list of inventions. The latest of these, which is an English product, involves the use of no new principle, being of the dash-pot type, and though not as simple as some which have been produced, is not unduly complex and should prove trustworthy and not likely to get out of order.

As outlined in the accompanying sketch, the device consists essentially of a pair of "lazy tongs" between which is mounted a cylinder fitted with a hollow plunger, within which works a piston which is affixed to the base of the cylinder. As the affair is made to work by the motion of the chassis upon the running gear, the plunger and piston work back and forth, forcing the fluid with which the device is filled backward and forward through restricted openings in the latter, thus checking the oscilation.

In detail the device consists of four members, A, which are articulated together, one pair of the joints being fixed to the chassis and axles, respectively, by means of universal joints, and the other having the elements of the dashpot attached to them. The cylinder, B, has a piston, C, connected with its base by means of a rod passing through a stuffing box in the head of the plunger, D. The latter has a pair of tapered splines, a, fixed in its wall, which fit in slots cut in the head of the piston, C. The piston is also provided with a series of outlets which are closed normally by means of a check valve, b, which is held to its seat by a spring. A projection on the piston fits rather tightly into a socket in the head of the plunger, when the device is in the position of full stroke.

In action the bouncing of the chassis causes the parts to work, the passage of the fluid through the ports in the side of the piston being restricted by the tapered splines in accordance with the position of the piston, from full opening at the extreme position to entire closure at the point where the projection on the end of the piston enters the corresponding chamber in the head of the plunger. Thus, upon the outstroke, which occurs when the chassis is rising, the fluid is practically unrestricted up to the end of the stroke, when the projecting end of the piston entering the socket in the head of the plunger acts as a cushion stop to further motion. On the instroke, on the other hand, the check valve is closed by the pressure of the fluid and hence the only outlet for that which is contained in the plunger ahead of the piston is through the openings at the side, this gradually enlarging, allows the weight of the machine to settle down upon the springs in a perfectly natural manner, but without shock.

Thus the device permits a range of considerable freedom of downward movement to the body, it checks any upward tendency, and checks it in an amount which increases in proportion to the extent of that movement.

Motor Trucks in New Fields.

Among the more recent achievements of the sales department of the Packard Motor Co. are recorded the placing of two of their trucks in lines of work in which hitherto the value of motor traction has not been recognized. The first of these machines came to New York to be used in the business of Schwartzenbach, Hüber & Co., silk merchants, and the second was placed in Chicago with the local department of the Standard Oil Co.

The latter sale was the outcome of a serious test which one of the Packard machines had made in the work and which was so satisfactory that the order was forthcoming without delay. In this test, which lasted for three days, ten trips were made in all over an average distance of seven and three-eighths miles, carrying an average load of 3,707 pounds. The average speed maintained was seven and one-half miles an hour for the entire test, the total running time being ten hours, lacking five minutes. During the three days the heaviest load carried was 4,657 pounds, and the lightest was but 400 pounds, the loads consisting of oils in barrels. The fuel consumption was 7.25 gallons in all, which figures out at 10.17 miles per gallon, while the entire quantity of oil consumed was but a third of a pint. The total cost of gasolene and oil sums up to 81 cents for the test, or five and one-half mills per ton mile—a most creditable showing.

MOTOR CARS FOR RUSSIA

Conditions to be Met as Explained Jointly by a German and by an American Consul.

According to expert evidence published in the "Nachrichten für Handel und Industrie," Berlin, Germany, natural conditions in Russia are both favorable and unfavorable to the automobile trade. The favorable ones are found in the absence of many hills and the long distances over level stretches. The unfavorable are found in the long winters, the intense cold and the absence of romantic places or scenery to attract tourists. The people and public officials do not favor this method of getting over the ground. They are poor sportsmen. The people have little skill in handling complicated machinery, hence the inability to get chauffeurs on reasonable terms. The country folk are often bitter enemies of the automobiles, the roads of the empire are often wretched, and the network of ways far from what it might be and what it will have to be before Russia can count on a very successful industrial or commercial career.

In the cities it is different. There everything favors the automobile. The slowness with which street railways are built forces many families to keep carriages. These will doubtless turn to automobiles. The only serious obstacle to a rapid development of the automobile trade in the large cities is based on police supervision and regulation. Now that a great change has come over Russia's police and other policies trade in automobiles may develop unmolested. The different cities, however, have each its own ways of handling the automobile traffic. St. Petersburg and Moscow long since recognized the automobile as a necessity, hence their regulations are comparatively liberal. Riga and other cities have been rather severe. In those places certain streets may not be traversed by the automobiles. Applications in writing for permission to use an automobile must be made and the machine must be subjected to expert investigation.

Up to date, Russia, including Poland, the Caucasus and Finland, has from 1,200 to 1,500 automobiles of the lighter kind. Besides these there are fully 1,500 motor bicycles. Any one interested in discovering the actual conditions governing automobiles and the automobile business in Russia will do well to go over the ground carefully in every large city from St. Petersburg and Moscow down to the smallest place in which sales are to be sought. The further the empire emerges from a mere agricultural country to a position among the industrial and commercial states the automobile business is bound to grow. A long time will pass before the country will be able to build as great a network of railroads as is found in other parts of Europe or in the United States. Nor will they be as necessary, now that so convenient and pleasant a method of transportation is available. The men who own the mines and forests will want automobiles, for in the long run they will be found far superior to horses, for these latter call for great care and entail enormous expense.

Nobody has done much about building automobiles in Russia. A St. Petersburg firm that built motor boats tried its hand at the automobile. Another firm is now doing what it can to introduce the manufacture of automobiles on the basis of a well known American make, also one resembling a well known German type. During the season of 1905 this firm turned out thirty machines. The warm weather is practically the only time during which the automobiles may be run in Russia. Some firms buy all the parts abroad, limiting themselves to the work of putting them together.

The writer in Handel and Industrie, from whom most of the foregoing was taken, says the peculiar needs of Russia in regard to these machines has never been met. The comparatively great success of the American type, he thinks, was due to cheapness, abundance of supply, skilful advertising, etc. Simplicity of construction and driving are the prime requisites. The simpler the machine the better. If a machine is ever built to meet Russian ideas, it will have to be strong so as to go safely over bad roads. Great speed is not required because of the danger from bad roads. Low geared cars are wanted because of steep hills and bad places that require the machines to go slowly. The springs must be stronger and longer when possible than they usually are. They should be provided also with shock absorbers. Strong axles and crank shafts are desirable; in fact, those are practically indispensable. Only large sized pneumatic tires will be acceptable on the wheels. The space between the bottom of the body of the machine and the road must be considerable, so as to avoid shocks from obstacles. The gauge or distance between wheels must be somewhat narrow, because of the narrow, almost pathlike road over which the machines have to pass, particularly in the country. (The 4½ h. p. De Dion machine is said to be a suitable standard for Russia's roads.) It must have sprags and powerful brakes for the hills. The water tank must be easy to empty, and in a short time and to the last drop, otherwise the automobiles could not be used in Russia's winters. For the same reason the gas generator must be able to take up warm air. The machine must be as noiseless as possible. For trips into the provinces the only machines that are worth anything are those that carry a large supply of benzine and have electromagnetic ignition, for supplies may not be easily renewed and accumulators cannot be charged. The seats should be wide and comfortable, and the machine should have a top to guard against wind, mud and rain.

It is hard to find out just what sizes and prices should prevail. Russia is rich only in resources. Her available wealth is comparatively small. Her people have no huge sums as Americans and others to put into luxuries like automobiles. It is only by really recognizing actual conditions that merchants and manufacturers seeking outlets for their goods in Russia will be able to realize fair, never fabulous profits. First class goods go fairly well only in large cities like St. Petersburg and Moscow. For these fairly large prices will be paid, as there are people in those cities to whom four or five thousand dollars mean no more than to people in the large cities of the United States. One thing is possible, and for that all parties seeking sales in Russia must be prepared, viz, a demand not only for credit, but for long periods of credit. In the automobile business cash payments have prevailed in the past simply because the purchasers have been persons of great or considerable wealth. The best informed parties say that the machines that will sell best will run between $1,000 and $2,000 apiece.

The United States will have to meet French and German makers in Russia's markets. How much that means or may mean the manufacturers understand. It is the purpose of this paper, particularly at this point, to suggest lines along which the success of the past may be materially augmented. At present American makers are the favorites. This the Germans admit. A writer in the Nachrichten fur Handel und Industrie says 'the rapidly acquired popularity of the American machines,, on the Russian market only since 1903, may be regarded as only a passing episode," etc.

The French, with their elegant forms and splendid productions, winning their way to a profitable and permanent place at home and in other parts of Europe, suffer in Russia because of bad roads. Here it is that the German's solid, strong, heavily built machines have the advantage. Once the world learns that the American made machines, with their wonderful steel parts, will stand more than the heavy, clumsy creations of European rivals, increased sales are certain. The German writer already referred to urges his people to do nothing for a foreign field that will lead to the neglect of the home market, but to be sure to do nothing that will lead to the neglect of the foreign fields, for these will be profitably worked in the near future. Any attempt to find a market or to force sales in Russia during a depressed period at home must be preceded by the sale of most excellent machines in Russia in recent and immediately preceding years. No one who is wise will look for large sales in Russia now. The best basis to build on is a steady market, and that is to be secured only by the most careful study of conditions and by conforming to its demands. Care must be taken as to terms. These must be explicit, well explained and well understood. The time for delivery must be definitely held to and the forms of advertising must be as near perfect as possible. Catalogues, circular letters, etc., in any language than Russian are of little or no value. German and French are preferable to English, but all are bad.

If possible, a fairly large stock to select from should be in the large trade centres. This is true of automobiles and motor boats. Russia does little or no business based on price lists. Her people like to see, feel and

Digitized by Google

examine what they buy. If one cannot establish a branch of his own house, he can and should put a machine or two in the hands of a reliable commission house. The successful American machines have aroused Europe. The success achieved was won by fine forms. Real success is sure if one only finds out and follows Russian needs. If one firm finds itself financially unable to carry stock, etc., two, three, four or five might combine. One firm might send a heavy or big machine, another a middle weight, a third a light weight, etc. At any rate, whatever is done the field is worth working. And what is true of Russia is true of many parts of the world. The purpose of this report is to point out the possibilities for the automobile trade in fifty parts of the world by detailing somewhat the conditions, needs, etc., of Russia. Relatively speaking, the conditions are the same. What applies there is true elsewhere.

Perhaps a better plan than the one suggested, says the American consul who transmits this information, would be for firms making agricultural implements, paints, etc., to unite with automobile manufacturers, motor boat builders, furniture makers, etc., to open large display and sales rooms in St. Petersburg, Moscow, Odessa, Riga and other points in Russia. Indeed, this policy should be carried out in all countries and in all parts of the world; for, again, what is true of Russia in this respect is just as true of the Orient, South Africa and South and Central America.

The following is a list of firms in Russia dealing in automobiles:

St. Petersburg: Automobile, Nevsky, 108; "Pobjeda," Tanski & Co., Moika, 61; Freese & Co., Ertelew Per., 10; A. M. Fokin, Troizka, Emil Braum, Kamennoostrowsky Pr.; "Polytechnik," Troizkaja; Hoffmann, Kleine Dworpanskaja, 19.

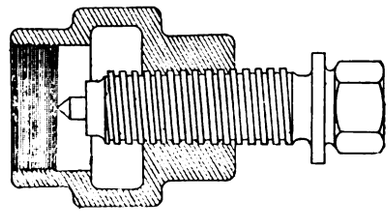
Moscow: Automobile Club, G. Schemlitschka, Mjarrnizkaja; Oktien Gesselschaft "Dux"; "Express" Neckarsulm, Banzhaf & Co.; Handelshaus Pochilsky, Twerskaja; Aktiengesellschaft "Enfield," Roshdestwenskaja; I. Block, Kusnezky Most.

Riga: A. Leutner & Co., Alexanderstr, 129.

Odessa: M. Asnach, F. Zorn &Co.; A. Reno, J. Glats & Co.

Saratof: R. Ehrt.

Warsaw: International Automobile Agency, Leschno, 25; Kowalsky & Trylski, Mjodowa, 4; Maison Ormonde, B. Wahren.

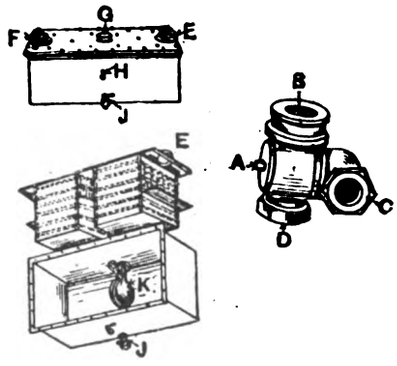


Kief: E. Torkler.
Kharkof: S. L. Popow, Usowskaja, 9.
Novorossisk: F. Burkhardt & Co.

Where the Roof is Utilized.

One of the features of a large London garage that is conducive to cleanliness on the main floor is the use of the roof for car washing purposes. The roof is of brick, well lighted and well provided with hose connections for cleaning the dozen or more cars that it accommodates and which are brought to this al fresco wash house by the "lift." It is an ingenuous utilization of space otherwise going to waste, but has the disadvantage of being subject to weather conditions.

Facilitating Removal of Tight Wheels.



Some of the most simple operations of dismounting parts of the car are rendered difficult of accomplishment by the lack of proper appliances, and the result in many cases, particularly where the operations have been repeated any number of times, is a more or less battered appearance, due to the use of a hammer or similar tool on the metal work of the parts. None but a careless mechanic or one of deficient training would, of course, resort to the use of such a tool to

loosen a refractory part, but as the name of such gentry is legion, it is not hard to account for the many battered looking parts on used cars. One such operation is the removal of a driving wheel or wheels from the squared or key and tapered end of the live axle to which they are affixed. When they have been in place for some time this is a job that requires patience as well as care not to damage the hub or axle end. To make it an easy matter, an English concern has placed the simple tool shown in the accompanying sketch on the market. To start the wheel with this it is only necessary to remove the hub cap and substitute the tool in its place. Tightening up the set screw against the axle end soon starts the tightest wheel.

Variation of Surface Carburetter.

There has been a tendency in some quarters, and more particularly abroad, to set up a cry that first principles were too hastily discarded. The virtues of the rudimentary beginnings that long since gave way to more advanced ideas better suited to the car and its requirements, as known

to-day, are accordingly being lauded by this gentry in an attempt to revive them. Chief among these have been first principles of carburetion, such as surface and wick vaporization. A piece of apparatus designed to combine both these principles is being exploited by a German concern and is termed the "Ader Carburretter," the details of which are shown in the accompanying sketch.

This is a combination of the surface and wick types of carburetter. It consists of a brass box, which for an 8 h. p. twin-cylinder engine is about 9 inches square by 5 inches deep. At the bottom of the box a pipe is led in from the main fuel tank. The interior of the box is fitted with a needle valve and a large float. This works in the same way as an ordinary ball cock of a water cistern, and is very large and substantial as compared with the ordinary float feed of a spray carburetter. The lid of the box has attached to it, on the underside, a framework of brass, in which are inserted a number of wicks, the framework itself being divided into two portions, the central space giving room for the float to work. At each end of the head a union; to one is attached a pipe through which the main air supply is drawn, the pipe being preferably arranged with its end near to the exhaust pipe, so that the air drawn into the box is warmed. This fixed ordinary air supply coming in at one end is drawn longitudinally right through the whole of the wicks, and on its way to the engine it passes what is really a mixing valve, which can be set by hand to allow more or less pure air to mix with the carburetted air. A light spring governs a flat valve fitted on the top of this mixing chamber, the spring being regulated to give a constant mixture when the machine is sent out.

The proportion of air once set for the day by the lever on the dashboard remains fairly constant, although it may require a little alteration if the temperature varies very much. In addition to this there is a throttle which is connected up to the clutch pedal. At the moment the clutch pedal is put down, or the brake applied, the throttle closes, leaving one small orifice in the centre, through which sufficient gas is sucked to keep the engine running without racing. The carburetter is fitted with a tap at the bottom to entirely empty it if it is found necessary to clean the wicks. There is also another tap fixed at a point where the level of the fuel should be maintained, so that the float can be tested without taking off the lid of the box.

Object of De Caters's Offer.

As though the needs of the car were not sufficient in themselves as an incentive to motor car designers to develop the most perfect machine possible, several worthy motorists have recently taken it upon themselves to offer prizes for the strengthening of this or that quality which they deem to be most important in the construction of the automobile. The most recent of these is a $1,000 challenge cup which has been offered by Baron De Caters to be annually awarded to the maker producing the most accessible motor. The idea is to stimulate the simplification of the machine and also the ease with which disordered parts may be got at on the road.

Features of the Well Tested New Haynes Car.

JOHN HAYNES AFTER REACHING NEW YORK IN THE 1906 HAYNES CAR.

"Haynes, Model R," is the official title of the 1906 top notch representative of the line of the Haynes Automobile Co., of Kokomo, Ind. As already refered to in these columns, a model of this car has been on an extensive demonstrating tour, in the course of which it covered 6,500 miles before returning to its home town. The engine and all running gear were immediately dismounted for examination, and found not to show the slightest signs of wear.

The engine, which is hung directly from the main frame of the car by arms cast integral with the upper half of crank case, has independently cast cylinders, the dimensions of which are 5⅛x6 inches, and is rated at 50 horsepower. By this arrangement it is unnecessary to disturb the cylinders or their connections in order to make adjustments or replacements of internal parts, as the removal of the lower half of the crank case exposes all parts. Water jackets are cast integral with the cylinders, unusually liberal provision being made for circulating water about the exhaust valves. All valves are mechanically operated, and, in accordance with approved practice, are located on opposite sides of the cylinder. The pistons are grooved up to the lower ring for oil, and are fitted with three triplicate and one retaining compression ring. The end bearings of the nickel steel crank shaft are of the roller type, all others in the engine being of white bronze, the total bearing surface of the crank shaft aggregating nineteen inches. A mechanical force feed oiler, with an individual pump for each pipe, takes care of the piston lubrication, while an auxiliary pump maintains the supply in the engine base, splash lubrication oiling all other moving parts in the motor.

Jump spark ignition, with an option of dry cells or accumulators, operating through a Lacoste distributer, forms this essential, although a magneto will also be fitted if desired. The carburetter is of the water jacketed type, embodying the latest advances in design made here and abroad, and is the product of the home factory. A honeycomb radiator with a tremendous amount of cooling surface, supplemented by a fan immediately behind, as well as another represented by the spokes of the flywheel, comprises the constituent parts of the cooling system, circulation of the water being guaranteed by the use of a gear driven force feed pump, which is capable of throwing a stream forty feet from the end of a garden hose. The power plant is entirely protected from beneath by the use of a sheet steel dustpan extending from the radiator rearward underneath the transmission case.

The clutch is an extremely simple device, consisting of a ten-inch drum keyed to the end of the crank shaft, around the face of which is a heavy steel band keyed by its hub to the transmission shaft. When running idle the drum revolves freely inside this band. In action the band is constricted on the face of the drum by means of a lever and cam operated by foot pedal, a second pedal operating both clutch and brake. The emergency brake lever also disengages the clutch. Some of the features of the change speed box are the use of chrome steel gears of large face and coarse pitch; reverse pinion in mesh only when in use, and roller bearings on the main and counter shafts, which are of nickel steel. By means of a patented device exclusive to this car it is possible to change from low to intermediate or high speed without releasing the clutch and without the danger of stripping the gears. The transmission is by a 1¼-inch special steel propeller shaft provided with universal joints at each end.

Both the rear axle and driving mechanism construction are of interest, the former being a one-piece live axle of nickel steel, extending through both wheels and bearing one member of the differential. One wheel is keyed direct to the axle, and the other is keyed to a sleeve carrying the other half of the differential, and is slipped over the opposite end of the axle and held in place by a retaining nut. Over all is fitted a steel housing carrying four sets of Hyatt roller bearings. The spring saddles are integral with this housing, which likewise covers the driving mechanism. The latter is of the familiar Haynes sprocket and roller pinion construction. A bevelled sprocket gear is attached to the axle sleeve and driven by a pinion keyed to the driving shaft. In this pinion rollers take the place of teeth, making in effect a roller chain. The whole revolves in a bath of oil. The front axle, which is a one-piece forging, also carries the spring saddles.

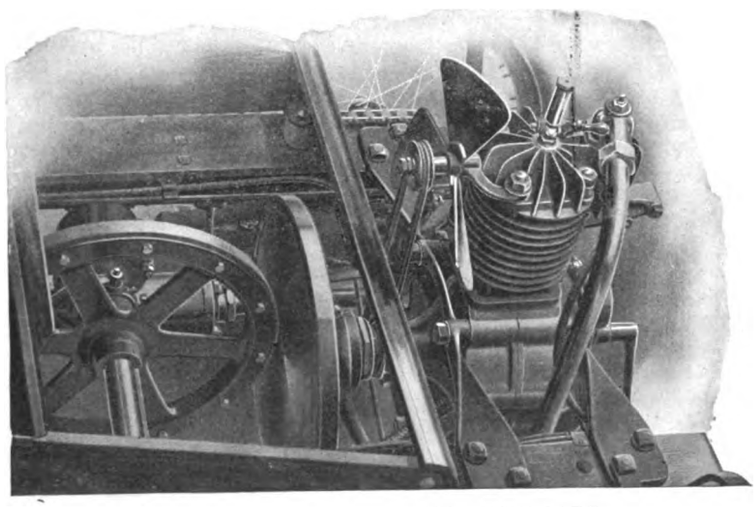
BUCKBOARD MADE UP-TO-DATE

Popular Priced Orient Altered in Appearance and in Important Details—What They Are.

In preparing the Orient buckboard for the new season, the Waltham Mfg. Co. have taken pains to add a sufficient number of novel and important features to make the little machine worthy the attention and respect of the public as an up-to-date product, without in any way taking from it its reputation for lightness, low cost and general handiness. In fact, although it is still very much a buckboard, and thoroughly characteristic of its type, it is now furnished with all that goes to make up a "full grown" automobile, even to the point of a variable speed transmission. It is a 600-pound car at the poor man's price, yet suitable for any sort of general knockabout work in the fields of business and pleasure.

As heretofore, the motor is placed vertically at the rear of the machine, and is air-cooled. The dimensions are 3¼ by 4¼ inches, and the rated output is placed at 4-horsepower. As an aid to the cooling action of the radial ribs on the cylinder, a triple bladed fan is mounted at the front, driven by a belt from the crank shaft. An Orient carburetter is used, which is fed from a three and one-half gallon tank, giving the machine a running radius of some thirty miles on one charge. The oiling is accomplished by a sight-feed mechanism which is controlled from the seat. Ignition is by the jump spark system, energy being supplied by a four-cell dry battery, while the distribution is effected in a wipe contact commutator of foreign pattern.



The transmission gearing is of the simple friction disc order, a metal disc being fixed to the crank shaft of the motor and driving a fibroid wheel which is slidably mounted upon a jack shaft having a driving sprocket up on either end, which communicates the motion by chains to the rear wheels. The position of the driving wheel is regulated by means of a ratchet foot lever at the driver's right, which premits of a somewhat flexible controller, while allowing of absolutely positive action when hill climbing. Thus the speed variations may be obtained in a perfectly simple manner and one which is thoroughly within the range of comprehension of the novice.

1906 ORIENT BUCKBOARD.

The mounting of the car has been altered in the new model to give it an appearance more in keeping with the average machine than has been that of its predecessors, a duck back being placed over the transmission at the rear of the seat, and a small hood, being placed at the front, which affords a place for storage. The suspension is by 19-inch eliptical springs, which carry the motor as well as the body, thereby doing away with much of the vibration which has been noticeable in former models, and rendering the riding qualities fully up to the best standards. The wire wheels are 26 inches in diameter, and are fitted with 2½ inch single tube tires. The tread is 42 inches, with a purchaser's option of 56 inches subject to a time order. The wheel base is 80 inches.

As regularly equipped, the buckboard is capable of making a speed of thirty miles an hour under favorable conditions, but a larger front sprocket may be placed on the driving shaft, increasing the rate of travel by a considerable amount. The record of 121 miles in six and three-quarter hours, which the little car recently made, consuming in that time but four gallons of gasolene and one and three-quarter pints of oil, together with an even better showing which it made subsequently on the following day, shows something of its capabilities when taken in conjunction with its complete ascent of "Old Boston Rock," up which no automobile had ever before been able to climb.

"POWER PLANT" OF ORIENT BUCKBOARD.

Details of the New Model!

Occasionally the automobile columns of the non-technical papers, always productive of much distorted information, secure combinations which are highly amusing to the reader. Thus, a somewhat "horsey" publication prints in a paragraph directly following a des ription of an all aluminum body the following, which apparently refers to the same superstructure:

"A double floor is used to overcome the vibrations incident to a gasolene engine. The top floor can be removed easily, and doors in the lower floor give free access to the machinery beneath. Between the two floors are carried a folding casket and a folding stretcher, which push in entirely out of sight when not in use."

From which the lay reader would infer that provision was made for caring for the injured in the proverbially frequent accident, though, as a matter of fact, the quotation referred to a special form of ambulance which was recently constructed for a local undertaker.

Test of Lubricating Oil.

The following is an easy method of testing lubricating oil for the presence or otherwise of at least two of the qualities it should not possess: The oil should be neither acid nor tacky. Consequently, if a drop of it is placed upon a polished copper plate it should remain clear and keep its color for several days. If there is acid present it will turn green, and if it becomes tacky it shows that the oil dries too rapidly. In either case it should be rejected as being unsuitable for lubricating purposes. This is, of course, merely a rough and ready method, and cannot replace tests to ascertain the degree of acidity and dryness.

For Filling in Body Bruises.

A good receipt for filling in deep bruises and cavities in car bodies is the following from the Carriage Monthly: "Make a putty consisting of three parts of bolted whiting and one part of white lead, mixed with equal parts of pale drying japan and raw linseed oil. Into the mass stir a quantity of plush woof or velvet pickings. If the hole to be filled is unusually deep, drive two or three tacks into the bottom of it. Fill in with the putty, slashing across the top of the mixture to promote drying, and as the filler dries fill the depressions with regular putty.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our show rooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country, at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

LOZIER

BEING TALKED ABOUT

If you are Automobile-wise, you have heard much of late about **THE LOZIER CAR**

In what is being said among your friends, at the Club and elsewhere, there is an undefinable something that must have convinced you that this is a car of real merit.

You have not heard an unfavorable word.

Those who have seen the car pronounce it a **Great Machine.** Those who own and drive one (and all have been owners of other high-grade cars—both American and Foreign) say "THE FINEST I EVER OWNED." **Inform yourself further.**

Deliveries of all styles, Limousines, Landaulets, Touring Cars. **Prices, $4,500 to $5,500.**

THE LOZIER MOTOR COMPANY,
1 Broadway, New York City.

Temporary salesroom at R. M. Stivers, 19 West 62nd Street, for a short time, until our building at Broadway and 55th Street is comp eted.

CARBURETTER FOR KEROSENE

Here's a French Device Claimed More Powerful and Economical than Gasolene Gasifiers.

Considerable interest attaches to the problem offered by the designing of a perfected carburetter for the use of what are usually known as "heavy oils," but which in the majority of instances is taken to mean kerosene. In view of the fact that the average motor designed for gasolene will work without any difficulty or modification of the carburetter when kerosene is employed, provided the latter is supplied while the engine is warm, the numerous attempts to design apparatus for this purpose which have resulted in the creation of complicated contrivances involving the use of chemicals would appear to be abortive—that is, waiving all questions of comparative efficiency. There have been various systems of kerosene vaporizers introduced which are in large part based upon principles of chemical dissociation, whereby the more refractory by-products undergo a chemical conversion into gas. Although the results attained are good, the apparatus involved is in the majority of instances so complicated that few of them have ever been put to practical use, except for marine engines.

There is another large class which has started with the principles of carburetion evolved through long study in the use of gasolene, and has so far as possible adopted them in designing apparatus to use the heavier and less easily vaporized oil. Kerosene is not only far less volatile, but its flash point is vastly higher than the lighter hydrocarbons. Accordingly not alone a higher temperature is necessary to vaporize it, but a greater degree of mechanical mixing is required to thoroughly break up the liquid and incorporate it with the proper amount of air. But aside from the additional parts involved in this construction, as well as the increased size of the mixing chamber made necessary, the carburetter to use kerosene is found not to differ in its essentials from those which have proved most successful for lighter fuels. Nevertheless, those who pin their faith to the principles of chemical dissociation are not deterred from following out their theories to legitimate ends, and now a French investigator has invented a type of apparatus which belongs to neither of these schools, but may most correctly be classed as something between them. It is much simpler than the creations of the first class, but not on a par in this respect with those of the second.

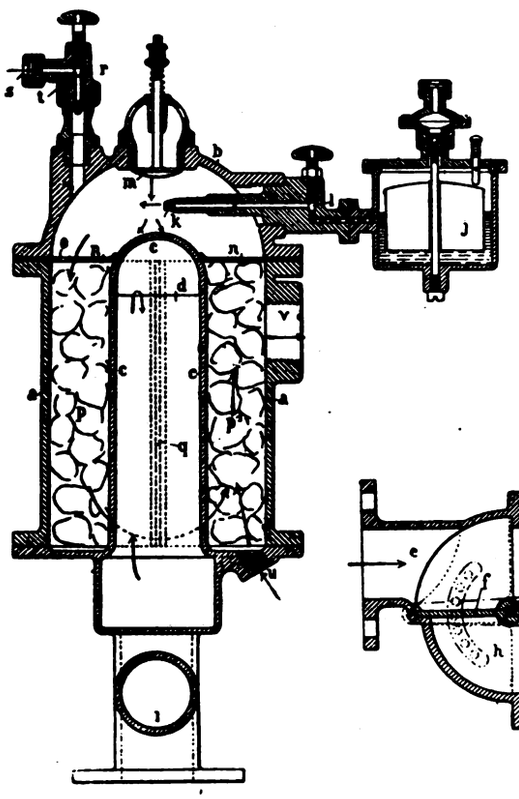

Fig. 1.

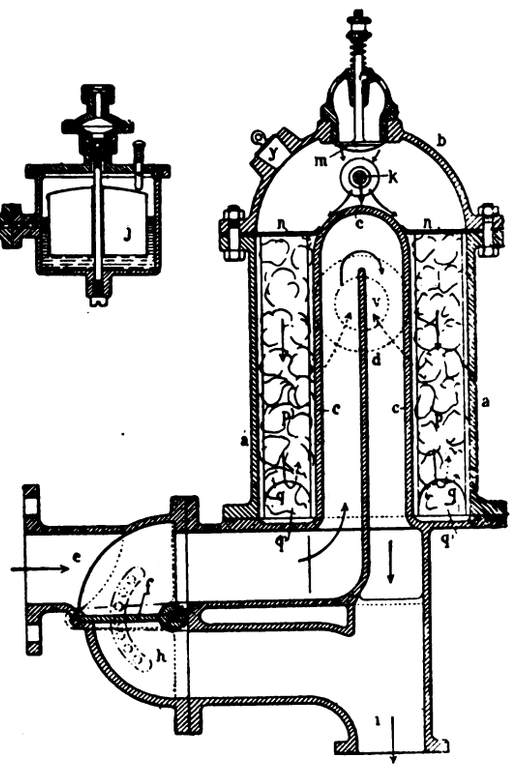

Fig. 2.

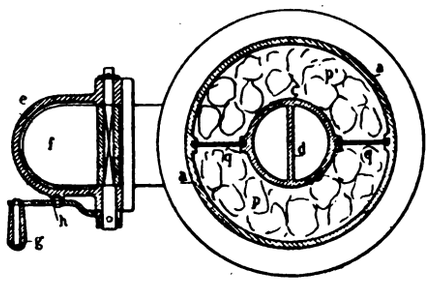
Its creator is M. Breuillard, a French chemist, who is said to have devoted considerable attention to research along this line. He has ascertained that kerosene can be transformed into a perfectly homogeneous gas at about 575 degrees Fahrenheit, leaving no by-products, and has embodied his principles of accomplishing this in what he terms the "integral vaporizer." To secure this result the kerosene has to be finely pulverized and then passed through hot coke, where the vaporizing process is continued until it leaves in the form of a homogeneous gas mixed with the desired proportion of air.

The vaporizer is composed of a cylinder, A, with a cover, B, and inside is a concentric tube, C, closed at its upper end. The space between the inside tube and the cylinder is packed with ordinary gas coke, and above is a circular plate, N, separating the coke from the space above, except for the aperture, O, opposite to the induction pipe, V, where the gas enters the engine. The operation is as follows: On the cover is a gasolene injector, R, connecting with a small gasolene supply which may be conveniently fitted to the vaporizer itself. To start the engine a turn is given to the needle valve, T (Fig. 1), when the gasolene drops on to the coke through O and the vapor is drawn up with the desired proportion of air through the pipe U. As soon as the engine starts running the exhaust enters the base of the vaporizer and passes directly up over the partition, D, and leaves by the exhaust pipe, I. In seven or eight minutes the coke is sufficiently hot for running with kerosene. The gasolene supply is then cut off. At the opposite side of the cover is the kerosene constant level chamber with the spray nozzle extending over the dome of the inner tube and beneath the air valve, M. The needle valve, L, is now opened, and under the influence of the suctional stroke the air valve, M, descends, allowing a rush of air on the kerosene spray, which is projected down over the hot dome of the concentric tube. The kerosene is now in the form of a heavy gas with globules of liquid. It is drawn down by O through the hot coke, and on reaching the bottom passes through holes in the separation, Q, when it mixes with the air coming through the pipe U. This aperture also serves to draw off any liquid that may not have been vaporized in the coke. In the process of rising through the coke in the second compartment the gas and air are thoroughly mixed by the time they reach the induction pipe, V. The temperature of the apparatus can be varied at will by a valve, F (Fig. 2), which regulates the quantity of gas passing up over the division inside the concentric tube.



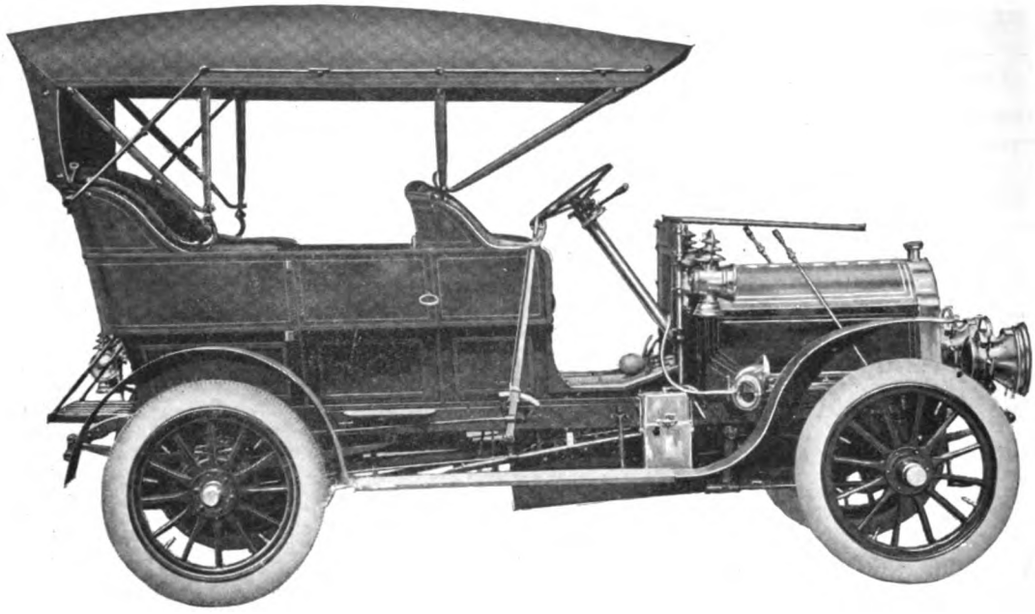


Fig. 3.

It can easily be imagined that with such a system the gas is always of a uniform quality, whatever may be the load under which the engine is running. The coke, moreover, serves as a reservoir from which gas will continue to be drawn for some time, even after the supply of kerosene has been cut off, and there can consequently be no change in the quality of the mixture under varying loads. It may also be assumed that, supposing the fuel should not be entirely vaporized in the way claimed, the coke would still serve the useful purpose of collecting any non-volatile by-products and purifying the vapor, so that the homogeneity of the gas is doubly insured. The apparatus can be used not only for kerosene, but also for alcohol and heavy oils, with which it is claimed to run very satisfactorily. One of these vaporizers has been running on an industrial engine for six months past, during which time it has been shown that there is an economy of 10 to 15 per cent in favor of kerosene as compared with gasolene in the ordinary spray carburetters, while it is also stated that there is an appreciable increase in the power developed by the engine.

This is the Pierce Great Arrow 28-32 H. P. car with straight tonneau body, cape top and folding glass front. Price $4000. Cape top, extra, $200.

PIERCE

The Pierce Arrow is an American car—the best American car that has been made—better in proportion to its cost than any imported French car—better for American use, American roads and the American motorist. It offers satisfaction, minimum of expense in running, perfect service, and can be operated by the owner.

Catalogue and descriptive literature on request.

The Week's Patents.

805,243. Spring-Tire for Wheels. Richard Stone, Wellington, England. Filed February 18, 1905. Serial No. 246,269.

Claim.—1. In spring-tires for wheels, the combination with a tread provided at its bottom with an annular buffer-flange, plates secured on the sides of said tread and having lateral projections, side flange-plates bolted to the felly and having overhanging flanges adapted to engage over said buffer-flanges and provided with recesses for receiving said projections, and an endless flexible spring-band surrounding the felly at a distance therefrom and normally engaging the under side of said tread.

805,274. Steering Device for Motor-Vehicles. John W. Eisenhuth, Brooklyn, N. Y., assignor to the Eisenhuth Horseless Vehicle Company, a Corporation of Maine. Filed May 25, 1905. Serial No. 262,303.

Claim.—1. A running-gear for vehicles comprising a suitable frame, guiding-wheels pivotally secured thereon having comparatively large non-revoluble web portions, yokes rigidly secured directly to the said webs, and means for moving the said yokes for moving the wheels in one direction or the other for directing the movements of the vehicle, the yoke affording a strong leverage on said wheels, substantially as described.

805,318. Apparatus for Portable Sleighs. Alanson K. Ramsdell, Old Orchard, Me. Filed May 5, 1905. Serial No. 259,075.

Claim.—1. A motor-sleigh comprising, in combination with the bobs, a platform connecting the same, a driving-wheel, a pivotally-mounted rack on which said wheel is mounted, springs secured to the platform of the sleigh and bearing against the rack carrying said driving-wheel, a shaft mounted upon the platform, chains adapted to wind upon said shaft passing over suitable pulleys and connected with said rack, and means for rotating said shaft, as set forth.

805,392. Speed-Governor. Henry E. Warren, Newton, Mass., assignor to The Lombard Governor Company, Ashland, Mass., a Corporation of New Jersey. Filed March 22, 1905. Serial No. 251,419.

Claim.—1. In a speed-governor for motors, a centrifugal element which rotates at a fixed ratio of the speed which it controls, an inertia element which tends to rotate at a constant speed and centrifugally-controlled means which interconnect the centrifugal and inertia elements and tend to cause such elements to rotate synchronously.

805,430. Means to Regulate the Power of Explosion-Engines. Adolf Vogt, West Norwood, England. Original application filed January 9, 1902, Serial No. 89,072. Divided and this application filed December 16, 1903. Serial No. 185,379.

Claim.—1. In a two-stroke cycle internal-combustion motor, a cylinder having its front closed and acting as a pump for drawing in combustible charges through a suction-valve, an outlet-valve at said front end communicating by a pipe and connected reservoir to an inlet-valve at the back end of the cylinder, cams controlling said valves so as to cause them to allow a charge drawn into the front end of the cylinder to pass through said pipe into the back end of the cylinder, a governor controlling said cams adapted to bring these into position for hold-

Digitized by Google

ing the said outlet and inlet valves open during the first part of the compression-stroke of the piston, when the normal speed is exceeded, whereby a portion of the charge admitted at the back end of the cylinder will pass back into the front end again, substantially as and for the purpose described.

804,953. Universal Joint. Patrick L. Hussey, Cleveland, Ohio. Filed July 10, 1905. Serial No. 269,060.

Claim.—1 In a universal joint the combination of two joint members having forked ends arranged to be disposed at an angle to each other, a bearing-carrying member arranged to incase said joint members, said bearing-carrying member having an opening at each end so that each joint member may be mounted in the said bearing-carrying member by introducing one of the fork members thereof into the bearing member and allowing said fork member to travel past its normal position and then introudcing the other member of the fork into the casing and means for centralizing each joint member in the bearing-carrying member.

804,954. Bearing for vehicles. Eric Johanson and Charles Johanson, Dillmanstown, Kumara, New Zealand. Filed July 2, 1904. Serial No. 215,160.

Claim.—For the purpose indicated, in combination, a wheel-hub having its ends bored conically, an axle passing into the hub, a socket having a race and fitting the axle and engaging a portion square in section of the axle, a socket having a race and fitting the end of the axle being screwed thereon, a nut on the axle to retain said socket in position, there being square bosses upon the sockets, other sockets having races and having holes engaging the bosses, washers upon the sockets, balls within the races, there being rims upon the sockets and washers for retaining the washers on the sockets, as set forth.

804,955. Steering-Wheel. John W. Johnson, Kokomo, Ind. Filed December 16, 1904. Serial No. 237,167.

Claim.—A wheel having a pitted rim, and a sheet or envelope of hard rubber permanently vulcanized upon the rim and anchored in position by the pits.

804,971. Lever Mechanism for Motor-Vehicles. James W. Packard and William A. Hatcher, Warren, Ohio, assignors to Packard Motor Car Company, Warren Ohio, a Corporation of West Virginia. Filed November 14, 1902. Serial No. 131,327.

Claim.—1. In a motor-vehicle, having relatively movable speed-changing and reversing gears adapted to vary the speed and direction of the vehicle, a hand-lever, two arms for shifting different sets of said gearing arranged adjacent to said lever, and means mounted on said lever and adapted to connect said lever with either of said arms.

805,046. Spring-Tire. Troy Ware, Letch, W. Va. Filed March 30, 1904. Serial No. 200,692.

Claim.—A spring-tire for a wheel, the same comprising a band of metal adapted to be fitted snugly over the rim of a wheel, and spring metal strips spaced equally about the band with their free ends bent at an angle to their length and terminating in spring portions concentric with the band and parallel with the rim of the wheel, the other ends having a long bearing upon the band and formed with integral tongues extending in opposite directions with their backs or connecting portions adjacent each other, and the tongues extended through openings in the band opposite the slots formed by the striking up of said tongues in the strips, and bent in opposite directions and clenched upon the inner face of the band, each strip having a bearing against the band upon each side of the tongues.

805,111. Automobile-Cyclometer. Jesse Alexander, Brooklyn, N. Y., assignor to Kittie Alexander. Filed October 17, 1903. Renewed May 23, 1905. Serial No. 261,850.

Claim.—1. A registering mechanism comprising, two series of registering-drums, a series of connecting-gears for each of said series, a shaft for each of said series of gears, a spring connecting said shafts and means for manually retracting said shafts to withdraw the gears from engagement with the registering-drums.

805,138. Carburetter. William Herrick and John G. Lohrman, Elkhart, Ind. Filed October 26, 1904. Serial No. 230,092.

Claim.—A gas-producing machine comprising a hydrocarbon and an air tank, a generator having a weighted foot, a seat formed within the generator, a grid located on the seat, a foraminous member on the grid, an absorbent pad resting upon the foraminous member, a communication extending from the air-tank to a point below the grid, a communication extending from the hydrocarbon-tank to a point above the pad, a conical cover on the generator, a gas-receiver, and a pipe leading from the apex of the cover to the receiver.

805,194. Lamp or Headlight for Vehicles. Emil C. Geissberger, New York, N. Y., assignor of one-half to A. T. Demarest & Co., New York, N. Y. Filed July 13, 1905. Serial No. 269,481.

Claim.—1. In an automobile or similar vehicle, embodying a rotatable block and a stub axle for each of the forward propelling-wheels thereof, a crank-arm rotatably mounted upon a suitable part of the vehicle, a lamp or headlight supported thereby, an arm having rigid connection with said rotatable block, and a link movably connecting said arm and said crank-arm.

805,434. Vehicle Tire. Lemuel E. Allen and William J. Potser, Canton, Ohio. Filed May 11, 1905. Serial No. 260,020.

Claim.—1. In a tire for vehicles of the class described a series of chambers formed in the tire, said chambers separated by radial partitions, integral members located through the chambers and between the radial partitions, said integral members extended parallel with the felly upon which the tire is mounted, substantially as and for the purpose specified.

805,442. Automobile Engine Suspension. Fred H. Bogart, New Britain, Conn., assignor to The Corbin Motor Vehic.e Corporation, New Britain, Conn., a corporation of Connecticut. Filed April 4 1905. Serial No. 253,817.

Claim.—1. In an automobile, a support for an engine and transmission mechanism comprising a continuous frame or base for said engine and transmission, said base being supported at or near its forward and rear ends in a line substantially parallel with the sills of the vehicle, and an intermediate support between the aforesaid supports and arranged at substantially right angles thereto.

805,474. Means for Inflating Rubber Tires. Alfonso G. Lavertine and James E. McNellan, Johannesburg, Transvaal. Filed March 6, 1905. Serial No. 248,632.

Claim.—1. In an apparatus for inflating rubber tires by means of a cartridge containing compressed air or gas, means for releasing air or gas and conducting it to the tire to be inflated, said means comprising a

needle adapted to perforate the cartridge to release the air or gas and a valve through which the air or gas may pass to the tire to be inflated, means for raising said valve and causing the needle to perforate the cartridge, and means whereby the valve is closed when the means which serve for opening it are released, to allow a portion only of the contents of the cartridge to be utilized.

805,484. Power Transmitting Apparatus. Carlton R. Radcliffe, New York, N. Y. Filed January 17, 1903. Renewed May 27, 1905. Serial No. 262,681.

Claim.—1. In an apparatus of the character described, a driving member and a driven member, intermediate mechanism comprising a shaft, a gear and a clutch supported thereby, the latter being adapted to be connected with or freed from the driving member, gears revolubly mounted on said shaft, a gear case, gears of different ratios supported by said case, one of the same meshing with the gear on the aforesaid shaft, the others meshing with the gears revolubly mounted on said shaft, a clutch operatively connected with one of the latter gears, the other of said gears being connected with the driven member, and means for controlling certain members of the intermediate mechanism to produce changes in the speed of the driven part relatively to the driving part.

805,504. Friction Drive Speed Gear. Walter E. Trufant, Whitman, Mass. Filed April 25, 1904. Serial No. 204,682.

Claim.—1. In an apparatus of the kind described the combination of a power shaft, a disk receiving power from said power shaft, a driving shaft, an idler gear carried by said driving shaft, two rolls mounted on the driving shaft, means for controlling the frictional contact between the rolls and disk, gears carried by said rolls which mesh with said idler, means for moving one of the rolls along the face of the disk, means for disconnecting the power shat rom said disk, and means for connecting the power shaft and the driving shaft together.

805,528. Vehicle Wheel. Eugenio Cantono, Rome, Italy. Filed January 30, 1905. Serial No. 243,345.

Claim.—1. In a vehicle wheel the combination of a tire comprising a rope tread, one end of which is fixed and the others free, and a take-up device to which the free end of said rope is attached.

805,550. Friction Clutch. Harry W. Hill, Cleveland, Ohio. Filed March 15, 1905. Serial No. 250,221.

Claim.—1. In a friction clutch, the combination of the clutch frame, a pair of inversely and radially movable jaws mounted thereon, a rocker having a radially adjustable fulcrum pivot by which the rocker is connected with said frame, pivot connecting said rocker to one of the jaws, and a radially adjustable pivot connecting the other jaw with said rocker on opposite side of the said fulcrum pivot, and means for operating said rocker.

805,562. Valve Gear Mechanism. Frederick Lamplough, Willesden, England. Filed March 22, 1905. Serial No. 251,452.

Claim.—In mechanism for operating the valves of steam and gas engines and the like, the combination of a screw-toothed wheel fixed on the engine crank-shaft, a screw-toothed wheel of contrary direction to the above fixed on the shaft carrying the valve-cranks, eccentrics, a pair of right and left-handed screw-toothed wheels fixed and rotating together, on a counter-shaft, one of such wheels gearing with the wheel on the engine crank shaft and the other with the wheel on the shaft carrying the valve cranks, eccentrics, and means for moving said conical pair of right and left handed screw-toothed wheels endwise, substantially as herein shown and described.

805,567. Driving Axle Structure for Automobiles. Thomas J. Lindsay, Indianapolis, Ind., assignor of one-half to Willard Harmon, Indianapolis, Ind. Filed March 13, 1905. Serial No. 249,926.

Claim.—1. In a driving axle structure for automobiles, the combination of a hollow axle structure, a pair of shaft sections ends separated, a compensating gear structure journaled in the axle structure between the adjacent ends of the shaft sections, and driving connections between the said shaft sections and compensating gear permitting transverse withdrawal of the compensating gear without axial movement of the shaft sections.

805,591. Non-Puncturable Tire. Luther A. Davison and James M. Logan, Hartford, Conn. Filed June 8, 1905. Serial No. 264,276.

Claim.—1. In a non-puncturable tire the combination of an exterior cover provided with an interior chamber, a series of cylindrical cork sections compactly placed within the interior chamber, rubber plugs, forming the end sections and vulcanized together and to the tire.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 15x Nassau Street, New York.

THE GROWTH OF RUBBER TIRES

The Firestone Side-Wire Feature Adds Much to the Safety and Economy of Road Travel.

CLEVELAND O., June 22.—Rubber tires are almost essential on all kinds of vehicles. They lengthen the service of commercial vehicles and add comfort to the occupants of pleasure vehicles.

The "Firestone" tire has steadily won favor with the public. Its mechanical construction is so perfect that absolute safety is assured, while in point of economy it excels its closest competitor. Interested parties should write for full particulars to the Firestone Tire & Rubber Company, Akron, Ohio.

The automobile trade is thoroughly familiar with the REASONS for the almost universal popularity of the

SIDE WIRE TIRE

FIRESTONE has proven durable and satisfying.

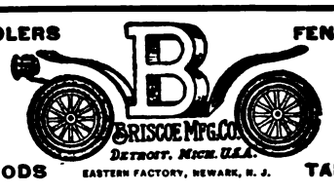
The Jones Combination
SPEEDOMETER - ODOMETER
(1906 Model)

not only shows the **speed** of your car and registers the Season mileage up to 10,000 miles, but has a three figure "Trip" attachment which registers the mileage up to 100 miles. A touch of the button instantly resets the "Trip" column to zero.

In both the Season and "Trip" registers, the miles are shown in plain black figures and tenths of miles in red.

AN ADJUSTABLE SHAFT CONNECTION permits of passing the Shaft through the floor; through, or around either end of the dash.

THE DASH BRACKET occupies a very small space on the dash board and is **adjustable** to permit of the instruments being set at any angle desired.



Speed is indicated and mileage cumulatively recorded whether the car go forward or backward.

Full description of our 1906 combination Speedometer-Odometer and all other instruments will appear in our new catalog now in course of construction, is to be the most artistic catalog ever compiled for an automobile accessory.

Builders of Machinery who have been using Gears exclusively during the past century are now commencing to replace many of them with Chains and Sprockets.

Nearly all the Manufacturers of Cream Separators are now adopting a Chain Drive, while Gears have been used exclusively in the past.

Our reasons for recommending the Chain Drive for Motor Cars are as follows:

PATENTED

Less weight—Less friction—Lower cost to manufacture—Lower cost to repair—Less time to repair—Ease of changing gear ratios to suit road conditions for various parts of the country—Saving of tires by less weight—

More reliable rear axles for rough roads and heavy loads—In case of an accident the chain driven car may be pushed off a railroad track or from the center of a road.—One pound added to the axle is harder on both tire and axle than many pounds added above the springs.

We urgently request manufacturers to be careful in machining sprockets, to select chains of a suitable size, and to provide sufficient space for chain clearance. Thousands of chains have been damaged by interferences and unfavorable conditions.

"Whitney" Chains on certain cars have given satisfaction for an entire season with practically no attention, but we recommend cleaning, inspectin and lubricating a number of times a year if best results are desired.

TO CLEAN A CHAIN soak it over night in kerosene or gasolene.

TO LUBRICATE A CHAIN (when clean and dry) soak it for 30 minutes in some heavy melted lubricant, such as best quality beef tallow mixed with a little graphite. The lubricant should be heated in a heavy pan nearly to the boiling point to insure its flowing freely, and the shape of the pan should be such as to permit the chain to be wholly submerged. After treating in this manner the chain should be allowed to cool and the lubricant will then set in the bearings.

It is absolutely impossible to properly lubricate a chain by applying oil from a can to the outside surfaces.

THE WHITNEY MFG. CO., Hartford, Conn.

Are you acquainted with

Willard W. Low?

Mr. Low is president of the Electric Appliance Company, manufacturers of high grade electrical supplies.

Time was when automobiling was not a continuous round of unhampered pleasure to him.

Stated plainly, he enjoyed about the same measure of peace that a timid woman would on the back of a bronco.

He never knew just what was going to happen.

All of which was attributable to tire troubles that were as exasperating as they were continuous.

There is no telling just how long this thing would have gone on had it not been for—

But let Mr. Low tell it:

"I desire to advise you that automobiling is now a great pleasure to me. Some time ago it got to a point where I was afraid to take out my car on account of tire troubles. I could not take a drive of any account without having them. At last, one fortunate day a friend of mine recommended your tires, and I had my car fully equipped with them. From that time up to the present my tire trouble has been practically nothing.

I desire to congratulate you on the quality of auto tires you are turning out."

Pretty strong proof of the superior quality of our tires, isn't it?

"Every Stock Car Guaranteed to Show Sixty Miles an Hour Before Leaving the Shops."—E. R. THOMAS.

THOMAS

AN AFFIDAVIT THAT SPEAKS VOLUMES:

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

BUFFALO, N. Y., Nov. 10, 1905.

This is to certify, that we, the undersigned, this day rode at the rate of 60 miles per hour with five passengers over average roads, maintaining a speed continuously in regular stock model 1906 Thomas touring car, and went up a 14 per cent. grade with five people on the high speed and on very bad roads, increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation, and the clutch is extraordinarily sweet and effective.

This is the only American built stock car that within our knowledge has made 60 miles per hour on ordinary roads, even without passengers.

The Ford 4 Cylinder Runabout

This car—Model N—is the biggest revelation yet made in Automobile construction. A car of this type for less than $500.00 seemed an impossibility, but here it is.

4 Cylinder—15 H. P. Direct Drive. Speed 40 miles. 78-inch Wheel Base. Weight 700 Pounds.

FORD MODEL K.

Six cylinders—40 H. P. 4 to 50 miles per hour on high gear. Perfected magneto ignition. Mechanical oiler. 114 inch wheel base. Luxurious body for 5 passengers. Weight 2,000 pounds. Price, $2,500.00.

No further particulars will be given until these cars are shown for the first time at the Automobile Club of America's show at the 69th Regiment Armory, New York, Jan. 13th to 20th.

DELIVERIES FOR MODELS N AND K WILL NOT BE MADE BEFORE MARCH.

1906 will be a "Ford Year." Agents who have closed with us can congratulate themselves.

The Incomparable WHITE

The Car for Service.

WHITE GENERATOR

Above is illustrated the generator of the White steam car, together with burner, vaporizer, pilot-light and gasolene connections. A glance is sufficient to show that the White generator is totally unlike any other boiler ever designed. We might point out how wide this difference is by calling attention to the fact that in the White generator the water is at the top and the steam at the bottom. In every other type of steam-making apparatus, water is at the bottom and steam at the top.

If the coils of the White generataor should be unwound and straightened out, the generator would be seen to consist of a single long piece of steel piping. Could anything simpler than this be conceived? The capacity of the tubes is comparatively small; i. e., the amount of water and steam contained therein at any one time is small. The tubes will safely withstand a pressure of many times that which it is possible for the steam to attain. Could any safer arrangement be imagined?

As regards the superior reliability of the White system, that is a matter which has been amply demonstrated by the continuous victories and notable achievements of six successive models of "The Car for Service."

WHITE SEWING MACHINE COMPANY

CLEVELAND, OHIO

An Investigation of GOODRICH TIRES

Mr. E. Shirts, cashier of the Citizens National Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new. His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with Goodrich Tires 3 in. x 30 in. I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and I found them in perfect condition, not even rim rusted.

I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

HAYNES

Exclusive Features That Appeal to Discriminating Buyers

Model "R," Four Cylinder Touring Car

Roller bearing vertical engines. Cylinders, 5⅛" x 6"; 50 H. P. Cast separately. Sliding gear transmission, with exclusive device which prevents possibility of burring or stripping gears and permits instant change from high to lower speeds with perfect safety and without noise. Positive cooling system operated at very low cost of power. Individual and special lubrication. Carburetter which assures perfect mixture in all temperatures and under all climatic conditions. Master Clutch, that has no leather surfaces to wear. Takes hold easily and gradually, without jerking. Shaft drive. Exclusive universal joints, that do away with wear on pins, run in housing packed with grease. One piece nickel steel rear axle, with beveled sprocket gear, driven by roller pinion; thrust eliminated, friction reduced, noiseless; all in a bath of oil. Roller bearings throughout. 108-inch wheel base. 50-inch tonneau, with ample room for two folding chairs. Six to 60 miles an hour on high gear. Weight, 2,750 lbs. Price, $3,500, F. O. B. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906 HAYNES roller bearing engines, master clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES factory and with exact reference to every other part. There is perfect harmony throughout the entire mechanism. This is the reason that in the HAYNES car there is less than 10% loss of power between the engine and rear tires. It is the reason that its cost of maintenance, upkeep and operation is so remarkably low, and that for 14 years it has had the acknowledged reputation of being a car of pre-eminently high quality.

Its cylinders are extra large. They hold compression perfectly and give high power. When changing gears the transmission device never allows the momentum of the fast moving car to be thrown against the power of the engine, with its consequent strain to the entire mechanism, frame and tires, a fault common to all other types of transmission. No danger of stripping gears or of gearing climbing out of casing, which constitutes the chief objection offered to large shaft-driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum and wood. Grey curled hair and hand buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirements.

These are some reasons why the HAYNES gives such satisfactory service at a low rate of cost for upkeep. Others are given in our catalogue, No. 15, sent prepaid upon request.

ELMORE ANNOUNCEMENT.

During the New York and Chicago Automobile Shows, 1905, we were approached by hundreds of automobile owners, saying, "If you people would only put out a four-cylinder two-cycle car, you would simply have the rest beat out of sight. It would be practically the same as an eight-cylinder of the four-cycle type, with about one-fourth the complication, and as steady running as a clock." Well, we have built the four-cylinder, and it is all you expected, and more. You may have already heard this from persons who have seen and ridden in it, but you have never heard us say so. We, therefore, take this occasion to announce that it is our firm conviction that not only have we exceeded the most sanguine expectations of our friends, but that in all essential points we have the best four-cylinder car ever built.

Our two-cylinder two-cycle car is a worthy successor to our Model 11, which, for reliability, as is well known, has never been excelled. It is in the details of construction that we have made our great advance, and in changing from chain to shaft drive we accede to the popular demand for a two-cylinder car of that type. Among the details we have improved is in using a new planetary gear running in oil, a popular make of circuit breaker, heads cast solid with cylinder, and on both cars we use the famous Hill Precision Oiler. But, as said above, there are so many things we want to talk to you about that we hope you will at once get into communication with us.

We have made so many improvements on our 1906 Models that we have not the space to speak of them here, but our literature will explain them all in such a manner that you will readily see we have a car with the exact features that have been talked of for years as being most desirable, but are impractical on any four-cycle car on account of complication, rythm of motion, power, etc., but which come perfectly natural to our two-cycle. The action and power of an eight-cylinder car with one-fourth the complication does it all. Ask for literature.

NOTE.—Will exhibit in New York City at Madison Square Garden ONLY.

Powerful

90 inch wheel base. Four-Cylinder. Four-Cycle. Air-Cooled.
Made of the best material obtainable, and strictly high grade in every particular.
Starts from the seat by a foot lever, no cranking.
Full control on steering column, no side levers.
Speed, 40 miles per hour.
Price, complete with cape top, $2,000.00.

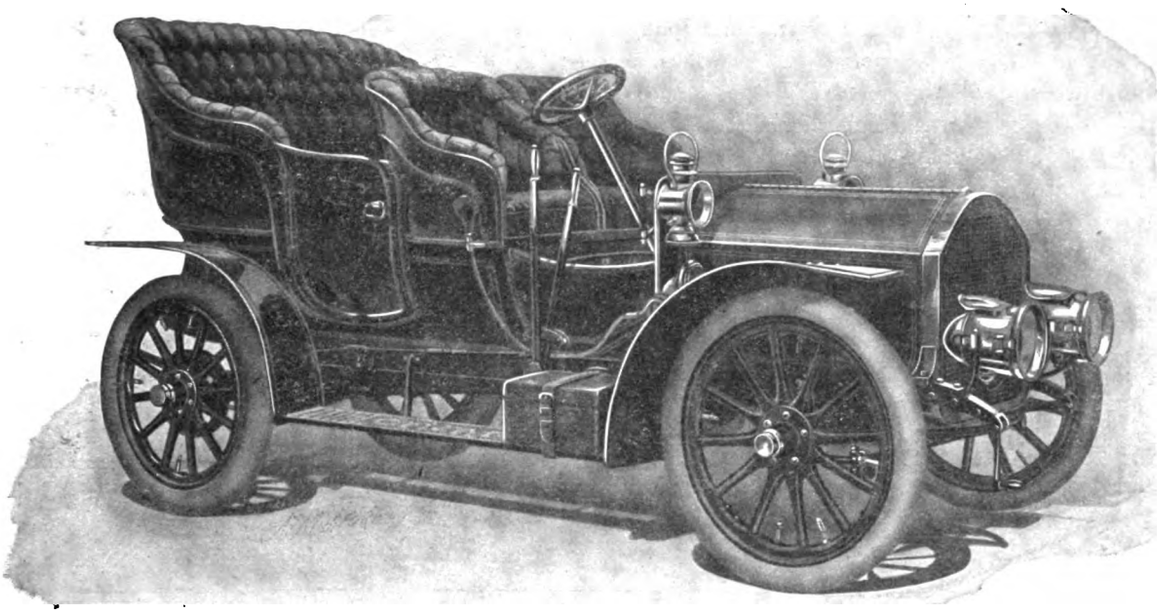
Duquesne Construction Co.
JAMESTOWN, N. Y.

GET ACQUAINTED WITH THE GROUT.

The Car of Quality and Simplicity.

A Four-Cylinder Water-Cooled car of 30-35 H. P. with slide gear transmission, built on sound, sane principles, lacking not one of the accepted attributes of a high-class car, and listing at $2,500.

SPECIFICATIONS:



30-35 H. P., 4 cylinder, balanced motor, high tension ignition using o e coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse actuated by single lever.
Wheels, 32 inch wood artillery, ball bearings, 4 inch tires.
Armored Frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication, mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.
Top and headlight with generator.

Waltham=Orient

Waltham-Orient, Model R, $2250.

The Car of Today Must do More than Look its Price. The high priced, high powered motor car is all right—it has its place and its purchasers, but the POPULAR DEMAND is for a car of moderate price, reasonable speed, that will be maintained up-hill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.

It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it, and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of Its Price

SIX MODELS FOR 1906.

Model R, a Swell Special 20 H. P.....	$2,250
Model N, 20 H. P. Tourist.....	$2,000
Model L, 16 H. P. Tourist.....	$1,750
Model M, 16 H. P. Runabout, Detachable Tonneau	$1,750
Model K, 16 H. P. Two Passenger Runabout	$1,600
Model BB, 4 H. P. Friction Drive Buckboard	$400

We are alive for live agents. Write for specifications and proposition. We will exhibit at New York, Chicago and Boston Shows.

OLDSMOBILE

Standard Runabout, Model "B" Price, $650.

For 1906 we have brought out, in addition to our well known curved dash runabout (the "you see them wherever you go" kind), a straight dash or "piano box" runabout, which we sell at the same price. This style appeals strongly to a certain class of drivers. It is unique and attractive and possesses all the most desirable features essential to a satisfaction-giving runabout.

It has a simple single cylinder motor, with 7 h. p. It is lever controlled. Starts from the seat; has safety device to prevent all danger of back fire; effective and easily operated brakes, and many attractive and serviceable features, making it up-to-date and desirable in every way—a big value for the money, and essentially a car for business utility.

Use the Catalog Coupon below for further particulars regarding the Standard Runabout, Model "B," price $650; the Palace Touring Car, four-cylinder, Model "S," price $2,250; two-cycle Model "L," price $1,250, or any of our commercial vehicles.

Change Tires 30 Seconds Goodyear Universal Rim

SUPPOSING you were 25 miles from home, and your tire exploded. And you hadn't another with you. And when you stopped at the garage, the man said: "I'm sorry, but I haven't a single tire of that make."

Wouldn't it make you mad?

Of course it would, if you had an *ordinary* rim.

But if you had a Goodyear Universal Rim, you would smile and say: "Bring on any old tire, as long as it's a clincher my rim will take it." And in less than three minutes you would be enjoying the scenery once more.

Because it *isn't* an all-day job to take off and put on a tire when your car has Goodyear Universal Rims. Just jack up the wheel and in 30 seconds the old tire is off, and in another 30 seconds the new tire—ANY kind—is on. You need no tools but the hands—and are "fixed up" and on the road while the man with *ordinary* rims is hunting for his crowbars and levers.

Figure 1

You see the flange comes right off on Goodyear Universal Rims, like Fig. 1.

And then a 30-inch tire (for example) slides right on to the 30-inch rim like Fig. 2, as easy as you would put on yoor hat. On an ordinary rim you would have to pry that 30-inch tire over a 31-inch flange.

Figure 2

You know what a profanity-inspiring job that is, and it doesn't do the tire any good, either.

Now this is all there is to taking off and putting on a tire when you have Goodyear Universal Rims. See how simple and easy it is.

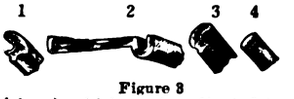

Figure 3

The rim is made up of four parts, like Fig. 3.

Nos. 1 and 3 are the removable flanges (rings), which can be adjusted to any clincher tire.

No. 2 is the base of the rim attached to the felloe of the wheel. It can be used without fitting on any standard wheel built for the standard clincher rims.

No. 4 is the locking ring, which holds the flanges in place.

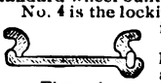

Figure 4

If you have decided to relieve yourself of all tire troubles and in consequence ride Goodyear Detachable Auto Tires, a section of the rim, when put together, would be like Fig. 4.

Or, if you ride an ordinary clincher tire, the rim section would look like Fig. 5.

The ring which holds the flanges in place is split at a point alongside the valve stem, like Fig. 6.

Figure 5

It can't be removed (and, of course, the tire can't come off) while the flange presses against it.

This flange is kept tight against the ring by a plate which slips over the valve stem, like Fig. 7.

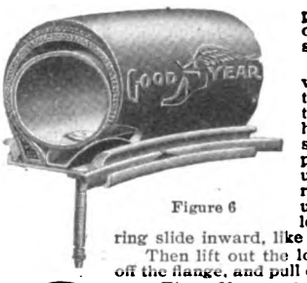

Figure 6

When you wish to remove the tire, loosen the nut which holds the valve stem down, and push the stem up through the rim. This pushes up the plate and lets the flange ring slide inward, like Fig. 8.

Then lift out the locking-ring, slip off the flange, and pull off the tire.

Time, 30 seconds. No tools but the hands.

Figure 7

Figure 8

Those who are weary of tire troubles are specifying Goodyear Auto Tires on Universal Rims. This equipment *costs no more* than the ordinary kind, and multiplies the pleasures of motoring many times.

Ask for our "Good News Book" and find out all the good points of the Goodyear Auto Tire and Universal Rim. It's of vital interest to the Manufacturer, Dealer or User who is satisfied with nothing but *the best*.

Rambler

Surrey Type One

We invite inspection of this car, which stands, without question, the leader as a practical car for general utility and steady daily service in the hands of the ordinary non-professional operator.

It is the result of years of development in the line of absolute simplicity in control and the elimination of those complications that tend to petty and sometimes serious breakdowns, that while readily repaired by expert repair men, result in vexatious delays and expense to the layman who prefers to operate his own car.

Briefly, it is a five-passenger touring car of elegant appearance, with power to carry you anywhere at any speed up to 35 miles per hour, with the maximum of comfort and satisfaction.

We will gladly show you, and a practical demonstration at our Branches and Agencies everywhere will be our most convincing argument.

Ready for the road, with lamps, horn and full equipment of tools, etc., $1,200.

Cape top, or canopy top with glass front, $100.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, December 14, 1905. No. 12

HERE HE IS AGAIN!

Pennington Now Blowing Bubbles f r Toledo —Nutless Truck his Newest Wonder!

Like the proverbial penny, Pennington has turned up again.

This time Toledo, Ohio, is his objective. At present he is dealing only with such a comparative trifle as a spark plug. But, of course, he has larger things—much larger things—in view. He would not be Pennington were it otherwise. There's only one of him—E. J. are his initials—and Colonel Sellers never was in his class. He has flitted from one continent to the other and back again, and has "rested" in many, very many towns, and never has he failed to blow a fine large bubble and to equip the Boards of Trade and the admiring townspeople generally with eyeglasses that enabled them to see millions in its every changing hue.

Usually before they have removed the glasses Pennington has found the air oppressive and sought a different climate. He seems to relish the game. He seems never to tire of it. When it was newer it netted him so many dollars that he used diamonds as jackstones. Latterly things have not come his way so swiftly, but his solicitude for Toledo suggests that he is in no wise discouraged. He apparently believes in the "try, try again" maxim. Not even the "disappearance" of his airships or of the million-dollar Standard Oil Automobile Co. of St. Louis, on which the Motor World turned such a flood of light, have deterred him.

In Toledo one of the papers refers to him rather cautiously, it is true, but in big black type as the "father of the American automobile in that he states that he made the first exclusively automobile ever made in America."

Just now he is "having the machinery made" in Toledo, not for the famous little motor which will burn kerosene or any other old thing, and for which every farmer craves, but for a simple ignition plug. But the mere fact that he has honored Toledo to this extent "leads to the belief that he will ultimately locate his entire plant in that city." "His present plans call for a large institution which will require a large amount of capital"—that's Pennington, all right. "His present project is to erect a plant for manufacturing automobile parts according to his own ideas, a specialty being made of light truck wagons having a capacity of two tons. These are also to be made after a new pattern, which, it is stated, will require only two or three bolts in the entire construction" —that's the same old Pennington in every line.

The Toledo paper refers to him as E. J. Pennington, of Grand Rapids, Mich., but the thumb marks are only too plainly those of "the only" Pennington, of New York, London, Cleveland, Cincinnati, St. Louis, Cortland, N. Y.; La Crosse, Wis.; Carlisle, Pa.; Racine, Wis., and the Lord alone knows how many other places.

Knox Acquired Engine, not Car.

The Knox Motor Truck Co., Springfield, Mass., will not, after all, take up the manufacture of pleasure cars. It transpires that their deal with the representative of the Sunset Automobile Co., San Francisco, did not have for its object the reproduction in the East of the Sunset car, as was first reported, but for the acquirement of the rights to use for commercial purposes only the Libbey two-cycle engine, with which it is equipped. These rights have been secured, and the motor will be used in a new heavy delivery wagon of about 2,500 pounds' capacity, which the Springfield concern will add to its line early in the spring.

Armstrong out; Burk in.

W. W. Burk was this week appointed manager of the Electric Vehicle Co.'s New York branch, succeeding F. C. Armstrong—a change that will cause considerable surprise to the local trade. Mr. Burk had been in charge of the E. V. branch in Boston for several years, and has all the qualifications that should enable one to "hold his own" in the metropolis. The vacancy caused by Burk's promotion has not yet been filled.

Brock to Leave Autocar.

M. I. Brock, sales manager of the Autocar Co., Ardmore, Pa., has resigned that office, and about the latter part of January, when his resignation becomes effective, will locate in New York. Mr. Brock was so generally considered an Autocar fixture that his change will prove a widespread surprise.

"LANDED" A LAWYER

He was a Novice so the Manhattan Storage Took Him in - Now he Sues.

One of those dealings for which the sweet-scented Manhattan Storage Company has made a name was uncovered last Tuesday when counsel for the firm was called upon to hand in a brief to Judge Moore in the Twelfth District Municipal Court, New York, in an action brought against them by George W. Carr, a lawyer of 29 Wall street, or have judgment taken by default.

The tale hanging thereto makes interesting reading and serves as an apt illustration of how even those trained to be on the alert in business dealings will place trust in their fellow man to an extent that is amazing in the light of their experience.

Last August Mr. Carr wished to provide his better half with an easily managed vehicle for use about his summer home in New Jersey, and responded to an alluring advertisement of a second-hand "Columbia Electric Elberon Victoria," which was held forth as being in the very prime of condition, with batteries as good as new, and was offered for the small sum of $450. Mr. Carr admits to a profound ignorance of electric vehicles and had no particular desire to acquire one for his own use. The first visit was without result, but the next day Mrs. Carr telephoned an offer of $300, which was accepted right out of hand and a second inspection was made.

"And me a lawyer!" disgustedly said Mr. Carr when seen by a Motor World man. "I have no words to express my chagrin at having been roped in so neatly. The very way in which they snatched up the offer of $150 less should have been sufficient to put me on inquiry. And I understand the man who waited on us, James Hand, is out on bail on a similar charge brought by a theatrical man named Perley. Of course, practically the only thing I cared about was whether the thing would go or not, and they guaranteed that it was good for at least thirty-five miles on a single charge of the battery. And—well, what's the use of swearing now, but their whole manner of dealing should have roused

(Continued on page 578.)

The Week's Incorporations.

Cambridge, Mass.—Harvard Automobile Co., under Massachusetts laws, with $45,000 capital. Treasurer, R. A. Faye.

Pontiac, Mich.—Pontiac Motor Co., under Michigan laws, with $25,000 capital; to make automobiles. Corporators—Martin Halfpenny et al.

Newark, N. J.—The Semi-Dry Battery Co., under New Jersey laws, with $135,000 capital. Corporators—Jay E. Dunn, Arthur F. Jackson and L. Breed Jackson.

New York City, N. Y.—Automobile Trade Credit Association, under New York laws, with $1,000 capital. Corporators—F. J. Alvin, E. J. Willis and J. E. Murray.

Newark, N. J.—Austin Auto Co., under New Jersey laws, with $25,000 capital. Corporators—Herbert Austin, Thomas G. French, Jr., and Charles Krebs.

New York City, N. Y.—The Perfection Reversing Gear & Supply Co., under New York laws, with $50,000 capital. Corporators—A. G. Brodie, G. W. Storm and G. D. Maxwell.

Buffalo, N. Y.—The Palace Motor Car Co., under New York laws, with $15,000 capital, $8,000 paid in. Corporators—Charles F. Benzig, Nathan Dougherty and Charles E. Shaw.

Milwaukee, Wis.—Welsh-Estberg Co., under Wisconsin laws, with $50,000 capital; to manufacture motor cars. Corporators—Harrison S. Green, Charles G. Welch and William O. Welch.

St. Louis, Mo.—St. Louis Motor Car Co., under Missouri laws, with $100,000 capital; to manufacture motor vehicles. Corporators—Marshall A. Sattley, Marquis Eaton and M. M. Keiner.

New York City, N. Y.—Gaulois Tire Co., under New York laws, with $500 capital; to manufacture all kinds of tires. Corporators—Edward S. Griffing, George A. Burkhardt and John G. Craig.

Boston, Mass.—Crown Motor Car Co., under Massachusetts laws, with $40,000 capital; to deal in automobiles. Officers and corporators—President, W. A. Shafter; treasurer, G. M. Barnum, Jr.

New York City, N. Y.—Franklin Automobile Agency, under New York laws, with $500 capital; to deal in automobiles. Corporators—Edward S. Griffing, George A. Burkhardt and John G. Craig.

Chicago, Ill.—Drake Electric Co., under Illinois laws, with $10,000 capital; to manufacture automobiles and electric appliances. Corporators—James M. Wilson, William Herrick and Frank E. Drake.

Detroit, Mich.—The Aerocar Co., under Michigan laws, with $100,000 capital; to make air cooled automobiles. Corporators—E. J. O'Hagan, A. Y. Malcomson, H. H. Thorp, W. G. Morley and M. O. Reeves.

Peoria, Ill.—Illinois Automobile & Parts Co., under Illinois laws, with $10,000 capital; to deal in automobiles and accessories. Corporators—J. Arthur Holsman, H. C. Marth, H. W. Bovee, C. E. Nixon, J. W. Goings, W. E. Epperly, William Eck and Emil Schimpff.

Jersey City, N. J.—The Pneumatic Ball Tire Co., under New Jersey laws, with $3,000,000 capital; to manufacture automobile tires. Incorporators—Frank A. Magowan, Brown McDonald and Frank Adams.

New York City, N. Y.—Dac Automobile Supply House, under New York laws, with $500 capital; to manufacture and deal in automobile parts. Corporators—Edward S. Griffing, George A. Burkhardt and John G. Craig.

Goodyear Gets Big Broadway Location.

After January 1 the Goodyear Tire & Rubber Co. will be "at home" in New York in the fine new building on the southeast corner of Broadway and Sixty-fourth street, which is now being made ready for their occupancy. The Autocar Co., of New York, held the original lease, but disposed of it to the Goodyear people. The latter will occupy the entire building, which is of three stories and basement, with a glass frontage of 54 feet on Broadway. The location is on a wide open part of that thoroughfare, where it must be seen from every elevated railway train and by every person who comes from the subway. Electric signs will impress the Goodyear establishment on their minds.

"They all will know a good deal more about Goodyear tires than they ever knew before," remarked Manager Harwood with a significant smile.

This new branch will, of course, carry a full stock of the Goodyear goods, and it is promised that its vulcanizing department will be the largest in New York.

Philadelphia Dealers Elect Officers.

A. E. Maltby, of the Philadelphia branch of the Winton Motor Car Co., has been elected to succeed himself as president of the united Philadelphia Automobile Dealers' Association. The secretary cast the ballot for all the officers, the others being as follows: Vice-president, G. S. Smith, the Motor Storage Co.; secretary-treasurer, L. J. Morse, Locomobile Co.; directors, the officers, and W. F. Smith, T. B. Jeffery & Co., and Daniel Cohen, Rea Motor Car Co. Show plans were discussed at length, and it was decided to hold the annual Philadelphia exhibition in the Commercial Museum Amphitheatre from February 24 to March 3. Chester I. Campbell, of Boston, was engaged as manager.

Cramer Heads Buffalo Ticket.

The annual meeting and banquet of the Buffalo (N. Y.) Automobile Trade Association will be held in the rooms of the Automobile Club of Buffalo to-morrow (Friday) evening. The following ticket is up for election: For president, J. A. Cramer; for vice-president, W. C. Jaynes and G. H. Poppenberg; for secretary, D. H. Lewis and John Frey; for treasurer, John J. Gibson; for executive committee, E. C. Bull, J. B. Eccleston, ... E. Denniston, N. P. Baker, P. W. Eigner, John Frey and Cal Paxton.

In the Retail World.

Githens Brothers Co. have taken the agency of the F. B. Stearns car for Chicago and Milwaukee.

Sheets & Knodle, De Kalb, Ill., have taken up the sale of automobiles. They will handle the Mitchell car exclusively.

Hatch & Co., New York agents for the Compound car, have reopened. They are now located at No. 1,655 Broadway.

The Fisher Automobile Co., Indianapolis, is erecting a large addition to the garage at No. 330 North Illinois street. The new structure will cost $5,000.

John J. Short & Bro. contemplate erecting a three story brick and limestone trimmed garage in Philadelphia. It is to be located at 2,018-2,020 Sansom street.

The L. C. Gilson Co., Portland, Me., have opened temporary quarters at Elm and Cumberland streets, that city. The Ford and Stanley will be the cars represented by the company.

To secure much needed elbow room the Santa Rosa Cyclery and Garage, Santa Rosa, Cal., has moved from the old Dougherty-Shea Building, on Mendocino street, into the new structure on 5th street.

The White Sewing Machine Co., Cleveland, Ohio, has taken over the business of James F. Cox & Sons, at No. 662 State street, New Haven, Conn. W. P. Frost, of New York City, has been placed in charge.

Frank W. Howell, as receiver for the Dayton Motor Vehicle Co., Dayton, Ohio, has filed a report showing receipts of $8,452.66 and expenditures of $8,252.91, leaving a balance of $199.75. An indebtedness of $2,285.55 remains, part of which is covered by the balance and several patents.

The Packard agency in Buffalo, N. Y., which early this season was transferred from the Centaur Motor Co. to the Jaynes Automobile Co., has again changed hands. Ex-Mayor Alliger of Tonawanda, N. Y., who had an interest in the latter concern, has withdrawn, taking the Packard agency with him, and will set up on his own account on Main street, in Buffalo.

C. F. Bates, a repairman and mechanic of Brockton, Mass., has filed a voluntary petition in bankruptcy. His liabilities are scheduled at $29,982, with assets amounting to $3,200, of which $3,000 is for a life insurance policy. Some of the liabilities were contracted when Bates was a co-partner with F. A. Hunt, in the Commission Automobile Company, now dissolved.

The L. W. Pond Machine & Foundry Co., Worcester, Mass., has completed an addition, 100x60 feet, to its foundry department, and will discontinue the manufacture of metal planers and will conduct in its stead a modern garage. Caleb Calvin has retired from the business, and M. T. O'Leary has succeeded him as president and treasurer. James W. Murphy, of the Prentiss Tool & Supply Co., has been engaged to take charge of the automobile business.

Digitized by Google

DEPARTURES IN THE DUNLOP

That Well Known Tire Radically Altered—Special Rim No Longer Required.

In the light of a year's experience with the Dunlop detachable tire, the Hartford Rubber Works have not been backward in recognizing the shortcomings of its first model, and for 1906 have added radical improvements that will do much to increase the vogue of the mechanically fastened tire, and that in the case of the Dunlop itself are so marked that it has "held its own" in convincing fashion.

The chief objection raised to the Dunlop tire last year was the fact that it required a special rim. This left the user of this type stranded unless replacements of the same tires could be had. Equally bad was the certainty of a tire creeping the moment it was punctured or through any other means became sufficiently deflated, so that before it was possible to stop the car the valve stem would be torn off, making it absolutely necessary to carry spare tubes and placing a roadside repair beyond the capacity of the average driver. These defects have all been taken account of and entirely eliminated in the design of the new rim.

First and foremost, the new rim will be made in standard clincher sizes, and with the aid of reversible beads will not only accommodate the Hartford Dunlop, but any standard clincher tire. The depth of the gutter has practically been doubled, this change greatly increasing the factor of safety as a preventive of the possibility of the bead blowing off the rim. The most striking improvement is, however, embodied in what is termed an "endless, floating ring." This not alone acts as a seal, preventing the entrance of moisture at any place except the valve hole, which will be protected by the use of a metal base valve, making the tire as a whole exceptionally waterproof, but constitutes the long-sought for non-creeping device. When the tire is flat this ring rests lightly on the inner edges of the cover throughout its entire circumference, thus effectively preventing any movement of the tire about the rim should it be ridden in this condition.

In proof of this, a tire of the new model that had already been run the equivalent of several hundred miles on a test wheel, was fully deflated and run flat for forty-five miles, the cover and rim being carefully marked in order to be able to note any movement. Subsequently the tire was reinflated and run several hundred miles more on the test wheel, which is eloquent testimony of its ability to withstand this treatment, inasmuch as the drag on the test wheel is far greater than it is possible to obtain on the road. This floating ring is of course only adaptable to the detachable edge clincher rim, and it is the intention of the company not to make it fit 1905 Dunlop rims.

During the past half year exhaustive experiments have been made with a view to improvement in the construction of the tire itself, and after thoroughly testing something like fifty different experimental types, it is claimed that hitherto unknown results have been obtained which will form a feature of the 1906 line of Dunlops. The composite of the numerous experimental types designed and tested out consists of a wrapped tread cured in one heat and vulcanized in the position it takes when on the rim. In addition to this, the inside of the casing is a true circle. This means that when inflated the tire is not called upon to bear an unnecessary strain at any one point. In other words, the compressed air does not have to gradually make the tire round, something that must take place eventually, regardless of what the original internal section of the tire may be. The base of the tire is further given a reverse curve, which acts as a preventive of rim cutting.

Where the general make-up of the tire itself is concerned, the cover stock will be softer than formerly, and a strip of pure gum will be inserted between the cover and the outer layer of fabric. Above this will be the regulation breaker strip. This is a combination designed to prevent what is commonly known in trade parlance as "shuffling"—that is, movement of the several layers of the tire upon one another, a defect that brings about rapid disintegration of the whole construction.

The 1906 line of Hartford clincher tires will in all respects conform to the same high standards of improved construction just described, in addition to being fitted with the new floating ring device, thus obviating the necessity of using lugs, although for obvious reasons the same ring will not be available for both types of tires.

The sweeping changes not only represent many months' work in bringing about, but also entail a tremendous amount of new equipment, particularly as regards the alteration of the Dunlop sizes to conform to customary clincher standards, entirely new facilities, even to the extent of tube sizes, being necessary in this case. In addition to this, facilities have been installed to produce reverse curve tires to conform to 1905 rim sizes, so that even for renewal business strictly up-to-date tires will be furnished.

INDEPENDENTS GO INTO TIRES

Company Formed, Plant Secured and All Else in Readiness—Details of the Project.

Rumors that had been current for several weeks that most of the prominent "independent" automobile manufacturers identified with the American Motor Car Manufacturers' Association were concerned with the formation of a big co-operative tire manufacturing plant crystalized into fact this week. Their plans are so well matured that a factory in this city already has been secured, and it is anticipated that the Ajax tires themselves will be in evidence on all the "independent" cars at the A. C. A. show next month.

Ajax Standard Rubber Co. is the style under which the company has been incorporated under the laws of New York with $100,000 capital. Horace de Lisser is its president, and Robert A. Patterson, treasurer. The secretary has not yet been selected. Mr. de Lisser was at one time connected with the sales department of the International A. & V. Tire Co., and later has been agent for Holbrook's Worcestershire sauce. Mr. Patterson is president of the Tarrytown (N. Y.) National Bank. The tire itself will be styled the Ajax. It will be of the standard clincher type, and will be manufactured in New York in a plant located at One Hundred and Sixth street and East River, New York. The building already has been leased, and the necessary equipment ordered from the John Thorpe Sons Co., Trenton, N. J. The superintendent of the plant will be Louis P. Destribats, formerly superintendent of the International A. & V. Tire Co.

The Ajax Co. has applied, through counsel, for a license to manufacture under G. & J. patents.

Mr. de Lisser stated to a Motor World man that failure to obtain the license would not affect the Ajax plans. They were ready to pay royalty, and indeed probably would set aside an amount on each tire as a sinking fund, which the G & J people could have whenever they wanted it. Mr. de Lisser made it plain that they were not seeking a fight or to create a disturbance of any sort. Ajax prices will be the same as the existing prices on other tires, likewise the guarantee, and, in all probability, the weights and sizes, though on this last point he would not commit himself definitely.

In view of this state of affairs, Mr. de Lisser was asked wherein the Ajax Co. could favor its patrons. He pointed out that as the stockholders were practically all automobile manufacturers, they would share in the dividends. Pressed closer, he became more specific.

"The new company will assure manufacturers that they will get the tires they want whenever they want them and in whatever quantities," he said. He said that the arrangement now existing in the tire pool prevented service of this sort. Each factory is allotted a certain percentage of production, which, if exceeded, ceases to be profitable. As a result, Mr. de Lisser said that automobile manufacturers frequently had been unable to obtain the particular tire or tires for which they were ready to pay and for which they had a call or a pressing need.

The stockholders in the Ajax Co., Mr. de Lisser says, include the Ford, Mitchell, Maxwell-Briscoe, Reo, Wayne, National, Bartholomew concerns—practically every member of the American Motor Car Manufacturers' Association.

EVERY PENNY SPENT FOR

FISK TIRES

IS REGAINED A VALUE
BY THE PURCHASER

We believe in giving just a little more in tire quality than any other maker for what you spend; it emphasizes the fact that we are earnest in our efforts to extend to our patrons a "Square Deal."

COMPARE FOR YOURSELF THE DIFFERENCE IN QUALITY BETWEEN FISK TIRES AND THOSE OF OTHER MAKES.

They actually cut your tire expense in two, doing away with all exasperating "tire troubles," and turn drudgery into uninterrupted pleasure.

Our methods of handling Fisk Tire users will appeal particularly to those who appreciate a "Square Deal."

THE FISK RUBBER COMPANY, Chicopee Falls, Mass.

CADILLAC UTILITY

THE SINGLE CYLINDER CADILLAC
Will climb any hill that any automobile will climb.

THE SINGLE CYLINDER CADILLAC
Will travel any road that any automobile will travel.

THE SINGLE CYLINDER CADILLAC
Will travel as fast as anybody ought to ride.

THE SINGLE CYLINDER CADILLAC
Costs less to operate. Costs less to Maintain.
Requires less attention than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined, and won for them the unquestioned distinction of

AMERICA'S LEADING MOTOR CARS.

NEW YORK

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 11th and 18th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

Little Things of Large Influence.

That it is the little things that count, practically every man who has had to do with motor cars is well aware. Generally speaking, the large ones take care of themselves.

The little hooks, pins, bolts, nuts and terminals are the things that often are at the bottom of a lot of vexation that entails both labor and expense; indeed, the loss or breakage of any one of them have caused grievous mischief, as witness, the recent fatal accident on Long Island, due to the loss of a nut from the steering gear of a foreign car.

There are many American manufacturers who have appreciated the importance of such things and made use of such nuts and bolts as add to the security of the whole machine. There are more of them who have done nothing of the sort, and who should lose no time in taking steps in that direction.

Despite their great concrete importance, it is in the nature of man to overlook these things and devote attention to the large things and to give but perfunctory notice to the apparently more trivial details. The hooks, pins, nuts and bolts are in this category.

It is a state of affairs that makes it incumbent on manufacturers of machines capable of such speed as automobiles are capable of to afford the fullest possible security. This is no brief for any particular device or devices, but if there are to be had nuts, pins, bolts or hooks that afford more security than those of common employment, common sense should dictate their use. It is a pennywise policy that causes eyes to be closed to the fact.

To our personal knowledge, the accident on Long Island which we have cited, was directly responsible for the loss of the sale of at least one $5,000 car. It frightened the family of the prospective purchaser. How many other families were similarly affected there is no means of estimating, but it is fair to assume that their number is not inconsiderable. Every accident to a person of prominence exerts that deterring influence. Business instinct, therefore, if nothing else, should inspire the use of every reasonable device that will tend to reduce the calamities that return to the injury of every one engaged in the industry.

The Question of Convertability.

Not every man who can afford to maintain a good touring car finds that his income covers all the conveniences and comforts that are to be had from automobiling at its best. For those who think nothing of maintaining a stable it is merely a matter of the choice of the proper cars, but there are many representing an intermediate class to whom the advent of a system of interchangeable bodies would be a boon.

It is not difficult to picture the many uses to which its owner could put his single chassis. It would be readily convertible into the customary side entrance touring car, which for wet weather could be replaced with a brougham, landaulet or other form of closed body, or with the use of rear deck converted into a runabout or two seated touring car, with ample room for baggage. Then there are the great possibilities that such a system would hold for the man who made use of his car during the week for business purposes.

An English firm is already placing on the market a system of what are termed "sliding, detachable motor bodies." The body is simply slid on to the chassis, inverted L shape retaining rails on the latter engaging a similar device on the body itself, which automatically locks itself in place when shoved "home" in such a manner that there is no danger of the passenger accidentally being goes its way. Further provision for concontinues on. Further provision for convenient handling is made in the shape of four legs running on castors, which support the detachable body at exactly the proper height from the floor for sliding it on to the chassis and permit of it being readily detached by one man without any lifting tackle. All the various forms of bodies are of standard construction and appearance in other respects, and are said to fit so perfectly that it is impossible to detect any difference. This would appear to be a development that is apt to come in for more attention in the near future. It would seem to merit it.

The Second-Hand Problem.

With the advent of the coming year the automobile industry as a whole will practically enter upon a new epoch in its history, and numerous problems that have not made themselves felt to any extent in the past will no doubt become pressing before the selling season is over. Chief among these is the question that each dealer must solve for himself, and that is the matter of taking second hand cars in exchange. Some have taken the step already, accepted it as part of the business, in fact, and took to it from the first as a matter of course. Not so with the majority. They have found themselves face to face with

Digitized by Google

it unceasingly during the last two years, but have as continuously evaded it.

It is not difficult to understand the reasons that have been uppermost in causing an adherence to this policy. The most important is that of the departure from catalogue prices that it would necessitate at the outset. Again, a more or less inflated valuation of the car taken in exchange would be necessary in the majority of instances to the closing of the bargain. That such cars would not in one case out of ten bring in the open market the prices that their owners would expect to trade them off for in exchange for a new car goes without saying. This in itself naturally forms the most serious bar to the plunge on the part of the agent.

Certain it is that no manufacturer could for a moment entertain such an idea so that the agent would be compelled to adopt the plan entirely on his own responsibility. Whether the car taken in exchange could always be disposed of at a price sufficiently large to cover the deficit in the selling figure of the new car, as well as the expenses of storage, overhauling and repairing, would not appear to be a certainty despite the perspicacity of the most experienced hand in avoiding pitfalls in the shape of good looking crooks.

Here, again, is another controlling element in the shape of the greatly increased expenses involved in providing room as well as a force to take care of a comparatively large number of cars, none of which is in the prime of condition. A car is never new but once, and such a thing as a second hand car that did not need more or less overhauling would indeed be a rarity. These and other considerations must cause the agent to hesitate before embarking upon such a move. That there will be ample reason for considering it, however, is apparent even now.

The Moral of Morrell's Bill.

Congressman Morrell's bill for the alleged national regulation of motor vehicles is remarkable chiefly as showing the heights to which statesmanship may rise. It is to be hoped that the Pennsylvanian will live long enough to discover what a monumental ass he has made of himself. His measure should, however, serve as a warning to those misguided automobilists who are so ready to suggest or support legislative efforts to revoke for prescribed periods what is and should be the inalienable right to the use of the public highways. Morrell has carried it to its logical conclusion and shown the way to revoke it for all time.

NEW TIRE WEIGHTS AND SIZES

Tire Association Adopts a "Per Wheel" Basis—Figures that will Govern 1906 Guarantees.

The Tire Association has finally made public the weight and sizes on which the guarantees will apply during 1906. They are as follows:

Size.	Weight Per Wheel.
28 to 36x2½	225 lbs.
28 to 36x3	350 "
28x3½	400 "
30x3½	450 "
32x3½	550 "
34 & 36x3½	600 "
30x4	550 "
32x4	650 "
34x4	700 "
36x4	750 "
32x4½	700 "
34x4½	900 "
36x4½	1000 "

For weights exceeding 1,000 pounds per wheel, 5-inch tires and over are recommended.

The weights are without passengers or luggage. In announcing them, to quote one announcement: "It is mentioned solely to avoid wrongful comparions, that foreign tires are usually listed with weights including the luggage and passengers. Proper allowance must be made to arrive at the equality of domestic and foreign made tires."

Local Shows that are Sanctioned.

In addition to the two New-York shows and the one in Chicago, the shows sanctioned by the National Association of Automobile Manufacturers are as follows: Washington (D. C.) Automobile Dealers' Association, Inc., February 3 to 10; Tri-State Sportsman's Association, Detroit, February 12 to 17; Cleveland Dealers Automobile Co., February 19 to 24; Buffalo Automobile Trade Association, March 5 to 10; Boston Automobile Dealers' Association, March 10 to 17; Denver Automobile Show Association, a date in April to be hereafter decided upon.

Nothern to Have Air Brakes.

One of the radical novelties of the new four cylinder Northern touring car will be an air controlled clutch and air brakes, which will be supplied from a large storage tank. They will be entirely manipulated from the top of the steering column, where a secondary wheel will give complete mastery of the gears and clutch. The braking system will be patterned after that in common and successful use on railroads, and the handling of the machine will be correspondingly simple and effective.

Mora, Not Pitkin, the Man.

It is A. H. Mora, and not James M. Pitkin, who intends to build automobiles in Newark, N. Y. There was a confusion in the names. Mora expects to colonize Newark with fifty families and establish a factory that will turn out one car a day. Mr. Pitkin is president of the Newark Board of Trade, and disclaims any mormonistic tendencies.

"LANDED" A LAWYER.

(Continued from page 573.)

my suspicions. We bought the thing on a Friday and accepted it without the slightest demonstration; never so much as moved it from where it stood.

"They promised to give it a thorough cleaning and overhauling between then and Monday, when we were to call and take it away. I gave them a check for it, and hang me if they didn't make me guarantee the endorsement on it. Then I was incidentally and very innocently asked to put my signature to a 'bill of sale'; at least that is what they called it. A lot of fine print on a slip of paper, and I didn't pay the slightest attention to it. I found out afterward it was a sort of release from all claims against them of whatever nature. And I also found out that the ink on my check had hardly time to dry before it was on its way to the bank for certification. They had the money within half an hour of the time we concluded the deal—at least two and a half days before we got the car.

"We called for it as agreed and ran it down to the Long Branch boat, a short distance away. Before we got there one of the tires was flat. That didn't bother me so much as the appearance of the thing—it looked pretty 'rocky,' for they hadn't touched it. Once on the boat my attention was again called to the tires, for, by that time, two of them were flat. In fact, there was only one good tire out of four. I had them pumped up and started off the boat at Seabright landing and hadn't got more than a mile or so away when the thing stopped dead right in the middle of the railroad track—and trains are pretty frequent down there in summer. I was afraid we were in for a wreck, but we finally got past the tracks, and then the car laid down 'for keeps' after less than six miles of running. I took it to a garage down there, but the proprietor said he didn't want to tinker with the batteries, because he said he wouldn't guarantee what kind of a repair bill would be accumulated in putting them into shape; it might be a matter of $100 or it might be more.

"Well, I decided to give it another trial and had the cells charged. We only went a few miles away and started back but didn't get there, for she gave out again at the six-mile limit. That was Wednesday; I telephoned the storage people and they promised to send a man early the next day to look the machine over. I foolishly waited until well along in the afternoon, but the man never materialized, and when I telephoned again they repudiated point blank any promise to do such a thing. I gave them back the car on Friday, just one week after I had bought it and five days after it came into my possession, and brought suit against them for fraud. The action was tried without a jury and the court allowed them until Tuesday last to hand in a brief; it should be a highly interesting document. The judge has fifteen days in which to consider the matter, but I believe it will not take him that long to come to a decision."

MOTORPHOBE IN CONGRESS

Pennsylvanian Wants National Licences, $50 Fees, $1000 Fines and—But Read his Bill.

Congressman Morrell, of Pennsylvania, has made his bid for notoriety. While other people were talking of a national law regulating automobiles, he proved himself a man of action. On December 4 he distinguished himself by unloading on the House of Representatives a bill that seeks to do that very thing—it will practically regulate them out of existence.

Except as a medium for the advertisement of Morrell, none will accept the measure seriously. It is the same old frothing concoction, the froth being piled on a little heavier, if anything. It requires examination and a license, of course—price, $50—to pass from one State or Territory into another, not excepting Porto Rico or the Philippines, and would revoke for all time the right to use an automobile of any person who had been convicted three times in any court of the land. The additional penalty is a fine of not less than $500 nor more than $1,000.

The bill was referred to the Committee on Interstate and Foreign Commerce, where probably it will slumber long and peacefully. As a choice specimen of what a Congressman can do on occasion, however, it is interesting. Here is its full text:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that on and after the first day of January, nineteen hundred and seven, it shall be unlawful for any person owning or operating an automobile or motor vehicle, whether the motive power of the same be electricity, steam, gasolene, or other source of energy, to operate the same for business or pleasure along the public highways of any State, Territory, or dependency of the United States, or of the District of Columbia, so as to pass from one State into another State, District, Territory, or dependency, or from one Territory into another Territory or State, or from the District of Columbia into any State, without first undergoing a special technical examination as to his ability and power to manage, control, and direct automobiles or other motor vehicles with precision and safety, and obtaining a license or permit to operate automobiles or other motor vehicles between the States from the regular constituted authorities of the United States, as set out in the following section:

Sec. 2. That the Interstate Commerce Commission of the United States shall have power to conduct the examination prescribed by this act, under such rules and regulations as may be required, and shall appoint a technical expert to test the personal fitness, practical ability, and mechanical knowledge of any applicant, owner, or operator of any automobile or other motor vehicle as aforesaid, at such times and places as it may determine. Said technical expert shall be certified by the Civil Service Commission of the United States to the Interstate Commerce Commission, and shall receive a salary of one thousand two hundred dollars per annum and four dollars per diem for expenses while absent from Washington in the necessary discharge of his duties.

Sec. 3. That every owner or operator of any automobile or motor vehicle passing a satisfactory examination before said technical expert shall be licensed by the Interstate Commerce Commission to operate automobiles or other motor vehicles between the States and Territories, District of Columbia and the States, or vice versa; and such license shall be good for three years from the date of its issue, and may not be renewed without examination.

Sec. 4. That every owner or operator of any automobile or other motor vehicle who shall pass the required examination shall, before receiving his license or permit, pay into the Treasury of the United States the sum of fifty dollars.

Sec. 5. That whenever it shall appear that any owner or operator of an automobile or other motor vehicle, so licensed as aforesaid to operate automobiles or other motor vehicles between the States, has been convicted on three several occasions in any Federal, State, or municipal court of violating this act, or any State or municipal law governing automobiles or other motor vehicles, the Interstate Commerce Commission shall, after proper notification, cancel and revoke the license of said owner or operator and shall not reissue the same.

Sec. 6. That any owner or operator of any automobile or other motor vehicle violating the provisions of this law shall be fined not less than five hundred nor more than one thousand dollars, to be recovered in any district court of the United States in the district where the violation occurred.

Sec. 7. That this act shall take effect from and after its passage.

Jerseymen Want to Dig Ditches.

Another fool bill may be expected to crop out in the next session of the New Jersey Legislature. Residents of Centre Township, down in Gloucester County, will petition the Assemblymen of that section to introduce a measure to allow the use of gutters across the pikes a mile or less apart. That is their happy solution to the so-called "scorching" problem.

Gates Gets a Mileage Cup.

For driving his car 7,531 3-5 miles and sending a postcard from every town he passed through, Fred C. Gates, a member of the Cleveland (Ohio) Automobile Club, has been awarded the mileage cup "hung up" by the organization. Gates also won the "longest run" cup. His tour comprised a roundabout journey from Cleveland to Chicago and return.

Topeka Exacts its Little Tax.

Topeka, Kan., now has an automobile ordinance. It provides for a yearly registration fee of $1 and the display of one license number on the rear of the car. Speed of from six to sixteen miles an hour is allowed. The penalty for violation of any section of the ordinance is punishable by a fine of from $5 to $50 upon each conviction.

BOSTONIANS GROW BRAVE

After Long Suffering, Owners' Finally Organize and May Really Oppose Persecution.

The Automobile Owners' Association is being formed in Boston. Its purposes are twofold: (1) To fight in the courts all complaints for alleged overspeeding, and to appeal such cases where proper; (2) to exert the association's influence toward proper running of automobiles, in order that the prejudice now existing against automobiles may be lessened.

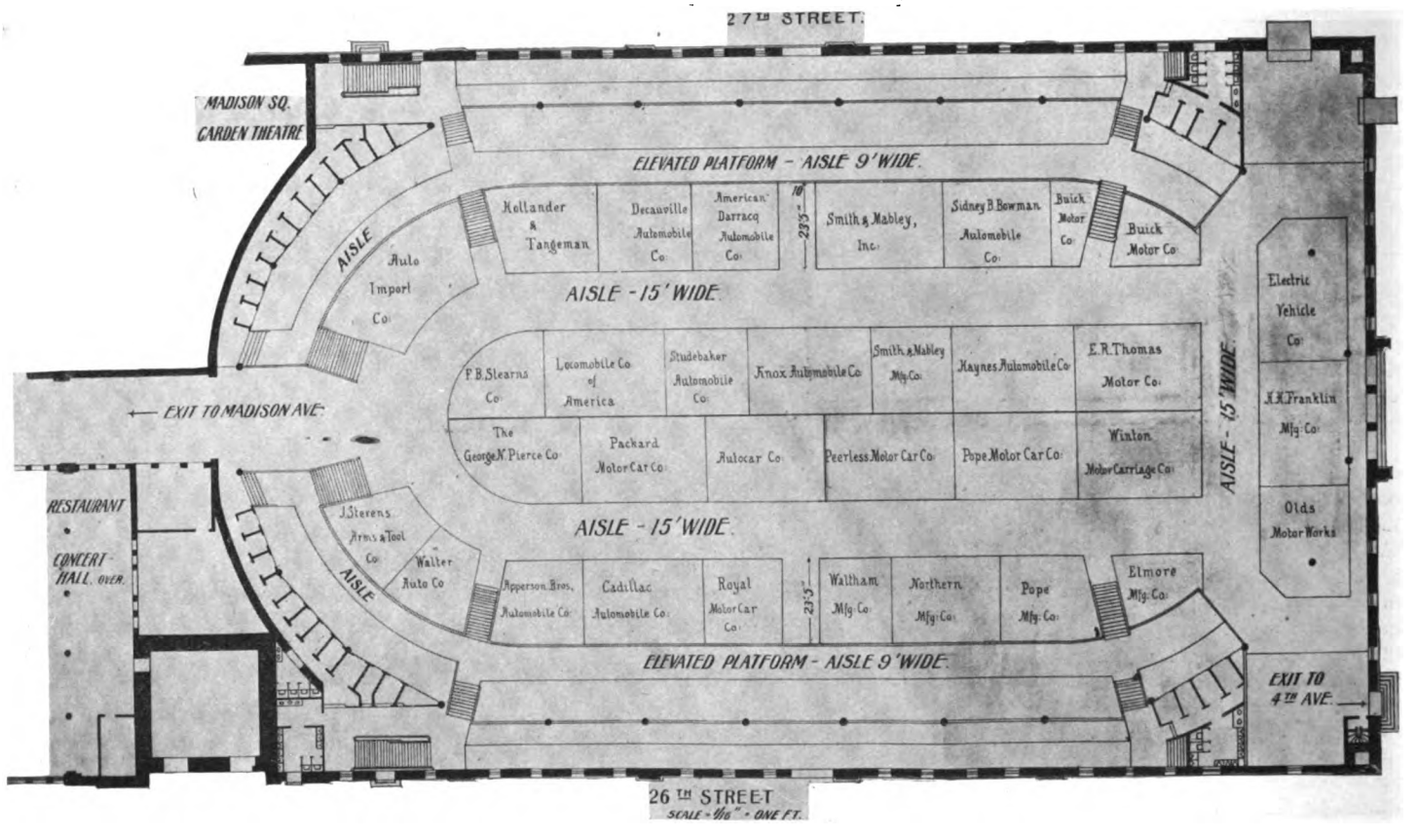
Members will be expected to report all cases of reckless or unlawful driving to the association, which will use its power to prosecute such cases.

All cases of arrest for alleged "overspeeders" by members, it is claimed, will be taken up by the association, a lawyer having already been engaged. Where practicable these cases will be appealed, as in this way the fine money, if collected, will go to the county instead of to the town where the arrest is made. It is hoped by this method to do away with the arrests made "for revenue only."

At present the association has no plans in regard to automobile legislation, though it is likely that later in the year this subject may be considered by the members, with a view to appearing before the legislature, if such a course shall seem advisable.

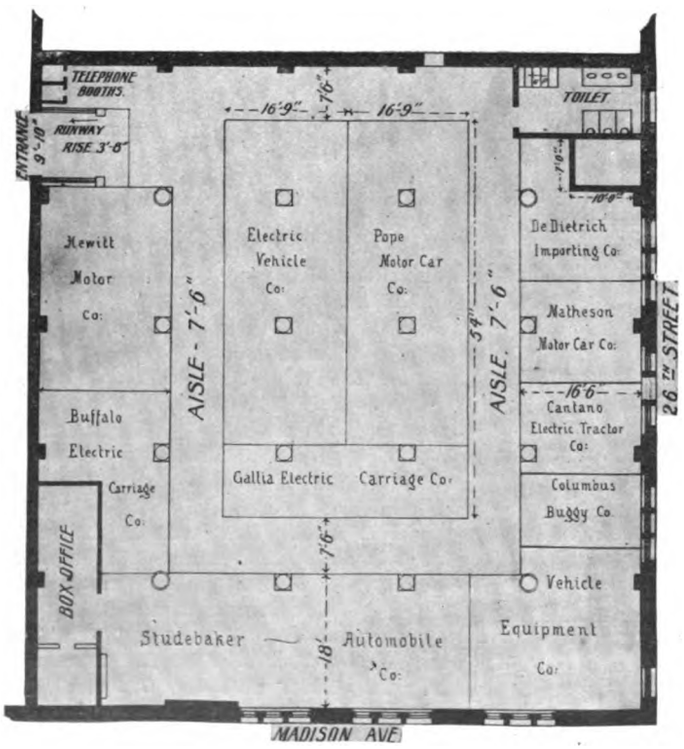
The membership of the association is to be made up from among owners of automobiles in "good standing." It is to be in no sense a business or racing association.

Frederic Tudor has been elected president and J. M. Graham treasurer. The other officers are to be selected when plans are fully consummated.



Philadelphians to Fight Local License.

Philadelphia is now having the same difficulty over its license law as was experienced by Pittsburg some time ago. The Automobile Club of Philadelphia and the Philadelphia Automobile Dealers' Association maintain that the new State law which goes into effect January 1, 1906, supersedes all local ordinances regulating motor cars, and naturally the officialty hate to lose the source of revenue from the sale of license tags.



To test whether the city of Philadelphia has a right to mulct motorists an amicable suit has been instituted. Counsel for H. Bartol Brazier, Charles S. Wurts, Jr., and Samuel Y. Heebner last Saturday filed a bill in equity in Common Pleas Court enjoining the city of Philadelphia, John Weaver, Mayor; Sheldon Potter, Director of Public Safety; John M. Walton, City Controller; John M. Lukens, Chief of the Bureau of Boiler Inspection, and Henry R. Schoch, City Treasurer, from enforcing the ordinance of December, 1902, averring that it conflicts with and is superseded by the act of Assembly of April 19, 1905.

PARIS LAMPOONS LONDON

Exclaims "Pooh!" Regarding its Show and its Products—Criticism Full of Instruction.

Paris, Dec. 1.—The Olympia Show in London is over. Opened with a great flourish of trumpets, it was to knock the wind out of the Paris Salon by showing, for the first time, all the novelties of the coming season, and incidentally to prove to the world that the British industry has at length taken its stand on the same plane as that occupied by what has always been regarded as the leading automobile country. Now that we have had time to digest the show, it really does seem as if there has been a little too much bombast about the Olympia gathering. No doubt it was a great success. The British public went there prepared to make it a success, for who could venture to say a word detrimental to the show when that puff agency, the British Empire Motor Trades' Alliance, had dinned it into the ears of people that the British motor industry was striding ahead and that the Olympia show was to be the biggest and most successful that the world has ever seen?

WHY THE SHOW SUCCEEDED.

The truest impressions of a show are those which come afterward, when we are no longer influenced by the glitter and the bewildering variety and number of exhibits. It is then that we can cast back our minds and see just where the show succeeded and where it failed. It succeeded because it drew enormous crowds, and was highly interesting for people whose knowledge of automobiles is not yet sufficiently thorough to enable them to "pick holes" in the cars exhibited. They were quite content with the assurance that Olympia represented all that was best in motor construction, and were ready to spread themselves out in eulogies accordingly.

The show certainly proved that the British industry is making headway, and will before long be quite capable of supplying the home needs in motor vehicles. But when we come to look into the details of the cars we find that they are singularly barren of anything which may point to a technical advance in motor construction. It is true that there was plenty of variety at Olympia, more so perhaps than we are accustomed to see in Paris, but this same variety may be regarded as a source of weakness, although in some respects it may not be without a beneficial influence upon the industry. If we are to believe that the standard types of mechanism are the survival of the fittest, and that nothing better can be devised until we can get a more elastic gasolene engine that will dispense with the change speed gear, then the variety of systems shown proves that the majority of makers are still groping their way forward in the same way that was done by the French makers five or six years ago. At that time the Paris Salons were even more remarkable for their novelties and freaks than the Olympia gathering is now. These many departures from standard practice are no longer to be seen at the Paris exhibitions for the reason that makers have experimented with them and found them wanting, and the trade has consequently gone solidly in favor of the standard type of chassis; but at Olympia manufacturers are still turning out all sorts of vehicles, though it must be admitted that the number of novel chassis was much smaller than in previous years.

NOT SNEERING, BUT—.

Are the British manufacturers on the right track in building vehicles with a variety of motors and driving gears? We should not like to fall in line with the French and sneer at these attempts to break away from standard practice on the plea that it shows a want of experience on the part of those who are making them. It is true that the experiments with horizontal engines and the like have been heart breaking failures in the past, and that nothing has been introduced which can compare with the vertical engine and standard transmission for the touring carriage, but it must be remembered that all the experiments have been carried out in the past when makers had less experience of automobile construction than they possess now, so that it is quite possible that better results could be obtained with these despised mechanisms in the light of a fuller knowledge of automobile mechanics. Nevertheless, everything goes to show that the standard mechanism represents for the moment the final type, although it is very probable that the ingenuity being displayed in the designing of original chassis, which are merely revivals of old systems, may eventually find a considerable application in the lighter descriptions of vehicles.

WHAT EXPERIENCE HAS TAUGHT.

In England, as elsewhere, all the makers who have had a long experience of motor car construction have settled down to the prevailing types, which have indeed proved the turning point in their careers, such, for example, as in the case of the Wolseley, whose productions now vie with the best turned out anywhere. There consequently has been a gradual reduction in the number of horizontal engines, of which there are now only a few examples, the most noteworthy being the Arrol-Johnston, with its opposed cylinders and rocking shafts, which would probably be regarded as very much out of the fashion if it were not for the striking success of this vehicle in the tourist trials. The makers themselves do not seem at all certain that this will be their permanent type; this at least is what we gathered during an interview with them. Then there is the James & Browne, with its four cylinder horizontal engine and long connecting rods to a crankshaft gearing direct on to the countershaft by spur wheels. There are one or two others, including a small car which has evidently been inspired by the Oldsmobile, and, being intended for small powers, this is the only type of vehicle with horizontal engine which seems likely to meet with any success.

Coming back to the standard mechanism, the material and workmanship put into some of the British cars must be pronounced as very good. We were particularly struck with the Rover engine, of which the four cylinders are in one casting. This was a very fine example of foundry work. The French C. G. V. engine also had the four cylinders in one casting, and there are signs indeed that we are coming back to this system of engine construction which was abandoned for the now almost universal separate cylinders on the score of economy. With the engines cast in one piece there is obviously a good deal of unnecessary scraping in the event of flaw, but, on the other hand, they allow of an easier and more accurate adjustment, so that what is lost in one way is more than gained in another. The adjustment of four separate cylinders on the crank chamber is by no means an easy matter.

CRUDITY IN DETAILS.

It is when we come to look into details of construction that we find how far the British makers are behind the French ones, with but few exceptions. In this country the details are worked out with a patience approaching genius, but nothing of the sort was observable on most of the British cars at Olympia, where some of the makers displayed their carelessness or ignorance in a really marvellous manner. What, for instance, can be said of a maker who transmits his braking power from a hand lever on the right to a drum on the off side driving wheel through a cable passing round pulleys, whereby only about one-tenth of the power applied to the lever is exerted on the drum? This shows want of thought and attention to detail which are the real secrets of success in motor car construction. The explanation is probably to be found in the fact that many people have gone into the motor car industry who are not engineers, and copy the main lines of current design without being able to work out the details; but it is nevertheless strange that such flagrant errors can be committed in an industry which has already developed so considerably. On the other hand, we can point to such firms as the Simms Mfg. Co., Daimler, Napier and others whose cars will challenge comparison with those produced anywhere.

ABOUT SIX CYLINDER CARS.

One of the trump cards turned up at the Olympia show was the six cylinder engine. A lot has been said about the advantages of the six cylinders as if it were something startlingly new and was going to knock foreign competition into the proverbial cocked hat. This, of course, has been engineered by the irrepressible S. F. Edge, who has been feeding the public with all sorts of pabulum about "constant turning force," "elasticity" and the rest of it whereby the variable speed gear will be suppressed altogether. The six cylinder engine is, of course, smoother than the four cylinder, which, however, is quite good enough for all ordinary purposes, and it has yet to be seen whether the little extra advantage in the way of smoother running is

Digitized by Google

Where the A. C. A. Show Will be Held.

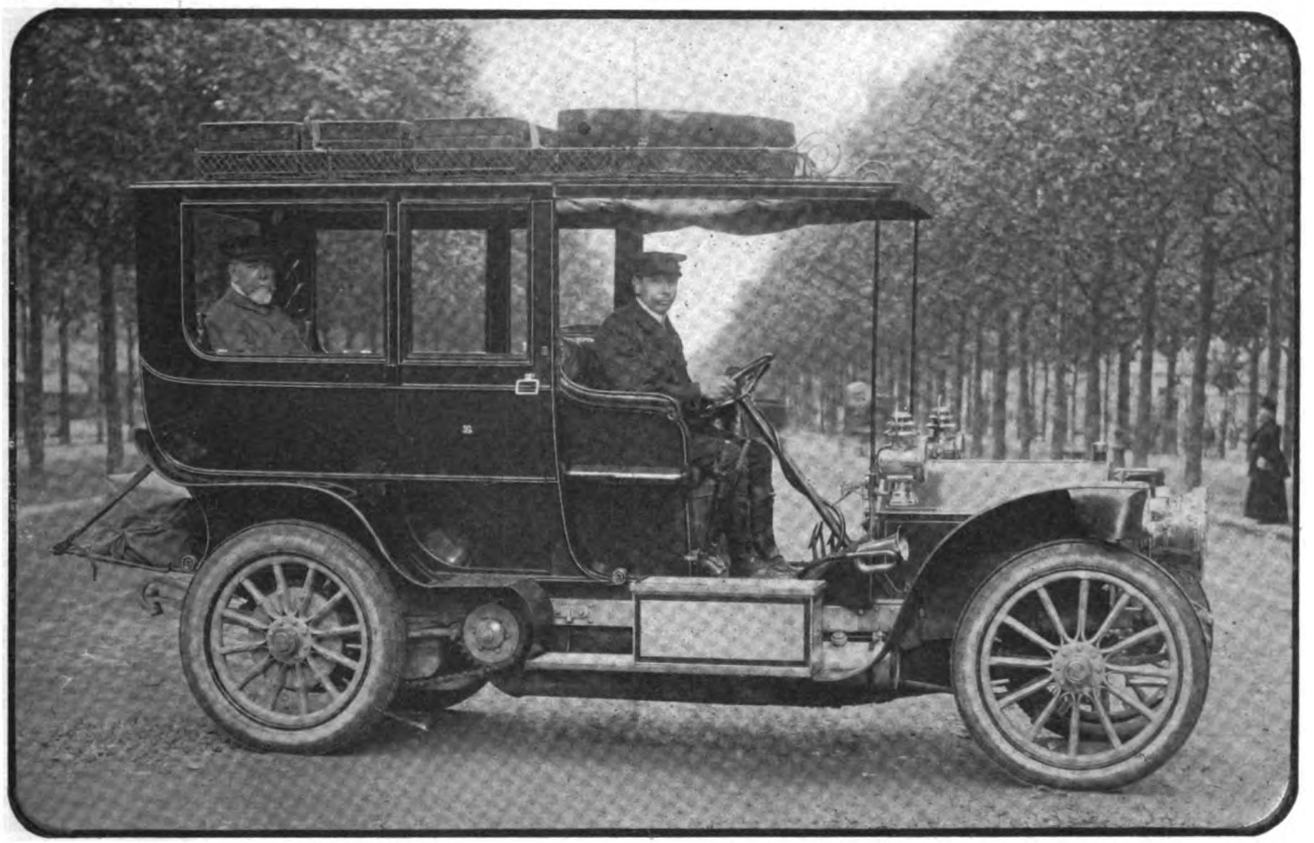
69TH REGIMENT ARMORY, NEW YORK; MA--SON SQUARE GARDEN IN RIGHT BACKGROUND.

going to outweigh the added cost and complication as well as the increased room taken up by the engine. We doubt very much whether the six cylinder engine will have much vogue, even in England. Finding that an attempt was being made to popularize this type of engine, Panhard & Levassor sent a six cylinder car to Olympia. This has been made solely for British consumption, and the firm does not intend to show it at the Paris Salon.

Leaving the shows for the moment, the reference above to the adaptability of different types of mechanism to small cars brings us to the tests of voiturettes which have been carried out in the neighborhood of Paris during the last week. By giving themselves up too exclusively to the high priced vehicle the French have allowed themselves to get a long way behind in the building of popular cars, in which they have been surpassed not only by America, but also by England.

Owing to the almost unlimited demand that would be expressed for popular vehicles if only suitable types were placed on the market, several leading makers are now giving attention to this branch of the industry, and one of the Paris journals has endeavored to prove to the public the reliability of the voiturette by organizing a voiturette test in which the vehicles had to cover stages of 150 miles in six consecutive days at a minimum average speed of fifteen and one-half miles, while those coming successfully out of this ordeal were tested for speed and hill climbing over kilometre courses. The contest was carried out under deplorable conditions of weather, with a fall of snow followed by heavy rains. The roads in places were scarcely passable, and the only way of running safely was by using non-skids on the tires. Of the twenty-two entries there were thirteen starters. The weight of the chassis was limited to 500 kilos., and the engines developed about 6 horsepower. With the exception of the Hugot car, which had belt transmission and was soon put out of the contest by overturning in a ditch when trying to avoid collision with a cart, all the voiturettes followed very much the standard pattern of mechanism. They all had single cylinder engines, with the exception of the Grefoire, which had two cylinders, and the propeller shaft was universal except in the case of the Gladiator, which had chain transmission.

The voiturettes ran very satisfactorily, and only four were put out of the running by accidents of various kinds, whereby they lost so many marks that the drivers found it hopeless to continue. One of the Lacoste & Battmann cars was leading up to the last day but one, when it fell in the rear through repeated tire punctures. On the last day the trials threatened to collapse altogether, for between Paris and Mantes the competitors punctured with such singular frequency that an investigation was made, when it was found that they had all been picking up nails obviously manufactured for the express purpose of doing execution on the pneumatic tires. Made of thick wire, they were bent in such a way as to insure the sharp pointed end sticking upward. A collection is being made for the offer of a big reward to whoever will give information as to where these nails were made. The punctures naturally completely falsified the results of the tests, and as the judges would not take upon themselves to decide whether the run between Paris and Mantes should be neutralized, the matter has gone to the sporting commission of the Automobile Club of France. Whatever decision is come to there is bound to be a lot of protests from those who find themselves put down in the placings. The reliability trials this year have been very unfortunate, and the task of those who organize them is no sinecure.



If the commission does not annul the run between Paris and Mantes the final placings will be as follows: Vulpes (Barriaux), De Dion (Liniol De Dion), De Dion (Cromier), Lacoste-Battmann (Gachet), De Dion (Bardin), Gregoire (Taveneaux), Lacoste-Bottmann (Rochay), Lacoste-Battman (Thomas), Gregoire (Renonce). The regularity prize goes to the De Dion-Bouton team,

KING COPIES KEARNEY'S CAR

American's Conveniences and Ideas of Comfort that Appealed to His Majesty.

It is not often that an American citizen sets a fashion for the King of the British Empire, or of any other empire, but something of the sort has been done by M. Theo. Kearney, president of the California Fruit Growers' Association.

M. THEO. KEARNEY IN THE CAR OF HIS OWN DESIGN.

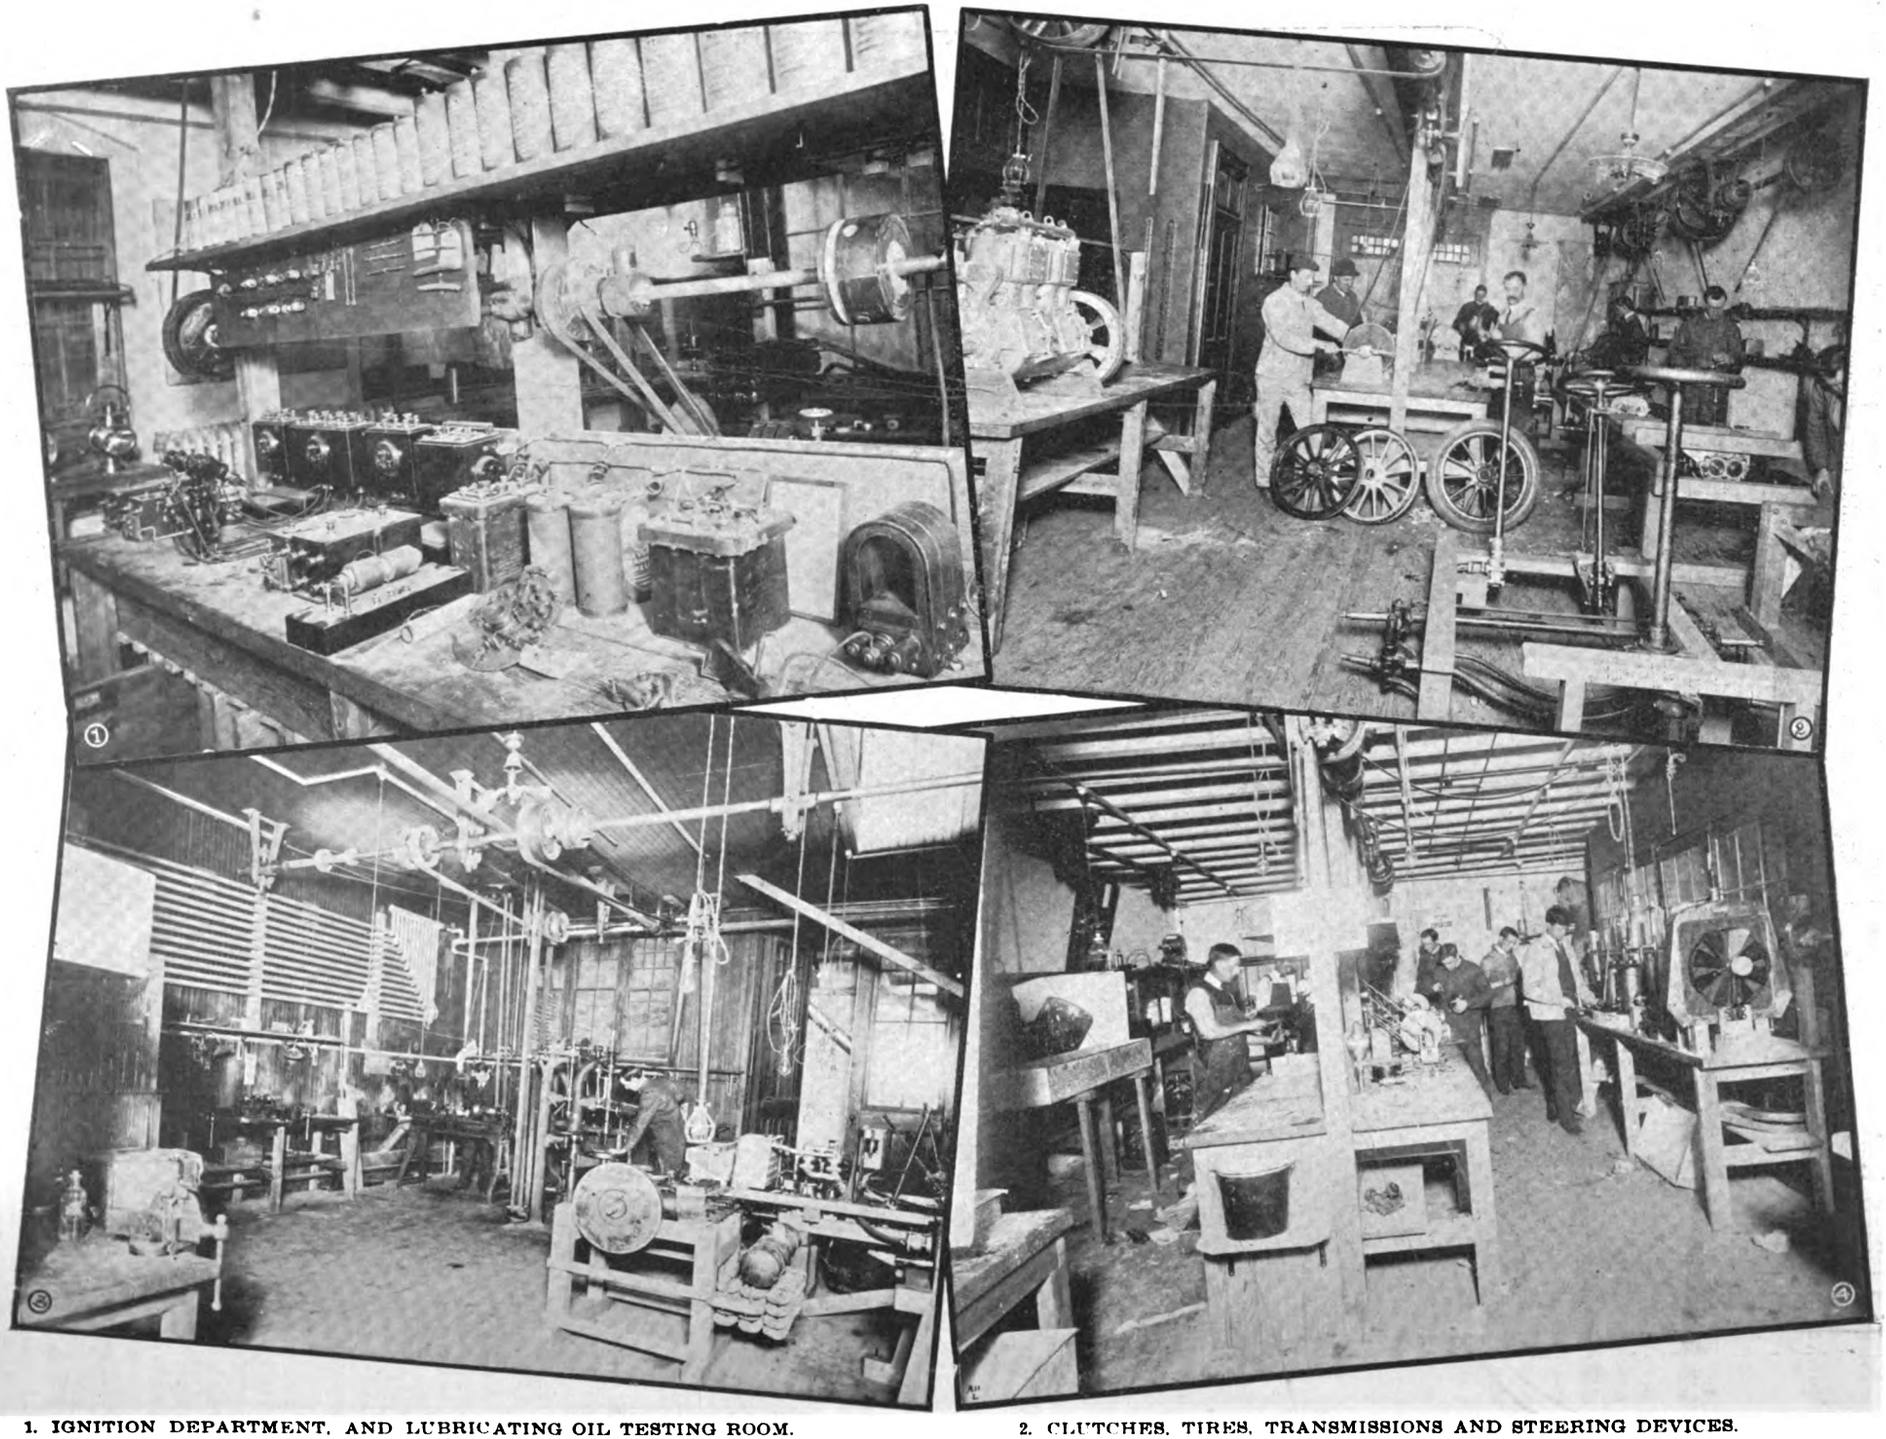
Mr. Kearney is an ardent automobilist, and spends a portion of each year in Europe. His touring experiences led him to design a body for his own car, a Mercedes, which, after some effort, he had built by Hooper & Co., of London, for sixty years coach builders to the royal family. When Mr. Kearney's car was brought to this country in December last the Motor World pictured and described it—a service that attracted no small notice. The body, which was of the limousine type, was uncommonly well thought out—so well, indeed, that Hooper & Co. have built what is practically a duplicate of it for his majesty.

Mr. Kearney's car, ready for the road, with the load on the roof evenly distributed and with that gentleman seated within, is shown by the accompanying illustration. In designing it the Californian's chief idea was to obtain a limousine body for all seasons' use—that is, one that would afford practically an open or closed car, as fancy or the weather willed. To this end the windows were made as large as possible, having due regard for the weight of the roof, and instead of being swung on hinges they were made to slide out of sight into pockets, as in the case of carriages and railway coaches. This permits them to be quickly raised without stopping the car or calling the driver when dust or a shower is encountered. Mr. Kearney also devised wooden shutters akin to those used on four-in-hand coaches, and similarly operated. They slide down alongside the glass.

Primarily these shutters were designed for protection from broken glass in case of accident when travelling at speed, but his tour of Europe last summer convinced Mr. Kearney they reach much further. They assisted in keeping out the dust, enabled the force of the air to be regulated and afforded agreeable protection from the sun, which so often strikes the neck or side of the face for hours at a time. In cold weather also the shutters afford air without a discomforting rush being felt. As the shutters in the large side windows are made in two parts, each part sliding up or down independently of the other, convenience in meeting all conditions is considerably increased. There are spring side curtains for the protection of the driver.

Mr. Kearney's car is provided with four seats inside, all facing forward. The two in front are removable, and when not in use may be folded and stored under the rear seat. The seats are all finely upholstered and slope backward, which makes for real comfort. There are three electric lights inside; also large pockets to hold maps and books, a timepiece, a speedometer and Mulbacher's push electric indicator, giving the signals, "Faster," "Slower," "Right," "Left," "Stop."

The luggage rail running the full length of the roof is also an item. It permits the suit cases and spare tires to be evenly distributed, and thus relieve the rear tires of undue weight. There also is a luggage rack on the rear of the car. The two headlights are arranged with a purpose. One, with a powerful lens, projects the light far ahead; the other lights up the road immediately in front of the car.



How the Car Was Frozen Fast.

They tell a story of a motorist who, being obliged to abandon his car for the night in a barn having a dirt floor, was at considerable pains to drain all the water from the cooling system and went away firm in the conviction that even though the thermometer might drop out of sight before morning he need have no fear for the safety of the machine.

His disgust when on coming back in the morning he discovered that the wheels had sunk even to the rims in the soft earth during the earlier hours of the evening, and then had frozen there, was profound and explosive. It required two hours of hard work, first with an old axe and then with a lot of hot water lugged from the nearest farmhouse, to get them clear again, and then he found that several sections of the tread had been torn off the shoes. Thereafter, when he had occasion to leave the machine under similar circumstances, he took care to stand the wheels on planks.

TEACHING THE OLDER IDEA

Not How to Shoot, but All About Automobiles—New York's New School.

Without any flare of trumpets or other formalities than welcoming the forty-two scholars who comprise the pioneer day class, the New York School of Automobile Engineering began it first session promptly at 8 o'clock last Monday morning. The institution is housed in the building at 146 West 56th street, where it occupies all the space available, the various departments being distributed over three floors. In its entirety it is safe to say the new school not alone represents the most complete plant ever collected and installed under one roof for this purpose, but its curriculum is a more ambitious attempt at thorough-going automobile education than has hitherto been undertaken in this country.

Instruction is divided into three courses, day, evening and a special course for the benefit of owners of a car, the tuition fee being the same in all cases, viz, $75. The day course consists of eight hours' instruction daily for two months, beginning at 8 a. m. and ceasing at 5:30 p. m. every working day in the week. This is divided into short periods, a full day's work being apportioned about as follows: First session, lecture; second, shop; third, carburretion; fourth, ignition; fifth, transmission. This arrangement is adhered to for three weeks, the subjects being taken up in varying order from day to day in such a manner that the student receives four sessions on each during the course of the week. At the end of this time the order of instruction is somewhat changed, the periods of lecture and shop work being retained and the subjects of motors, general car construction and tests being substituted. Upon the completion of these two indoor terms the pupil rounds off his education by taking the wheel. In order that the novice should not run amuck to the annihilation of innocent pedestrians or wagons, he is confined for a week to the secluded stretches of the Morris Park racetrack. But before being allowed out of doors at all he must show that he is able to manipulate ignition and control as well the change speed levers without becoming confused to the extent of losing sight of the necessity for steering at the same time.

This part of the instruction is carried out by mounting the car over a pit containing a rope brake apparatus. This relieves the beginner at the wheel of the duty of steering so that his mind may be free of the responsibilities of avoiding other traffic while being inculcated into the subtleties of gear changing, as well as the niceties of spark advance and throttle control. Having demonstrated his efficiency here he graduates to the racetrack, not to show speed, but his ability to add the care of the steering to the duties already mastered. At the end of this primary initiation into the mysteries of tooling a car round the oval track he is then transplanted in the same guise to the haunts of the maddling crowd and must show that he is master of all the functions of the car where traffic runs in every direction at the same time and absent minded pedestrians and trolley cars are ever looming up in such a nerve racking manner. Having accomplished this much he is entitled to all the honors the school can confer, which consist of a certificate recording the fact that he has successfully passed the prescribed courses, taken the examinations and is a fullfledged chauffeur. That this will amply compensate him for the time and money expended will be apparant, not alone from the thoroughness of the course, but the fact that the school is backed by men prominent in the trade so that the future of the competent graduate should be assured.

The lectures consist of an introduction to mathematics sufficient to enable him to figure horsepower, gear ratios and the like, together with elementary electricity and mechanics. The lecture room and office are located on the third floor of the building. On the floor beneath this are departments fitted to illustrate the principles of transmission, carburretion and ignition, including facilities for carrying out tests of lubricating oils. In the first division there are several chasses bolted to the floor with the transmissions exposed. One chassis likewise has the engine attached; this has been opened sectionally to reveal its interior working. All are arranged so as to be run by belts from the line shafting and the instruction connected with them is gained from a study of their operation in action, assisted by manipulations of the change speed levers. This principle is, in fact, carried out in every department. For instance, standard types of carburretters are connected up with exhaust blowers to produce the necessary suction for purposes of testing, the character of the resulting mixture being shown by burning it in a crucible. Various forms of cooling devices are likewise tested in actual use, the water being heated to the temperature that it would attain from the running of the engine, by means of gas stoves and the cooling effect of the motion of the car being simulated with the aid of blowers. In both this and the ignition department the student applies his recently gained knowledge of elementary principles and supplements it with practical demonstrations of all the standard systems and forms of apparatus, under the guidance of an instructor.

The ground floor is devoted to the machine shop, which is equipped with all the necessary tools driven by power, including an air compressor. Several more complete chasses are here, as well as separate motors and instruction in this branch will take the form of dismounting and reassembling their constituent parts, as well as in the making of all repairs required, which will be carried out by the students. Among the chasses in this part of the equipment are an old Searchmont, a Gasmobile and an ancient Daimler, and while the school's stud will number several modern cars of approved make, it is the intention of the management that the pupils shall gain their knowledge through handling cars that are prone to fall ill with all the complaints that the automobile is heir to. When on the road it will be up to the would-be chauffeurs to bring these old timers back under their own power and it goes without saying that knowledge gained in this manner should form a resource that will be a practical guarantee against being stalled by anything short of something requiring the facilities of the shop to make good.

On the same floor is located the pit containing the brake apparatus and in addition to using this for instruction purposes, it will be constantly employed for making efficiency tests, showing the consumption of fuel, oil and water, as well as for percentage of power delivered to the road wheels. Horsepower tests will be conducted with the motors alone. It is not intended to touch on the subject of dynamics in connection with these performances, as it is not alone something beyond the average chauffeur, requiring knowledge of higher mathematics, but because it would be of little or no practical use to him.

The evening course in which there are at present sixteen scholars, includes the same course of instruction and is conducted from 7:30 to 10:30 each evening, extending over a period of four months. In addition to this there is a special course for owners, the entrant being permitted to take the entire curriculum if he so chooses or select his study. In either case he may attend whenever convenient and is assigned special instructors. Of the baker's dozen of owners already enrolled few have gone in for more than one or two branches, the favoriate naturally being carburettien and ignition. As yet a time limit has not been set on this course, the student being allowed to drop in and make his instruction in installments whenever the mood strikes him or business permits.

Value of Presence of Mind.

Presence of mind is probably the most valuable asset of the good chauffeur. A striking illustration of what may be accomplished by the clear, cool headedness that sums up the requirements of the situation at a glance and does the right thing at the right time comes from Chicago, where but for the timely action of a chauffeur a garage and eleven machines would have gone up in smoke. He was making adjustments to the motor of a car when some gasolene blazed up, burning his hands. At his feet was a five-gallon can of the fluid, and this he hastily removed to a distance and returned with a chemical extinguisher, which proved of no aid. He then started the engine, burning himself more severely, but in spite of this managed to drive the car out into the street. The fire department responded in time to make a good job of it, leaving the car a total wreck.

REO CREATES A COUPE

Which also May be Converted into a Touring Car—Some of its Characteristics.

In accordance with the present overwhelming demand for the closed type of vehicle body the Reo Motor Car Company, Lansing, Mich., has added to its line a model, to be known as the Reo coupe, which embodies all that is to be desired in the way of a limousine body, while maintaining those characteristics of light and shrewd design which already have done so much to put the firm name on the list of public approval. The coupe follows the general lines of the horse drawn depot carriage, being somewhat on the order of the true limiosine, yet lighter and less cumbersome than that vehicle, and accordingly better adapted to the type of chassis for which it has been designed. The latter is presented to the market as the standard member of the Reo family for 1906.

REO 16 HORSEPOWER COUPE.

The frame is of pressed steel, excellently put up and suspended on elliptical springs, those in front being of the semi-eliptic pattern, while the rear equipment is of the full type. Tubular axles are used, the wheels running upon roller bearings of approved construction. They are of the artillery pattern, built of wood, and run on 30 by 3½ inch tires. The motor is of the horizontal opposed type, having 4¾ by 6 inch cylinders, cast with water jackets integral. Both valves are mechanically operated and are thoroughly protected from external derangement. The carburetters are of the latest design of R. E. Olds, one being used for each cylinder. Ignition is by the jump spark method, two sets of dry battering being furnished to supply the necessary primary current. The cooling of the motor is accomplished through the medium of a tubular radiator, circulation being maintained by means of a gear driven pump. The rated output of the power plant is given as sixteen horsepower.

From the motor the propulsive effort is carried to the rear wheels through a planetary transmission, driven by a multiple disc friction clutch of novel construction, a distinguishing feature of the gearing being that there are no internal pinions. A direct single drive is supplied to the rear axle by means of a roller chain. Three brakes are fitted, one acting upon the sprocket and the others upon the rear hubs. All are strictly double acting, and the emergency pair is equalized.

The body, which is fitted in most complete fashion, is capable of accommodating two passengers inside, and one outside, in addition to the driver. Although following the general lines of body design as seen in many machines of the present day, it is unique as being adapted to a car of the calibre of the Reo, combining as it does, the handiness of the runabout, in facility of handling through traffic and ease of manipulation with comfort. The occupants are entirely protected at all times, though when driving in warm weather all the windows may be let down into the walls, thereby securing the effect of an open car to all intents and purposes. The body is completely detachabe, thus rendering it interchangeable with the regular form of touring body.

The running radius of the machine is placed at two hundred miles on one charge of the tanks, the consumption averaging from ten to twenty miles pper gallon of gasolene. The facilities for control are characteristically simple, the transmission giving two speeds forward in addition to the reverse, and the steering gear being irreversible. The wheel base is ninety inches, and the tread, the standard for wagon construction, that is to say, fifty-five inches.

The Prophets of 1833.

In an exceedingly quaint prospectus of the "General Steam Coach Company," published in London about 1833, which has been unearthed recently by the Car, and which presents a strong argument in favor of the use of motor traction upon the highways, there appears the following interesting paragraph:

"A select committee of the House of Commons, too eminent to be dishonest, too wise to be duped, after a careful examination of the most distinguished civil engineers, reported 'that Steam Carriages could ascend hills of considerable inclination with facility and safety—that they were perfectly safe for passengers—that they would become a speedier and cheaper mode of conveyance than carriages drawn by horses—that, with the slightest exertion, they might be stopped and turned under circumstances where horses were totally unmanageable—that they would not act so injuriously on common roads as the feet of horses—that the substitution of inanimate for animal power in draught on common roads is one of the most important improvements in the means of internal communication ever yet introduced; and its practicability had been fully established.' The truth of this decisive Report has, since 1831, been most fully confirmed by the performance of several steam coaches upon different lines of road."

The document formed, of course, an eloquent plea to the investor to subscribe to so worthy a cause and to support the establishment of a regular steam coach service upon the public roads. That the effort ultimately came to naught was not so much the fault of the promotors nor of the poor efficiency of the machine then in use, as might be supposed, though those factors might have come in for a share in the downfall. The real cause of failure lay in the lack of perspective in the view of the parliament of the time, which outlawed the use of such vehicles.

The document is particularly interesting in consideration of the fact that mechanical propulsion for road vehicles is often referred to as the growth of a decade.

To Prevent Being Poled.

To the chauffeur who has had the unpleasant experience of having his car ignominiously "poled" by the carelessness of a following teamster in heavy traffic, the device which was recently on view at the London show should be particularly pleasing. This consists of nothing more nor less than a little semaphore on which appears the word "Stop" in large letters, and which is mounted at the back of the car in plain sight of all who are following. It is interconnected with the brake pedal in such a way that ordinarily it is invisible, but when the pedal is depressed it pops into view, warning other drivers of their obligation to slow down.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau street, New York. ***

CHINESE AS CHAUFFEURS

Where They are the Rule and not the Exception—China Full of Promise.

"China presents a steadily increasing market for automobiles, and the sale of machines of American make has kept pace with the demand," says Special Agent Burrill, writing from that country. "While the purchase of cars to this time has been confined almost exclusively to the foreigners of Shanghai, the wealthier Chinese now regard this mode of travel with especial favor; and as they are well able to afford the luxury, it is safe to assume that the demand will soon extend to them. Chinese drivers of automobiles are the rule rather than the exception here, and this familiarity of the natives with the running of the machine, its speed, comfort and utility is assisting materially in influencing the Chinese in its favor. The roads in and around Shanghai are macadamized and kept in excellent condition by the municipal authorities, money is abundant and conditions are generally favorable to the extension of the automobile business.

In 1900 six or eight steam machines were imported from the United States, but none of them was sold. In 1902 three Oldsmobile runabouts were imported and disposed of, and the next year two French gasolene sliding gear cars were brought over. These machines were of the runabout type and were fitted with De Dion vertical single cylinder engines. A marked increase in the number of cars imported was noticeable in 1904 and 1905, while there has been a greater demand for higher power machines. Several 10, 16 and 20 horsepower machines have been sold and have given good satisfaction. There have been only two English cars of any description imported, and one of these was returned because of its unwieldy size. The comparatively narrow streets of the foreign settlement in Shanghai make the operation of the larger type of cars difficult, if not dangerous.

"While American machines are firmly established on the market and have repeatedly demonstrated their superiority over cars made in other countries, it would be well for the manufacturers of the United States carefully to observe the suggestions which are regarded here as essential to the increase of the sale of American automobiles. These may be summarized under four general heads, and all are necessary to the successful development of trade in this particular line:

"1. Manufacturers should give prompt attention to filling and shipping orders. Unnecessary delays frequently occur which furnish additional cause for criticism of American carelessness and indifference to the demands of the export trade.

"2. Any misrepresentation as to the time of shipment should be scrupulously avoided. Manufacturers should forward the machine on the date promised, as any excuse, although it may be fully warranted by conditions, will be regarded here with suspicion. This is the unfortunate, though unavoidable, result of previous experiences when the shipment of other commodities has been delayed beyond all reason.

"3. Close attention should be paid to the details of the shipment. No car should leave the United States unless its equipment is complete. This caution becomes all the more important because several instances are cited where a machine has arrived in Shanghai and when unpacked discovery was made that the starting handle, crank or some other essential part had been forgotten. This kind of carelessness occasions a long, unnecessary delay and natural irritation on the part of the purchaser.

"4. Freight rates on automobiles are high, both by San Francisco and the Suez Canal, and while it may be difficult to procure any reduction because of the comparatively limited number exported to the Orient, it is suggested that some action be taken in the interest of the trade here looking to cheaper transportation.

"The foregoing recommendations were made to the writer by men here who have carefully studied the situation, and who believe that if they were faithfully carried out a decided improvement in the business would follow.

"The American method of packing automobiles is commended in Shanghai, and is regarded as superior to that of any other country. The wheels are always removed from the body of the machine, and usually the axles, steps and steering gear as well, which are packed separately. This is a decided advantage, as it not only insures greater safety to the car in transit, but decreases the cubic measurement of the case for shipment.

"Although the freight rates on automobiles from the United States to Shanghai are regarded as too high by the dealers here, yet they compare favorably with those from other countries. Insurance rates, however, are slightly higher. The freight and insurance charges on a car laid down in Shanghai amount approximately to $50 gold. The warehouse charges here are the same to all countries exporting automobiles to Shanghai, and are comparatively unimportant, as the machines are usually removed immediately on arrival. A customs duty of 5 per cent on the invoice valuation of the car, including freight and insurance to Shanghai is collected. In Shanghai there are now established two garages, or, more properly speaking, repair shops, and a third is soon to be erected. There is also a club, known as the Automobile Club of China, which was organized in May, 1905, and already has a membership of twenty-two.

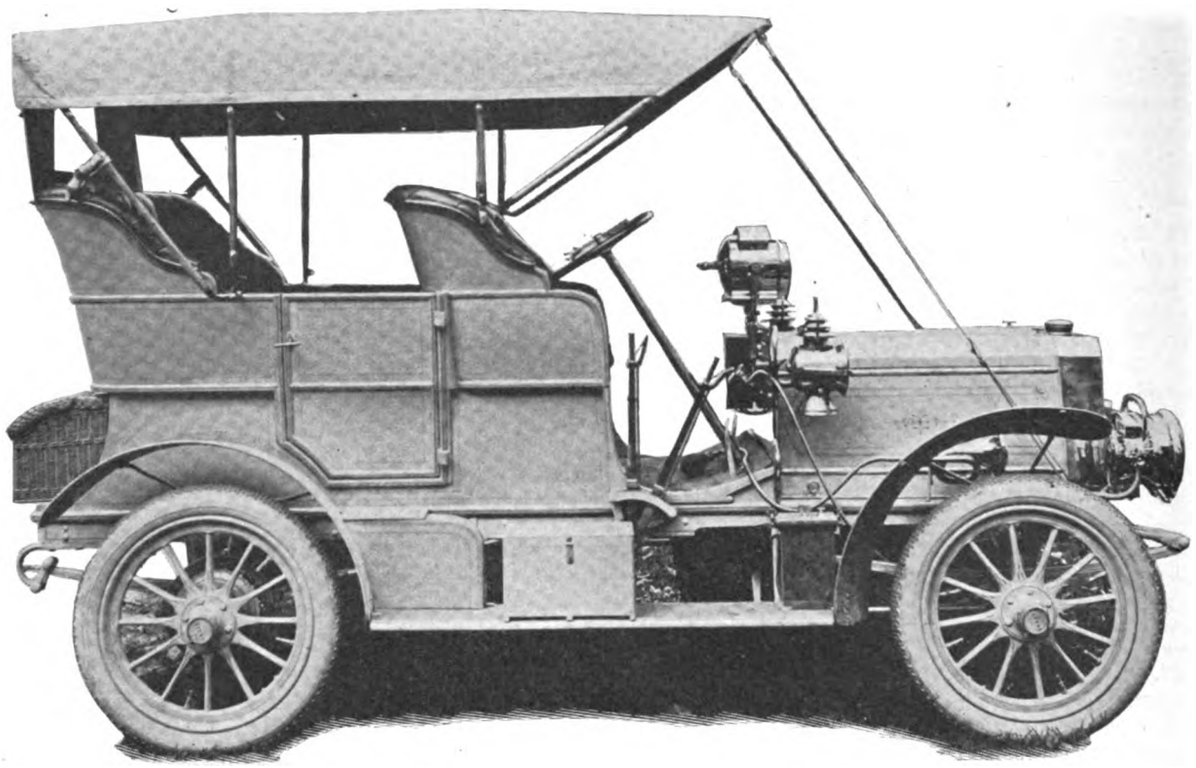
"The New York Export & Import Co and a French firm are the only business houses in Shanghai dealing in automobiles, but both regard the outlook for trade in this particular line as bright and worthy of encouragement. While the price of a machine laid down in Shanghai must not be excessive, as compared with its cost at home, with due regard, of course, to the additional expense incidental to importation, the margin of profit is sufficiently large to make the business satisfactory to the dealer."

WHEN THE CAR BACKS DOWNHILL

Manouvre that is Possible and that Makes for Safety—if the Driver Keeps his Wits.

It is getting to be a habit with some people, apparently, to see how near they can come to backing a car through the guard rail of the 155th street viaduct, in New York—without succeeding. In one instance, a machine which had been left in charge of a man who knew nothing about its mechanism slipped its brakes and started down the grade, finally bucking into the railing and coming to rest with two wheels hanging over space. Still more recently another machine climbing the hill snapped a chain and began to slip backward. In this case it would appear that the brakes were not in order, for the car was in charge of a professional chauffeur, who applied the traditional means which are universally prescribed for such occasions and turned toward the curb. The machines jumped the six-inch obstacle without any hesitation and plunged into the rail, only stopping when a good section of the gaurd had been torn away and the passengers thrown into paroxysms of fright by the sight of the 125-foot drop between them and the street below.

It is a habit not to be cultivated. Even the stoutest of railings have their weaknesses, and sooner or later some machine will, likely enough, jam its way entirely through the barrier and somersault to the pavement underneath. Yet it would not be a necessary accident should it ever happen. When a machine begins to back down a grade, the first thought of the driver is for the brakes; failing to check the speeds with these, he naturally turns toward one curb or the other in the hope of stopping in that way, but it is by no means necessary to run into the curb in order to do this on so broad a drive as that at 155th street, for there is sufficient width for the average car to make an almost complete turn without striking either railing. Where this is possible, by far the best plan is for the driver to shear into one side until the wheels touch the curb, and then bring the steering head around so that the rear end is turned uphill and the momentum checked by the grade itself before the other side has been reached. In this way it is frequently possible to get out of an otherwise serious difficulty without in any way damaging the machine or endangering its occupants. To do it, however, the driver must keep his head.



When Appearance is Deceiving.

That the motorist who employs an ebony skinned chauffeur is apt to be misunderstood when he himself undertakes to do the driving was well illustrated recently by rather an amusing incident. The owner of the car was at the wheel with his dusky driver seated beside him, seeing which a woman was overheard to remark to a companion:

"Oh! Jennie. Just look at that nigger with a white chauffeur."

What Grout has Wrought in Gasolene Cars.

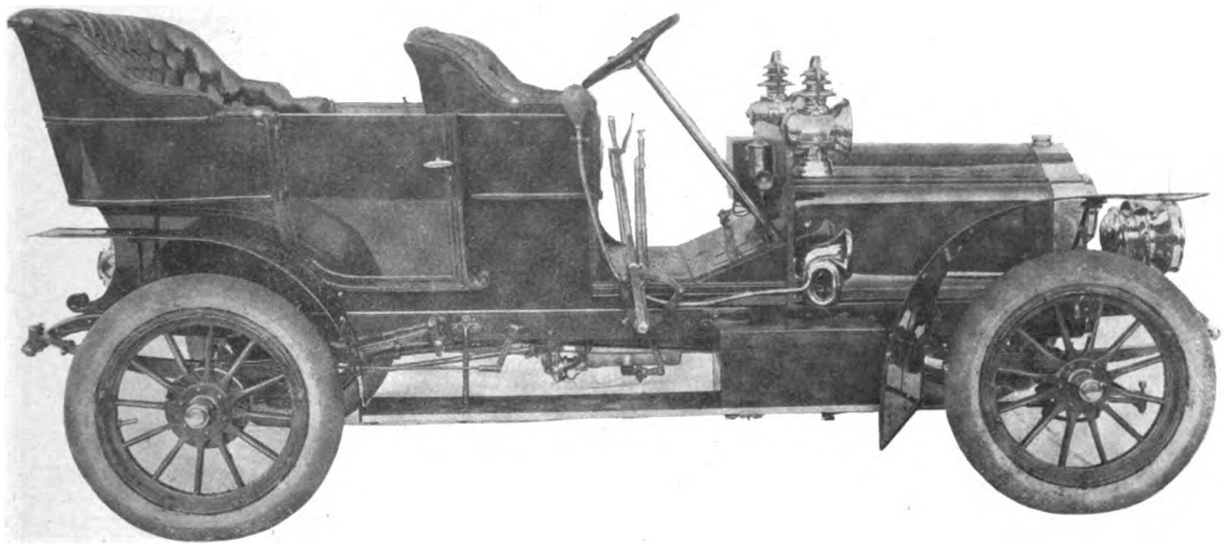
When a manufacturer of steam automobiles turns his attention to the production of a gasolene model one thing is reasonably certain, and that is that he will pay the strictest attention to the production of a car which will be easily and smoothly controlled under all sorts of conditions. Also he is quite likely to do away with vibration as far as possible. When the Grout gasoline car was first presented to the public a comparatively short time ago the public knew just about what to expect. The car which is to be marketed under that name during the forthcoming season of 1906 is essentially a conservative machine, built upon standard lines, with due care and respect for the many little points wherein a car of quality differs from one which is lacking in worth.

Of the four cylinder pattern and rated at 30-35 horsepower, the motor is built to stand hard usage and develope its full power under unfavorable as well as favorable conditions. The valves are disposed upon the left hand side, both sets opening from below, the spark plugs being located over the inlet pockets, and relief valves over the exhaust. The valves are interchangeable. The cylinder castings are cast individually, with the water jackets made integral. In the ignition system, but a single coil is used, the high tension distributor being of a novel pattern which permits of rigid wiring being used. In it, the advance of the spark is obtained by rotating the revolving wiper in advance of its shaft instead of turning the timing box about it, thereby avoiding one of the greatest difficulties of the jump spark system. The lubrication of the motor and as well of the more important portions of the other mechanism is accomplished by a force feed oiler of unique design which supplies a measured quantity of lubricant to each of the various points in turn, from a single pump acting through a distributing valve, which permits of satisfactory working with a minimum of moving parts.

The transmission is of the standard three speed type, giving a direct connection on the high gear. It is of simple and effective design, and not calculated to give trouble of any sort under the severest of service. The single sliding member is mounted on the driving shaft, and meshes in turn with one of a pair of gears on the lay shaft for the two lower speeds, locking with the clutch shaft for the direct drive. The counter shaft is mounted on roller bearings and carries a foot—actuated brake just outside the case. The double chain drive is used.

The frame is of armored wood, liberally strengthened at the corners by quarter inch steel braces, while the power plant is mounted on a channel steel sub-frame. Solid axles are used, upon which the frame is mounted by semi-eliptical springs. The wheels are 32 inches in diameter, carrying four inch tires, and running on ball bearings. A point which has been given special attention in the construction of the machine is that of securing the greatest possible radius of control of the machine by the use of the throttle alone. Both the ignition advance and gas levers are mounted on the steering wheel on a stationary sector which retains them in definite relation to the driver, no matter what the position of the steering gear, and enables him to handle them with an otherwise impossible degree of nicety.

Eccentrics for Valve Operation.



For the most part, the gasolene engine designer is content to construct his motors for continuous rotation in one direction, trusting to a system of gearing to accomplish the occasional reversal which is necessary for the car or boat in which it is mounted. One or two reversible motors have been designed in the past, and several have been constructed which had a trick of reversing unexpectedly under certain circumstances, but both types have been a rarity. Now comes an inventor with a scheme for actuating the valve mechanism by means of paired eccentrics, after the manner commonly employed on reversible steam engines, the regulation Stephenson link being employed. Just how much there is in the idea remains to be proven, but at all events it can be of but little real value until some reasonably certain self-starting device is fixed upon.

To Braze Gray Iron.

For brazing gray iron a process of decarbonizing is resorted to. This is accomplished by the use of exide of copper or some other chemical giving the same result, in conjunction with a high temperature to burn off or otherwise remove the carbon. The process is only continued until decarbonization has been effected to a slight depth beneath the surface, after which the brazing may be done in the same manner as if the material were wrought iron.

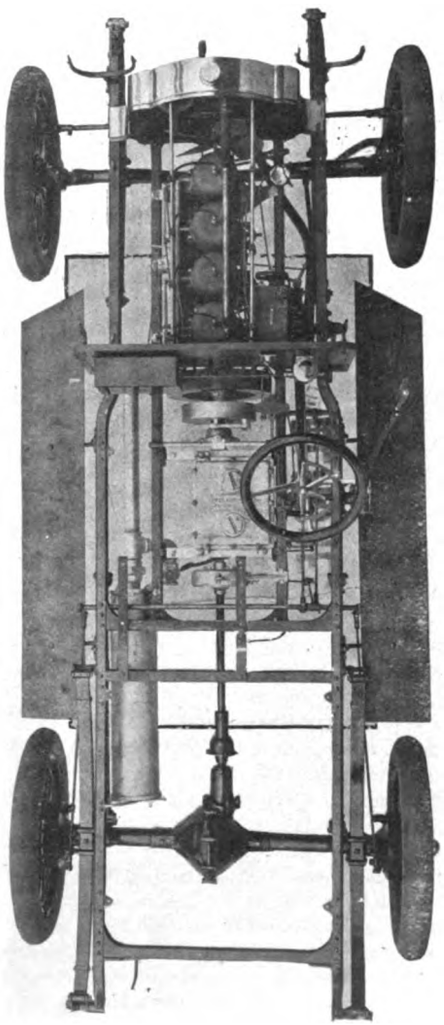
Here's the First Four Cylinder, Two-Cycle Car.



When a visitor at the Garden last January, on being shown the Elmore exhibit, having had the principle of the two cycle motor explained to him for the first time, said, "Now, if you will only build a four cylinder engine you'll have 'em all 'skinned to death,'" he sounded a note of prophecy, it would seem, for this coming "show time" will indeed see a four cylinder Elmore, which is calculated to do just that very thing. For some time the Elmore Mfg. Co., of Clyde, Ohio, has been practically alone in the application of two cycle motors to motor cars. Hence it is fitting that it should be the pioneer in introducing a four cylinder model, and also that they should claim for it the title of the "smoothest running car ever built."

Aside from the unique feature of the power plant, the Model 15 Elmore, as it is to be known, comprises all the chief elements which go to make up a perfectly "regular" car. The running gear is mounted on 34x4-inch tires, and measures 104 inches wheel base by 56-inch tread. Heavy walled tubular axles are used, having a large diameter, and fitted with roller bearings of approved type. The spur pattern of differential gearing is utilized, a ball bearing being installed to take up the thrust of the bevel driving gears. The suspension is by means of semi-elliptical springs, the front set being 48x2 inches, while those in the rear are 42x2 inches. Both sets have five leaves, and are equipped with clips to lessen the tendency to recoil. The frame is of pressed steel, braced with liberal reinforcements.

A sliding gear transmission is used, giving three speeds in addition to the reverse, and a direct drive on the highest gear. An interlocking system is supplied, as well as a system of interconnection with the brakes, as a safeguard to the mechanism. The clutch is of the Mercedes type, having a bronze expanding ring, which is automatically centred, requires but little attention, and does not "drag" when thrown out of engagement. The transmission shaft runs on roller bearings, and is provided with universal joints both between the gear case and the engine, and the gear case and the rear axle. It is constructed of a special high carbon steel, and is thoroughly protected from dust and dirt at all points.

The office of control is largely centred at the top of the steering gear, where are the spark and throttle levers, rotating over a stationary segment. The wheel itself is 15 inches in diameter, and requires two and a quarter turns to accomplish the full swing of the steering wheels. In addition to the interlocking systems already indicated, there is a special device whereby the engine is throttled whenever the clutch pedal is depressed, an arrangement which is intended to facilitate the process of gear changing.

ELMORE FOUR CYLINDER CHASSIS.

The motor, which is a betterment of the regular Elmore type, has its four cylinders rigged fore and aft of the car, and is rated at 35 horsepower. The cylinder dimensions are 4½x4 inches, which should give ample capacity for the rating. The cylinders are made in unit castings, with dom shaped heads, and all fittings, including the piping, are of cast brass. The construction of the motor includes no valves whatever, a feature which should have considerable weight on the selling stand. The vaporization of the fuel is accomplished in an atomizing carburetter of Elmore design, which has automatic regulation working on the Krebs principle and needing absolutely no attention at any time.

Of the other engine auxiliaries, the circuit breaker is of the wipe contact type, having a roller contact maker, staunchly built and mounted upon the upper end of a vertical shaft driven by bronze mitre gears from a horizontal time shaft. The same shaft also carries the pump, which is easily detachable. The main lubrication is effected through a pressure fed oiler of standard make, which is equipped with sight feed glasses on the dash and also with test cocks at the side to determine the rate of flow. The principal engine bearings are fed from a master grease cup mounted on the dash within easy reach of the driver.

The radiator is of the gilled tube order, and also constitutes the supply tank of the cooling system. The gasolene supply is carried under the driver's seat in a twenty gallon seamless steel tank. The general design of the body

Digitized by Google

and hood, following along the lines of the well known foreign types of car, gives the machine a stable and pleasing appearance and an air of complete modernness.

To Make Meddling More Expensive.

As the result of a conference between Judge Kimball, of the Police Department; W. S. Duvall, president of the Washington (D. C.) Automobile Club and Commissioner West, the latter will recommen dthat Congress make radical changes in the "Peace and Order act," approved July 8, 1898, which provides "that the taking and carrying away of the property of another without the right to do so shall be a misdemeanor and punishable by a fine not to exceed $40," so that the fine shall not exceed $100, or imprisonment for a term not to exceed six month, or both. Also that consideration be given to changing the phraseology, "taking and carrying away," so as to cover the movement of vehicles without the offender actualy taking and carrying away the property; that the police department be notified that tampering with automobiles, jumping in and out of vehicles left unguarded, manipulation of brakes or clutches and the tooting of horns will render the persons guilty of these offenses liable to a charge of disorderly conduct under Sections 5 and 6 of the Act of July 29, 1889, as amended July 8, 1898, and under which a penalty of not more than $25 for each and every such offence can be imposed.

Also that the commissioners recommend to Congress that Section 1 of the Act of July 29, 1892, be amended, so that the maximum penalty for injuring, destroying, etc., private property shall be increased to $100 for each and every such offence, instead of $50, as now provided, or imprisonment not to exceed six months, or both, in the discretion of the court.

5,000 Miles Without a Puncture.

Speaking of tire records, the sort of records of which both the tire makers and the user like to boast, A. G. Hoffman, treasurer of the Hartford Suspension Co., is relating with considerable pride how he drove his car, a 50 horsepower Thomas Flyer, 5,150 miles during the summer and autumn without getting a single puncture, and that not over the sand papered boulevards, but over the give and take conditions of country thoroughfares throughout New Jersey and New York States. Which record, he thinks, is quite beyond comparison for a car of such size.

Two Texas Darkies Want Ten Thousand.

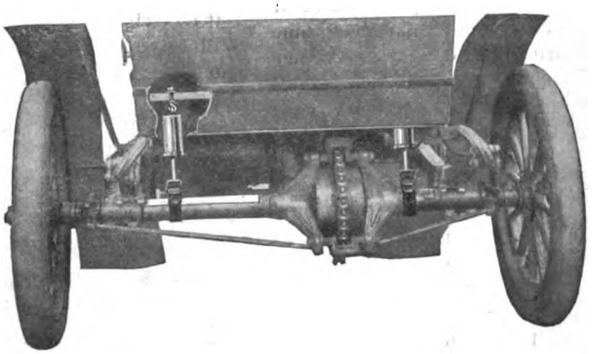
When the Southern Pacific Railroad instituted its motor car service between Galveston and Houston, Tex., two weeks ago, it issued a notice that no negroes would be allowed to ride on the cars. A few days afterward two colored law sharks applied for and were refused transportation. Each thinks $10,000 the proper financial balm to soothe his wounded feelings, and has accordingly entered suit.

At its special meeting Tuesday night, 12th inst., the Automobile Club of America voted to increase the membership limit from 700 to 1,000, exclusive of life members. This will permit the admission of some 100 applicants who have been on the waiting list.

TO REDUCE THE SHOCKS

Simple Device Easily Applied to Any Car—How it Performs its Mission.

That there is more in the spring damping problem than would at first appear is shown quite as well by the number of various devices on the market, each of which is supposedly able to cope with the needs of the

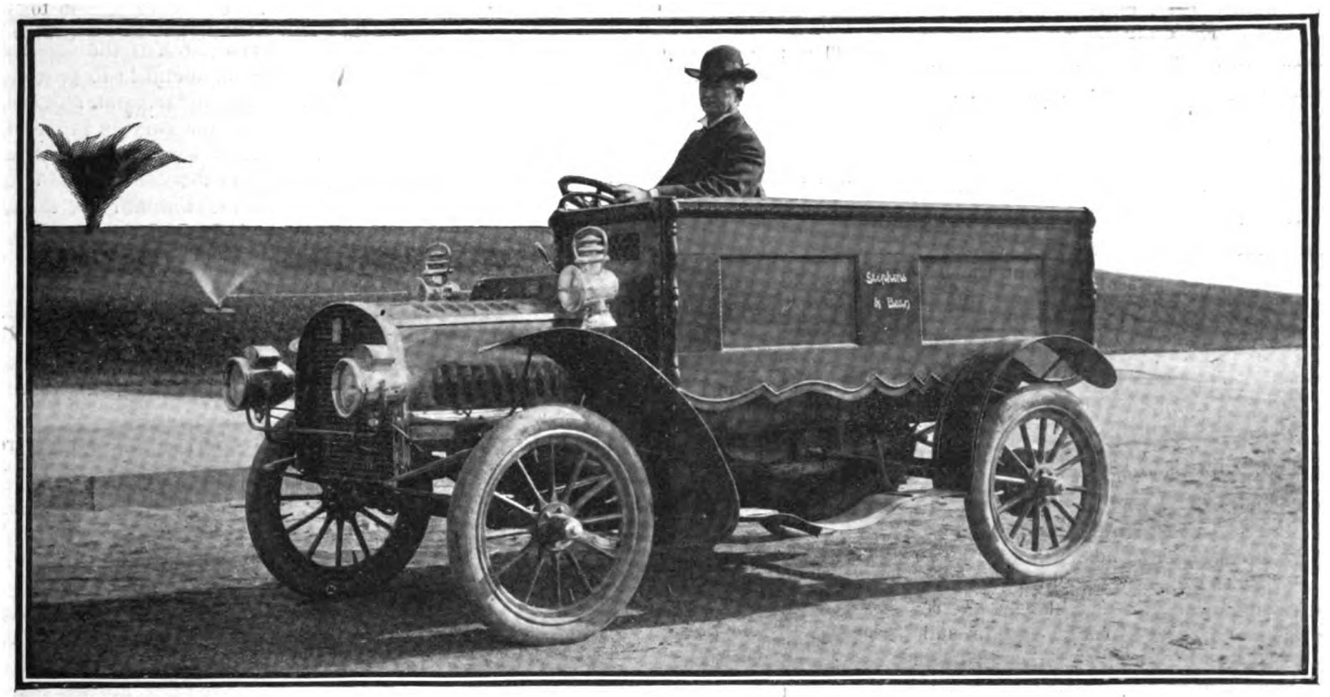


case, and the different principles upon which they depend as by the amount of discussion which is running its course through the press at the present time. That the perfect shock absorber, or spring check, or recoil check, whatever may be its name, is calculated to greatly prolong the life of the tires and also to work a great saving in the mechanism of the machine, as well as to relieve the fatigue incident upon long rides over rough roads, goes without saying.

The latest of these devices to come into the public eye is called the House Patent Spring Recoil Check, and is a product of the Baldwin Chain & Mfg. Co., of Worcester, Mass. Its action depends upon the theory that to check the downward motion of the car body upon the springs is to deprive them of their resiliency in just proportion to the amount of damping effect, and hence that to in any way hinder their working in the downward direction involves a greater strain upon the tires and the entire machine than should be put upon it. Hence the whole effort here is to check the rebound, as its name implies, leaving the main suspension entirely unhindered in its action except when the motion is upward; also, the measure of the checking effect is regulated in proportion to the force of the rebound, so that under ordinary circumstances, when the shocks encountered on the road are comparatively slight, there is little or no retardation to the action of the springs themselves.

The amount of mechanism involved is slight and not likely to become deranged, and in its application the device is correspondingly simple. It consists essentially of a right cylinder, which is furnished with an eye at its upper end for attachment to the frame of the car or to its floor. Within this is a segmental piston packed with specially treated oiled leather, which gives the desired frictional resistance. The segments of the piston are controlled in their mutual relation by means of toggle joints, which are retained in their extreme position by springs which also hold the piston at the upper end of the cylinder. To the piston is attached a piston rod which is connected to the axle of the car by means of a strap, the method of attachment to the piston being such that upon its being drawn down the toggles are expanded, forcing the segments out against the cylinder walls.

As is evident, the amount of resistance which is offered to the piston's motion is proportional to the pull, a slight amount of force causing a slight expansion of the piston with comparatively slight resistance in consequence, while a stronger pull involves a greater expansion of the toggles, with a greater amount of resistance of the piston against the walls of the cylinder. The arrangement is the result of a long series of exhaustive tests which have been made upon the road, from which the theory was first deduced and the mechanical means of attaining it evolved as a result.



Californians Talk of a Boycott.

The Southern California Automobile Dealers' Association has decided to boycott the Southern Pacific Railroad Co. if the new rules regulating the transportation of automobiles on the ferries from Oakland to San Francisco are not withdrawn. The rules do not allow the carrying of cars on the boats between the hours of 7 and 9 a. m. and 4 and 6 p. m. to Oakland, and 6 to 9 a. m. and 4 to 6 p. m. to San Francisco on week days. On Sundays no automobiles will be transported to Oakland between the hours of 10 a. m. and 1 p. m.

Undertaking Brought Right Up to Date.

Fresno, Cal., believes it has cause for pride. It has the only up to date undertaker's wagon in America. The accompanying illustration shows it "in all its glory." It is not only the property, but the design, of the funeral directing firm of Stephens & Bean. In addition to the driver and the compartment for the casket and necessary appliances, it also carries an attendant. A Fresno paper is responsible for the statement that it "is neat and graceful in appearance and it glides along the streets, attracting much admiration as it goes on its mission." The firm thinks so highly of the vehicle as a "business-bringer" that they feature it in their advertising.

Long Islands Make Annual Awards.

For driving his car the greatest number of miles—6,436, to be correct—Charles Jerome Edwards was awarded the Mersereau Mileage Mug, as the trophy is alliteratively dubbed, at the fifty annual banquet and meeting of the Long Island Automobile Club, which was held at the clubhouse, Brooklyn, N. Y., on Wednesday night of last week. Dr. C. Pinney was given the President's Cup, for securing the largest number of members during the year. Dr. Pinney induced twenty-four to sign application blanks. That the competition was productive of good results is evidenced by the membership roll. Twelve months ago there were 127 names on the roster, now there are 297.

The Mackay Meandering Memento, going to the member touring in the greatest number of States and making proper returns to the committee, was won by Charles Jerome Edwards, who drove his car in five States other than New York. Mr. Edwards will offer a similar trophy in 1906. The Adams Attendance Award went to A. R. Pardington, who was present at every one of its nine regular runs called by the touring committee. Raymond Healy got a Veeder Odometer of dashboard type for having covered the greatest number of miles of any member recording the same on an odometer of the make given as prize. Mr. Healy drove his car 5,989 miles.

It was announced at the meeting that the club would pursue its previous policy of holding a continuous show of new cars at its clubrooms, No. 360 Cumberland avenue, throughout the winter. The first of these novel shows will be held this week Friday. The 1906 models of the Royal tourist, Reo and Franklin cars will be exhibited and explained.

Preceding the presentation of the awards and the banquet, the annual election of officers took place. The following went in with a landslide of "Ayes!": President, Alfred Wilmarth; vice-president, Edwin Melvin; secretary, Walter G. Pierson; treasurer, Charles Jerome Edwards; board of governors (two years), Frank G. Webb, Dr. C. B. Baker and John H. Manuel, Jr.; membership committee, Lefferts Lefferts and M. S. Allen.

More Witch Law in Massachusetts.

That all automobiles and motorcycles shall be excluded from the northern roadway of Commonwealth avenue, between the Boston line and the boundary of Weston, is the edict of the Newton (Mass.) Board of Aldermen. The regulation reads in part, as follows: "No automobile or motorcycle shall go upon or use the northerly roadway of Commonwealth avenue from the Boston line to the Charles River, excepting to go to a residence or building upon the northerly side of said Commonwealth avenue, and then only by the most direct route from the southerly roadway. . . . It is hereby ordered that any automobile or motorcycle may be run on said southerly roadway at a speed not exceeding fifteen miles an hour."

Judge Weand Dispenses Real Justice.

In setting aside a verdict of $150, given by a jury last summer to Max Silberman, of Jenkintown, Pa., for damages for alleged personal injuries sustained in a collision between the former's horse and the defendant's automobile, Judge H. K. Weand, at Norristown, on Monday, said:

"An owner of an automobile has as much right to the highway as the driver of a horse and carriage. If a horse cannot be driven past a vehicle or car, properly managed, the owner should keep him off the highway or submit to the consequences. We do not wish to infringe upon the function of the jury in matters of fact; but, recognizing the hostility and feeling in the country against the reckless use of automobiles, we think the jury may have been misled. We do not say that it was not a fair case for deliberation and for an honest difference of judgment, but in our opinion the weight of the testimony was in favor of defendant, and that he ought to have the verdict of another jury, whether it be for or against him."

Numerous tales are told of the eccentric behavior of that ubiquitous bird the stork, but when one lighted upon the top of a London motor omnibus the other day he broke all previous records. It is reported that the visit was a success and that "both are now doing well."

METALS FOR MOTOR CARS

The Vast Differences in Grades of Iron and Steel—Homely Facts Little Understood.

It is said that the cost of the material that goes to make up the constituent parts of the modern motor car is in excess of the expense for labor in building. Whether this be true or not it is certain that few realize to what extent the nature of the steel, iron and other metals employed control the strength, weight and durability of the car of which they form part. It is only within very recently that many makers were totally in the dark in respect to the exact characteristics of the metals they were employing and they were accordingly forced to add weight in order to attain strength and even then were not certain of durability. In order to attain all the desirable features requisite the metal must be thoroughly tested and orders placed in accordance with the results ascertained—that is, on a definite specification to suit the particular end to which it is to be put.

In this respect France must readily be accorded the palm as a pioneer, investigations along this line being carried forward extensively by her makers before the rest of the world awoke to the fact that such a thing might be an advantage. Her metallurgists were so far in the lead that their firms were able to supply motor car builders with all the varying grades of steel in bar, rod, channel section or tube, and exactly to specification as regards the percentage of carbon. The services of expert chemists and metallurgists are naturally beyond the reach of smaller builders, but where the rolling mill and foundry force make up the deficiency the absence of such facilities is not felt to the same extent.

Just what "steel" means to the layman is not hard to define; briefly put it as a metal harder than iron, nothing more, nothing less. Given a knife blade he can usually tell whether it is steel or not by its spring and capacity to retain a cutting edge. But all steel is merely steel to him, and further than the rudimentary stage in classifying it as compared with wrought or cast iron he does not go. So far as appearance is concerned iron and steel both look alike and it takes more than the novice to distinguish them.

This is not to his discredit by any means, nor to that of the more experienced metal worker, for the difference between iron and steel of a certain character is so exceedingly slight that decimals of four figures must be resorted to in order to correctly express it. That is, the proportion of carbon that must be employed to convert iron into what is commonly known as mild steel, though the decimals are not employed in trade parlance, steel of a very mild nature being termed "10 point carbon," equivalent to but one-tenth of 1 per cent. Steel of this character is very ductile, easily machined and not liable to fracture, but must be thoroughly case hardened to form a frictional bearing surface.

What is generally termed machine steel is obtained by an increase to 25 or 30 point carbon when made on the Bessemer or Siemen's process, but this is still a soft metal and it is not until 50 point carbon is reached that it will harden slightly by direct quenching when heated to redness. From 60 points upward the metal takes on a greater degree of hardness until the tool steel stage is reached. In consequence of its strong affinity for oxygen, carbon, or rather substances containing it, are generally used for the purpose of reducing iron and similar metals from the ore, in which they are frequently combined with oxygen. Iron ore particularly is always smelted in conjunction with carbonaceous matter, such as the charcoal used in Sweden, which combines to make a grade of iron that is very pure and is highly valued for use in the construction of the pole pieces of dynamos in which rapid and thorough demagnetization is a requisite of prime importance.

Generally speaking, the only distinctions current are wrought or cast iron, which are, however, terms embracing as great a range of character in the metal as the word steel. Pig iron is the first product of the blast furnace and represents the primary stage in its reduction from the ore. In this process it is to a very great extent separated from its grosser impurities which, being lighter than the molten metal, float on it and are run off in the form of liquid slag, after the withdrawal of the charge of iron. In the heavy bars into which it is molded, termed pigs, from which it takes its name, it is coarse-grained and brittle. A second stage consists of its refinement by contact with charcoal, which results in the production what is ordinarily known as cast iron. It is then converted into wrought iron by a process termed puddling, which is nothing more or less than a constant stirring or agitation of the molten iron in order to bring every portion of it in contact with the air or oxygen which it contains. At this stage there is an excess of carbon, the iron is too rich in it and is accordingly wrought into masses of a size permitting of its ready handling and then passed through successive rollers, is reheated and rolled again, as well as hammered, the process being continued until the carbon is practically eliminated. The iron is then approximately pure and is very tough and flexible.

By whatever process the pure iron is produced the metal known as steel is a compound of iron and carbon, the latter in minute proportion. The chief difference between commercial mild steel and tool steel lies in the degree of purity of the iron at the start and the percentage of carbon added during the process of conversion, though for some purposes still smaller percentages of other substances such as maganese, silcon or tungsten may be added.

From this it will be apparent what a small difference in the composition of the metal may mean to the strength of such parts as axles, channel framing, steering knuckles and the like, each part calling for a specific mixture and character, if the smallest practicable amount of metal is to prove equal to the work it has to do, and still retain its shape against all the varying range of stresses to which it is subjected. Although the subject is beyond the knowledge of the average car owner the durability of the mechanism as well as his own safety are in the hands of the metallurgist. The science of the chemistry of metals thus has an important bearing on the production of the most efficient car, and it is a matter for congratulation that the subject is now coming in for the attention it deserves in this country.

For a Street Motor Railway.

W. H. Mitchell, of New York City, and W. S. Brawner, of St. Louis, have been granted a franchise by the city of Joplin to build and operate a motor street railway in that city. The proposed line is to be 100 miles in length, and will have its beginning in Joplin, and, after making a circuitous route through the country southeast of Joplin, will have its ending at this place. The line through the city will be operated as a streetcar line, and will run cars at intervals sufficiently close to handle the traffic. The object of the road is to open up the fine farming country south and east to the markets of Joplin. The cost of building the road is estimated at $2,000,000. The line will be operated with gasolene motor cars, the first of the kind in the Southwest. The franchise provides that freight depots can be established at certain points in the city, and that light freight in combination cars may be hauled through the city, not to exceed two cars at a time and not to stop at any of the crossings of the streets to exceed five minutes.

Thomas Tested on a Mountain.

To test its hill climbing powers, one of the 1906 model Thomas Flyers was put through its paces on the Wilkesbarre (Pa.) Mountain Monday, this week. The party in the car consisted of Montague Roberts and six other passengers, whose combined weight totalled 1,285 pounds. The run was made from the Empire Hotel to the top of the mountain, two and one-half miles, in 8 minutes and 8 seconds. Part of this grade is 27½ per cent. The car was again sent up the mountain, and the time taken from the beginning to the end of the grade, a distance of over a mile. The time was 4 minutes and 16 seconds, and the occupants made affidavit stating this to be accurate, and the first authentic time clocked by residents of Wilkesbarre.

The George N. Pierce Co. have adopted the Hartford suspension as a part of the regular equipment of the 1906 Pierce cars. It will be supplied without extra charge.

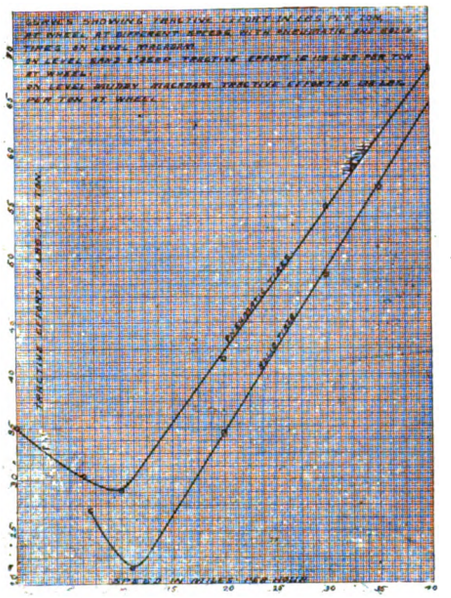
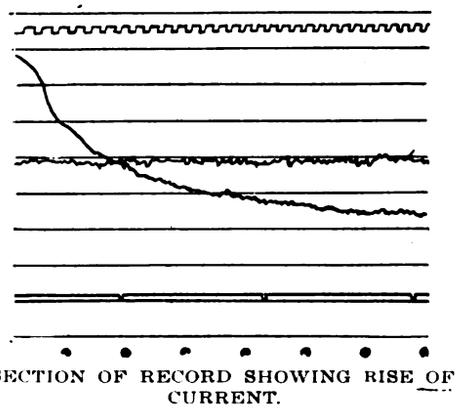
MEASURING POWER CONSUMPTION



Churchward Explains and Illustrates How it May be Done—His Instructive Discourse.

With the aid of an imposingly mysterious and complicated instrument that excited the curiosity of all who beheld it, a bank of Edison storage cells, a young trolley car controller and a duo of human assistants, Alexander Churchward lectured before the Automobile Club of America on Tuesday last on the subject of "The Energy Consumed by Electric Automobiles." So businesslike appeared the array of apparatus that President Morris expressed the fear that the club would begin to move off when the controller was turned on. It was the intention of Mr. Churchward, who is a member of the club, to have a small electric vehicle chassis upon which to demonstrate the workings of the instruments, but it was unfortunately found impossible to get it into the club rooms.

"Although the power consumed by automobiles under various operating conditions has formed the subject matter of many articles in the technical press, as well as of numerous papers read before scientific bodies, it has, until the present time, been wellnigh impossible to indicate the instantaneous value of the power consumed by a vehicle when running under the conditions met with in city streets and country roads," said the lecturer in opening his address.



"In the case of the gasolene car it is practically impossible to take indicator cards of each cylinder simultaneously, together with the speed of the car; with the steam car, while it is a simpler problem, it is hard to take accurate readings of the power consumed at any given instant. With the electric automobile it is, however, possible to measure the voltage, the amperage and the speed of the car simultaneously. To accomplish this the General Electric Company has designed a special graphic recording meter, the principles of which are based upon those employed in the apparatus constructed by the same company for testing street railway cars.

"It consists of a spring actuated roll of paper which is caused to pass beneath two automatic pens terminating the pointers of the voltmeter and ammeter. The paper may be regulated to run at any speed desired. It is ruled longitudinally into spaces calculated to represent a known unit, such as ten or fifteen amperes, the pens being arranged to pass across it from side to side in the course of its travel. A chronograph attachment automatically records intervals of five seconds, and a circuit adapted to be closed by a contact on the front wheel records every revolution of the latter on the strip. It has been found necessary to use one of the front wheels, instead of a driver, owing to the slip of the latter. The data of elapsed time and revolutions per minute thus recorded simultaneously with the amount of energy consumed supply a basis upon which the relation of the latter to the speed may be figured. The working of the instrument will be better understood from the section of its record here reproduced. The line next to the row of small perforations is the work of the chronograph, each indentation representing the passage of a period of five seconds. On the opposite side of the strip the regularly

CHARACTERISTIC CURVES WITH PNEUMATIC AND SOLID TIRES.

serrated line gives the equivalent of revolutions of the front wheel per minute, which, in connection with the chronograph record, is readily reduced to miles per hour. The record in the centre of the strip represents the consumption of energy, the voltage remaining practically constant, while the sharp rise of the current curve illustrates the increase due to accelerati.n. The apparatus complete weighs 150 pounds and is so delicately con-

SECTION OF RECORD SHOWING RISE OF CURRENT.

stituted that it is necessary to suspend it on springs.

"This apparatus, although primarily designed for indicating the power consumption of electric vehicles, has a very important, if indirect, use in the steam and gasolene automobile field. The results given below show the tractive effort in terms of the draw-bar pull in pounds per ton weight of car for electric cars when operating under widely varying conditions, and thus, knowing the efficiency of the mechanical transmission gear and weight of the car, it is possible from these results to deduct rules giving the requisite brake horsepower for any weight of car when the weight, speed and operating conditions are learned.

"Last year, in co-operation with the principal makers of commercial electric vehicles, I made a series of tests to determine the energy consumed by various cars when operating under actual working conditions. The cars used in these tests ranged from the little single seated runabout up to the large five-ton trucks used by manufacturers. To make a fair comparison between the different types of machines, each was run over a course which was selected with grades of different magnitude and pavements of various compositions.

"The grades selected were as follows:

TABLE NO. 1.

No.	Material.	Grade.
1.	Asphalt	Level
2.	Macadam	1.1%
3.	Macadam	Level
4.	Belgian block	9.5%
5.	Asphalt	4.7%
6.	Macadam	3.75%
7.	Asphalt and brick	3.125%
8.	Asphalt	2.25%

"Another course was selected in New York in Fifth avenue, extending from Sixtieth to 110th street. The temperature was taken of both the pavement and the air at various periods throughout the tests. The following table gives the results of these tests. The numbers in the first column refer to the grades given in table No. 1. The second column gives the draw-bar pull per ton weight of car; these readings are the averages taken for seventeen different vehicles. The third column gives the average speed of each test, and the last column states whether solid or pneumatic tires were used.

TABLE NO. 2

Grade No.	Draw-bar pull.	M. P. H.	Type of tire.
1	40	12	Solid
1	50	12	Pneumatic
2	48	11	Solid
2	66	10.5	Pneumatic
3	41	12	Pneumatic
3	49	12	Solid
4	250	5	Solid
4	270	5	Pneumatic
5	132	7	Solid
5	150	7	Pneumatic
6	114	8	Solid
6	128	8	Solid
7	95	8.5	Solid
7	119	8.5	Pneumatic
8	85	8.8	Solid
8	103	8.8	Pneumatic

"The difference in the consumption of power when running on wet and dry pavements was discovered to be so small that the additional tractive effort required when the pavements are wet may be neglected, skidding not considered.

"The most remarkable thing brought to light by these tests was the fact that a given car, when frequently running under exactly the same operating conditions over a given stretch of level asphalt track, will by no means require the same amount of energy for each run. The difference in the power consumed in several instances amounted to

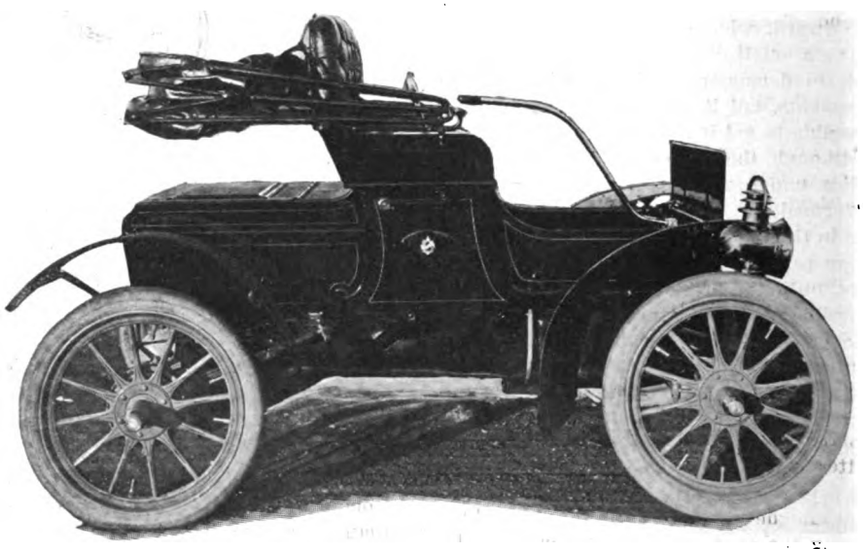
Digitized by Google

22 per cent, while in one case a variation of 72 per cent was indicated with the same car. There is little doubt that this great difference—namely, 72 per cent—was largely owing to the temperature of the asphalt, as the tests lasted for several weeks and were made at different times of the day.

"The temperature of the asphalt greatly affects the consumption of energy. In one case a difference of 40 per cent was found between operating a car on cold and warm asphalt.

"It was further proved that there are no difficulties in predetermining the amount of energy required to propel a given weight of car up a grade of known magnitude, as the ordinary mathematical laws generally used for this purpose were found to be perfectly accurate. Given horsepower, weight and grade, it is easy to calculate speed.

"It is interesting to note that while the pneumatic tires are less efficient than solid tires when operating on smooth pavements (absorbing about 15 per cent more energy), they are more efficient on rough roads. The reason for this condition of things is apparent when we bear in mind the well known fact that pneumatic tires are compressible, and solid tires, so far as practical purposes are concerned, are incompressible. Solid rubber is not quite as compressible as water. The natural result of this is that a pneumatic tire will run over or around any small obstacle in its path, the tire itself being indented rather than tending to raise the vehicle, while the solid tire must either rise over any obstacle or else the rubber will become distorted out of its true shape. It is this continual lifting of the car, caused by the many small obstructions which form a rough road, that consumes the extra amount of energy and makes the solid tire less efficient for such service. The tests further showed that a car equipped with pneumatic tires provided with leather treads, consumed more energy than when plain pneumatic tires were used. Steel studded treads have, in fact, been shown to bring about a decrease of 10 per cent in the speed.



"The results of these tests conclusively proved that it is impossible to show the true saving in energy consumed by the use of such devices as pneumatic tires, or special types of bearings, by simply running a car at its maximum speed over a level road. Atmospheric conditions vary every day, and the factor of wind pressure is ordinarily greatly underestimated, even the surface presented by the tires of the wheels or the spokes in case of a cross wind having to be considered to calculate it accurately. At thirty miles an hour the atmospheric resistance amounts to four and one-half pounds per square foot.

"By the courtesy of Mr. Edison and Mr. Lansden I was enabled to make a series of tests with various electric vehicles, running at a much higher speed than could be obtained with any of the standard commercial cars. The curve illustrated shows the results of these tests, giving the increase in tractive effort required per ton mile as the speed increased. These tests were made with both solid and pneumatic tires. It can be seen from the curve that a speed of nearly forty miles an hour was reached. It was also determined that the draw-bar pull when running through two inches of sand was increased 119 pounds per ton, while on muddy roads it showed an increase of 138 pounds per ton.

"The results of these tests have been reduced to tractive effort in pounds per ton in order that they may be used for calculating the necessary power required for operating steam and gasolene cars under any ordinary service conditions."

Olds Puts up a New Front.

At length Oldsmobile runabouts will be seen minus the long familiar "curved dash." For 1906 the Olds Motor Works will give the option of a body of the box type, having a straight leather dash in front and looking not altogether unlike a sidebar box buggy. The seat lines will be practically unchanged, while the deck at the back, instead of running to a sharp corner and an undercut back, will be rounded smoothly at the corner to a vertical back, the deck being nicely panelled. The axles are placed at the limits of the body, which, with the use of ploughshare curves in front and straight wings in the rear, gives the machine a neat and rangy appearance which is altogether attractive.

OLDSMOBILE RUNABOUT WITH BOX FRONT.

Features of Wayne's New Plant.

The new factory building of the Wayne Automobile Co., now being constructed on the northwest corner of Piquette avenue and Brush street, Detroit, Mich., will be of no mean dimensions, as its plans indicate. The main building, three stories high, will be 400 feet on Brush street and 300 feet on Piquette avenue. The testing building will be back of the main building, 36x100 feet, and the boiler and engine room, 30x45 feet, with a covered loading platform 150x16 feet. There will be a private running track, inclosed, to test cars on the grounds. All the buildings will be mill construction and will be provided with the sprinkler system. The builders are under contract to have part of the main building and testing building and the boiler and engine house finished by January 15, 1906. The remainder will be completed in the spring.

Buffalo Electric Becomes Babcock.

The recently incorporated Babcock Electric Carriage Co., Buffalo, N. Y., have purchased and taken over the assets and goodwill of the Buffalo Electric Carriage Co., and are figuring on an output of not less than five hundred vehicles. They will manufacture on similar lines to the old company, but will add two or three new models.

F. A. Babcock, president and general manager of the old concern, occupies the same offices in the new one; F. L. Bapst is vice-president, and E. R. Whitney secretary and treasurer. The other directors are R. B. Adam, Harry Yates, Charles L. Williams and Samuel J. Dark, all of Buffalo, N. Y.

Mahoning Will Wind Up.

The Mahoning Motor Car Co., of Youngstown, Ohio, which is a subsidiary company of the Youngstown Carriage & Wagon Co., has decided to go out of business and the affairs of the concern will be wound up immediately. Charles Gaither, who was in charge of the mechanical department, it is understood, has acquired the letters patent of the company and will go into business for himself.

Midgley's First Meeting in New Factory.

At the annual meeting of the stockholders of the Midgley Manufacturing Company, Columbus, Ohio, in their new factory, the following officers were elected to serve during the ensuing year: Thomas Midgley, president; E. A. Cole, vice-president; C. S. M. Krumm, secretary; F. W. Flowers, treasurer and general manager. The annual report disclosed a most gratifying season.

Ranier Makes a Change.

C. G. Rainier has resigned from the Rainier company, and is now with the Vehicle Equipment Co. as general representative.

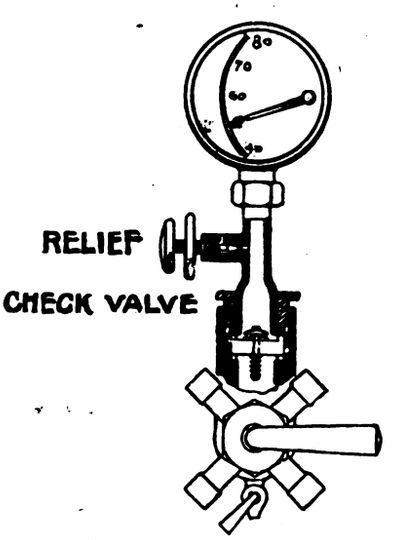
"KEEPING TABS" ON CYLINDERS



Ingenious Instrument that Performs the Service—How it Indicates the Power.

What the end of the craze for decorating the dashboard with a mass of devices may be, there is no telling. Some of them are worse than useless, and the practice seems to have culminated in at least one instance in the man who boasts that he has close to a thousand dollars worth on his car and is still open for suggestions. The desire to encumber every available square inch of the dashboard with a device, whether ornamental or useful, is apparently a trait of human nature that the accessory man can rely upon to the end of time.

One of the most recent additions that can lay claim to at least a few good reasons for its right to exist, is in the form of a pressure test gauge. It is termed the Gibson Power Indicator and was referred to in these columns when first exploited by its inventor. It is of English origin and has since undergone practical tests and has been placed on the market in full fledged form so that it will doubtless be a part of the equipment of a number of cars on the other side during the coming season.

When the engine begins to droop and shows unequivocal signs of lack of vigor, the difficulty of locating the fault on the road is frequently such that it is considered the better plan to run home without tinkering. Current practice favors a resort to cutting out the cylinders consecutively by preventing the explosion of the charge and provision for switching off the ignition in this manner is now coming to be a standard part of the equipment of the up-to-date car. This is, of course, a process of elimination which ends by tracing the fault to the cylinder that is either not working at all or developing so little power that it is proving a drag on the others. This method of testing is, however, not one that will give results of an entirely satisfactory nature except where the symptoms of the trouble are sufficiently decided to respond to this treatment. It is possible that fairly equal results may be obtained from all cylinders when tested under such conditions without revealing the source of fault, which immediately recurs when the engine is run under normal load in driving the car, some faults only making themselves apparant at high speeds. Hence the value of an accurate instrument indicating the work done by each cylinder in the regular course of duty.

This so-called power indicator provides a convenient means for the purpose. It consists of the usual form of gauge dial to be affixed to the dashboard or any convenient location where plainly visible. A copper tube of small bore is taken from the compression chamber of each cylinder and led to a four way cock placed just beneath the gauge. Between the two is a compression release cock or escape, which the Englishman picturesquely terms a "leak valve." Just below this is a check valve to prevent the escape of the compressed gas when the cylinder begins to exhaust. In the technical nomenclature of the Briton, this is a "non-return." The arrangement of the various parts of the device may be seen from the accompanying illustration. Starting from the bottom there is a small cock to shut off the pressure from the gauge altogether and above this the four way connection representing the ends of the copper tubes coming from each cylinder with its handle by means of which the pressure from any one of the cylinders may be diverted into the gauge. Just above this is the check valve to prevent its return.

In operation it is merely necessary to turn the handle to the cylinder suspected, means of identification being rendered easy by numbering the leads, and if the cock be open the hand on the dial will immediately respond to the pressure generated by the explosion. If nothing further be required and it is the purpose to test each cylinder in turn, the hand is returned to zero by opening the relief or "leak" valve. By means of the adjustment of the latter the gauge may remain connected to one cylinder for a length of time and the escape being constant, the hand will show whether the compression in the cylinder is uniform or fluctuating. All four cylinders may be tested in rotation in this manner in very few minutes, with results that are apt to yield more definite information than a long session with the starting handle. As it is not necessary to stop the car the motor may be tested under widely varying conditions, such as in hill climbing, running at various speeds on the level, and its performance noted. Such data would be of value for reference when trouble did develop.

Evidently the motor bus is a paying investment in Cuba. The West Indies Transportation Co., of Havana, who have had eight Knox cars in use during this year, have ordered four more of them—three twenty-eight passenger buses and one five passenger car.

REPAINTING OLD BODIES

Not Such a Simple Task as May Appear—How to Obtain Best Results.

In repainting old bodies the utmost caution must be taken if the best result is desired, says the Blacksmith and Wheelwright. The body should be sandpapered with No. 1½ sandpaper, and should be cut down thoroughly, cutting off all dirt and old paint that is cracked or peeling. After it is sandpapered well, a coat of permanent woodfilling should be put on with a good bristle brush, and then it should be wiped off perfectly dry and clean with a clean piece of cloth. After this is dry, which takes from eighteen to twenty-four hours, a coat of body filling should be put on. The body filling is mixed as follows: Body filling and white keg lead of equal parts and thinned with turpentine only. After this is dry, which takes about twelve hours, a coat of body filling without the lead should be applied every day until four or five coats are on the body. The body is then ready for rubbing, which should be done with brick pumice stone, care being taken to use plenty of water to keep the stone from clogging and scratching. After the body is rubbed out it should again be sandpapered with No. ½ paper and all the dust caused by the rubbing carefully removed. It should then be dusted well and it is ready for the color coats. Two coats of color should be applied with a two-inch camelhair brush. After this is dry, which takes about eight hours for each coat, the body is ready for the rubbing varnish, which should be put on with a two-inch badgerhair brush. The rubbing varnish should be given at least twenty-four to thirty-six hours to dry before rubbing should be done with pulverized pumice stone and water. Care being taken that all pimples are rubbed out. After the body has been washed off clean it is then ready for the finishing coat of varnish, which should be put on with a two-inch badgerhair brush. Before putting this finishing touch on the body, the floor of the room in which the body is to be varnished should be sprinkled with water, so as to keep down the dust.

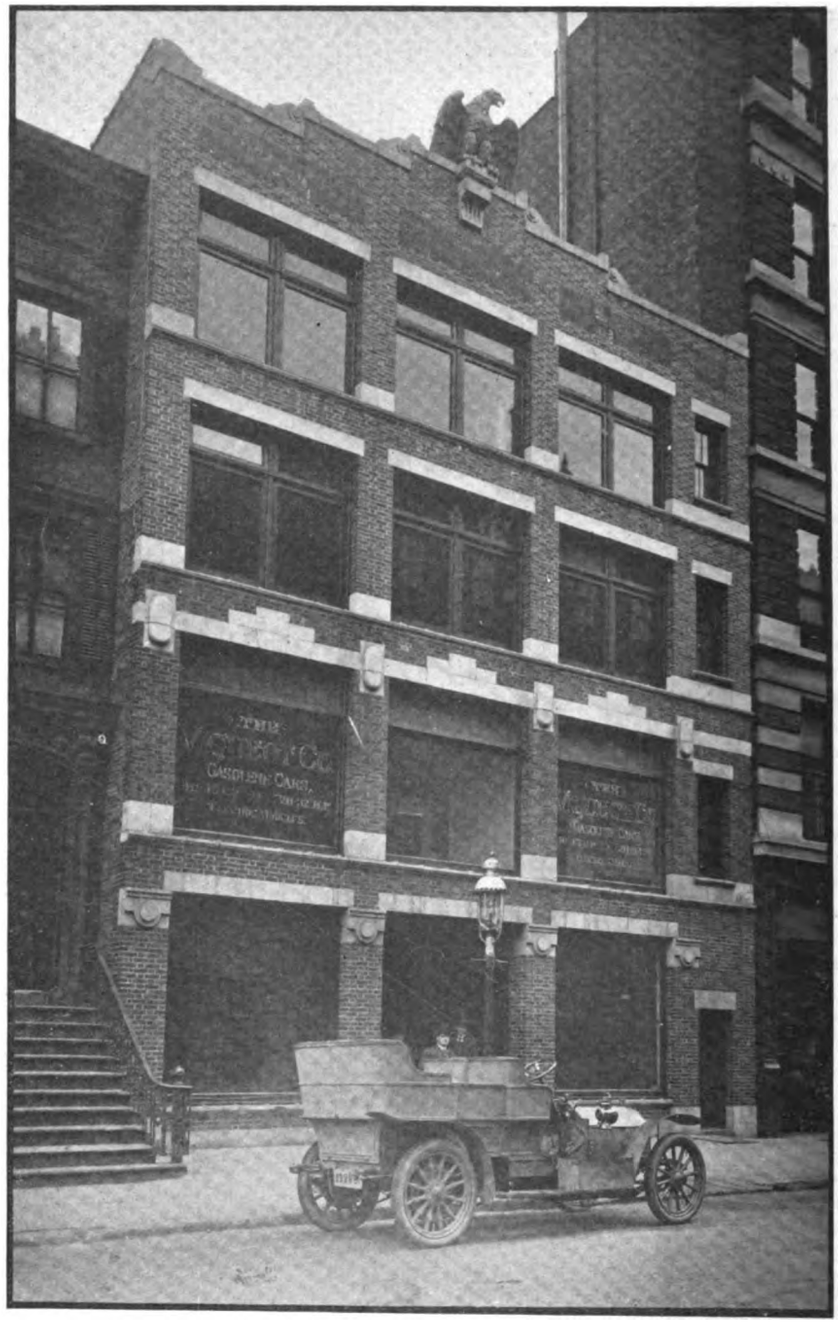
In case it is not desired to go through such an elaborate and lengthy process as the foregoing, then after the body has been sandpapered, touch up all bare wood spots with oil lead priming. Let dry twenty-four hours. Now give body a coat of flat lead which is mixed same as second coat lead for gears. Let this dry twenty-four hours and putty all uneven places and when dry sandpaper with No. 1 paper. Dust off cleanly and apply color.

Should a much better job be desired than either of the two preceding methods, proceed to burn off all the old paint with either a flat iron heated in the forge or a gasolene lamp prepared for such work. In burning

Digitized by Google

off the body aim to burn the paint against the grain of the wood, thus insuring a smooth surface. The knife used to scrape off the old paint should be a stiff putty or glazier's knife ground to a square edge.

It is advisable where a body is burnt off, to use a permanent wood filling for the first coat, as it is a time saver. Then proceed with method No. 1 throughout, and with care even a beginner can turn out a fair job of carriage painting.



The proper tools are of the utmost importance to a beginner. While the brushes may cost a little more, always get the best. The difference in cost will be more than made up in quality of work and its pleasing appearance. The brushes usually used by coach painters are soft brushes, 0 size oval. These are used for gear work or for body filling. Next in importance are camelhair brushes, sizes 1, 1½ and 2. These are used for second coat of lead and colors. Next is a limber blade putty knife for puttying gears and bodies. Carriage and not house paints should always be used on carriages, and varnish of some good reputable maker will give satisfactory results. Where a poor or cheap varnish is used it would destroy one's best efforts.

One of the most essential things in repainting old gears is to get every particle of grease and dirt off, as paint will not dry on a greasy surface. Next is to sandpaper the gear, cutting off smooth as possible all places where the paint has been cracked or blistered. After this has been done the gear is ready for the first coat of paint, which is known as priming. For red gears the coat is mixed as follows: Three parts of white keg lead and one part of Indian red mixed with boiled linseed oil, one gill to every quart of priming. If the gear is to be painted black, put one part of lampblack instead of Indian red. After this coat is dry, which takes about twenty-four hours, the gear is ready to be puttied, the putty being mixed as follows: For red use dry white lead three parts and Indian red one part, with rubbing varnish two parts and coach painter's japan one part. The putty should be put on as smooth as possible. When this is dry, which takes about twelve hours, the gear should be sandpapered with No. 1½ paper. Care should be taken while puttying to fill up all holes and cracks, and while sandpapering to cut off all the edges of putty, but not the paint underneath; the gear should then be dusted off thoroughly.

Then it is ready for the second coat of lead, which should be mixed same as priming, omitting the oil and japan and thinning with turpentine only. After this is dry, which takes about twelve hours, the gear is ready for the color coats, which can be bought ready for use with the exception of thinning with a little turpentine. These coats should be put on also with a camelhair brush. After this is dry, which takes about eight hours, the gear is ready for the finishing coats of varnish, which should be put on with a 1¼-inch badgerhair brush and using one-coat gear or elastic gear varnish.

In case the gear is to be painted green, black, dark brown or wine color, the priming should be mixed as follows: White keg lead three parts and lampblack one part. The second coat is mixed same as priming, with the exception that the second coat has no oil in it.

Handsome Home of the Viqueot.

Evidence is not wanting that the newly established Viqueot Company is making a bid for the business of those who wish to have their cars cared for under the best auspices. The four story and basement building shown in the accompanying photograph, which has been erected especially for this purpose, is intended to house a number of private owners' cars in addition to the sales department of the Viqueot car and the Vehicle Equipment Co.'s line of electrics.

Under the active management of L. S. Caswell, who has long been identified with the sales end of the trade, it already provides accommodation for quite a number, and more are being added rapidly. The location, Nos. 215 and 217 West Forty-eighth street, just off Broadway, is practically in the centre of the automobile district, so that it will doubtless be only a matter of a short time before its facilities are taxed to their limit.

A special tank for the safe storage of gasolene has been installed under the cellar, while the first floor will be devoted to general garage purposes and the charging of electric vehicles. On the floor above this is the office and storage for cars. The third floor is entirely devoted to the latter purpose, while the fourth is occupied by the repair shop, which is equipped in a manner to fit it to take care of all general work.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, Bevel gear drive. Very large and roomy full aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

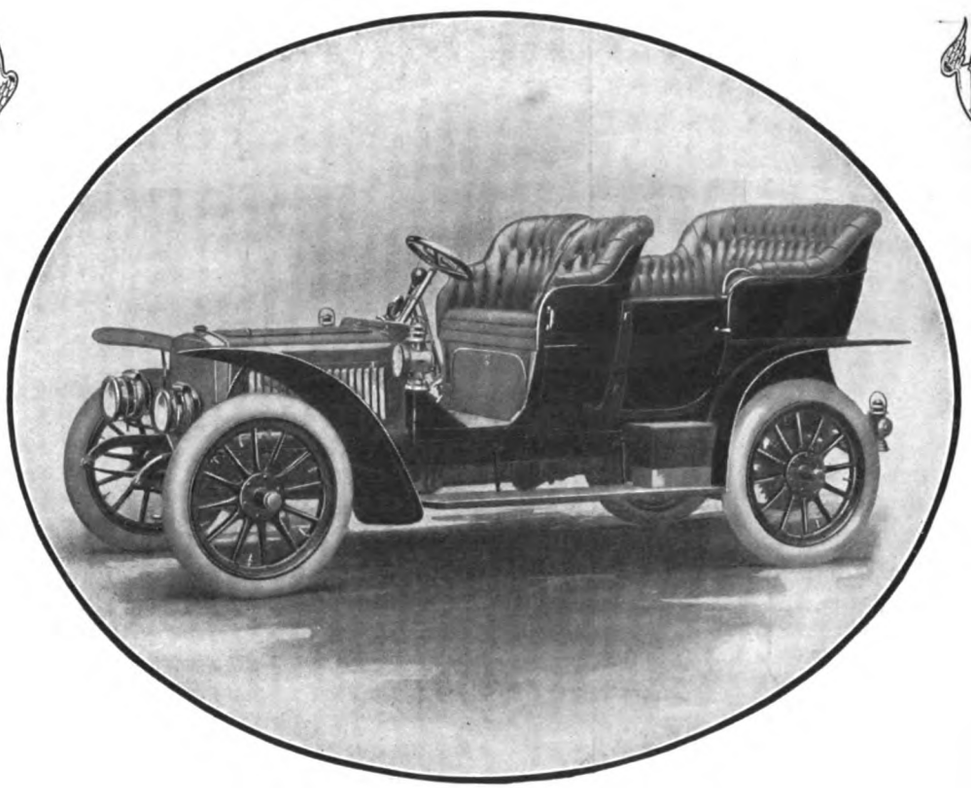
GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?



Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

WE GATHER from the good opinions expressed by many highly pleased owners of The Lozier Motor Car, that its "smooth running, ease of control and all-around reliability," covers about everything that is to be desired in a High-grade Motor Car. The item of low maintainance cost and all that it implies, was correctly calculated in its design, and is fully guaranteed in its perfect construction. Among the notably distinctive features that are embodied in

The Lozier Motor Car

may be mentioned—THE USE OF HESS-BRIGHT BALL BEARINGS in sliding gear, change speed and differential gears, WELDLESS NICKEL-STEEL FORGED I-BEAM AXLES of heavy construction. DROP FORGED STEERING KNUCKLE. BALL-BEARING WHEELS of large diameter (36 inches). PLATFORM SPRING SUSPENSION. SOLID FORGED MOTOR CRANK-SHAFT (arms being webbed out instead of drop-forged—turned, hardened and ground on its own centers). TRANSMISSION and differential shafts and flexible shaft with universal joint of *nickel-steel*. BABBITTED BRONZE MOTOR BEARINGS LONG WHEEL-BASE, 115½ inches.

1906 MODEL, TYPE C, 35 HORSEPOWER LIMOUSINES, LANDAULETS AND TOURING CARS now delivering. PRICES $4,500 TO $5,500.

THE LOZIER MOTOR COMPANY

1 BROADWAY, NEW YORK CITY

(Cars now showing at R. M. Stivers' Carriage Rooms, 19 W. 62d St.)
(After January 1st, at our New Building, 55th St. and Broadway.)

The Week's Patents.

805,613. Exhaust Muffler. Frederick S. Williams, Amsterdam, N. Y., assignor of two-fifths to C. F. Hesser, Amsterdam, N. Y. Filed July 25, 1904. Serial No. 218,064.

Claim.—1. An exhaust muffler, having communicating exhaust conduits, and non-communicating open-ended air passages arranged one within another.

805,647. Spring Wheel. William H. Jackson, Bakersfield, Cal. Filed July 15, 1904. Serial No. 216,735.

Claim.—1. A wheel comprising a hub, radial tubular spokes carried by the hub, a rim, spokes carried by the rim and having their inner end portions loosely working in the tubular spokes, a coil spring encircling the point of juncture of the hub and rim spokes, respectively, and a sleeve inclosing the said spring.

805,668. Vehicle Body. Herbert H. Rice, Indianapolis, Ind., assignor to Pope Manufacturing Company, Jersey City, N. J., a corporation of New Jersey. Filed January 23, 1905. Serial No. 242,288.

Claim.—1. In a vehicle body, the combination with a dash, of a storm apron permanently attached to the dash on the outside thereof, and means for storing said apron when not in use.

805,673. Vehicle Wheel. George Schram, Detroit, Mich. Filed February 17, 1905 Serial No. 246,143.

Claim.—1. A wheel comprising a hub, spokes yieldingly connected with the hub, a supplemental rim separated longitudinally into a plurality of parts and connected with said spokes, clamping members engaging opposite sides of the supplemental rim, and a tire held between the clamping members.

805,716. Automobile Axle. Adam R. Demory, Canton, Ohio, assignor to The Timken Roller Bearing Axle Company, Canton, Ohio, a corporation. Filed July 10, 1905. Serial No. 268,915.

Claim.—1. A pivotal connection for an axle and a spindle comprising a yoke on the one having a hearing and an aperture in its respective jaws, an adjustable bushing having a bearing therein and adapted to be entered and locked in the aperture, and a cross-pivot on the other having journals adapted to be entered and to operate in the respective bearings, there being shoulders on the pivots adapted to abut against the bearings.

805,740. Motor Vehicle. Willard D. Lowe, Columbus, Ohio. Filed December 2, 1904. Serial No. 235,152.

Claim.—In a device of the character described, the combination with a divided axle of a housing consisting of two parts having outwardly disposed flanges, a shaft, with an enlarged central portion, secured within and extending through recesses in said flanges, pinions loosely mounted on said shaft having their inner faces engaging the enlarged portion thereof, and their outer faces engaging bearing faces on the interior surface of the housing, and gears secured to said axle sections meshing with said pinions.

805,790. Sparking Device. Benjamin G. Gilbough, Chicago, Ill. Filed December 30, 1904. Serial No. 238,926.

Claim.—1. An ignition device or the purpose set forth, comprising an oscillating contact member presented to the charge in the engine cylinder, a gas-actuated member serving to oscillate said contact member, and means for restoring said last-named member to its normal position after the gas pressure is relieved.

805,824. Apparatus for Settling Dust Raised by Motor Vehicles. Samuel S. Stitt, Cambridge, England. Filed September 28, 1905. Serial No. 280,511.

Claim.—1. An apparatus for settling dust raised by the wheels of motor road vehicles, said apparatus comprising means for producing a spray of finely divided liquid behind the wheels of the vehicle, and means for supplying liquid and gas under pressure to the spraying apparatus.

805,828. Vehicle Wheel Rim. Ernst Weiler, Berlin, Germany. Filed March 7, 1905. Serial No. 248,833.

Claim.—1. A wheel rim or felly in two parts, comprising a detachable ring or flange in which the ring and the outer edge of the rim carry helically-formed ribs bearing mutilated screws engaging one with the other and a tire-engaging flange on each part by which the tire is wedged into and held firmly in position when the parts are screwed together.

805,878. Crank Shaft. Francis C. Osborn, Detroit, Mich. Filed August 25, 1903. Serial No. 170,741.

Claim.—1. In an engine, the combination of a hollow shaft, a disk secured to the same, a lug on said disk, a crank shaft revoluble within the hollow shaft, a disk secured to said crank shaft, means to prevent backward rotation of said shaft, a lug on said second disk, and a spring whereby the crank shaft may drive the hollow shaft, said lugs enabling the hollow shaft to turn the crank shaft.

805,944. Controlling Apparatus. Edward S. Clark, Boston, Mass. Filed February 3, 1905. Serial No. 243,975.

Claim.—1. In a safety controlling apparatus, a device for simultaneously locking the steering-wheel shaft in an operative position and releasing the starting mechanism, consisting of a hinged steering-wheel shaft, a hinged quadrant engaging therewith, means for compelling said engagement, said engagement in an operative position of said steering-wheel shaft releasing means for operating the starting mechanism.

805,978. Transmission Gear. Albert C. Menges, Grand Rapids, Mich., assignor to William Harrison, Grand Rapids, Mich. Filed September 14, 1904. Serial No. 224,458.

Claim.—1. In a transmission gear, the combination of a main shaft and a secondary shaft, driving gears carried by each shaft, friction disks upon the shafts adapted to engage with one another and mechanisms for engaging and disengaging the disks and for moving the gears on one of the shafts.

805,979. Carburetter. Albert C. Menges, Grand Rapids, Mich., assignor to William Harrison, Grand Rapids, Mich. Filed December 23, 1904. Serial No. 238,141.

Claim.—1. In a carburetter, the combination of a shell or case having separated valve seats therein, valves co-operating with said seats and having stems, the said valves controlling the admission of air and the outlet of the commingled air and gasolene, a gasolene valve located intermediate of the said valve seats and valves and regulating the supply of gasolene to the carburetter, movable projecting devices connected to the stems of the valves and located exteriorly of the carburetter, and a longitudinally slidable rod having cams thereon with which the free extremities of the projecting devices loosely engage, the said projecting devices being normally out of ngagement with respect to the cams and automatically returning to normal position when out of engagement with the cams to permit the valves to close.

805,981. Pump Attachment for Internal Combustion Engines. Reuben A. Mitchell and Lester L. Lewis, Oil City, Pa. Filed October 22, 1903. Serial No. 178,091.

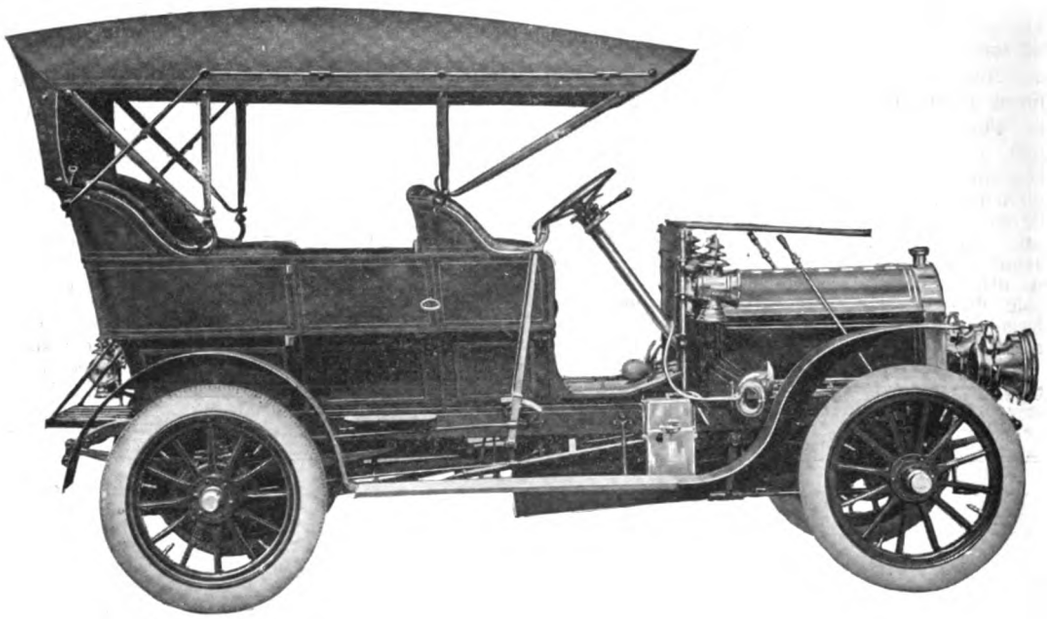
Claim.—1. In a mechanism of the class described, the combination with a gas engine, of a cylinder connected to and communicating with the explosion end of the cylinder of said engine, a piston within said first-mentioned cylinder adapted to be actuated by the pressure from the gas engine cylinder, means actuated by the piston of said first-mentioned cylinder for compressing a charge of air or gas, and means for cushioning the termination of the operation of the compressing means.

806,013. Means for Securing Pneumatic Tires to Rims of Wheeels. Sheffield Smith, Providence, R. I. Filed March.

Claim.—1. The combination of the wheel and a pneumatic tire with a clamping hook, having its shank extending inwardly between the metallic tire of the wheel and the felly, and screw-threaded means also extending inwardly between the metallic tire and the felly, to actuate the said hook to clamping engagement with the edge of the cover of the pneumatic tire, for clamping the said edge to the wheel.

806,017. Ignition Plug. Charles F. Splitdorf, New York, N. Y., assignor to Electric Vehicle Company, Jersey City, N. J., a corporation of New Jersey. Filed March 7, 1903. Serial No. 146,778.

Claim.—1. In an ignition plug for explosive engines, opposed electrodes located in a secondary circuit of an induction coil, a plug conductor or conducting rod for one of said electrodes, an insulator for said conductor or rod, a metallic cap at the end of said insulator, the latter being separated from contact with said conductor or rod by an air space, and a binding post upon said cap to receive one of the terminals of said circuit.



806,021. Differential Gearing. Robert Symmonds, Kenosha, Wis., assignor to Thomas B. Jeffery, Kenosha, Wis. Filed March 2, 1903. Serial No. 145,707.

Claim.—1. In a differential gearing, the combination with a hollow power transmission member, of a pair of meshed pinions, bearings formed integrally with said member in which said pinions are journaled, a pair of gears meshing with the respective pinions in said pair, aligned shafts upon which said pair of gears are respectively fixed, a bearing also formed integrally with said member and surrounding the adjacent ends of said aligned shafts between said gears, tubular supports surrounding said shafts, and roller bearings interposed between the portions of said shafts adjacent said gears and the surrounding tubular supports.

806,044. Speed Indicator. Henry Andrews, Hollis, Alaska. Filed February 8, 1905. Serial No. 244,737.

Claim.—1. A speed indicator for vehicles, comprising a casing, a dial in said casing, a pointer movable over the dial, a spindle on which the pointer is mounted, a lever integral with the spindle and adapted to be engaged by a part carried by a wheel of the vehicle, a ratchet wheel on the spindle within the casing, a pawl for engaging with the ratchet wheel, a coiled spring connection between the pawl and spindle and a radial arm wheeel adapted to be engaged by said part carried by the vehicle wheel and oper-

This is the Pierce Great Arrow 28-32 H. P., with straight tonneau body, cape top and folding glass front. Price, $4,000. Cape top, extra, $200.

PIERCE

The Pierce Arrow is an American car—the best American car that has been made—better in proportion to its cost than any imported French car—better for American use, American roads and the American motorist. It offers satisfaction, minimum of expense in running, perfect service, and can be operated by the owner.

Catalogue and descriptive literature on request.

ating to release the pawl from the ratchet wheel.

806,079. Carburetter for Hydrocarbon Engines. Oscar Gavelek, Chicago, Ill., assignor of one-half to William L. Paul and Guy W. Mervin, Chicago, Ill. Filed July 25, 1904. Serial No. 218,048.

Claim.—A carburetter for hydrocarbon motors, comprising a cylindrical casing provided at one end with inlets for air and hydrocarbon liquid, respectively, and at its other end with an outlet for carburetted air, a throttle valve controlling said outlet, a valve controling said inlet for liquid, fluid pressure actuated means on said last-named valve for opening same, a longitudinally movable plunger disposed in the path of said valve and controlling the degree of opening movement of same, said plunger being threaded betweeen its ends and passing through a threaded opening in said throttle valve, means for holding said plunger against revolution, and means for holding said throttle valve against longitudinal movement, whereby when said throttle valve is turned said plunger will be moved longitudinally.

806,080. Vehicle Wheel. George L. Glaser, New York, N. Y., and John Olsen, Jersey City, N. J. Filed December 19, 1904. Serial No. 237,442.

Claim.—1. In a vehicle wheel hub, an outer rim having a chamber, an inner rim provided with projections extending into the chamber of the outer rim, a cushion between the rims, and a cushion in the chamber of the outer rim and engaging the projection of the inner rim.

806,088. Jack for Relieving Pressure on Pneumatic Tires of Motor Vehicles. John C. Wands, St. Louis, Mo. Filed May 18, 1905. Serial No. 260,995.

Claim.—1. The combination with a lifting jack base having a flange provided with a straight side and a curved portion, of an upstanding tubular threaded portion integral therewith, a threaded shank in the threaded tubular portion, outwardly curved handholds carried by the shank, integral shouldered jaw-engaging portions above the handholds and an arcuate jaw rotatably carried thereby; substantially as described.

806,089. Device for Relieving Pressure on Motor Vehicle Tires. John C. Wands, St. Louis, Mo. Filed May 27, 1905. Serial No. 262,610.

Claim.—1. A device of the class described comprising a base having a horizontal hub-receiving portion and an inclined portion for guiding the wheel hub onto the horizontal portion; substantially as described.

806,101. Endless Solid Rubber Tire. Robert D. Bradley, Canton, Ohio. Filed April 10, 1905. Serial No. 254,662.

Claim.—As a new article of manufacture, a tire for children's vehicles consisting of a solid endless annular body of rubber adapted to be rolled onto a rim and having a lining of closely woven fabric cemented to the inner circumference thereof and covering the entire inner surface of the tire.

806,125. Rotary Explosive Engine. Fay O. Farwell, Dubuque, Iowa, assignor of one-half to The Adams Company, Dubuque, Iowa, a corporation of Iowa. Filed April 16, 1904. Serial No. 203,391.

Claim.—1. An explosive engine, comprising a mixing chamber and an explosion chamber, an inlet valve controlling the passage between said chambers, an exhaust valve for the explosion chamber, and a cam ring common to both of said valves and having projections of different heights controlling the opening and closing of the respective valves, said cam ring having adjustable means for varying the period of time the inlet valve is held open during the compression stroke of the engine.

806,136. Vehicle Hub. William T. Hanna, Cincinnati, Ohio, assignor to Martha A. Hanna, Cincinnati, Ohio. Filed Feb. 27, 1905. Serial No. 247,431.

Claim.—1. The combination of a short axle haing in its periphery a longitudinal groove intercepted by a bridge, a hub to fit over the axle and having a groove to form a keyway with the groove in the axle, keys seated in the keyway upon opposite sides of the bridge and nuts to engage the hub and to abut against the keys.

806,139. Device for Vaporizing Liquids. Albert Hayes, New York, N. Y., assignor, by mesne assignments, to Theodore J. Lindley. Filed February 27, 1905. Serial No. 247,514.

Claim.—1. In a device for vaporizing liquids, the combination of an air conduit, a diapnragm in said conduit having therein an air passage provided with a valve seat, means for supplying liquid to the valve seat, a lift valve for the ale seat arranged to control the passage of air through the conduit and means carried by the valve adapted to be acted on by air passing through the conduit to rotate the valve to distribute the liquid.

806,167. Piston. Dudley R. Morrison, Hartford City, Ind. Filed March 17, 1904. Serial No. 198,615.

Claim.—1. An engine pitman having a fixed pin at its piston end, and a piston having journal boxes at each side of the piston t receive the ends of said pin, means extending to that end of the piston which the pitman enters, for adjusting said boxes, and bolts having heads projecting from the same piston end for adjusting said means.

806,190. Variable Speed Mechanism. Richard E. Rosewarne, Covington, Ky. Filed September 29, 1904. Serial No. 226,502.

Claim.—1. The combination with the driving element and the driven element, of a circumferentially interrupted gear having an engaging portion of varying diameter and carried by one of said elements, and pinions for contact with the engaging portion movable along the periphery of said gear and connected with the other element.

806,195. Motor and Engine. Georges O. de Sanderval, Mont-Redon, France. Filed October 15, 1903. Serial No. 177,183.

Claim.—1. A combined internal combustion and hot air engine comprising side-by-side pistons reciprocable in said cylinders, a common crank shaft, a valve intermediate the two cylinders adapted to open automatically under the effect of an explosion in the internal combustion cylinder, exhaust valves for said cylinders and an air inlet valve for the hot air cylinder, and positive means for cutting out the hot air cylinder and allowing its piston to run free when the gas cylinder is working, substantially as set forth.

806,302. Transmission Mechanism for Automobiles. Zadock B. Starr, Gloversville, N. Y. Filed August 12, 1904. Serial No. 220,554.

Claim.—1. In an automobile, a pair of disks, a crank shaft upon which said disks are mounted, two shafts, a friction roller at each end thereof, two pair of disks connections between each shaft carrying said pairs of disks with the rear wheel of the automobile, said friction rollers mounted in such a manner that one roller on each shaft shall engage the disks mounted on the crank shaft on opposite sides thereof, the other friction roller on each shaft engaging one of the pairs of disks, respectively, substantially as described.

806,308. Gasolene Burner. Rollin H. White, Cleveland, Ohio, assignor to The White Sewing Machine Company, Cleveland, Ohio, a corporation of Ohio. Filed December 3, 1900. Serial No. 38,408.

Claim.—1. The combination of a main burner, a pilot burner tube which passes vertically through the same and is open at both ends and has on its lower end an internal drip cup, a pilot burner in said tube, which burner contains near its upper end a port which partly surrounds the burner, a discharge pipe connected with one end of said port and which discharges into the inlet of the pilot burner, and a supply pipe having one branch which is connected with said port, a second branch adapted to discharge into said drip cup, and a third branch which is coiled over the pilot burner and discharges into the inlet of the main burner, and three valves for severally controlling the flow of the fuel through the said three branches, substantially as and for the purpose specified.

806,316. Transmission Mechanism. Charles E. Bertels, Wilkesbarre, Pa. Filed May 31, 1905. Serial No. 263,037.

Claim.—1. In a device of the class described, a driving shaft and a driven shaft spaced apart and arranged in longitudinal alignment an intermediate mechanism including two shafts mounted for independent rotation and disposed in longitudinal alignment with said driving shaft and driven shaft, means for connecting and disconnecting said intermediate shafts, a clutch element between said driving shaft and one of said intermediate shafts, a clutch element between said driven shaft and the other of said intermediate shafts, and speed-changing mechanism associated with said intermediate shafts.

806,351. Vehicle Tire. Albert de Laski, Trenton, N. J., assignor to The de Laski and Thropp Circular Woven Tire Company, Trenton, N. J., a corporation of New Jersey. Filed August 11, 1904. Serial No. 220,326.

Claim.—1. A clincher tire comprising a body composed of a heavy circular woven fabric, a restraining jacket applied thereon consisting of courses of threads extending obliquely to the longitudinal axis of the tire and a tread applied on the restraining jacket, the whole being bound together in a coherent mass.

806,352. Pneumatic Tire. Jean P. Le Grand, Levallois-Perret, France. Filed July 2, 1904. Serial No. 215,199.

Claim.—1. In combination with a pneumatic tire, an exterior flexible protective strip, pins traversing the same at intervals, and a strap lying along the inside of the tire wall and carried through said wall and around said pins, substantially as described.

806,378. Automobile Street Sprinkler. John J. Sullivan, Chicago, Ill. Filed April 27, 1905. Serial No. 257,718.

Claim.—1. In a street sprinkler, the combination with a horizontally disposed cylindrical tank, a body frame consisting of side sills and end sills formed of I-beams and bolsters mediate said end sills formed of drop frame truss-shape construction, and endless bands surrounding said tank and having offsets that rest upon said side sills, of power generating apparatus and transmission gear actuated thereby, both of which are supported by said bolsters, a drive axle driven by said gear, sprinkling devices connected with said tank, and means which, while said sprinkler is in motion, force the water out of said sprinkler under pressure.

ASK ANY OWNER OF A ROYAL TOURIST.

This Letter is a Mild Sample.

Toronto, December 2, 1905.

ROYAL MOTOR CAR CO., Cleveland, Ohio.

Gentlemen—My family are not particularly fond of driving in the cold weather, and I have, therefore, laid up my car until Spring. As I had the honor of signing the first Canadian order for a Royal Tourist, thought you would be interested in what I thought of the machine, after one season's experience, and have only to repeat what Prince Louis of Battenberg had to say when travelling in the machine, "a wonderful car, good enough for any man living." Quite a number of your cars have come to Toronto, and the above few words express the opinion, I think, of all the owners.

Wishing you the success that your machine should bring, I am,

Yours truly, WM. J. SMITH.

THE CELEBRATED BRAMPTON CHAINS

MADE FROM SELF-HARDENING STEEL

TWO PAIRS OF CHAINS IN 75,000 MILES.

EALING, LONDON, February 13, 1905.

BRAMPTON BROS., Ltd.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, runn ng daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

can be and will be fitted with the celebrated Brampton chain if you order it that way, and it won't cost you or the manufacturer any more than an inferior chain the kind that breaks and stretches and have to be replaced every few hundred miles. All standard sizes in stock to fit American and Foreign cars.

We are Sole United States Agents for this Line of Chains, and are Ready to Quote Manufacturers Interesting Prices on American Standard Sizes.

Catalogue Mailed on Request.

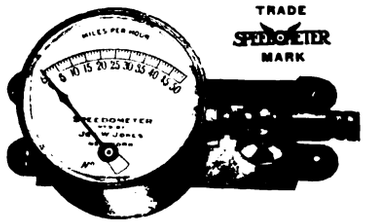
AUTOMOBILE users, drivers, repairmen, chauffeurs and others wanted all over the country; 50,000 machines built this year in United States, affording great opportunities for men trained in this coming business; six cents a day will qualify you for good wages in this field; in which the demand is such that ability counts ahead of pull and length of service. For full particulars, address THE CORRESPONDENCE SCHOOL OF AUTOMOBILE ENGINEERING, Suite 1357, Flatiron Building, New York City.

Every Automobilist's Automobile



should be equipped with a JONES SPEEDOMETER for the reason that it is recognized as the only *practical* speed indicating device.

¶ The accuracy of the Jones Speedometer is attained by the mechanically perfect application of an absolutely unchangeable law. Its standard of perfection will never be equalled by devices based on theories. In the development of our Speedometer we experimented with a large variety of devices, employing the principles of hydraulics, pneumatics, magnetism, electricity, etc., but after exhaustive tests, discharged them because found lacking in one essential or another.

¶ *Theoretical* accuracy does not necessarily mean *practical* accuracy:—nor does *initial* accuracy mean *permanent* accuracy.

¶ Our Speedometer Protection Tag will protect you against unwarranted arrest; this is presented free with each instrument. Probably you may find some interesting speed items in our 'Speedometer' Bulletin. Copy sent free on application.

Digitized by Google

Thousands of Chains have been damaged by interferences and unfavorable conditions.

For the future we demand Sprockets better than the average of the past, and we will no longer shield manufacturers who neglect to give this question proper attention.

In designing your car select the chain you consider right and leave plenty of space for a wider and larger chain.

Are your Sprockets cut to the correct bottom diameter with cutters correct in form?

Are your Sprocket teeth too wide and too straight on the sides?

Have the sharp corners of your sprocket teeth been removed after cutting?

Are your sprockets in line?

As a manufacturer do you inspect every sprocket by comparing it with a correct model or master gauge, or do you accept anything so long as it has the right number of teeth?

THE WHITNEY MFG. CO., Hartford, Conn.

WE most heartily extend to our patrons and friends everywhere our sincere best wishes for a Holiday Season of surpassing Good Cheer.

We are not unmindful of the good-will that has been so generously manifested on the part of our patrons during the past year; and for this, and for the constantly increasing liberality of their patronage, we are deeply grateful.

We pledge you that an earnest effort will be made to merit a continuance of your valued confidence.

$675
1906
Four-Seated
Runabout

REO

The extra seat carries two people facing forward, and when not in use is folded down snugly out of the way. 8 h. p., 1000 pounds, 25 miles per hour.

5 Prizes out of 7.

In the New York Motor Club's great six-day economy test

The Reo 8 horse power Runabout (shown above) carried 4 passengers 682 miles for $3.81½ per passenger.

By this feat this car won two medals—**The Gold Medal** for all cars up to $1500 in price; and the **MacMurty Medal** for least ignition trouble, having none at all.

The Reo 'Bus with exactly the same horse-power as the Touring Car referred to below carried ten passengers 682 miles for $2.93 per passenger (including ferriage).

And won three prizes:—The **National Trophy** for Economy per passenger; the **W. J. P. Moore Trophy** for Economy per mile, including tire charges, which were only 4 3-10 cents; and the **Morgan Trophy** for the least gasoline per passenger, which cost only $1.60.

Thus 5 prizes out of 7 went to the splendid REO capacity and power.

WRITE FOR REO BOOK THAT TELLS WHY.

REO 1906 TOURING CAR, 16 h.p., 1,600 pounds, 90 inch wheel base, 5 passengers, side-door detachable tonneau, speed 35 miles per hour, $1250.

TO SELLERS AND USERS

OF

CLINCHER TIRES

We have commenced and are vigorously prosecuting suits for infringement of our patents against the Pennsylvania Rubber Company and the Michelin Tire American Agency, Inc., on account of the sale of Clincher tires.

The sellers and users of infringing tires are equally liable with the manufacturers of such tires. Whatever rights we may have under our patents will be rigorously enforced. To escape liability purchases should be made from one of the following named manufacturers, who have the right to manufacture and sell G & J Tires:

G & J Tire Co.
Hartford Rubber Works Co.
Morgan & Wright.
B. F. Goodrich Co.
Diamond Rubber Co.
Goodyear Tire & Rubber Co.
Fisk Rubber Co.
International Automobile & Vehicle Tire Co.
Continental Caoutchouc Co.

ELMORE ANNOUNCEMENT.

During the New York and Chicago Automobile Shows, 1905, we were approached by hundreds of automobile owners, saying, "If you people would only put out a four-cylinder two-cycle car, you would simply have the rest beat out of sight. It would be practically the same as an eight-cylinder of the four-cycle type, with about one-fourth the complication, and as steady running as a clock." Well, we have built the four-cylinder, and it is all you expected, and more. You may have already heard this from persons who have seen and ridden in it, but you have never heard us say so. We, therefore, take this occasion to announce that it is our firm conviction that not only have we exceeded the most sanguine expectations of our friends, but that in all essential points we have the best four-cylinder car ever built.

Our two-cylinder two-cycle car is a worthy successor to our Model 11, which, for reliability, as is well known, has never been excelled. It is in the details of construction that we have made our great advance, and in changing from chain to shaft drive we accede to the popular demand for a two-cylinder car of that type. Among the details we have improved is in using a new planetary gear running in oil, a popular make of circuit breaker, heads cast solid with cylinder, and on both cars we use the famous Hill Precision Oiler. But, as said above, there are so many things we want to talk to you about that we hope you will at once get into communication with us.

We have made so many improvements on our 1906 Models that we have not the space to speak of them here, but our literature will explain them all in such a manner that you will readily see we have a car with the exact features that have been talked of for years as being most desirable, but are impractical on any four-cycle car on account of complication, rythm of motion, power, etc., but which come perfectly natural to our two-cycle. The action and power of an eight-cylinder car with one-fourth the complication does it all. Ask for literature.

NOTE.- Will exhibit in New York City at Madison Square Garden ONLY.

"EASILY THE BEST BUILT CAR IN AMERICA."

15-20 H. P., $3,000. 30-35 H. P., $5,000,

Both with complete touring equipment.

TYPE E. 15-20 H. P. $3000.

Top and Luggage Carrier extra

SPECIFICATIONS OF 1906 MODELS.

Type "E" Locomobile—15-20 H. P.

PRICE, $3,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; extra wide doors; fitted with top irons; color and striping optional.
MOTOR, 4-cylinder, 3¾ inch bore, 4½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, placed underneath the machinery.
FRONT FENDERS, have inner wings extending to bonnet.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
RUNNING BOARDS, rubber covered and brass bound.
TIRES, 32 inch x 4 inch on all four wheels.
WHEEL BASE, 93 inches.
CONTROL, spark and gas levers on steering wheel.

Type "H" Locomobile—30-35 H. P.

PRICE, $5,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5 to 7; fitted with top irons; extra wide doors; color and striping optional.
MOTOR, 4 cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, is placed underneath the machinery.
FRONT FENDERS, have inner wings extending to bonnet.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
RUNNING BOARDS, rubber covered and brass bound.
TIRES, 34 inches x 4½ inches on all four wheels.
WHEEL BASE, 106 inches.
CONTROL, spark and gas levers on steering wheel.

The Ford 4 Cylinder Runabout

This car—Model N—is the biggest revelation yet made in Automobile construction. A car of this type for less than $500.00 seemed an impossibility, but here it is.

4 Cylinder—15 H. P. Direct Drive. Speed 40 miles. 78-inch Wheel Base. Weight 700 Pounds.

FORD MODEL K.

Six cylinders—40 H. P. 4 to 50 miles per hour on high gear. Perfected magneto ignition. Mechanical oiler. 114 inch wheel base. Luxurious body for 5 passengers. Weight 2,000 pounds. Price, $2,500.00.

No further particulars will be given until these cars are shown for the first time at the Automobile Club of America's show at the 69th Regiment Armory, New York, Jan. 13th to 20th.

DELIVERIES FOR MODELS N AND K WILL NOT BE MADE BEFORE MARCH.

1906 will be a "Ford Year." Agents who have closed with us can congratulate themselves.

Model F.

Pope-Hartford Model F

is the result of our 28 years of experience in making and marketing mechanical vehicles and is the latest product of our famous Hartford Factories. **Motor:** consists of 4-cylinder, vertical, water cooled engine with cylinders cast in pairs; all gears encased; brake test 28-30 H. P. **Transmission:** sliding gear, three speeds forward and reverse. **Carburetor:** specially designed, insuring economy in fuel consumption and maximum power. **Control:** throttle and ignition levers on single sector that does not revolve with wheel. **Drive:** bevel gear through propeller shaft to the rear axle. **Tonneau:** non-removable, dust proof, double side entrance. **Design:** artistic in conception and execution.

While great attention has been given the essentials of construction it will be found that no detail has been overlooked. Everything that will contribute to the user's comfort and convenience has been embodied in this up-to-date car. **Price $2500.**

Pope-Hartford Model G

is our 2-cylinder, opposed, 18 H. P. touring car. The engine is under the hood and all parts are accessible for inspection and repair. This is our dependable 2-cylinder machine of last year with such minor changes as has been suggested by a seasons use. **Price $1600.**

We exhibit in New York at Madison Square Garden only.

The Incomparable WHITE

The Car for Service.

WHITE GENERATOR

Above is illustrated the generator of the White steam car, together with burner, vaporizer, pilot-light and gasolene connections. A glance is sufficient to show that the White generator is totally unlike any other boiler ever designed. We might point out how wide this difference is by calling attention to the fact that in the White generator the water is at the top and the steam at the bottom. In every other type of steam-making apparatus, water is at the bottom and steam at the top.

If the coils of the White generator should be unwound and straightened out, the generator would be seen to consist of a single long piece of steel piping. Could anything simpler than this be conceived? The capacity of the tubes is comparatively small; i. e., the amount of water and steam contained therein at any one time is small. The tubes will safely withstand a pressure of many times that which it is possible for the steam to attain. Could any safer arrangement be imagined?

As regards the superior reliability of the White system, that is a matter which has been amply demonstrated by the continuous victories and notable achievements of six successive models of "The Car for Service."

What Royal Tourist Owners Are Writin'.

"More pleased with Royal than any car I have ever owned. Have owned about 25, both foreign and American."

"Mine has run about 4,900 miles this season, and has had absolutely no repairs."

"Since June 2nd I have toured about 6,000 miles, and during this time I have never once stopped on the road to make a single repair or adjustment."

"The Royal Tourist which I purchased of you has run about 6,000 miles, over hard country roads and sharp hills, and total cost of repairs will not exceed $3.00."

"I have run this car about 6,000 miles and have given it some hard usage. The expense for repairs has been $3.25."

"Am delighted with my Royal. Have run it nearly 2,000 miles, and have had no repairs."

"We have been over 7 500 miles, at this date, without a repair or replacement of any kind or description, except to tires."

Ask any of our Agents to show you reproduction of letters from which these remarks were taken.

HAYNES Exclusive Features that Appeal to Discriminating Buyers

MODEL "R" FOUR CYLINDER TOURING CAR.

Roller bearing vertical engines. Cylinders, 5⅛" x 6"; 50 H. P. Cast separately. Sliding gear transmission, with exclusive device which prevents possibility of burring or stripping gears and permits instant change from high to lower speeds with perfect safety and without noise. Positive cooling system operated at very low cost of power. Individual and special lubrication. Carburetter which assures perfect mixture in all temperatures and under all climatic conditions. Master Clutch, that has no leather surfaces to wear. Takes hold easily and gradually, without jerking. Shaft drive. Exclusive universal joints, that do away with wear on pins, run in housing packed with grease. One piece nickel steel rear axle, with beveled sprocket gear, driven by roller pinion; thrust eliminated, friction reduced, noiseless; all in a bath of oil. Roller bearings throughout. 106-inch wheel base. 50-inch tonneau, with ample room for two folding chairs. Six to 60 miles an hour on high gear. Weight, 2,750 lbs. Price, $3,500, F. O. B. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906 HAYNES roller bearing engines, master clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES factory and with exact reference to every other part. There is perfect harmony throughout the entire mechanism. This is the reason that in the HAYNES car there is less than 10% loss of power between the engine and rear tires. It is the reason that its cost of maintenance, upkeep and operation is so remarkably low, and that for 14 years it has had the acknowledged reputation of being a car of pre-eminently high quality.

Its cylinders are extra large. They hold compression perfectly and give high power. When changing gears the transmission device never allows the momentum of the fast moving car to be thrown against the power of the engine, with its consequent strain to the entire mechanism, frame and tires, a fault common to all other types of transmission. No danger of stripping gears or of gearing climbing out of casing, which constitutes the chief objection offered to large shaft-driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum and wood. Grey curled hair and hand buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirements.

These are some reasons why the HAYNES gives such satisfactory service at a low rate of cost for upkeep. Others are given in our new catalogue, sent prepaid upon request. For prompt attention address Desk 20.

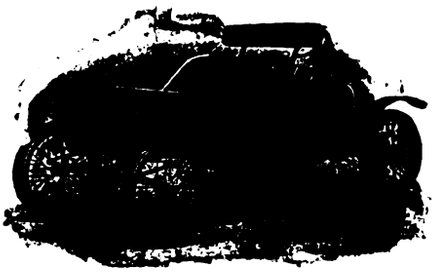
Waltham Orient

Waltham-Orient Model R, $2,250.
The Keystone of the Air-cooled Arch.

The Car of To-day Must do More than Look its Price. The high priced, high powered motor car is all right—it has its place and its purchasers but the popular demand is for a car of moderate price, reasonable speed that will be maintained up-hill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.



It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of its Price.

FIVE TOURING MODELS FOR 1906.

Model R, a Swell Special 20 H. P.....	$2,250
Model N, 20 H. P. Tourist.....	$2,000
Model L, 16 H. P. Tourist.....	$1,750
Model M, 16 H. P. Runabout, Detachable Tonneau	$1,750
Model K, 16 H. P. Two Passenger Runabout	$1,600

Friction Drive Buckboard Model BB, $400.
The Lowest Priced Motor Car Made in the World.

A Greyhound can run a mile as rapidly as a five thousand dollar Racehorse, and he can course through the sand and up the cliffs where the thoroughbred cannot follow; which only goes to prove that price, bulk, weight and power rating do not necessarily mean the first to finish nor the one to get nearest the top of the mountain.

The Buckboard is the Greyhound of Motor Cars.

It makes no pretensions to being the thoroughbred horse, it has no five thousand dollar price tag on it, but is simply in a class of its own, equally a pleasure to its owner for it serves its purpose and serves it well.

WHY?

BECAUSE: It creates interest quicker than any car you can represent. It conflicts with no other sales. It makes Motorists out of Horsemen and Cyclists. It sells to owners of the "thoroughbreds" for daily service to the station, the country club or the seashore, It sells for Rural Mail Routes, Telephone and Telegraph Linesmen, Parcel Delivery, etc. It requires less time and trouble for each sale, and less subsequent expense and repairs. It has an operating cost less than one-third of any other motor car in the world. It will run 35 miles to the gallon of gasoline, and 100 miles to the pint of oil. It has a maximum power ratio of 40 to 1. No other car exceeds 18 to 1. It will climb 40 per cent. official grade and run 30 miles or more per hour. If you will write us we will send you forty other reasons.

We are alive for live agents. Write for specifications and agency proposition.
We will exhibit only at the New York, Chicago and Boston Shows.

OLDSMOBILE

We certainly have no monopoly in good motor cars this year. The best American cars are all good, and we only put in a bid for our car at $2250 (Model S, 4 cylinder) because it has an individuality worth knowing before you buy anything else. Have your trial run in it and then you can purchase or not, but you will have learned something about compactness, power and style that may stand you in good stead. If you want a lower priced car The Two Cycle (Model L) at $1250 is apt to be "it." We don't have to more than refer to The Two Cycle because every one knows about it. If you want to read up a little, make use of the coupons below.

WE WILL EXHIBIT AT MADISON SQUARE GARDEN.

This AUTO TIRE is both DURABLE and LIVELY

When you buy an *ordinary* Auto Tire, you have to decide a difficult question.

Is it best to get a hard, inflexible tire, which will rack your bones and soon put your car out of business, but which will *last a season or more*

Or—

To get a soft, resilient, easy riding tire, which will go to pieces in a short time because it won't stand the wear and tear of the road?

Momentous question.

And either way you answer it—you lose.

Because if you decide on the *hard* tire, it means breakdowns on the road, and consequent liberal use of a farmer's team. It means constant repairs to your engine, a car always in the shop. Your aching joints are thrown in for good measure.

And if you select the *soft* tire, it means punctures, tire explosions and tire troubles generally. And you have to buy new tires every little while.

It's Money—Money—Money, either way.

You'll envy Rockefeller before you get through.

Now you can *dodge* this momentous question if you will.

Because the Goodyear Detachable Auto Tire has all the GOOD points of both the *hard* and the *soft* tire with the bad features of neither.

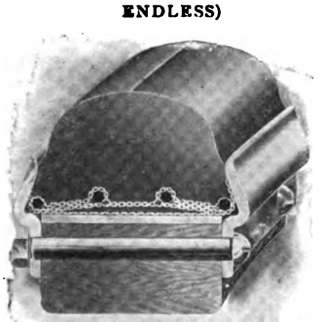
It's easy for anyone to understand WHY this is true. Read carefully, and see for yourself.

First, look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it. It's what the *hard* tire is made from.

Now right underneath this is the remainder of the outer tube (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be. It's the same as the seldom-used *soft* tire.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The dense rubber and the soft rubber together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.



Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

THE GOODYEAR TIRE & RUBBER COMPANY, Grove St., Akron, Ohio

Branches in the following cities: Boston, 6 Merrimac St.; New York, Cor. 64th St. and Broadway; Chicago, 110 Lake St.; Cincinnati, 242 E. Heavy Trucks,
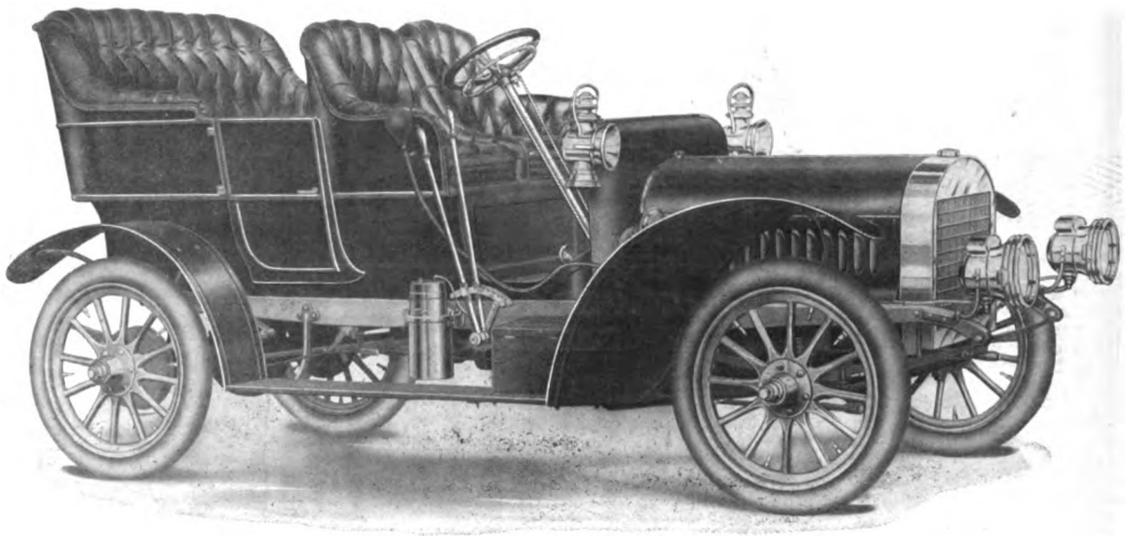
Broughams,
Hansoms, Surreys,
Victorias,
Hotel 'Busses,
Hose Wagons,
Ladder Trucks,
Chemical Engines,
Water Towers,
Fire Engines.

TIRE ECONOMY

COST OF MAINTENANCE is main factor for consideration in selecting tire equipment.

MAKE CAREFUL COMPARISONS.
Don't be prejudiced by poor results obtained from cheap tires.

STOP EXPERIMENTING and end dissatisfaction by adopting a tire that has demonstrated its worth by years of use under all conditions, and to thousands of satisfied users



PROVEN LOW COST OF MAINTENANCE.

THE HARTFORD RUBBER WORKS CO.
HARTFORD, CONN.

Branch Houses:—NEW YORK, BOSTON, PHILADELPHIA, BUFFALO, CLEVELAND, DETROIT, CHICAGO, DENVER, SAN FRANCISCO, LOS ANGELES.

Rambler

Model Fourteen

Looks good, doesn't it? It *is* good inside and out, with every modern feature refined to the Rambler standard, than which there is no higher. The motor is four cylinder, vertical, 20-25 horse power, giving a full horse power to each 90 pounds dead weight of the car with full equipment.

A sliding gear transmission that is simple, positive in action and noiseless. Three forward speeds and reverse.

Shaft drive, the entire shaft and universal joint enclosed, the latter in an oil bath.

Wheel base 100 inches, wheels 32 inches with 3 1-2 inch tires.

Finish and trimming in keeping with the whole, that is, the best obtainable.

Price with lamps, horn, and full equipment of tools, $1,750.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, December 21, 1905. No. 13

POPE FILES HIS REPORT

Reorganization Nearly Completed, he Sees Larger Profits Ahead—Figures for the Year.

The annual report of the Pope Manufacturing Company was made public last week. It covers the twelve months ending with July last and is as follows:

	1905.	1904.
Gross earnings	$7,801,145	$7,226,589
Expenses and costs	6,496,395	5,995,793
Net earnings	1,304,749	1,230,796
Other income	*753	62,158
Total income	1,303,995	1,292,954
General exp. and interest	1,216,775	1,241,961
Balance net earnings	87,219	50,992

*Loss

ASSETS.

Cost of properties	$18,553,986
Deferred charges to operations	346,855
Stocks and materials	2,663,998
Accounts receivable	692,928
Bills receivable	82,687
Miscellaneous investments	286,283
Cash	262,519
Total	$22,894,260

LIABILITIES.

Preferred stock	$2,429,676
Second preferred stock	9,183,000
Common stock	10,000,000
Bankers' loans	825,000
Accounts payable	306,206
Payrolls accrued	51,518
Reserve for renewals	75,000
Surplus	23,859
Total	$22,894,260

In his report to the stockholders President Albert A. Pope says:

"In the reorganization of the business of the company industries in several factories were found to be not only unprofitable, but of a description that it seemed impossible to continue at a profit. The liquidation of such industries seemed to be inevitable, and thus far has been accomplished with the least possible loss. Other departments of the company have shown large profits, which have been nearly absorbed by the losses and expenses of liquidation and the cost of maintenance of unoperated factories, the latter item amounting for the year to $90,264. These unavoidable burdens on the earnings of the company are, I believe, largely a matter of the past.

"The manufacture of automobiles, which is now the larger part of the business of the company, is a comparatively new industry, and it has taken much time and money to experiment and produce goods of a standard quality.

"The amount of business done by the company during the first months of the new fiscal year considerably exceeds that of the corresponding period of the year just ended, and now that reorganization is nearly completed and losses from liquidation will be limited, the results of the company's operations should be more satisfactory."

May be Licensed Purchasing Department.

The Association of Licensed Automobile Manufacturers is contemplating the establishment of a purchasing department. How deeply the subject has been gone into or whether and definite steps have been taken is not known.

The first and only intimation that anything of the sort is in view is contained in a casual line in a circular letter issued to the members of the association, which summarizes the several departments that have been established and adds "prospectively a purchasing department." On the face of things, this mere reference appears to be fraught with possibly far reaching importance, and is suggestive of co-operative buying.

Miller Enters Buffalo and Detroit.

Charles E. Miller has "invaded" Buffalo and Detroit, which brings the number of his branch houses to six. The Buffalo store has been established at No. 824 Main street, and will be the largest of the Miller branches; in fact, it will be Miller's Western distributing depot, and permit the delivery the Western orders the day of or after their receipt. The Detroit store will be located on Jefferson street. The execution of the lease, however, is still pending.

Firestone Increases to $500,000.

The Firestone Tire & Rubber Co., Akron, Ohio, has increased its capital stock from $200,000 to $500,000. Much of the new money is to be used in the exploitation of the new Firestone mechanically fastened pneumatic tire, which is now practically ready for marketing and which is to be pushed with uncommon aggressiveness.

Ranier to Open in Chicago.

Having firmly established the Rainier car in the East, the Rainier company is now reaching Westward. It is making ready to establish a branch in Chicago.

GETS BACK AT GOODYEAR

Relieves Pressure for Debt by Claiming $150,000 Damages—Three Sides of the Case.

Joy unrestrained pervades the ranks of the Unamalgamated Order of New York Automobile Promoters and Press Agents.

It was caused late last week, when Charles Blake Cisco, assignee of a claim of the New York- Broadway Rubber Tire Co., filed an action against the Goodyear Tire and Rubber Co. in the Supreme Court of Kings County, N. Y., for $150,000 damages, in which breach of contract and "restraint of trade" was alleged. The Unamalgamated Order which has a keen and devouring appetite, and which has found tire manufacturers generally to be "poor pickings" of late, executed a cakewalk on the receipt of the news, and then drew forth their trusty hammers, battleaxes and coloring pots and proceeded to "get busy." The chief promoter in the Order is reported to be still delirious with delight. He tried to force the tire makers to supply about $1,000 worth of their goods to assist one of his private money making schemes, and when they refused to be coerced he acquired a sandbag, and ever since has been industriously fanning the atmosphere with it.

The delight of the Order was increased by the added news that the stock in the Goodyear branch had been attached to secure the claim. The attachment was, of course, promptly released when the Goodyear attorneys had their inning, and the branch is doing business as usual.

According to the best information obtainable, the New York-Broadway Rubber Tire Co. owes the Goodyear Co. some $15,000, for which notes are in existence. The first note was considerably overdue, and the Goodyear people were pressing for payment. Previously there had been some friction over the alleged failure of the New York-Broadway Co. to maintain prices, and to their method of selling tires outside the territory allotted them, Greater New York. When the Goodyear pressure for payment became uncomfortable and was accompanied by refusal to continue delivery of goods, presto! the New York-Broadway Rubber Tire Co.

Digitized by Google

saw itself damaged all of $150,000 worth, and promptly assigned its claim to Charles Blake Cisco. Cisco is one of the concern's salesmen or employees in Brooklyn to whom it is said the idea of being mixed up with so much money or the thoughts of it has caused no little perturbation.

Meanwhile, there is promise of interesting developments on the Goodyear side of the controversy.

Brock Becomes Day's Lieutenant.

If M. I. Brock's resignation as sales manager of the Autocar Co. proved a surprise, his New York connection, which the Motor World remarked last week, will cause even more eye opening. He is to become assistant manager of the Association of Licensed Automobile Manufacturers, "to relieve the general manager from much of the detail and routine business of the office in order that he may have the necessary time to devote to the more important matters of litigation, patents and the direction of the general policy of the association." Mr. Brock, who is a lawyer by profession, is, because of the fact, unusually well fitted to be the right hand man of General Manager Day, in itself no mean compliment. He will assume his new duties on January 20.

Selden Suit Against Gallaher.

E. B. Gallaher—usually mistakenly called Gallagher—has been made a defendant in suit for infringement of the Selden license. Gallaher has been selling the Richard-Brazier car in New York without the formality of obtaining a license. Several years ago he did have such license, but it was revoked because of his alleged failure to pay his "dues." In addition to Gallaher, the Selden attorneys have filed another batch of infringement suits against some twenty prominent persons who are using unlicensed imported cars.

Buckeye's Big New Buildings.

The new buildings of the Buckeye Mfg. Co., at Anderson, Ind., makers of the Lambert car, have been completed, and last week the factory began running two shifts, eleven hours each. The new buildings are built of steel and concrete. The repository and paint shop measures 600x50 feet, the assembly room 140x50 feet, the pattern room 90x32 feet, the boiler room 30x90 feet and the engine repository 50x100 feet.

Court Says Stockholders Must Pay.

Judge Sears, of Omaha, Neb., has handed down a decision in the suit brought by Edward S. Stout, receiver of the defunct Omaha Gas Engine & Motor Co., in which he holds that the stockholders must pay their subscriptions to meet the indebtedness of the concern. The amounts the stockholders must pay range from $250 to $46,250, totalling $73,942.

Maxwell in Solid Mahogany.

The Maxwell-Briscoe Motor Co. is making ready a limousine car, the body of which will be of solid mahogany, with French plate glass trimmings. It will list at $2,000.

In the Retail World.

In addition to the Packard line, A. Jackson Brady has taken the Peerless agency for Detroit, Mich.

E. L. Mathewson, of Denver, Col., has taken the agency for the Oldsmobile and Thomas lines in that city.

The Imperial Automobile Co. has opened salesrooms at No. 1,024 Boylston street, Boston, Mass. The Dolson car will be handled.

In addition to the White and Rambler lines, the H. T. Hearsey Vehicle Co., Indianapolis, Ind., has added the Pope-Waverly electric.

Work was commenced last week on the garage of Edwards & Peck, Rye, N. Y. When completed this will be the only garage in the town.

Sigmund Frucht, Plainfield, N. J., has purchased the Long property, on Park avenue, where he will erect a garage. It will be of one story, 80x27 feet.

The three Grant Brothers, well known in Detroit, have combined and taken the local agency for Buick cars. Previously each was in business for himself.

Harry R. Drake & Sons, Newark, N. Y., are erecting a fireproof garage, 40x80 feet. It is being built of cement blocks. The firm will handle the Reo car exclusively.

The West Coast Motor Car Company, Los Angeles, Cal., has changed its title to the Middleton Motor Car Company. The Autocar will continue to be its leader.

Schenck Brothers, Great Neck, N. Y., who maintain one of the largest carriage repositories on Long Island, have "taken on" automobiles. They will handle the Ford.

H. Bernard Hallam, who this season handled the Cadillac and Winton lines in Seattle, Wash., has removed to Sioux City, Iowa, where he will have Reo territory for that city and vicinity.

Pending the lease of larger quarters Joseph T. Montfort has temporarily located at No. 1,309 Sycamore street, Cincinnati, Ohio. He will represent the Reo in Southern Ohio and Northern Kentucky.

J. P. Schneider, of Detroit, has taken the local agency of the Oldsmobile and Pierce lines. The deal for the former was closed by Roy D. Chapin, sales manager of the Olds Motor Works, last week.

The recently incorporated Colonial Automobile Co., St. Louis, Mo., has established itself at No. 3,944 Olive street, where Reos will be handled. Charles E. Lane is president of the company and S. J. Keiffer manager.

H. D. Aldrich, who operates as the Flushing Automobile Agency, Flushing, N. Y., has taken possession of his new brick garage at 107 Broadway. For 1906 he will handle a slice of Ford territory on Long Island.

The Metropolitan Automobile Co., which will handle Autocars in New York, has located at No. 2,182 to 2,186 Broadway. S. F. Randolph and his colleagues are the interested persons; in fact, the Metropolitan Automobile Co. is but a change of name, Autocar Co. of New York being deemed too suggestive of a branch house. Mr. Randolph will be the active manager.

A. M. Fuller, who was connected with the Los Angeles, Cal., branch of the White Sewing Machine Co., has been made manager of the recently formed Success Automobile Co. The Success company will handle the Winton on the Pacific Coast.

The Hamilton Automobile Co., of Chicago, has opened temporary salesrooms at No. 1,337 Michigan avenue, in the building occupied by J. W. Hayden, agent for the Prest-O-Lite gas tanks, and H. P. Branstetter, agent for the Queen cars.

On the occasion of his last visit George F. Kehew, sales manager of the C. H. Blomstrom Motor Co., of Detroit, Mich., finally enthroned the Queen car in New York City, and quite fittingly with the Majestic Automobile Co., at Broadway and Fifty-fourth street.

The Eastern Automobile Co., 326 North Broad street, Philadelphia, have let contracts for the erection of an addition to their salesroom and garage, which when completed will triple their "elbow room." The concern is handling the Peerless and the Stevens-Duryea cars, and is ready to take on one more line

A. J. Smith and C. S. Anthony, Los Angeles, Cal., agents for the Elmore car, have contracted for the erection of a new salesroom and garage at the northwest corner of Tenth and Main streets, that city, to be completed February 1. Until then the agency will be at the Mills & Price garage. No. 830 South Main street.

On Saturday last, 16th inst., Judge Amend, of the Supreme Court, appointed Rudolph A. Seligman receiver for the Pioneer Automobile Campus Motor Co., which formerly did business at No. 54 West Forty-third street, New York City. The application was made by the National Battery Co., a judgment creditor for $366. The company was incorporated in July, 1903.

William Newman, formerly manager of William E. Metzger's retail store, has secured the agency of the Welch motor car and the product of the Soules Mfg. Co., of Grand Rapids, for Detroit, and will shortly "open up" at the corner of Alexander and Woodward avenues. The new establishment, in which a garage will be included, will be 225x150 feet, and it is expected that it will be one of the most pretentious of the local colony.

Edward Inman and J. B. Connally have purchased the interests of J. H. Nunally, Ernest Woodruff, D. Woodward and William Kiser in the Atlanta (Ga.) Automobile Co., and this company has consolidated with the White Motor Car Co., taking the name of the former. The company will handle the White, Cadillac and Franklin cars, and do a general storage and repair business at Nos. 89, 91 and 93 North Pryor street. Edward Inman will be president of the reorganized company, and J. B. Connally vice-president and manager.

CHICAGO MAKES ALLOTMENTS

How its Show Space has been Apportioned—Long List of Exhibitors.

The allotment of space for the Chicago show was completed last week. The distribution and full list of exhibitors are as follows:

Coliseum—Main Floor.

Apperson Bros. Automobile Co., 96 and 97; Autocar Co., 5 and 6; Baker Motor Vehicle Co., 85 and 86; Bartholomew Co., 91 and 92; Cadillac Automobile Co., 100 and 101; Corbin Motor Vehicle Co., 83 and 84; Duryea Power Co., 13; Electric Vehicle Co., 14 to 19, inclusive; Elmore Mfg. Co., 60 and 61; H. H. Franklin Mfg. Co., 102 to 104 inclusive; Ford Motor Co., 111 to 113, inclusive; Haynes Automobile Co., 7 and 8; Holsman Automobile Co., 95; Thomas B. Jeffery & Co., 42 to 47, inclusive; Knox Automobile Co., 55 to 59, inclusive; Locomobile Co. of America, 48 to 51, inclusive; Mitchell Motor Co., 80 to 82, inclusive; National Motor Vehicle Co., 76 to 79, inclusive; Northern Mfg. Co., 69 and 70.

Olds Motor Works, 62 to 67, inclusive; Packard Motor Car Company, 34 to 37, inclusive; Peerless Motor Car Co., 9 to 12, inclusive; George N. Pierce Co., 105, 106 106½ and 107; Pope Mfg. Co., 20 to 26, inclusive; Premier Motor Mfg. Co., 93; Reliance Motor Car Co., 94; Royal Motor Car Co., 98 and 99; F. B. Stearns Co., 40 and 54; J. Stevens Arms and Tool Co., 27, 28, 29 and 41; St. Louis Motor Carriage Co., 68; Studebaker Automobile Co., 38, 39, 52 and 53; E. R. Thomas Motor Co., 30 to 33, inclusive; Waltham Mfg. Co., 89 and 90; Wayne Automobile Co., 87 and 88; White Sewing Machine Co., ½-107, 108, 109 and 110; Woods Motor Vehicle Co., 71 to 75, inclusive; Winton Motor Carriage Co., 1 and 4, inclusive.

Armory—Main Floor.

Adams Co., A50; Acme Motor Car Co., A41; Automobile Importing Co., A14; American Locomotive Automobile Co., A3 and A4; American Motor Truck Co., A2; Buffalo Electric Carriage Co., A30; Buckeye Mfg. Co., A17 and A18; C. H. Blomstrom Motor Co., A8 and A9; Berkshire Automobile Co., A5; Cleveland Motor Car Co., A24, A25 and A26; John L. Dolson & Sons, A40; Daimler Mfg. Co., A31; Dayton Motor Car Co., A27 and A38; English Daimler Co., A24; Knight & Kilbourne, A10; Kansas City Motor Car Co., A6 and A7.

Logan Construction Co., A48; Lozier, Motor Co., A36; Oscar Lear Automobile Co., A45; H. Sargent Michaels Co., A19; Moon Motor Car Co., A49; Marion Motor Car Co., A47; Maxwel-Briscoe Motor Co., A34 and A35; Moline Automobile Co., A33; McCrea Motor Truck Co., A39; Palais de l'Automobile, A32; Panhard & Levassor, A16; Reo Motor Car Co., A42 to A44, inclusive; Rapid Motor Vehicle Co., A37; Rainier Co., A20 to A23, inclusive. Synnestvedt Machine Co., A46; Smith & Mabley, Inc., A11 to A13, inclusive; Soules Motor Car Co., A1; Ralph Temple, A15; Western Tool Works, A28.

Armory—Gallery.

The Automobile, A81; American Lamp Co., A61; Automobile Accessories Mfg. Co., A59 and A60; Eugene Arnstein, A56; Cycle and Automobile Trade Journal, A74; Culver Novelty Co., A86; Chicago Caloric Engine Co., A66; Gearless Transmission Co., A83 and A84; Hancock Mfg. Co., 160; Week Chain Tire Grip Co., 200; Wheeler Mfg. Co., 196 and 197; Webb Co., 191; Warner Gear Co., 181; Warner Instrument Co., 174; Whitney Mfg. Co., 145; Wray Pump and Register Co., 137.

Packard Gets Import Decision.

In a decision by I. F. Fischer, of the Board of United States General Appraisers, filed on Monday last, he sustains a claim made by the Packard Motor Car Company of Detroit. It was held that the Collector of Customs erred in levying duty at the rate of 45 per cent. ad valorem on automobile forgings. Instead the board finds that the merchandise was properly dutiable according to the rate per pound, or at 35 per cent., varying with the character of the merchandise. The Collector is ordered to make a liquidation of the entries.

Will Wind Up Without Receiver.

There likely will be no receiver to wind up the tangled affairs of the Simplicities Auto Co., of Middletown, Conn., after all. Its affairs will be wound up, however, but by the board of directors—that is, if certain interested persons consent to this plan. At a meeting of the counsel and creditors in Hartford last Friday afternoon an agreement was practically reached to withdraw the application for the appointment of a receiver. Judge Henney represented E. D. Seymour, of New Hartford, the largest stockholder, owning 310 shares, and the conference adjourned to enable Judge Henney to communicate with his client and see if he would agree to have the company wound up by the directors. M. C. Hillery, of Hartford, another large stockholder, is said to be agreeable to such a course.

Hussey's Creditors to Take Charge.

The Hussey Drop Forge & Mfg. Co., Cleveland, Ohio, is in financial straits. It was known that it had been sailing close to the wind for some time, but last week things grew so threatening that the creditors felt impelled to act. At a meeting called for the purpose, it was found that the Hussey liabilities were just about double the assets, and decisive action followed. It was recommended that the Hussey officials be called on to resign, and that the creditors take over and operate the business until spring, at least. By so doing, it is believed that they will be able to realize 50 or 75 per cent. of their claims.

Maxwell-Briscoe Choose Chicago.

Chicago finally has been selected by the Maxwell-Briscoe Motor Co. as the site of their Western plant, a suitable building, with 60,000 square feet of space, having been secured at Grand Crossing and 73d street. The Maxwell-Briscoe idea is to ship the parts of their cars from their Eastern factories and have them assembled in Chicago for the Western trade. The immediate result will be a great saving in railroad charges and prompt deliveries of all Western orders.

To Make Ford Motors.

There has been formed in Detroit the Ford Mfg. Co., capitalized at $100,000, which will make engines and parts for the Ford cars, hitherto made by the Dodge Brothers. John F. Dodge is interested in the new concern, having been made its vice-president. Other officers are Henry Ford, president; C. H. Wills, secretary, and James Couzans, treasurer. The Ford Motor Co. will continue to assemble and market the cars.

FISK TIRES—THE MOST PRACTICAL TIRE EQUIPMENT OF ANY AUTOMOBILE—ARE SAVERS OF TIME, TROUBLE, AND MONEY.

They have all the good points of other style tires, with better construction, materials, design, and wearing qualities—and, besides, important additional features pertaining to safety.

Every detail of construction is in the hands of the most skilled tire workers, and we invite and urge you to compare their quality with any other tire on the market.

THE FISK RUBBER COMPANY, Chicopee Falls, Mass.

CADILLAC UTILITY

THE SINGLE CYLINDER CADILLAC
Will climb any hill that any automobile will climb.

THE SINGLE CYLINDER CADILLAC
Will travel any road that any automobile will travel.

THE SINGLE CYLINDER CADILLAC
Will travel as fast as anybody ought to ride.

THE SINGLE CYLINDER CADILLAC
Costs less to operate. Costs less to Maintain.
Requires less attention than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined, and won for them the unquestioned distinction of

AMERICA'S LEADING MOTOR CARS.

CADILLAC MOTOR CAR CO. - - - - Detroit, Mich.

Members Association of Licensed Automobile Manufacturers.

WE WILL EXHIBIT IN NEW YORK AT MADISON SQUARE GARDEN ONLY, JANUARY 13-20, 1905

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, DECEMBER 21, 1905.

THE

NEW YORK

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 11th and 18th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

"Starting" from the Seat."

"Self-starting from the seat" has been more or less of a qualified recommendation, but one that the majority of manufacturers of higher priced cars found it necessary to include in their specifications even though it cost considerable in the way of extra accessories such as a battery and coil system beside the magneto, in order to be able to do so. It has in the past, except in the case of the runabout with crank handle in convenient reach not meant anything more or less than that the motor could be started by switching on the current in case there happened to be a compressed charge in one of the cylinders. But this did not always happen even under the most favorable circumstances and seldom, if ever, after the engine had been stopped for a length of time.

At least two manufacturers have attempted to secure a method of starting from the seat at all times and both of them have accordingly done away with the familiar crank under the radiator. One, an American maker, has substituted an arrangement, the details of which are not at present known, to be somewhat after the fashion of the usual pedal on the footboard, which through a geared lever or similar contrivance turns the motor shaft. The other, which hails from England, is merely a shift in the location of the crank from the front end of the bonnet to the dashboard, the motion being transmitted by means of sprocket and chains on the engine side of the board to the shaft. While both devices may prove conveniences in their way, it is much to be feared that when considerable turning is necessary there will be a longing on the part of the individual who has to do it for a crank in the open—in a position where there is room "to swing a cat."

Development of the Throttle.

Elasticity of control ever has been the goal of the internal combustion engine designer, who has accordingly looked to the steam engine as a guide. The development of the throttle in its present day state of efficiency has been the outcome of investigation along this line, and it is generally conceded that as represented by the best types extant, it is a method that marks a close approach to the long sought for end.

Whether in the course of time it will continue to improve and eventually constitute that degree of perfection beyond which it is not profitable to go, remains to be seen. In the meantime foreign designers, apparently considering that this limit has already been reached, have instead of attempting to replace it with something else, supplemented it with an accessory in the shape of provision for varying the lift of the inlet valve. While not exactly the same principle this aptly may be compared to the variable cut off slide valve of the locomotive, the skilful manipulation of which has so much to do with the speed as well as the economy of running. As matter of fact, some of the devices for accomplishing the variable lift of the inlet valves in the gasolene motor are patterned directly after steam engineering practice.

So strong is this tendency on the other side that where comparatively few cars have been so equipped in the past year, 1906 will see quite a number, the recent London show bringing forward several varying types. It may well be considered as sound engineering practice to govern an engine by the most elastic means possible, and for this end it has been found that the use of the throttle in conjunction with a variable lift of the induction valve is superior to either alone and permits of a far greater degree of elasticity than any method in which impulses are cut out to keep the speed down.

It appears somewhat strange in view of the amount of attention that has been devoted to this feature of the engine abroad during the past year that it should apparently have been allowed to pass unnoticed by American designers, although in view of what the coming shows may bring to light, this statement may not be entirely accurate. Still, a large number of makers has already uncovered 1906 models, and in none of them, so far as appears at present, is this feature embodied.

The Open Closed Car.

It is with no small degree of satisfaction that the liberal minded motorist observes that the drift of popular design in the building of the more elaborate types of body for general and touring uses is inclining more and more to the acceptance of ideas which make for all around utility under every possible condition, even though still following the general set lines of construction, which have shaped the four-wheeled vehicle ever since the days of the post chaise of yore. Thus, while the average limousine of the day readily falls under the general classification of the coupe type of carriage body, its modernness is revealed in points which go to increase the comfort and enjoyment of the occupants in all weathers, and this apart from those points of technical improvement

Digitized by Google

which affect the more vital portions of the mechanism alone.

The most noticeable effect of this tendency is to be seen in the arrangements for the light and ventilation of these bodies which are being adapted to the more elegant cars at this time—a tendency to make them appear less like elaborate delivery wagons and more like sumptuous carriages.

This is observable to a certain extent in the types of landaulette bodies, which, as now built, have large window area, and are readily manipulated to secure the effect of the victoria, or open barouche either with or without the wind shield in front. But it is even more noticeable in the true limousine types, to which the area of sash and framework material is reduced to the minimum and the glazing made entirely adjustable either by hinge or drop arrangements—in other words, more windows and much larger windows are the rule. The occupants are not being "cooped up," and need no longer peer through mere portholes. It is being made easy for them to see and be seen and to have a close or an open car at will.

A couple of years ago, little relationship between the types of canopy and limousine was to be observed. They were intended for totally different purposes, and each was sufficient in itself for the particular use for which it was intended. The great cost of the high grade automobile has, however, necessitated the development of a kind of body which combines with the advantages of both these types an adaptability which neither of them possessed. Hence, they have been merged into the present form of closed body, which may be made to yield the free ventilation of the one, or the complete protection and warmth of the other.

The body designed by the California gentleman, which was duplicated for King Edward, and which was re-illustrated in last week's Motor World, embraces much of the ideal. The windows are large and drop into side pockets, and there are divided adjustable shutters raised to any desired position to shield from sunlight or draught. These shutters are well worth general adoption, because, as their designer made plain, while they add much to comfort, with the greatly increased area of glass, they also serve a protecting purpose when at speed or in case of accident.

The demand for the ultra fine bodies is limited; it is exclusive; yet it is quite imperative in its requirement of all that is best in the way of comfortable and convenient arrangements. It calls for something which shall answer to the same class of use to which the parlor car is put in railway work, and only that design fitted to fulfill the demand which is comparable with the parlor car in point of complete utility. Pure decorative elegance, the fitting up of an interior with a host of folderols and fancies in the way of writing desks and lavatories, cannot serve to much account, for they are not germain to the chief uses of the motor car. What is needed is light, and plenty of it; air, and plenty of it, and protection from dust, wind and rain.

Where Danger Lamps are Needed.

Whether or not a universal lamp law is possible or impossible of passage, there is one measure which should be brought to the attention of our lawmakers before a lengthening list of serious accidents forces home the need of emphatic legislation in the matter. This is in regard to the haulage of overhanging loads by trucks, which are in no way guarded by signals either day or night.

It is no uncommon sight to observe a truck laden with stage scenery, steel beams or telegraph poles slowly moving along with anywhere from six to ten feet of swaying material projecting behind, menacing other traffic. No measure of protection is given the public from these loads, by day, nor is any sort of warning of their existence given at night. A driver following such an affair in total or semi-darkness is not likely to notice the extension of the load even though he sees the team itself.

A case in point which aptly illustrates the nature of this peril occurred only this week. A well known motorist and party were driving along a comparatively isolated thoroughfare. In the obscurity of growing darkness they discerned a team ahead, and with no thought of possible danger ran up to within a few feet of it before slowing down. Just as they slowed down they became suddenly aware of a pile of timber ends which projected from the rear of the wagon. The fore part of the machine had slipped under the logs, and had not the driver of the automobile been checked in time a serious accident would have resulted.

We realize full well that such loads are necessary in the field of daily commerce, and cannot be eliminated, but there should be some measure of protection afforded the other part of the travelling public. A law compelling such vehicles to prominently display rear danger signals on their projecting loads at night seems the only solution of the problem.

The Week's Incorporations.

Augusta, Me.—Pontiac Motor Car Co., under Maine laws, with $25,000 capital. Corporators—I. L. Fairbanks and L. A. Burleigh.

Evansville, Ind.—Windsor Automobile Co., under South Dakota laws, with $250,000 capital. Corporators—William M. Copeland et al.

Middletown, Conn.—The Middletown Automobile Body Co., under Connecticut laws, with $50,000 capital. Corporators—C. E. Neal, F. W. Woychinske and Felix Janicki.

Los Angeles, Cal.—Rapp Wave Motor Co., under California laws, with $200,000 capital. Corporators—Theodore Rapp, Frederick Detmers, D. D. Dayton, Charles D. McKelvey, N. D. Bowsee.

Portland, Me.—Park Square Motor Mart Garage, under Maine laws, with $100,000 capital; to deal in automobiles. Officers and corporators—President, G. A. Hutchins; treasurer, C. H. Tolman.

Dayton, Ohio.—Borderwisch & Glancy Automobile Co., under Ohio laws, with $25,000 capital. Corporators—Edward Borderwisch, E. M. Glancy, O. C. Waveries, L. Y. Cooper and William G. Powell.

New York City, N. Y.—Zim-Rock Motor Car Co., under New York laws, with $15,000 capital; to deal in automobiles. Corporators—Charles E. Zimmerman, Oliver C. Carpenter and Hartwell P. Heath.

Buffalo, N. Y.—Cleveland Cycle & Auto Co., under New York laws, with $2,500 capital; to make motors, engines, automobiles, etc. Corporators—James MacNaughton, F. Louis Du Broy and M. D. Ashford.

Brooklyn, N. Y.—Macbeth Bros.' Co., under New York laws, with $10,000 capital; to make automobiles, wagons, etc. Corporators—John Robison, Magnus Eriksen, Elisha T. Halse and George MacBeth.

Indianapolis, Ind.—The American Motor Car Co., under Indiana laws, with $25,000 capital; to make all kinds of motor vehicles. Corporators—William A. Moore, William E. Barton and Clifton R. Cameron.

New York City, N. Y.—Hamburg Tire Co., under New York laws, with $20,000 capital; to make tires for motor cars, carriages, etc. Corporators—Neil A. Weathers, Millard C. Hunstone and Rose A. Mackey.

Detroit, Mich.—The Motor Car Co., under Michigan laws, with $150,000 capital; to make automobiles. Corporators—Frank C. Caughey, Fred Postal, Randall A. Palmer, George A. Young and Harry C. Radford.

Here's a Non-Freezing Water.

Big Rapids, Mich., is a town that should justly spring into fame in connection with winter automobiling, for it boasts of a spring of mineral water that is capable of supplying non-freezing mixture ad lib. It is said to be proof against atmospheric changes to the extent of remaining liquid until a temperature of 45 degrees below zero is reached. While the water is saline, it is said not to leave any sediment.

George F. Kehew, sales manager of the C. H. Blomstrom Motor Co., Detroit, Mich., is making a hurried Pacific Coast trip. It will probably result in an extension of the Queen's dominion.

FOUR A'S FIRST AUCTION

When Price Was Not Right, Cars Were Withdrawn—"Pikers" Make $2 Bids.

Due to the method of giving it publicity employed more than anything else, the first sale of the Auto Auction Association of America, held last week at 220 West 41st street, in this city, did not score as heavy a success as was to have been anticipated under more favorable circumstances, particularly when the quality and condition of the cars offered is taken into consideration. The mistake was made of advertising the sale principally in those papers which make a specialty of catering to the professional buyers at auction. Consequently, instead of attracting individuals anxious to pick up good cars, there was, as might have been expected, a congregation of small dealers of the "two dollar bid" class, as they were dubbed by one of the members. They were reinforced by some of the professionals of the second-hand game, who were there to see what manner of picking there would be at this organized auction. They were not enthusiastic bidders, and did not do much to liven the game up after the opening figures had been passed. They were doubtless responsible for starting some of the numbers at $2 in an attempt to harrass the auctioneer and show the backers of the "square deal" method of auctioning off cars that are neither wrecks nor relics that they are to be figured with.

Add to this the fact that the twenty-nine cars comprising the entrants appeared but an hour or two previous to the time set for holding the auction, which allowed but scant opportunity for inspection, and it is not so much to be wondered at that there was a lack of interest displayed when some of the exhibits were put under the hammer. But one of a total of thirty cars scheduled to be sold, a 35 horsepower American Mercedes of 1904, failed to appear. The remaining twenty-nine constituted an array of good cars such as has never been brought together in this city and probably not in this country for a similar purpose.

As an opener $500 was bid on a Decauville 16 horsepower, 1905 model, which was gradually raised to $2,000, at which point the exhortations of the auctioneer failed to tempt further and the hammer dropped on it at that figure.

The next on the list was a four cylinder, 22 horsepower Locomobile of 1904, and it rapidly mounted from its start of $400 to $1,700, at which figure it also changed hands. Following this came a two-cylinder, 16 horsepower car of the same year and make, which, after some hesitation, was finally launched forth at $200. It did not arouse the same amount of interest that its predecessors and mounted slowly to $900 by comparatively small bids. It went at that figure and with it departed apparently considerable of the prospect for a rapid cleaning out of the lot that the ready disposal of the first three augured.

A Winton special that had been built specially for racing was No. 4 in the catalogue, but it proved a dark horse that could find few backers. It was reluctantly started at $50 and was withdrawn when after vain attempts to do better on the part of the auctioneer it stopped dead at $400. Although more interest was manifested in No. 5, which was a Columbia electric Stanhope, it fell flat at $900 and met the same fate. No. 6, a Peerless, four-cylinder, 40 horsepower runabout model of the current year proved a reviver, however, starting at $1,000 and bringing $2,500. After this a Peerless 24 horsepower motor separate, was raised to $250 and changed hands. A White steamer of 1903 was next in order, but found few takers. It was started at $100 and was finally knocked down at $600. This was the only steam car sold, Nos. 9 and 11, which were also White models of 1904 and 1903, arousing but a modicum of interest. Nor did a Mors of 1903 fare much better.

If Nos. 12 and 14, which were, respectively, a Columbia electric runabout and a Victoria, did not arouse sufficient interest, an electric hansom cab, which brought out an opening offer of $2, rather startled the auctioneer. The lack of demand for electrics was evident from the fact that of the five models entered none were disposed of. Unlucky 13 was a Peerless 24 horsepower model of 1904, which refuted its hoodoo by starting in the neighborhood of $800 and brought $2,400. In the case of a Pope-Toledo 24 horsepower, 1904 model, a Pierce-Arrow 32 and a Mercedes 28 of 1905, which were Nos. 15, 16 and 18 on the list, bidders were only responsive to the extent of $1,200, $2,200 and $3,000, respectively, at which figures the cars were withdrawn, a proceeding entirely justifiable, particularly in the case of the latter two, considering their list prices of $5,000 and $10,000, as well as the fact that they had seen but a single season's use. On the remaining cars the bids ranged from $200 for a 1904 Oldsmobile runabout up to almost $1,000 on various models of different makes, such as the Ford, Cadillac, Pope-Toledo and Locomobile, but one of which antedated 1904, but there was no spirit whatever to the bidding and most of them were withdrawn and no further attempt made to dispose of them.

France's Output of Chasses.

"Where do the French chasses go?" asks a writer in one of the Gallic automobile journals. France has twenty large factories which produce on the average two vehicles a day, which means 1,200 a month or 14,400 in the course of a year. To this total must be added the output of fifty smaller factories, which produce on the average of one car every other day, an estimate that is conceded to be very conservative. This would make the capacity of the latter 750 per month or 9,000 annually. He therefore arrives at the conclusion that it is not exaggerating in the slightest to credit the French industry with a yearly total of at least 25,000 chasses.

That the major portion does not remain in France has all along been quite clear. None of the makers in France carries any stock, for the vehicles are sold as fast as they are produced. The question then arises, where do they go? In 1904 the number of cars in actual use was augmented by 5,000, according to the official registration, and he accordingly concludes that something like 8,000 may be considered as having been disposed of at home, which leaves 17,000 to be accounted for. Even though the number actually disposed of in France were taken as double the official figures, this would still leave 15,000. England has proved the best customer, taking close to 50 per cent, or between 7,000 and 8,000. The United States likewise proves a good customer, with something like 3,000 to its credit, but neither the Americans nor Belgium, Germany, Spain, Italy and the colonies, which account for the remainder of the output are as eager takers of the French cars as the Briton.

Stylish Thief Bagged in Newark.

The man who is out to steal an automobile has a larger job on his hands than he bargains for. At least such would appear to be the experience of a dapper young man adorned with a tile and wearing an expensive looking fur lined coat, who turned up in Newark, N. J., from nowhere in particular, just the "South," with that avowed purpose. He immediately proceeded to take a few assistants into his confidence, and the latter in turn made confidants of some Central Office men.

The detectives shadowed him for three days, during which time he frequently took up a stand in close proximity to high priced cars standing at the curb, but somehow or other the chauffeur sat on his seat as if glued to it. Finally he decided, if he was to have an automobile, he would have to get it in some other manner, and accordingly proceeded to take it from the garage of the Motor Vehicle Co. late one night, but the detectives interrupted the proceedings. When the magistrate asked Diamond or Smith, as the stranger variously styled himself, if he intended to beat his board bill, he proudly replied that he was no "doormat thief."

"Miss" as an Aid to Second Hand Sales.

One of the many odd things that comes out of the Manhattan Storage Co. is a circular letter relating to second hand cars, which invariably bears a rather masculine signature in ink. The signature is, however, always prefixed by "Miss," inclosed in parentheses. What influence this touch of supposed femininity is expected to exert is, like many other matters, past finding out.

Just Why Winton Went Abroad.

It transpires that Alexander Winton did not go abroad wholly to rusticate or to visit the Paris show. He spent most of his time in Scotland, and as a result there is now a Mrs. Alexander Winton, who will accompany him back to America.

THOMAS REPLIES TO SCHWAB

His Answer is Specific and Deals With the Alleged Superiority of Foreign Cars.

In a recent public interview Charles M. Schwab, former president of the United States Steel Corporation, was quoted as saying:

"Yet it is notorious that American automobiles have not ranked as high as European automobiles. The truth is that we have hitherto made no genuine effort to produce forged steel working parts of automobiles of the highest quality. That is one of the reasons why our automobiles have not ranked as high as those of foreign make."

When he read this oft repeated calumny the red blood in E. R. Thomas, the Buffalo manufacturer, fired up, and he proceeded to show Mr. Schwab that he had overdrawn the case.

"As this seems to be a general opinion, naturally fostered and encouraged by foreign competitors, it seems time that the American, proud of home industry, should be informed of the actual facts, which, upon investigation, will convince the most skeptical that quality of material has been the smallest influence," says Mr. Thomas.

"It is true that in the transmission parts and in the axles and in possibly one or two of the minor details the foreign manufacturers have had in the past a slight advantage. It has enabled them to use smaller shafts and gears for the transmission, but that does not matter. American roads demand heavier mechanism, and we have used the larger shafts and gears at an expense of some eight or ten pounds, which has been more than saved elsewhere.

"There are several reasons why American automobiles have not in the past ranked as high as those of foreign makes, quality of steel being the smallest.

"The leading reason is due to the fact that the American manufacturer spent many years in experimenting before reaching his final conclusions. In the earlier stages of the industry he used electricity as his motive power; then for one or two years steam was the popular power. After that he switched off to horizontal gas engines.

"In the mean time the foreign manufacturer had adopted the style of vertical motors in front, now practically the universal design, and this gave to them the advantage of a start of several years on the American manufacturer. The chief advantage of the vertical design is its minimum of weight and its ready accessibility for examination and repairs, in those days a most important advantage.

"Another great reason why the foreign cars were considered superior is that the makers of them first saw the necessity of and introduced high power. This was not so much for the purpose of gaining excessive speeds as it was for the negotiating of hills and bad roads without overtaxing the engine and other mechanism. Higher power was not only contributory to the pleasure of the owner, but also eliminated to a large extent the expenses of repairs and delays on the road.

"During this transition period the American maker was using barely enough power to send his car over ordinary roads, and if the valves were foul or any slight derangements occurred his car could not climb hills or overcome bad roads. Under the same conditions the foreign cars would continue to operate at fair speed. This has all been remedied now. The American manufacturers are using greater power, and are more than holding their own under all conditions of travel to which their cars are subjected.

"Still another reason for the belief that the foreign cars are superior to those of American make is the high prices asked for them. But these high prices are due entirely to the fact that a number of middlemen share the profits and not because of any greater intrinsic value or better workmanship.

"To sum it all up, the foreign cars have been sold to a certain class of Eastern buyers mainly because they alone catered to the demand for high power, roominess and comfort, and because they were a year ahead of us in perfecting their permanent designs. Design, speed, power and size have been the causes, not an imaginary lower grade of materials or workmanship.

"This is proved in our own case. Last year we made and sold four hundred high powered and roomy cars. As a consequence this year it has become necessary to erect a new factory with a capacity of one thousand 50 horsepower machines which will seat seven people and make a mile a minute.

"The time for the American manufacturer to supplant his foreign rival on his home grounds has come."

Germany Opinion of America.

"If America could show a set of roads equalling even only in some degree those of France and Germany, where would the Continental automobile industry be, and where, pray, France?" asks the Allgemeine Automobil Zeitung in a recently published extended resumé of automobile conditions in various countries. "Europe would to-day have been left far behind, for it is only experience in building fast cars de luxe that is lacking in America, and without good roads it is something that is slowly acquired. The Vanderbilt races of the last two years have helped considerably to develop heavy touring cars, and a huge step has been taken in this direction."

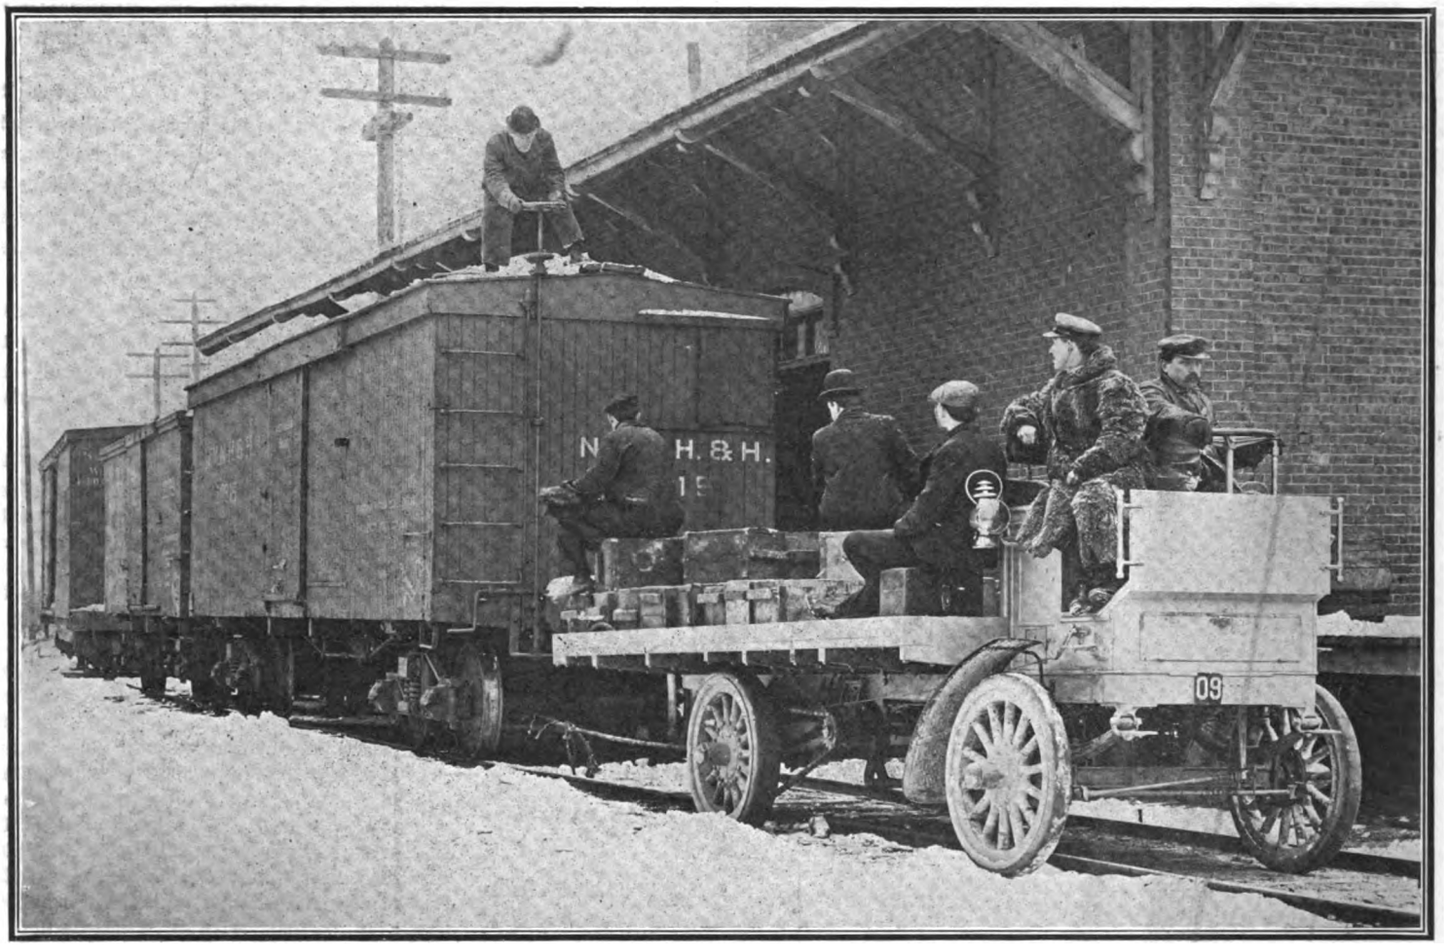
Dealers to Promote Hill Climb.

Los Angeles, Cal., is to have a hill climbing contest some time in January, the exact date to be set later. This was decided at the last meeting of the Southern California Automobile Dealers' Association when President W. K. Cowan appointed Fred Stamm, H. D. Ryno and Ralph Hamlin a committee to look after arrangements. The course will probably be from Pasadena to Altadena. There will be three classes—one for runabouts, another for cars costing less than $1,600 and a class for four cylinder cars.

LONDON'S MOTOR BUS SERVICE

Its Remarkable Success and Expansion—The Cars Used and the Tire Problem.

Since the end of March last, when the London motor omnibus began business with three vehicles, one company alone has carried 4,500,000 passengers without a single accident or a serious breakdown. There are now something like 200 licensed motor 'buses in London, and their average is said to be about 1,000 passengers per day—a statement of facts which conveys some idea of the manner in which the world metropolis has literally been invaded by the motor driven 'bus.



The vehicles are on the street eighteen hours a day, and the motormen have a considerable advantage over the drivers of the horse drawn 'buses, although the wages are about the same. The motormen receive $11.62 per week and the conductors $10.18, but those on the horse drawn vehicles have to work fourteen to sixteen hours a day. The "Vanguard" motor 'buses run eighteen hours a day, but there are two shifts of men to work them. The horse drivers are found to be the best raw material for conversion into motormen, because they have confidence, nerve and caution and can dodge other vehicles where a less experienced hand would pull up. The beginner is instructed at the yard, and then has to take a course in driving a practice 'bus under the guiding eye of an instructor until he has mastered the rudiments and acquired confidence.

London roads are not exactly tracks of velvet, and tires are said to constitute the great problem. Motor omnibus companies and tire manufacturers are still in the experimental stage where they are concerned. The traffic keeps a London 'bus always on the tilt, dodging here, there and everywhere, as well as everything and everybody. A 'bus weighs four tons, and all this means a heavy side strain on the tires. Filled with passengers, it weighs six tons. Is it any wonder that the tire problem as applied to the motor 'bus is to be spelled out in the alphabet of sorrow? The companies are always trying tires; half a dozen have been tried out already, some of them proving absolutely worthless.

The first cost of a set is from $450 to $500 bought outright, the makers giving a guarantee that the tires will "live" for 10,000 miles; if they do not, then an allowance or rebate is made for the shortage at the inquest. Another way in which motor 'bus tires are bought is on a mileage basis—so much per mile while the tire "lives." But whichever method is adopted, the cost figures out pretty much the same. The daily travel of a motor 'bus is 128 miles with thirty-four passengers, while the horse drawn vehicle travels only twenty-seven miles a day with twenty-six passengers, these figures being for full capacity in both instances.

Motor Truck in the Role of Locomotive.

Pulling a load of 73,450 pounds is as easily accomplished by a 16 horsepower motor as rolling off a log is done by a turtle, think the officials of the Knox Automobile Co., Springfield, Mass., after the feat performed by one of the Knox trucks in that city one day last week.

As shown in the accompanying photograph, the truck, which has just been completed for a large Chicago drygoods firm, was coupled to two freight cars on the New England Railroad's tracks on Wilbraham avenue, Springfield. One car was weighted to 41,250 pounds, and the other, empty, weighed 21,200 pounds. The truck itself was loaded, and weighed altogether 11,000 pounds, making a total of 73,450 pounds.

The truck was placed a-straddle the ties, and as the snow gave little foothold sand was sprinkled on the surface, but otherwise no attachments were used on the wheels. When the signal was given the truck started up the freight cars without any difficulty, and although the tracks are slightly upgrade at this point, easily hauled the great load. It is said that after the test it was discovered that the brakes on one of the freight cars were partially set.

It was a test that strikingly shows the capabilities of the gas engine.

Charged the Bus With Loitering.

A most amusing instance of the manner in which the English "bobby" interprets the law of his land occurred the other day when one of the fraternity haled into court the conductor of a motor 'bus plying through one of London's most crowded sections, on a technical charge of loitering. The offence, it developed was caused by a breakdown in the mechanism of the machine, which caused a rather lengthy delay. The magistrate was somewhat nonplussed at the circumstance, and asked the constable whether in case one of a pair of horses should fall and break a leg, he would arrest the coachman on a similar charge. He replied in the negative. The court scratched its head for a time, and then dismissed the case on payment of costs. Whether the company subsequently dismissed the poor conductor for having got himself into trouble is not known.

Moore Heads the New Yorks.

W. J. P. Moore was elected president of the New York Motor Club at its annual meeting last Thursday night, 14th inst., to succeed Charles H. Hyde. The other officers-elect are as follows: Vice-presidents, H. M. Swetland and R. H. Johnston; secretary, A. B. Tucker; treasurer, Frank J. Griffin; directors, M. L. Downs, Robert W. Haff, R. G. Howell and W. J. Morgan. The treasurer's report showed the club to be in a prosperous condition.

After three readings and three reductions, the City Council of Urbana, Ohio, has passed an automobile speed ordinance. An eight miles an hour limit is the restriction within the city.

To Improve Asbury's Thirst Service.

Asbury Park's time-honored "arks," which have done faithful duty toting booze around to the houses of thirsty individuals ever since the Rev. Dr. Ballard and the Ocean Grove Camp Meeting Association took a dominating part in the politics of her sister city, are soon to be no more. According to reports from the seashore resort, the horse-drawn "arks" are to be replaced by a more modern "wet goods" delivery service. Asbury Park is supposed to be a dry town, so the plan is to get a license for a roadhouse just outside the mile limit and have the hotel orders telephoned there and then rush the "goods" to the city in automobiles. Thus a man with a predetermined thirst need wait but a short time for a full evening's supply of liquid refreshments. What the W. C. T. U. thinks of the innovation has not developed.

CANNOT SCORCH BY PROXY

Massachusetts Court Upsets That Idiotic Contention—Police Must Identify Offenders.

One part at least of Massachusetts' despotic automobile law has finally been carried above the courts where a fine is levied regardless of all other considerations, and has been given a setback. Edward W. Taylor, of Concord, and Charles V. Smith, of Lincoln, Mass., were summoned to appear before a local court in Concord last summer and were accused of overspeeding their cars on the streets of the last named town. Although the evidence conclusively showed that at the time of the alleged breach of law neither of the owners were in the cars and that the latter were driven by persons other than the defendants, they were duly mulcted in accordance with what has come to be time-honored precedent in the Bay State.

They forthwith appealed from the decision and the merits of the case were argued before Judge Gaskill, of the Middlesex Superior Criminal Court, who has just made public his findings. They are to the effect that an owner of an automobile who is registered and has a license is not criminally liable for overspeeding when he is not in the machine at the time. He further ruled that, in order to convict an owner of overspeeding, the police must be able to identify him as having been in the machine, and that it is not sufficient for the prosecution to prove the ownership of the machine without connecting the owner with the alleged offence. The point of law which the lower courts have either been unable to recognize or have wilfully refused to take into consideration, is that one person cannot be convicted of a misdemeanor actually committed by another, even though he, the owner, may have been present as a passenger in the car.

It has been a common practice in Massachusetts to convict the owner of a car for overspeeding whether he was in the car at the time or not, and, what is worse, the great majority of convictions have been secured without the complaining official being compelled to recognize the defendant as the person who was driving the car when the offence is alleged to have been committed. The decision will undoubtedly give rise to a large number of appeals based on the same state of facts, as this form of procedure is known to have become an established practice in more than one local court.

Jersey Farmers to Advocate Big Fees.

Those people who till the soil in Mercer, Middlesex and Somerset counties, in New Jersey, and who proudly boast of membership in the Princeton Agricultural Association, have decided to go before the ensuing Legislature and "ask for the passage of a law to prohibit the driving of automobiles at a speed exceeding fifteen miles an hour in the country and ten miles an hour in the city; compelling non-residents to pay a license fee of from $25 to $100 per year, according to the size of their automobiles, and giving the right to any and all persons to arrest without a warrant any automobilist who violates the law, also the right to hale him before any peace officer, who shall detain him and his machine until justice is secured."

Prof. Huddy Delivers Some Opinions.

It has taken Professor Xenophon P. Huddy, of the Rhode Island bar, up to the present to discover that the legal status of the automobile "has not as yet been judicially defined," which is the manner he takes to express his opinion in the current issue of the Yale Law Journal.

For want of a precedent, the automobile is classified with all forms of wheeled users of the road, regardless of the form of their power. In an Indiana court decision its right to the highways has been "judicially declared to be equal to the rights of the other vehicles, "and a Massachusetts decision asserts that "one who is motoring on the streets and highways may be said to be 'driving.'"

It is the final conclusion of the learned professor, after discussing all the pros and cons of the matter, that "the hazard to which the safety of pedestrians, and in most cases persons with horses, may be exposed, results from the personal part played in motoring, rather than from the nature of the vehicle."

Bennett Cup Kicked Down Stairs.

According to cablegrams, at the meeting in Paris on Monday, 18th inst., of delegates to the International Automobile Conference, the French club was successful in its efforts to give the Bennett Cup a kick down to the first flight of stairs that leads to oblivion. That is to say, the conference decided that there shall be no race for the Bennett Cup next year. It was arranged to hold another conference in June, 1906, to decide whether a race for the trophy should be held in 1907 or whether it should be definitely abandoned. The consensus of opinion was, however, that the contest will be abandoned, the cup remaining with France. Some of the conferrees, the cable adds, censured the alleged bad organization of the Vanderbilt Cup race on Long Island, whatever that may mean.

Speedway Schemes Show Signs of Life.

Although the many mammoth speedway projects were supposed to have died the natural death befitting their kind, such seems not to be the case. The idea of building a five-mile triangular track in the pine forest, twelve miles below Lakewood, N. J., has been disinterred by a party of Atlantic City hotel proprietors, and one of the same kind is anxious that automobile manufacturers devote $35,000 to help a speedway near his resort in Indiana. The latest proposition is nearer home—on Long Island. Somebody has figured out that a circular speedway, thirty miles in circumference, can be constructed near Garden City for $4,000 a mile, or at a total cost of a trifling $120,000.

ADDING TO THE BURDEN

"Journalistic Enterprise" Evolves an Amazing Measure—Fees and Penalties Galore.

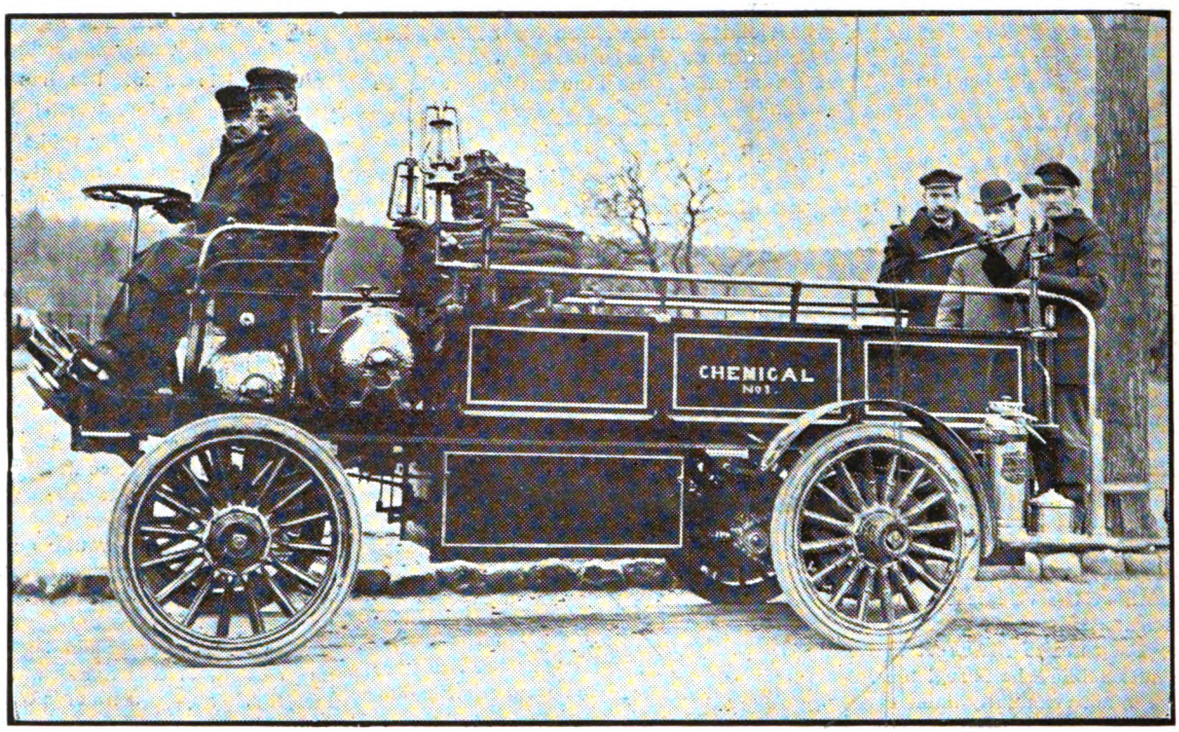
Outing, a monthly magazine supposed to be devoted to outdoor life, has seen a way to obtain some cheap advertising or notoriety at the expense of motor vehicles. It has had drafted a voluminous and rather crude measure, which it styles the "Outing Magazine Automobile Bill," and which it hopes to have introduced into the legislatures of various States. The thing is a loosely drawn hodge-podge of existing laws, including some of their most vicious provisions.

The Outing bill, of course, would require not only registration, licenses and numbered tags front and rear and also the State seal, but "examination by the State board of public roads." It is not content with the $1, $2 or $3 fees now exacted, but would increase the amount to $25 per vehicle. Manufacturers and dealers would be mulcted the same sum for a general license. For rental cars or motorcycles the fee would be $2 per year. Chauffeurs also would be taxed $2 each, and "no person shall employ for hire as chauffeur or operator of an automobile or motorcycle any person not specially licensed." Just imagine a man owning a motorcycle employing a chauffeur to operate it for him! When a machine is sold Outing would have the State seal returned to the Secretary of State, whom it would empower with authority to suspend or revoke licenses for any misconduct.

The other penalties are suspension of licenses for fifteen days for a first offence, thirty days' suspension for a second offence, and revocation and a fine of $100 or thirty days in jail for a third transgression. In addition, any motorist who "fails to stop and offer assistance to any person or property (it is not made clear what assistance can be offered to property) injured by him" shall have his license revoked.

About the only original thought in the entire proposed bill exempts motorists from suits for damages due to collisions with vehicles that display no lights. It does not, however, say that the motorist shall be entitled to damages, as should be the case.

To Keep an Eye on Motorphobes.



To have an eye on any automobile legislation that is likely to crop out in this session of the legislature the Associated Automobile Clubs of New Jersey has appointed a committee on legislation, with W. F. Sadler, Jr., of the Mercer County Automobile Club, Trenton, chairman. At the same meeting a State secretaryship was created. J. E. Gill, of the Mercer club, being named.

For a Clubhouse on the Beach.

The new Avalon (N. J.) Automobile Club contemplates the erection of a clubhouse on the beach. The house is to contain fifteen rooms, eight of which will be sleeping apartments for members.

How Hopedale Fights the Fire Fiend.

Hopedale, Mass., is proud. It now has an electric fire fighting apparatus, and enjoys also the distinction of being among the first cities to adopt the approved method of subduing Vulcan's wrath. The novel combination chemical and hose electric wagon reproduced above was built by the Pope Motor Car Co., at Indianapolis, Ind., and is being employed to good advantage in Hopedale. In a thorough test, in which its speed and hill climbing capabilities were tried out under adverse weather conditions, the truck developed a speed of over 16 miles an hour, and climbed a 13 per cent grade loaded with 300 or 400 pounds above that called for in contract, with ease. Ten seconds was found sufficient time for the apparatus to start and be on the street after the first alarm.

The Pope-Waverly electric fire engine is equipped with 48 cells of exide battery, furnishing current for two motors capable of developing a total of fifteen horse power. The chemical equipment was made by the Howe Engine Co., of Indianapolis, and the fire extinguishing apparatus includes besides the chemical engine, ladders, some 1,000 pounds of auxiliary hose, besides the hose for the chemical engine, buckets and extinguishers and the usual equipment of axes, bars and tools.

The Excuses They Give When Caught.

From grave to gay, from funny to farcical, are the excuses sometimes given in court by motor drivers as to why they were "going a bit fast," says Motoring.

"I was driving to get a marriage license," in one instance touched the sentiment of the bench to the extent of halving the panalty.

Doctors who have proved that they were travelling in a hurry to emergency cases have sometimes escaped scot free, but the naive excuse of an old wound left as a legacy from the Boer was suddenly breaking out afresh, and rendering the driver's hands incapable of regulating his speed, has been known to fail in working on the feelings of some hard-hearted magistrates.

A guileless plea put forth by an excellent driver that the car suddenly ran away and he was not able to curtail its innate lust, resulted in a fine of $50 and costs, while a motorist caught in a trap and timed at 30 miles an hour was pardoned on the never-do-it-again principle when he shyly explained that he was seeking a doctor owing to an interesting domestic event.

Unfortunately for the ingenious genius, such excuses, although adding materially to the gayety of police courts, are usually regarded by the bench as being on a par with those apologists in the Scriptures who "had married a wife" or "bought an ox," and could not, therefore, be held responsible for a defection of duty.

The Tale of a Housemaid.

A specially clever housemaid, who had been seven years in a family which took to motoring, was one day laughingly told by her master that "if she proved as capable as a chauffeur as she was at housework, he would employ her in that capacity." She took him at his word, insisted on learning motor-mechanics, and at a salary of $150 a year combines the post of chauffeur with that of house-valet-maid. She can do most repairs, is a capital driver, and after overhauling her car at the close of a day's run, waits at the family dinner table with the same skill as distinguishes her at the steering wheel. The combination of chauffeur, valet and waiting maid is one which goes far towards solving the problem of "motoring on nothing a year." The story, which comes from London, is almost too good to be true.

How the Horse is Not Diminishing.

Some are constantly claiming the final displacement of the horse with the automobile, and others are calling attention to the fact that there are more horses than ever before. The fact is there is room for both the horse and the automobile, and twentieth century civilization demands both and is going to have both. It is easy enough to see that the automobile is increasing wonderfully, but so is the horse.

At the present time there are about 17,000,000 horses in the United States. Ten years ago there were something more than 1,000,000 less, and in 1890 the Government statistics show that there were only about 14,000,000 horses in the country. This does not look very much as if horses would be driven out by automobiles.

Wants Racing on the Ice.

Some brilliant Western genius has conceived the idea of racing automobiles on the frozen surface of Lake Harriet this winter for the delectation of fashionable Minneapolis and St. Paul folk. All fully insured martyrs are invited to step forward.

FAIRBANKS; HIS DEER STORY

It Happened at Night in the Maine Woods and, of Course, the Deer's Dead.

According to a veracious press agent, Emmet Fairbanks, a prominent Boston sportsman, will have to answer to the game wardens for shooting a deer, which the latter claims was done in self-defence after the animal had charged upon the occupants of the motor car.

According to the story teller, Mr. Fairbanks and party were on their way from Mattawamkeag to Patten. They were making the trip in an automobile, and were travelling at night along the old stage road between these places, which in one place transects a ten mile stretch of forest. They were "bowling merrily along"—press agents invariably use this expression when possible—when the members of the party saw what appeared to be two green balls of fire which seemed to be suspended in the air about five feet above the road. Mr. Fairbanks immediately recognized the eyes of a deer, and running his machine up to within a short distance of the large buck, which seemed to be fascinated by the headlight of the machine, he turned the headlight on the animal, at the some time pressing the bulb of the born. Immediately the buck was transformed into a different creature, and, lowering his head, he made straight for the automobile.

His first attack was on the headlight, and after completely destroying this he cut one tire open with his hoof. Just what happened after this none of the party seem able to tell. The buck seemed to be on both sides of the machine at once. They could feel the shocks as he butted into the car, and once one of his antlers caught in Mrs. Fairbank's long fur robe and ripped clear through her dress to the skin. The animal ripped up a suit case as if it was made of paper. The party in the machine tried to escape by running the machine away, but it was run off the road and into a tree, and the enraged animal began anew his assaults on the car. The men succeeded in getting a rifle out of the baggage under the seat, and the animal was killed and hung up along the roadside.

This thrilling episode puts to shame any of Peter Fenimore Cooper's brilliant efforts.

Where Cars Must Have Red Lions.

Hyde Park's sacred precincts are henceforth to be open to London owners of certain types of automobiles. Electric vehicles are to be exempted from the operation of the ordinance excluding all kinds of motors from the park during certain hours of the day in summer.

The question at once arises, How are the London "bobbies," with their scant knowledge of things automobile, to distinguish the cars apart, particularly in view of the great similarity that now exists and that has led to the creation of the term "mock electrics" to describe the gasolene propelled coupes and other closed types that are sans bonnet as well as all other familiar indications of their kind, except the exhaust? But the authorities have taken this into account and special licenses will in future be granted for electromobiles.

Cars so licensed will be adorned with a large red lion and crown painted on them and an appropriate penalty has been laid down for all who counterfeit the device on cars for which it is not intended. One of the conditions of this special registration is that the owner of the car will be held jointly responsible with his driver for all offences against the law.

Moose Dinner, Automobile Style

Messrs. Risley and Hill, of the Electric Vehicle Co., Hartford, recently went gunning for moose. They bagged one of the "birds," and on their return to Hartford tendered the E. V. officials a "moose dinner," the "demonstration," as it was styled, being held on the 19th inst. The occasion set a new mark in menus, as witness the one that prevailed:

76° Raw Gasolene Straight or in Fire Balls

4 Trembles to the Man

Old Valvoline Brew—In Kegs

Little Neck Clams
Valve Push Rods on the Side

Moose and Venison
Smothered with Lock-washers and Albany Grease
Jelly Electrolyte or Low-tension Magneto Currants
(We don't know which you'll get; it's up to Maxim.)

Self-Starting Boston Baker Mufflers
"Old Style" Look out for the Back-Fire.

Cafe Noord "Spitfires"
Sea-going Cabs and Indecent Hotel Accommodations Furnished on Application Delivery in 90 days

Megargel Lost and Found.

Percy F. Megargel and David Fassett, the two tourists who are peregrinating about the continent on a Reo car, have been reported lost in the deep snow on the mountains west of Flagstaff, Ariz. According to the dispatch from Flagstaff, the men left the town of Williams at 10 p. m. Friday last, and have not since been heard from.

The trail has not been traversed for a month and is covered with deep snow, the telegram adds. Telegrams sent to all places along the Santa Fe have failed to locate the party. A relief expedition, with food, blankets and shovels, started out at noon on Monday in the midst of a blinding snowstorm. The next dispatch rescued them in the nick of time.

Club Gives Knoll a Library Lamp.

H. A. Meldrum has been elected president of the Automobile Club of Buffalo, N. Y., to succeed Augustus H. Knoll, who has retired on account of business. At the meeting, Monday night, this week, Mr. Knoll was presented with an electric library table lamp by the members. Other officers elected were: F. B. Hoover, vice-president; D. H. Lewis, secretary; Charles Clifton, treasurer; Edward H. Butler, E. R. Thomas and S. P. White, directors.

FRENCH VILLIAN, LATEST STYLE

How Jealous Lucien Obtained Revenge When the Proud Governess Spurned His Love.

The newest form of motor melodrama hails from Paris. A chauffeur named Lucien Broomed, part Irish and French, engaged in a garage in the Avenue Niel, fell desperately in love with a French nursery governess named Claudine Villon.

The lady accepted many motor drives from Lucien. But she rejected him as a permanent accessory of her heart and life. Dejeuners and trips by car into the country she did not despise. But she chose another partner for the non-stop run through life.

When the date of her marriage was finally fixed Lucien begged her to take a last and parting trip on his car. To this she consented. While whizzing through the Avenue de la Grande Armee, the love sick chauffeur once again implored the lady of his heart to jilt her accepted lover.

This she stanchly refused to do. In the Boulevard Lanne the miscreant motorist suddenly put in the top speed, opened wide the throttle and leaped from the car.

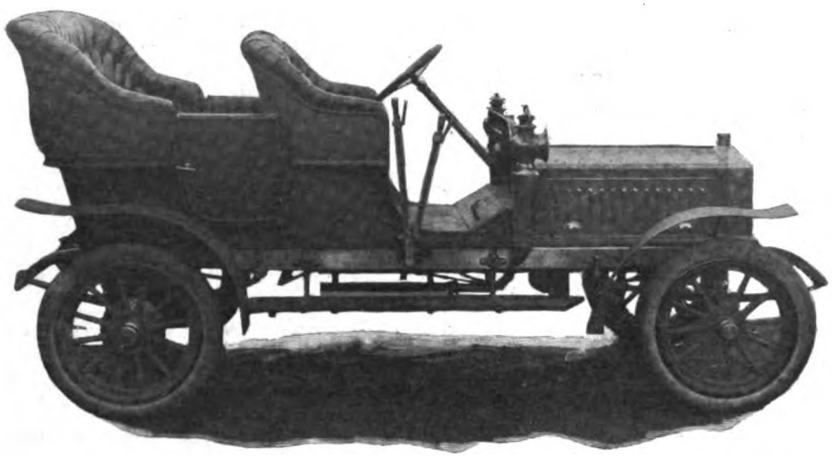
The lady and the motor ran amuck. The girl tried her best to stop the car, but was ignorant of the means. The motor car crashed against the curb; the young woman was hurled violently out, broke her leg and sustained other serious injuries.

The lover, Lucien, was arrested, and at the trial will probably be made by a sentimental public the hero of the first motor melodrama of its kind. Doubtless he will be the recipient of bouquets and lucrative offers of marriage. For the Paris public dearly loves a villain of the penny novelette order, whether guilty of vitriol throwing or of launching a girl on so destructive a journey as that of an uncontrolled high speed car in traffic.

License for a Twelve-Year-Old.

New Hampshire now comes forward with a bid for fame in the shape of the youngest licensed chauffeur in the country. He is Willie Carpenter, twelve years young, son of C. H. Carpenter, and a resident of Franklin, N. H. It is said that the Secretary of State had grave doubts as to the propriety of issuing a license to a twelve-year-old, but the manner in which the incumbent has tooled his father's Oldsmobile touring runabout during the last season has removed any fears on this score. He is credited with good judgment in driving and is said to be very careful.

Why Tilt Scorched and Was Forgiven.



A man is apt to forget the automobile speed laws when the stork pays a visit to his home. So reasoned C. A. Tilt when he was asked to explain to Judge Chatt, in a Chicago police court, why he happened to be driving his car faster than the prescribed limit. The judge also was of the opinion that the advent of a new son was sufficient cause to make a man forget himself for the nonce, so Tilt was allowed to go home and welcome the arrival.

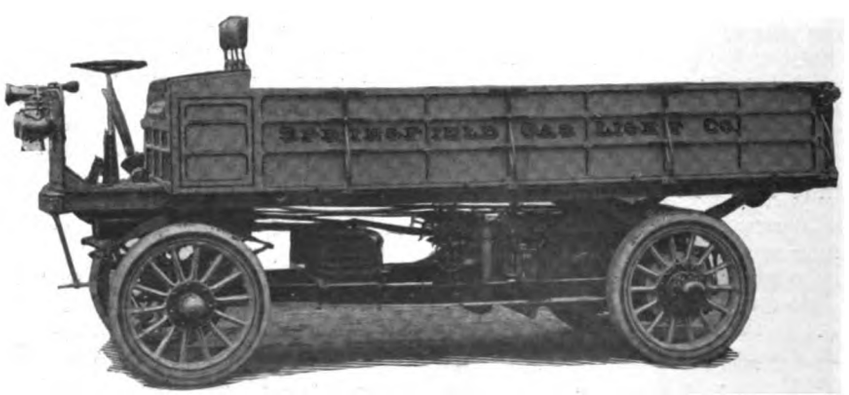
MITCHELL'S $1 800 MODEL

Despite its Relatively Popular Price it Incorporates Many High-Priced Features.

At last it would seem that the day of the good car selling at a moderate price has arrived. Of course, this is not the millennium, when a man may buy his heart's desire for a couple of hundred dollars, but it is the day when the purchaser of an American machine

of moderate price may rest assured that he is securing a dollar's worth for every dollar he lays down, and when for an amount of outlay which a year ago would hardly have bought a respectable two cylinder light touring machine, he may possess himself of a solidly built four cylinder car, complete and efficient in every detail and worthy of his use.

There are in the market at the present time several machines which come under this general classification, but none, it is safe to say, which approaches any nearer to the ideal than the head of the Mitchell line. This machine, which is catalogued by the Mitchell Motor Car Co. as Model D-4, occupies the somewhat equivocal position of the de luxe edition of a low priced four cylinder car. Yet it seems capable of fulfilling all the demands of its position without in any way coming under the classification of the cheap car—a point which is by no means to be considered lightly. It is simply a full fledged four cylinder touring car, equipped in the most modern fashion and mounted in a thoroughly workmanlike manner, comparing favorably with the most expensive types, yet produced in an economical way which permits of its distribution at a most "fetching" price.



In detail the specifications of Model D-4 include the four cylinder vertical motor, dimensions 4¼x6 inches and rated at 24 to 30 horsepower, built according to the best practice of the day and regulated in the most approved manner. The cooling operation is performed by the aid of a cellular radiator, with a suction fan mounted directly behind it. The carburation is automatically regulated, and the lubrication of the motor and other important parts of the machine is by a mechanical device.

The transmission of the motive power to the driving gear is by means of a three speed transmission, which gives a direct drive on the highest connection, all gears being out of mesh at the time. The final transmission is through a cardan shaft and bevel gears.

The running gear of the machine is mounted on 32-inch artillery wheels, shod with 4-inch tires, spaced 100 inches on the base by 56 inches tread width. The suspension is by 40-inch half elliptic springs, both front and rear sets being of the same size and pattern, and the steering arrangements give a complete and an irreversible control under all circumstances. The handling mechanism is simple and efficient, the motor being controlled by means of the spark and throttle, and the foot brake and hand operated emergency lever giving ample stopping power for all possible contingencies. The finish has been most carefully worked out, and the appearance of the machine is decidedly pleasing to the eye, while its road performance, which under favorable conditions reaches up to forty miles an hour, is all that could be required.

Test That Decided a Truck Purchase.

Although the Springfield Gas Light Co. has its plant and offices in Springfield, Mass., its purchasing agent, F. L. Belcher, is evidently from Missouri, in that he "has to be shown" when it comes to buying motor trucks. The test of two trucks, which has convinced Mr. Belcher and resulted in the placement of an order for an Atlas truck with the Knox Motor Truck Co., was this: The two trucks were each loaded with 6,000 pounds of pipe, together with four men, and, starting from the gaslight company's office, the drivers were instructed to deliver their loads seven and three-quarter miles distant and return. The Atlas, which is reproduced above, delivered its load in 37 minutes and returned unloaded in 30 minutes. Its competitor took 7 minutes longer on the out trip and was 5 minutes slower on the return.

Grout Beats the Lady.

Miss Helen Walker, a St. Louisan, who sued the Grout Bros. Automobile Co., of Orange, Mass., for the purchase price of an automobile, $700, alleging the car did not equal representations, has lost her case. Miss Walker bought the steam car at the St. Louis (Mo.) exposition last summer, but after obtaining another from the factory, on the ground that the first was defective, and then deeming the second the same, she brought suit to recover. The defendants contended that Miss Walker became frightened every time she approached a streetcar in the machine, and won out.

Electric Light for a Penny.

A recently added feature of the Paris taxameter cabs is a prepayment device by which the occupant may provide himself with illumination if he so chooses. It is, in short, a penny-in-the-slot electric light. Just how much light is considered an adequate return for this quid pro does not appear, but it is evident that by feeding the machine with coin the illumination may be made continuous.

Tire Thieves Tour the West.

Appleton, Wis., has a new kind of thief—the automobile tire purloiner. The culprits enter garages and even go so far as to take the tires from wheels of cars standing in the streets. As owners in neighboring cities have complained recently of these tire marauders, the police believe there is an organized band travelling from city to city. As yet they have not been apprehended.

J. A. Cramer, the Buffalo dealer, is adding a sundry department, and will actively enter the lists as a jobber. He will keep two men on the road, covering the Western New York territory.

ABOUT CYLINDER CONSTRUCTION

Wide Variation That Prevails and What It Suggests—Recent Remarkable Departure.

In the matter of cylinder construction, the common practice of gas engine design seems not to be approaching a point of finality as rapidly as it is in other directions. A considerable variation in the methods of casting the cylinders is noticeable to a very great extent, the divergeance including not simply the arrangement of the units in single or multiple castings, but also in the methods of jacketing. This fact is all the more remarkable since in other ways, motor construction is becoming fairly regulated into stereotyped lines.

Considering the various ways in which it is possible to construct the cylinders of internal combustion motors, the different types naturally group themselves under one of two heads according to whether they are arranged independently or in groups of two or more made in a single casting. Those which are of entirely independent construction may be complete in every detail, including the combustion heads and water jackets; they may have the jackets cast integral with the main portion of the cylinder while the heads are independent, being either air or water cooled; they may have separate jackets which do or do not include the heads; or they may have separate cylinder liners which are entirely independent of the main casting and are forced into place after the part containing the jacket and head has been suitably machined. Of those which come under the general classification of multiple cylinder construction, some have each cylinder complete in itself; others are complete in pairs, answering to the description of twin cylinder construction; while others have either separate heads, or separate jackets, or both, according to the fancy of the builder.

In order of development, the complete cylinder, including the combustion head and jacket, naturally enough takes precedence, as being the simplest and most legitimate form conceivable to the mind of the early investigator. Closely following upon the heels of this type, came the cylinder with separate head, made necessary by the Otto type of slidevalve engine, which was so largely used in stationary work for many years. Later on, the demand for more perfect machine work, was chiefly responsible for the adoption of the separate head which made possible a much simpler casting than otherwise could be obtained, and one which readily gave itself to the common boring machine of the day. Within a very short time, the development of special boring mills and especially those of more than a single spindle suggested to designers the possibility of cheapening the first cost of machining and at the same time increasing the accuracy of construction by using a multiple cylinder casting and machining it at a single operation. Hence, first of all the twin cylinder, and later, the multiple cylinder construction, which may be extended to embrace three or four cylinders in a single piece.

In the meantime, other consideration made the use of independent jackets seem much to be desired to certain designers, chiefly for purely mechanical reasons connected with the pouring of the metal and its subsequent treatment, and thus, the development of what may be called the sectional type of cylinder construction was brought about. In some instances the single cylinder arrangement is adhered to, the jackets or heads or both being separately constructed, while in others, the cylinders are made in pairs, and the jackets and heads are independent. There seem to be but two extreme variations from the classification of the two general groups, both of which are on the order of sectional construction. One of these, which has been in use on an English machine of repute for several years, comprises the use of a separate steel liner forced into the body casting of the cylinder, which includes the lower portion of the cylinder and the jacket, while the other, an American innovation at this time, consists of the application of twin cylinder heads to independently cast and jacketed cylinders.

The problem of cylinder design for gas engines which are to be applied to automobile work, is considerably complicated and altered from the corresponding problem in light steam engine design, its only precedent, first of all by the fact that much greater temperature and pressure ranges are to be dealt with, and, second, that the motor itself, when completed, instead of being cradled on a solid masonry bed, is suspended upon a more or less elastic framework, which in itself is liable to considerable gyration, and the entire fabric is then buffeted about over the face of the earth in a manner which is calculated to set at naught the most rational of calculations made according to the accepted standards of steam engine design. Of these considerations, probably the most important, is that relating to the tendency to distortion of the engine itself, owing to the excessive pressure which are encountered at certain portions of the cycle. This factor decreases in importance in proportion to an increase in the number of cylinders when the entire structure is considered, but as far as the individual cylinders are concerned, is not affected unless the multiple construction is resorted to.

In this way, then, a gain in addition to that due to a possible reduction in the cost of manufacture, is obtained by the use of two or more cylinderers cast together, since each serves to protect the alignment of each of the others. The ideal engine would, of course, be one in which there were no separate stationary parts in the main structure and, of course, the closer approximation to the ideal condition, the better, other things being equal. But, on the other hand an argument which militates strongly against the use of multiple cylinders, is that the expansion of so complicated a casting as is necessary under the circumstances, must of necessity be very unequal, and as it is quite customary to use an aluminum base in light motor cars, the internal strains set up between the two portions of the structure must be terrific when it is considered that the coefficient of expansion of cast iron is something like 45 per cent. lower than that of aluminum. Also in the case of the base and cylinders being constructed of the same metal, it is evident that the difference in temperature between different portions of the structure must be sufficient to cause considerable stresses, which ought to be reckoned with in the design of the motor.

Another argument against the use of this type of construction and one which furnishes as well the chief point in favor of the unit construction, is that of economy of upkeep. With the several cylinders cast in one, any derangement in one which entails its being examined, involves the complete dismantling of the entire motor, an amount of labor which otherwise would be unnecessary, and also, if one cylinder be at fault, the entire number must in many cases be discarded in order to replace one, the only alternative being that of reboring one and fitting it with a larger piston, in case the bore is affected. or, in the possible event of a breakage, the installation of a new set of cylinders is inevitable ordinarily.

Principally on account of this flaw in the success of the multi-cylinder construction, and also because of the employment of modern rapid production machinery, which makes possible the speedy completion of a greater number of individual cylinders than was formerly possible, the unit type of construction is in most common use. Its faults are numerous, including in addition to the cost factor, and that of less rigid preservation of the engine alignments, an unavoidable increase in the over-all length of the motor, and an increased complication in the matter of connections, both for gas and ignition, and for the cooling water.

As a sort of compromise between the two, the twin cylinder type of motor seems to be retaining a hold which for a time appeared to be likely to prove sufficiently strong to oust both of the others. It considerably reduces the number of separate parts in the motor through the possibility of slameseing the ports, and cuts off possibly three or four inches in the length of the motor, besides being considerably better structurally than the individual type, and cheaper to build. The mere matter of engine length, however, is not one which is of serious moment in the design of the ordinary touring car, and the proper design of the engine base, allowing for plenty of strength under the cylinders, would seem to put the unit type on practically equal terms with it, under ordinary conditions.

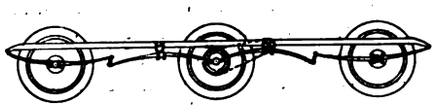
Another point in favor of the unit construction, which the multiple construction does not so readily permit, is the use of the separate jacket of spun copper which is clamped in place by suitable gaskets, and in addition to a considerable reduction in weight, serves to so simplify the original casting of the cylinders that they may be of

Digitized by Google

practically assured quality and strength throughout. This type of construction also effects a considerable reduction in weight per horsepower, and makes possible a thoroughly neat and pleasing appearance in the machine—a factor which is of no little value when sales to non-technical users are to be considered. In a single instance, to be sure, the independent jacket has been applied to the twin cylinder formation, but its use has not as yet become sufficiently general to argue its entire success.

The method of utilizing the advantages of the unit construction and at the same time gain the strength of the multiple system, by using slameseed independent heads, is worthy of serious trial. Of course, the use of independent heads is to be deplored in any machine which handles such great pressure as does the gas engine, and on that account, there is likely to be a loss of compression through the joints between the heads and cylinder walls unless the greatest of care is taken in the assembling to insure a perfect fit, and unless the best of treatment is accorded the parts when undergoing repairs. It cannot be gainsaid, however, that but for this drawback, there is a considerable advantage in the method, and that it should be much more serviceable than any method of bracing or tying between the cylinders which might be contrived.

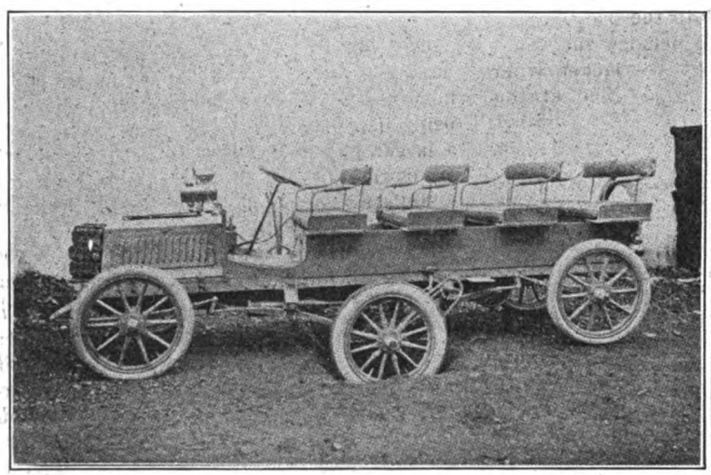
In the design of horizontal opposed motors, there is still considerable varience in the matter of the construction of heads, and also, to a certain extent, in jacket construction. Some very well built motors include the engine base in a portion of the cylinder castings, thus making the machine an assemblage of a very few parts. In certain cases, the heads are integral with the main casting, while in others, they are still of the separate variety. In this, however, as in the types of vertical motor, there is no absolute decision as to any one method as being of greatly superior advantage over the others.



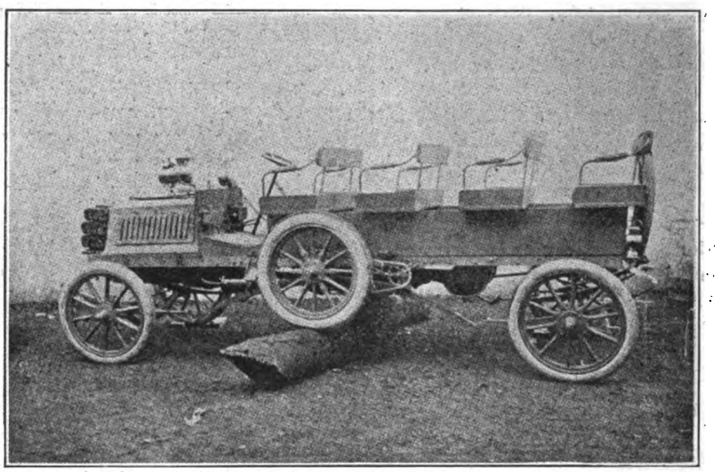
George E. Blakeslee has contracted for the erection of a two-story frame addition to his garage on the Boulevard, near Duncan avenue, Jersey City. The building will be 40x 99 feet, and cost about $3,500.

THE SIX-WHEELS IDEA

Features of the French Car in Which it is Embodied—Its Remarkable Flexibility.



Although it is not the development of a week, nor anything of startling newness, having been frequently exploited in the French press, the six wheel car made by Turcat et Mery in France under license from M. Lindecker, certainly proved one of the attractions of the Paris Salon.



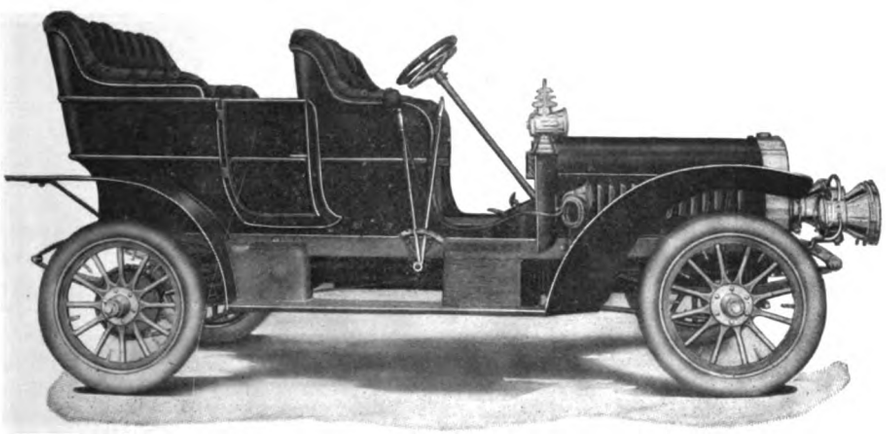
The invention really relates more to a system of flexible suspension, the outlines of which are made clear by the sketch shown, although the extra pair of wheels is of course an essential feature, for it is through the latter that the power is finally consumed in driving the vehilce. But in order to appreciate the great range of vertical movement of these driving wheels it will be necessary to refer to the photographs showing a char a banc built on this system, first in passing over a rather deep hole and in the second instance meeting with an obstruction in the shape of a log, without any of the wheels losing their normal contact with the road surface. This range is said to be equal to the total clearance of the body.

The idea of the inventor in devising this system has been to augment the size of the car without the necessity of increasing the amount of power employed. In order to render possible the use of an additional pair of wheels, a special system of suspension has been found necessary, consisting of springs interposed between each pair of the ordinary semi-elliptical springs on the front and rear of the car. These instead of being fast to the frame of the car as is customary are joined at their ends by a pair of springs which close the intervening space. These are also semi-elliptical, but are inverted and are hung from equidistant points on the frame from pins which permit of their movement about this fastening as an axis. At their inner ends they carry the axle of the third pair of wheels, which are the drivers, and are located exactly in the centre of the vehicle. The remaining four wheels are coupled so that all are utilized for steering, which permits of a vehicle of unusually long wheel base having a very short turning radius. This renders the otherwise difficult performance of negotiating sharp turns in city traffic very easy.

Among the many advantages claimed for this construction those of a more equal distribution of the weight, greater ease in steering and entire freedom from skidding stand out prominently. But in addition, the wear and tear on tires, not alone those of the four idle wheels, but also those of the drivers, is claimed to be far less than where but four wheels are used. Whether this saving is sufficient to offset the greater additional first cost of an extra pair of tires cannot be said. The char a banc shown by the photographs reproduced herewith has been in continual use for a number of months, even taking part in a hill climbing contest, and is said to bear out all the claims made for it.

When Looking for Trouble.

It has been aptly stated that the difference between a steam and a gasolene engine is, that it takes but a minute to discover trouble in the former, but an hour to right it, whereas in the latter an hour is spent in locating the source of trouble, and a minute to set it right. There is a measure of truth in the comparison, but much of it is based on the aimless manner in which many chauffeurs set about to look for the cause of a stop. One authority has compiled a list of thirty different "pannes" that may occur to the motor, any one of which may cause it to cease operations, and advises that they always be tried in rotation. It is rather a lengthy process, but it would be necessary to go through it far less frequently were each item tested out thoroughly before going to the next. System will accomplish in a fraction of time what aimless dabbing here and there may never reveal.



The Automobile Storage and Exchange Co. has taken the agency in New York, New Jersey and Connecticut for the Moline car.

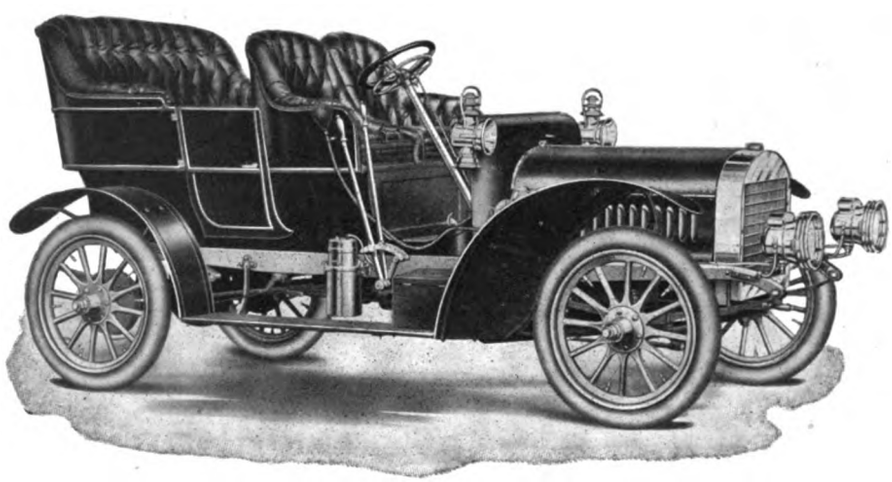
RAMBLERS WITH FOUR CYLINDERS

New Cars Full of Impressive Features—Simplicity, as Usual, a Keynote.



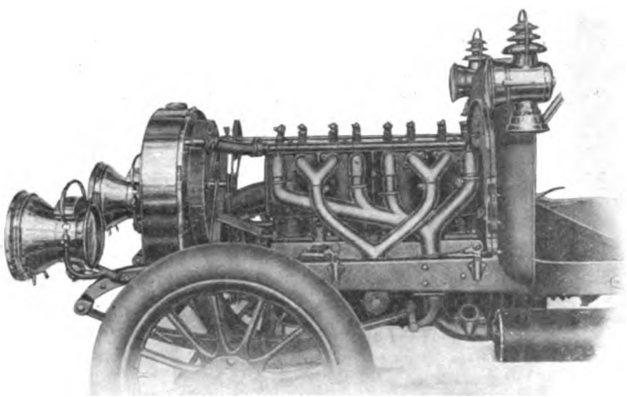
When during the last two years the question has been put to any of the Rambler agents, "Why is there not a four-cylinder Rambler?" the invariable reply has been, "Because Thomas B. Jeffery & Co. are not yet ready to build one." From which, considering past performances, the inquirer naturally inferred that when the time was ripe Thomas B. Jeffery & Co. would build a four-cylinder car, and that when that car appeared it would be ready for the road, a finished mechanism, upon which all experimental work had long been completed. The prophets have foretold that the beginning of the year 1906 would be the psychological time for the debut of such a car or cars, and the prediction is fulfilled by the appearance of the cars themselves, constructed in the fashion which has made possible the growth of the Rambler business, and characteristically up to date in all respects.

35-40 H. P. RAMBLER, MODEL 15, CHAIN DRIVE.

Including the innovations in the way of four-cylinder machines, the Rambler line for the coming year embraces seven distinct and different models, four of which are equipped with two-cylinder engines, and three with those having four cylinders. Of these, the most diminutive will be a runabout, Model Seventeen, having a double opposed horizontal motor rated at from 12 to 14 horsepower, and having 4 by 5 inch cylinders. The essential features of this model will be similar to those of the present types insofar as general detail is concerned. The transmission will be of the planetary type especially contrived for this machine, and notable for its light weight. The wheel base will be amply long a most modern attribute in runabouts, and the wheels will be 28 inches in diameter and fitted with 3-inch detachable tires. The equipment of tools and supplies will be complete, making the outfit in nevery respect complete and efficient. As an option, this machine will also be equipped with a detachable tonneau body and fitted with larger tires.

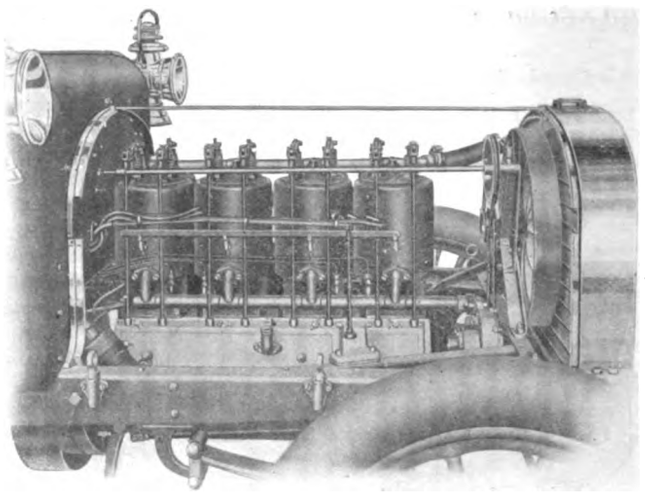
The models known as Surreys, Types One and Two, will still be marketed, their construction and equipment being unchanged as far as is consistent with good running results, and to the line will be added another Surrey, Type Three, which is a perfected type of the first in order, equipped with a body similar to that used on Type Two. It will have an improved detail construction, and have a more elegantly appointed body, thus satisfying the demand for a high grade two-cylinder machine of superior fitting and quality, yet marketable at a price lower than that which the four-cylinder machines command.

20-25 H. P. RAMBLER, MODEL 14, SHAFT DRIVE.



Models Fourteen, Fifteen and Sixteen, are of the quadruple engine pattern, embodying many new features, and thoroughly in accordance with the demands of common practice in every way. The details include such familiar terms as, mechanically operated valves, force-feed lubrication, jump spark ignition, sliding gear transmission, and Rambler throttle control, which last feature is common to the entire line. Model Fourteen is rated at 20-25 horsepower, and Model Fifteen, at 35-40, while the car known as Model Sixteen, is a Limousine, mounted on a Model Fifteen chassis.

The power plant of Model Fourteen, consists of a vertical 4 by 4 1-2 inch motor, driving a live rear axle through a three speed sliding gear mechanism and cardan shaft, which is completely inclosed. As will be seen from the accompanying illustration, the valves are located in the cylinder heads, and are actuated by means of vertical tappet rods moving rocker arms which are mounted on brackets carried by the heads themselves, making a neat and thoroughly accessible arrangement. This disposition of the valves also permits the employment of a simple arrangement of the piping and facilitates the carrying out of the cooling function. In this, a direct circulation between the cylinders and the radiator is attained by means of a positively actuated centrifugal pump mounted on the cam shaft at the forward end of the motor. The radiator, which also serves as a tank, has a cooling surface which amounts to something like 118 feet in the aggregate, which, with the forced draught of the fan directly behind it furnishes ample cooling effect for every possible condition.

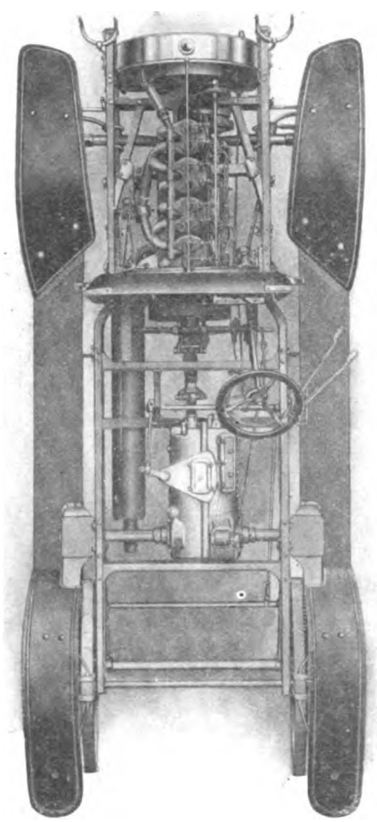


The primary energy for the jump spark ignition system is supplied by a six-volt sixty-ampere storage battery, the step up for the secondary being accomplished in a multiple-unit coil of special construction. The time of the spark is automatically controlled by the adjustment of the throttle wheel, which is arranged to control the motor in the ideal way for all ordinary conditions grading the time of ignition in proportion to the amount of throttle opening. For the purpose of sudden acceleration, a foot pedal is provided which acts upon the gas alone. Thus the feature of "one hand control," which has hitherto been a strong talking point, is retained, the use of the accelerator being confined to emergencies.

The carburetter has been newly designed, and is arranged to furnish a properly graded mixture under all conditions by automatic action. It is of the common float feed type, and its action is not affected by conditions of load on the motor, the supply of gas being regulated strictly in accordance with the speed. A new muffler also is provided, its construction being such that

Digitized by Google

SIMPLICITY OF RAMBLER PIPING.



RAMBLER TAPPET-OPERATED VALVES.

the exhaust gasses are efficiently silenced without the acquisition of back pressure. A muffler cutout is provided for the sole purpose, it is said, of aiding in a proper adjustment of the working of the cylinders.

The transmission mechanism includes a flywheel clutch which is interconnected with the gear shifting lever at the side of the car in such a way that improper handling of the gears is impossible. The brakes are in two sets, the one, an inclosed running brake, acting on the differential drum on the axle, and the other being a pair of expanding rings inclosed within flanges cast upon the hubs of the rear wheels, the latter, being for emergency use. They are effectually equalized.

The motor equipment of Model Fifteen consists of a 5 by 5½ inch 35 to 40 horsepower motor of similar design to that of the type just described. In other respects also, this machine is similar to the other except insofar as the difference of power has necessitated alterations in the dimensions of parts, with the exception of the transmission. In this the drive is by double chains to the rear wheels, the countershaft being enclosed in a heavy housing which is made integral with the gear case, and extends to the side frame members, thus forming a very rigid mounting. The support of the front end of the case is upon a single point on a transverse member of the frame, and that of the rear end is entirely placed upon the countershaft housing, so that the desirable feature of three-point support is obtained. As a protection for both motor and transmission mechanisms, a universal joint is placed at either end of the clutch shaft, thus rendering the entire mechanism of the plant self-aligning and self-adjusting. The rear sprockets are made integral with the wheel hubs and brake drums, their teeth being cut directly in the circumference of a flange on the latter.

The mounting of this type is thoroughly in accord with the demands of the best practice in touring car design, the wheel base being 112 inches, the tread 56½ inches, and the suspension consisting of 40-inch semi-elliptic springs in front and full elliptic in the rear, both sets being of the same length. The frame is of pressed steel, channel section, and the axles are tubular. The fuel capacity is fifteen gallons, and the maximum speed on the direct drive is rated at fifty miles an hour.

RAMBLER CHASSIS.

Radiators Hung on Trunnions.

A rather important point in the mounting of one of the foreign cars which is to be seen at the Paris show, is that the radiator is hung upon trunnions under the fore part of the frame thus allowing for a certain amount of working in the structure without any danger of leakages being caused as a result. It is beyond a doubt true that in many instances otherwise unaccountable leaks have been occasion by no less a cause, and it is only a wonder that hitherto no provision has been made to allow for the warping of the frame without affecting this most important part of the power plant. Similar arrangements protect the engine, and gear case in almost all cars, but the radiator is generally allowed to bear the brunt of the manifold strains which are bound to occur.

Pierce's School for Pierce People.

The George N. Pierce Co., of Buffalo, have inaugurated a school for owners and drivers of Pierce Arrow cars. The sessions are held every other fortnight, and last for a week. The instruction is entirely gratis, and invitations are forwarded to all owners of the company's cars to attend.

Experts in motor construction and automobile manufacture generally take the candidates through the rudiments of gasolene engine design and operation, basis principles being demonstrated with the aid of liberal facilities at hand, and so on up to the higher plane of efficiency, the class assisting in assembling of a complete car during the week's course. The makers consider that a more intimate knowledge of the machine on the part of the owner and driver will make the latter more capable to effect the numerous minor repairs which, when neglected, culminate sooner or later in serious trouble.

Telling the Tale Plainly.

"The Motor Car Dissected" is the title of what probably is the most readable and instructive booklet regarding automobiles yet issued. It has just been published by the Winton Motor Carriage Co. for the "guidance of Winton sales agents." It is a leather covered, handsomely printed little volume of forty-eight pages, of pocket size, in which in plain, non-technical English Sales Manager Shanks presents the very arguments and answers them that are neces-ary or that arise when the sale or purchase of a car is under discussion. He takes up each separate vital part and process, and shows wherein the Winton is superior, and does so in a fashion that leaves nothing to be desired.

DISPLACING THE BONNET

How Some Britons are Going About it— Novel Engine Position in one Effect.

Radical novelty of design is now a thing frowned down by maker, dealer and buyer with one accord. The buyer has but one desire and that is to become the owner of a car that is au fait in every respect and more particularly as regards appearance. The dealer will, naturally, only put his seal of commendation on something that possesses the easiest selling qualities and the manufacturer must conform his designs thereto. English makers have apparently not fully weathered this period; some of them are still in that intermediate stage represented by something between the Simon pure freak and the design which conforms in many respects with current usage, but still retains individual features to an extent more than sufficient to place it in a class apart. In this connection, it is to be noted, that the builders of the Arrol Johnson car, which, with its double piston motor, achieved such a victory in the tourist trophy trials, have made the leader of their line a car of the regulation type in every respect.

One of the few cars to be seen at the recent Olympia show, which differs from its confreres to an extent that attracted attention, is the James and Brown. As will be seen from the accompanying plan view of the chassis, the engine is of the usual four cylinder type, but is placed horizontally with the open ends of the cylinders, all facing one way—toward the rear. They are of 4½ inch bore by six inch stroke, and the makers give the buyer an option on automatic or mechanically operated induction valves. In the latter case they are operated from a cam shaft running across the rear of the cylinders. This is driven by a longitudinal shaft and spiral gearing from the crank shaft. Formerly the flywheel of the engine was placed between the cylinders and in the centre of the crank case, but is now on the left hand and outside, the projecting end of the main shaft carrying the wheel now running in a long bearing running right up to the boss of the flywheel web. The crank case and the gear box are bolted together before drilling the holes for the three parallel shafts in order to insure accurate alignment. In both this respect, and that of the drive, the car is in a class of its own. The latter is through spur gearing to the clutchshaft. The clutch is of a design exclusive with the house in question and great ease of manipulation as well as efficiency are claimed for it through the fact that four springs arranged about the periphery are employed in place of the usual single spring on the shaft. In other respects it conforms to current practice. A novel form of differential is also employed, the final step in the transmission being by means of side chains.

This form, however, permits of the elimination of the bonnet, a feature so closely adhered to by the majority of other makers that it is seldom absent regardless of the location of the engine. There seems to be a tendency on the other side with certain makers to build cars without bonnets in order to provide ample room for large closed bodies on comparatively short wheelbase. The front of the car is finished off with a light

ornamental dashboard of leather which, with the driver and "man" sitting prim and erect, conveys an impression approximating that of the coachman and footman of the horse-drawn carriage—something that is apparently desired by the Briton.

Portugal as a Market.

The importation of automobiles by Portugal shows a growth during four years from a value of $37,910 in 1901 to $229,265 in 1904. During the first five months of the present year the imports amounted to a value of $81,125. Most of the automobiles sent to Portugal were built in France, 80 of the 118 imported in 1903 being of French manufacture. The United States ranked second with 13, Italy third with 10 and Germany fourth with 3. Since that year the record of origin has not been given. The duty imposed by Portugal on finished automobiles is $120, and on chassis $70.

Winton on Lubrication.

"There are more cars worn out through lack of proper lubrication than are worn out through mileage and years of use," is the sweeping statement made by Winton's "The Motor Car Dissected."

COOLED SPARK PLUGS

Three Types that Aim at the Same Result— Purposes that are Served.

Practically speaking, it would seem that the design of the spark plug had reached a point of finality, since nearly all of the numerous and extravagantly advertised types follow along the same general lines and are the same in principle. From no less than three different sources, however, there has recently come a series of attempts at an alteration which, in theory at least, should work to considerable advantage in prolonging the life of that most essential organ and increase its working efficiency as well. Whether any or all of these are destined to succeed in the long run it is, of course, impossible to say at the present time, but there is something distinctly plausible in the principle upon which they are based and there seems considerable likelihood that they will be of more than passing importance in consequence.

As is but too well known to the motorist, the chief point of failure of the spark plug is in nearly every case owing to its accumulating a coating of soot from the burning gases and oil in the cylinder, which ultimately so befouls it that it is rendered ineffective through short circuiting. In most of the better class of cars the design of the lubricating system has been so well wrought out and the carburation has been brought to so great a degree of perfection that there is but little trouble from this source, yet there is always a possibility of some derangement in one or the other of these functions, causing a failure of the ignition on this account, and even granted that under ordinary conditions the common plug of commerce would serve to advantage, still its value under all circumstances would be slight were it not capable of undergoing a considerable amount of abuse before it gave out.

Some little time ago a plug was illustrated in the trade press which had the distinguishing feature of being ventilated with pure air at each induction stroke of the piston. This was accomplished by the introduction of an air duct leading through the body of the device and terminating in a check valve which opened to the air whenever the pressure within the cylinder fell below that of the atmosphere. The theory of the arrangement was that at all times the plug was surrounded with a stratum of comparatively pure air, which not simply served to cool off the points at the time of its induction and render them less liable to retain deposits of soot, but at the same time acted as a diluent of the charge, scavenging the combustion chamber in the immediate vicinity of the spark and insuring a better ignition flame about the points than otherwise would be secured.

Still more recently have been brought out two other plugs which are constructed on similar lines, though each in a slightly different manner. In one, which is an English production, one of the spark points is of tubular

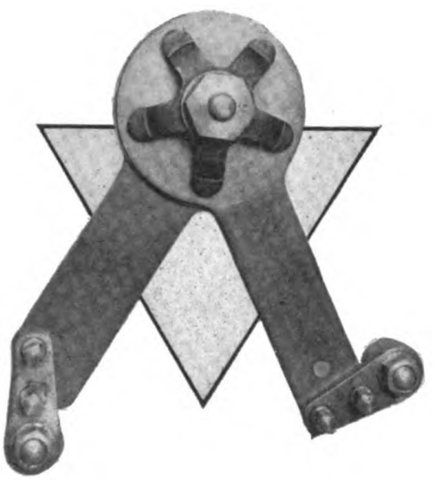
Digitized by Google

construction, and communicates with a duct in the base of the plug, which terminates in a check valve in the base just outside the cylinder. By this means a jet of cool air is projected directly upon the insulated point immediately prior to its use, thereby cooling it and surrounding it with fresh vapor, while the grounded terminal is cooled throughout its length by the passage of the air.

In a plug of American design, which also recently has been placed upon the market, the insulated terminal is made the conduit for the cleansing draught of air, the central wire of the plug, which otherwise is of perfectly regular construction, being of tubular material and furnished at its base with an enlargement which has a cup shaped opening on its under side. Below this, and held in place by the wire which serves as the grounded terminal, is a small metallic ball, which under the action of the compression rises into the seat and closes the outlet through the duct. In this, as in each of the other forms, the action is the same, a small amount of air being drawn in at the proper time to cool the points and scavenge the charge in the vicinity of the spark.

The most natural cause of failure in a device of this kind would be through a leakage in the check valve. This might be caused in any one of a number of ways, and might in some cases be easily remediable, while in others it would become chronic. In its theoretically efficient capacity there can be little doubt that such a device should be of a certain amount of value both in prolonging the life of the plug and in rendering the ignition of the charge more certain and effective than it otherwise would be, but the introduction of so small and necessarily fragile a part as the check valve in a place which is constantly being subjected to so great strains, both owing to excessive heat and pressure, would seem to present difficulties which could not readily be overcome. That, however, has nothing to do with the success of the idea, which seems to be a worthy one.

The Chauffeur and the Speedometer.



For ways that are dark and tricks that are vain the heathen Chinee has found his equal in the professional chauffeur. Although he has come upon the scene such a comparatively short time ago, it no doubt would be possible to fill a small volume with the ways and wiles that this individual resorts to in order to ingratiate himself with his employer.

One of the schemes concocted by a member of this gentry to increase his prestige sounds thin, but is good enough to be true. He boasted of having worked it successfully for a year, and finally this reached his employer's ear. The owner of the machine is very proud of it and sets a great deal of store by its distance eating capacity, and was somewhat chagrined that his chauffeur could always get the best time out of it. The owner never drove himself except when the chauffeur happened to be away, but his efforts always fell short of bringing the speedometer hand as far around on the dial. The plan of the chauffeur, it turned out, was to change the gearing of the instrument when he was to drive and set it back when any one else took the wheel.

SUSPENSION IMPROVEMENT

How a Shock Absorber Has Been at Once Simplified and Made More Efficient.

As a result of an exhaustive study of the problem of motor car suspension, which has been carried on not simply in an experimental way, but through the channels of observation opened up by the application of six thousand sets of the device on cars in daily use throughout the country under widely divergent circumstances, the Hartford Suspension Company has produced a new type of shock absorber for the 1906 market, which is a vast improvement over the model previously in use. The new type H, as it is called,

THE SUSPENSION ASSEMBLED.

ALL THERE IS OF IT.

carries out the same principle as the other, but is designed for permanent adjustment and automatic compensation for wear, besides being constructed in such a way that its effort is applied in a straight line between the frame and axle, so that all possible tendency to a shearing effect in the device itself is eliminated.

Instead of the two elements which were formerly attached to the frame and axle respectively and articulated together midway between, three members are now used, two of them being paired, and joined at their outer ends by rivets, while at the friction bearing, which is the vital portion of the absorber, they are separated sufficiently to permit of the interposition of the third member. A pair of friction washers are placed between the two outer sections and the inner one, thus securing double the amount of friction surface provided in the older model, and thereby reducing the tendency to wear by one-half.

Both arms swivel upon a hardened steel bushing which surrounds the tension stud. The latter is furnished with a lock nut which clasps an offset spider washer of tempered steel binding the moving parts together and maintaining a constant tension upon them. This washer, in which the particular merit of the improvement rests, is comprised of a circular body portion drilled out to receive the tension stud, and having five radial arms projecting from it which are bent down or offset to form feet, which hold the body portion out of contact with the outer arm. Thus the degree of tension which is put upon the friction surfaces depends largely upon the resistance of the arms of the washer and to a lesser amount upon the adjustment of the nut. Any amount of wear is in this way automatically disposed of, and the resistance of the device made constant at all times.

All the parts of the absorber are made of spring steel, and on account of the high grade of metal used, they are appreciably lighter than the corresponding elements on last year's model. The friction surfaces are hardened to withstand abrasion, and the friction washers are of an especially treated grade of leather which is particularly durable. The adoption of a lock nut does away with the necessity of a clamping device such as formerly was used, and renders the mechanism exceedingly simple. All suspensions are tested and adjusted before leaving the factory, and thereafter need little or no attention, being dust proof as well as self-adjusting. The durability of the device is shown by the fact that the company's demonstrating car has now been run something over twelve hundred miles without requiring the slightest amount of attention on the part of the suspension.

The success of the Hartford system is probably without parallel in the annals of the accessory business. The sales have constantly increased throughout the past year until the work of manufacturing them, which was originally jobbed out to a well known firm of machinists, is now done in an independent plant which is running upon an altogether satisfactory and paying basis. The influx of orders from the car builders argues in its favor as can nothing else, since they are not wont to equip their cars with parts which are not absolutely requisitioned by the public, and the voluntary doubling of his last season's order by one manufacturer of note speaks volumes for his own estimation of the need of supplementary motor car suspension.

MEASURES POWER MOUNTED

Ingenious Frenchman Devises an Instrument for the Purpose—How it Operates.

Owing to the difficulties attendant upon such an operation it is probably safe to say that the horsepower of a motor has seldom, if ever, been taken while in position on the chassis. M. Herisson, a French investigator, has, however, devised a modified form of Prony brake for this purpose, which, while scarcely destined to fulfill any large role from the very nature of the conditions, is of considerable interest.

There are three essentials that must be

ascertained in the carrying out of every horsepower test. These are a means of arriving at th exact amount of pull or torque generated by the engine, the speed in revolutions per minute, and a means of varying the drag of the brake at will. It will readily be apparent that practically insurmountable difficulties present themselves in connection with the use of a Prony brake of the usual type in connection with a motor mounted on its chassis. This modified form of brake consists of a wooden lever AB, as shown in the accompanying illustration, carrying an equalizing weight at the right hand end, at which is attached the hook of a spring balance supported from a tripod. At its centre, provision is made for the attachment of a metal collar armed with wooden brake shoes and adapted to encircle the flywheel of the motor which revolves in the direction indicated by the arrows.

This arrangement is a substitute for the weighted lever of the ordinary prony brake which the vibrations of the motor and chassis would tend to render uncertain in operation. The brake itself is suspended at each end from a hook, a series of holes being made in the left hand end to permit of adjustment for varying diameters of flywheel, the pressure being varied by means of a shaft and bevel gearing operated from the crank M. A helical spring damper is placed on the fixed screw at the right hand end, this serving to suppress any jerking movement that would be unavoidable otherwise. At ee the periphery of the brake band is drilled to permit of the placing of the wooden brake shoes, which are made of varying lengths in order to correspond with the size of fly wheel carried by the motor under test. The horizontal wooden lever also has a series of holes drilled in it, so that the screw r, carrying the fixed end of the brake band, may be moved in either direction for the same purpose.

A liberal application of grease to the collar is an essential preliminary to the carrying out of each test. If the duration of the latter exceeds two or three minutes the heat developed by the friction is apt to set fire to the wooden brake shoes, although provision against this may be made by arranging a jet of water that should be directed at about the centre of the flywheel from above. When this is done a screen must be provided for the carburreter, and probably for the ignition leads in order to prevent the water splashing on them. When these precautions are taken it is possible to make readings of far greater accuracy as the balance is permitted to come to rest; whereas, if the time of making the test is limited by the necessity of preventing the apparatus from taking fire through the amount of heat generated, the balance spring does not have sufficient opportunity to remain still.

The next essential is a knowledge of the speed, and this is readily ascertainable by means of an ordinary dynamometer if the end of a shaft with a centre point on it be accessible. As the latter is made in truing up the shaft before putting it in the motor the only difficulty presented is the matter of accessibility. Owing to the vibration of the motor and frame at high speeds an exact reading by merely holding the instrument against the swiftly turning shaft would be next to impossible, and in order to overcome this M. Herisson has made provision very similar to that employed in the brake, that is, the use of a spring to absorb the unnecessary movement. This is in the shape of a helice of steel wire contained in a small cylinder open at one end. At the latter point the spring engages the end of the instrument, while the plain cylinder is held in the hand.

But few motors have the main shaft in an accessible location, and in such a case acquiring the necessary information is somewhat more difficult. An eight tooth bicycle sprocket is placed on the exhaust cam shaft, and a thirty-two tooth sprocket is mounted on a plate adapted to be bolted to the frame of the motor in a convenient location. A bicycle chain is employed to transmit the power. A boss or projection is made on the larger sprocket, which permits of the speed being ascertained by pressing the finger against as it turns. It has been found possible to count the revolutions in this manner up to 250 per minute with accuracy, and as the wheel in question is running at a speed of one to eight with relation to the main shaft of the motor, this gives a maximum of 2,000 r. p. m. ascertainable by this method.

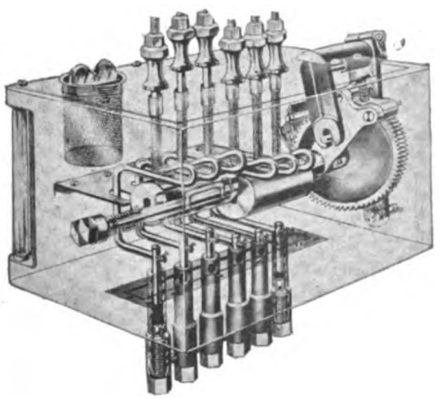
The manner of conducting the tests is somewhat as follows: The operator counts the turns with the aid of the second hand of a watch and directs an assistant to apply the pressure by tightening the screw; meanwhile, another assistant in charge of the motor, manipulates the throttle and spark advance in order to obtain the greatest amount of power. When the latter point is reached, the brake band being compressed to its maximum, the operator counts the number of revolutions for a determinate period such as twelve seconds, for instance. Multiplying this by 40 will give the speed developed. Taking this result, and again multiplying it by the pressure indicated by the spring balance and dividing by 750, will give the amount of energy expended in French horsepower, the formula corresponding to the English 33,000 foot pounds per minutes, being the number of ,kilogrammetres per second divided by 75.

With the aid of this apparatus it is possible for the chauffeur to test the power of the motor in a comparatively short time and without great inconvenience. By carrying out such tests after the motor has been in constant use for a year or more, it is possible to note by comparing the result with the maximum rated horsepower when new whether the motor has deteriorated or not.

Air Chamber in Cooling System.

An English manufacturer has installed an air chamber in the cooling system of his motor for the purpose of steadying the pointer of the manometer or gauge which mounted on the dash to show the amount of circulation of the water. Doubtless the steadying effect would also be to a certain extent imparted to the entire system and an increased steadiness of flow thus secured would be of benefit in cooling the cylinders.

Inspection Pit Ready for Use.



One of the novelties in the accessory line which has just been brought out is a corrugated steel inspection pit which is made and sold complete in every detail, including sides, flooring and tap, the metal being protected from decay by a coating of some resisting material. In order to install it, all that is necessary is to dig a hole in the ground and bury it to the edge, no sort of foundation or setting being necessary.

Kinsey's Lubricators and Radiators.

Given a good engine, it is universally conceded that the most important essential to its continued smooth running and long life is proper lubrication. No other requirement means so much to the wearing qualities of a motor as a proper supply of the right kind of oil. But it is easier to get the proper oil than it is to supply it to every moving part of the motor that requires it, just when and where it is needed and in the quantity required, consistent with the speed.

The Kinsey Mfg. Co., of Dayton, Ohio, who are specialists in sheet and cast metal parts have made a study of the subject of lubrication for the automobile motor, and have as a result placed the "Kinwood" oiler on the market. The chief aim in its design has been simplicity, and it has been achieved by the use of a minimum number

of small moving parts, as will be apparent at a glance at the illustration picturing its entire mechanism. Particular attention has been paid to the matter of regulation, which ranges from half a drop to fifteen drops for every 320 revolutions of the driving shaft. All adjustments are outside the case, and each pump can be worked by hand independently to flood its bearings without disturbing them. A constant, uniform pressure to each lead just when needed, coupled with instant stopping and starting with the motor, are advantages that make for economy as well as cleanliness. A further feature is the location of the only stuffing box above the oil level, thus avoiding the possibility of leaks.

Another specialty of the same manufacturers is a line of radiators, of which a sample is here pictured. It is said to be the result of careful experimenting to attain efficiency and liberal water space without the delicate construction that sooner or later leads to opened joints and annoying leaks. In accordance with the well established principle that radiation is greatest at the points and edges of a surface, high efficiency has been secured by the provision of a very large percentage of the edge fin surfaces, all in close proximity to and having contact with the body of water. The water spaces are 3 9-16 by 3-16, large enough to allow an unobstructed flow without danger of stoppage by scale or sediment, yet thin enough, in connection with the large fin surface, to cool rapidly. The flat tubes are flanged into tanks at top and bottom and are of such a

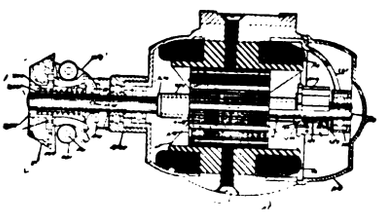
shape that decided crystallization does not cause leaks. In case of accidental damage the "Kinwood" radiator is easily repaired, because the joints are few in number and every one of them can be reached with a soldering iron from the outside.

Other specialties of the Kinsey Mfg. Co. are hoods, fenders, tanks, in all styles and sizes; pressed steel frames, one piece pressed steel dashes 4 inches deep, brass mouldings for steps, tool and battery boxes, a gasolene gauge showing the height of fuel in the dark as well as daylight, and other similar parts in sheet meal.

Foot armer Using Exhaust Gas.

Utilizing the spent gas has long been the dream of many inventors which few of them have been able to successfully realize. Willis F. Seaman, of Mineola, N. Y., is one of the few. He has made it of use in keeping the motorist warm—a prominent subject at

this season of the year—and has his foot warmer, which is shown by the accompanying illustration, ready for marketing. It is made of cast iron sheathed in aluminum, and is connected by piping with the exhaust tube; the degree of heat is regulated by a three-way valve. The warmer may be, of course, placed either in the tonneau or at the feet of the occupants of the front seat, there being no limit to the length or shape of piping that may be used.



Whom Christian Science Chauffeurs Help.

"It's no good trying to keep a car in running order by Christian Science methods," said the head of a Chicago repair shop. "It may cure the headache or gout to sit down and assure yourself that there's nothing the matter with you. But the lazy chauffeur who looks after his car on Christian Science principles brings us our best business."

Apple's Automatic Charging Set.

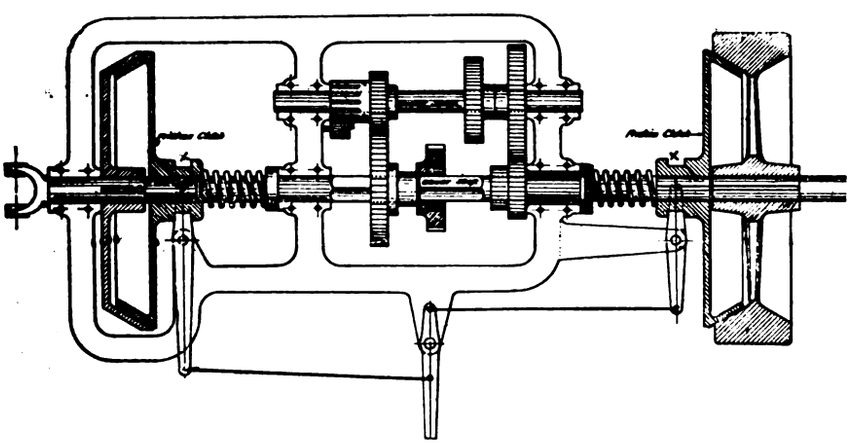
In view of the largely increased number of accumulators employed for ignition purposes, an automatic charging set on the car itself forms a convenience of great utility. It has been something long desired by numerous owners in a more perfected and practical form, and the Dayton Electrical Manufacturing Company, have had this demand in mind when planning their new Apple automatic storage battery charger for 1906. In size it is a trifle larger than the old Apple ignition dynamo and its capacity has been increased in proportion.

The new machine is designed to generate three amperes at ten volts at a speed of 1,400 r. p. m., and will charge a four cell battery at this rate; for a three cell set, or 6 volt battery, the speed may be reduced to 1,200 r. p. m., and for two cells to 1,000. As shown in the accompanying sectional view, it is fitted with the Apple 4 inch, bevel drive

friction governor, but the machine may be driven by belt, chain or gear, as desired.

Its construction throughout is characterized by the same high standard of excellence of material and design usually only found in large and costly generators. The armature core is built up of japanned iron discs forced together under heavy pressure on a brass sleeve which is in turn keyed to the tool steel shaft. Hydraulic pressure is also employed in assembling the commutator, which is made of segments of drawn copper with mica insulation in accordance with current high grade practise, so that there are no screws or loose parts. The fields are form wound and heavily taped and shellacked, additional insulation being forced into the armature windings by a vacuum impregnating system. The same iron clad, totally enclosed form is adhered to, thus excluding all dirt and water, and it will be marketed with two types of bearings; a plain bearing type with renewable phosphor bronze bearings and wick lubrication, and a ball bearing type fitted with Hess-right ball bearings under the customary guarantee of the latter makers. The manufacturers of the "Apple" dynamo claim for it a maximum output at a minimum speed, as well as the fact that it will not show a drop in voltage from no load to full rated capacity.

Winter Care of Tires.



When cars are laid up for the winter the tires should be removed, and, with the inner tube inflated, hung in a cool, dry room. It is also important to care for the rims to avoid the rusting which often comes to later help wear out the rubbers when put on for use again. A method of treating rims which has been found to work efficiently is to put on two coats of black asphaltum, the second to be applied at least a month later than the first.

TO PREVENT GEAR CLASHING

Friction Clutch Idea Brought to Bear on Sliding Gear—How it is Carried Out.

Clashing long has been a drawback of the sliding type of change speed gear and innumerable attempts have been made to overcome it, most of them taking the form of a changed arrangement of the pinions themselves. The desirability of perfecting a gear that will not possess this disadvantage is self-evident, for even the experienced driver is at times not proof against an error in manipulation of clutch and change speed levers that results in injuring, if not stripping the teeth altogether. The trouble centres in the momentum of the male portion of the clutch and shaft, which continue to revolve for a short time after the clutch is out of engagement.

One of the latest preventives designed for this purpose consists of a duplication of the friction clutch, the second one being placed between the change gear and the propeller or countershafts, as shown in the accompanying illustration. Both clutches are operated by the same foot pedal and act in unison. This results in isolating the change speed gear at both ends whenever it is desired to alter the ratio. In addition to this, the device embodies two brakes on the clutch collar shown at X in the illustration. These are connected with the yokes and act as a brake on the transmission when the clutch is withdrawn. This, together with the friction of the gears and the deterrent effect of heavy oil used in the case, is claimed to be sufficient to bring both shafts to an instant standstill. It is further claimed to save the wear on the teeth which may in consequence of the certainty of the stoppage be made square instead of rounded as is customary in order to avoid too sudden engagement. Another feature is the greater relief of the transmission from starting strains due to the slipping of the two clutches.

But just there comes the rub. It is a question that would appear to have but one answer, as to whether in duplicating this part of the transmission, a source of trouble as well of advantage, has not likewise been doubled. One leather faced clutch is usually considered sufficient and the placing of another in such an inaccessible place would be conferring a doubtful benefit on the driver whose duty it was to look after them. So far as expense is concerned, the addition of another clutch of this type would not be deemed excessive on the average high powered car, for it is a simple and inexpensive piece of mechanism. When it is a question, as suggested by the inventor in his claims, of placing a friction clutch "of any desired style," which may be taken to mean those of more advanced type such as the multiple disc, not alone the matter of increased initial cost would be involved, but the advantages of the plan of placing two of these clutches where one is sufficient would not be striking. Such a clutch of approved style is very small by comparison, and of light discs, so that it does not possess the disadvantages of excessive inertia and momentum which increase so rapidly with the weight and distance from the shaft.

Nashvillians' Striking Window Exhibit.

When the garage of the Southern Automobile Co., of Nashville, Tenn., reaches completion, which will be in the near future, it is the claim of the citizens of that city that nothing else of the kind in the South will be in the same class with it. Its owners are agents for the White cars, and a striking feature of the establishment will be a huge central show window containing a car mounted on a ball bearing turntable. The mechanism and wheels of the car will be kept in motion while the table revolves, turning it so as to be viewed from all points. The realism will be added to at night by the use of acetylene headlights. Back of this exhibit will be an ornamental auditorium on a diminutive scale, from which would-be purchasers may regard it at every angle without the necessity of leaving their seats.

Stage Line Goes Under.

The Commercial Transit Co., which has been operating an automobile stage line between Springfield and Jamestown, Ohio, has gone into the hands of a receiver. Joseph Lessner, who secured a judgment for $40.78, was the petitioning creditor. Clifton P. Grace was named as receiver.

SPUR GEARS FOR FINAL DRIVE

Few Efforts in that Direction—One Ambitious Attempt and the Methods Employed.

Up to the present time the use of spur gears for the purpose of securing the final drive to the rear wheels of motor cars has been almost wholly confined to those electric machines which have been equipped with separate motors directly geared to the wheels, all attempts at gear drive for steam and gasolene machines being confined to the use of the cardan shaft and bevel gearing. Apparently this practice is working out in an altogether satisfactory manner, judging from the extent of its adoption, and the slight amount of trouble which is experienced from cars so equipped; but at the same time it is not at all surprising to observe that at least one maker has endeavored to solve the problem of gear drive by the use of spur pinions mounted on a sort of supplementary driving axle and meshing directly with gears upon the wheels, which themselves run idle on a fixed axle.

In order to accomplish this the gear case is placed well to the rear of the machine, and the counter shaft, which is inclosed within it, is furnished with two sets of universal joints, which supply means of direct connection with the driving pinions at either side. The latter are mounted in dust proof housings, which also include the driven gears and protect them. In this way the mechanism used is precisely analogous to that in the ordinary chain driven machine, the spur gears being substituted for the chains.

The same machine is also unique in that it is furnished with direct drive on both the third and fourth speeds. To accomplish this a pair of concentric bevel gears are mounted on the differential casing within the transmission case, with which mesh a pair of driving pinions, the one being keyed to a shaft which revolves within a hollow sleeve upon which the other is mounted. The power distribution for the reverse and the two lower forward speeds is by means of a lay shaft, and involves no novel features. When it is desired to use the third speed a toothed member upon the single sliding set is forced into a corresponding annular space within an enlargement of the outer of the two driving shafts, thus locking the drive through the larger of the two pairs of bevel gears. A further motion of the male clutch member on the sliding set introduces it into a similar opening on an enlargement of the inner of the two shafts, thus securing a direct connection with the smaller pair of bevels and permitting the larger pair to revolve idly.

The principle upon which the change from second to third and third to fourth depends is not by any means new, having already been applied to transmissions having a double bank of spur gears constantly in mesh; but from the same token there is no reason why it should not prove effective in this particular case. The great disadvantage is, of course, that the inner shaft, having its bevel gear in constant mesh with the differential, must con-

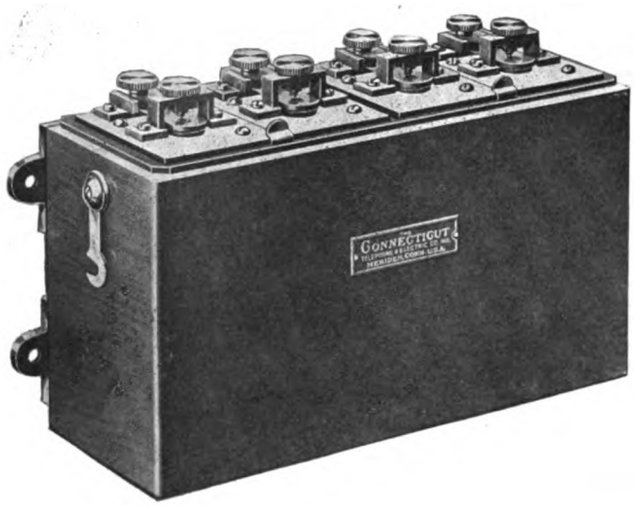
Digitized by Google

stantly turn whenever the car is in motion, and turn at a different rate of speed from the surrounding part in which it has its bearing, but with suitable lubrication there is no material objection to be offered to it on that score, so long as it runs perfectly idle and carries no other gears.

In regard to the method of the drive, it is evidently open to serious objection on account of the short length of the counter shaft, inasmuch as the vertical motion of the body over the axles must create a sharp angular displacement of the ends of the shaft, thus creating a varying frictional resistance in the working of the universal joints and causing serious trouble unless they are constructed with the greatest of care and are absolutely protected from dust at all times and suitably lubricated.

The Dominie's Piston Ring Discovery.

There are all kinds of "experts," in fact, it is safe to state that there is scarcely any other single term in all the great English language that is so wofully overworked nowadays as this one. And the automobile industry has more than its share of these same "experts." A New York agent tells of his latest experience with one of this gentry and claims that his hair is turning gray in consequence. He is A. L. Kull, of the Wayne agency, who recently sold a car to a dominie, and as he has a reputation for veracity second to none, his friends accept his story as gospel truth.



The reverend gentleman was possessed of a strong desire to "see the wheels go round" and accordingly pulled out all the "works." Then he gave it up as a bad job and called in an "expert" to put them back in place again. In a letter in which he used up most of the paper in describing his qualifications for the title including his vast and unlimited experience with gas and gasolene engines, this expert informed the Wayne company that it was their turn to furnish their customer with no less than sixteen new piston rings, as his examination showed that every one of them was broken, and further that each one was broken in exactly the same place, in exactly the same way, conclusively showing the use of defective material!

Paris to Try Gasolene Cabs.

Having experimented with the electric taximeter cabs, and found them wanting on the score of expense. Paris has decided to try all over again. Two hundred and fifty cabs have been constructed by a Levallois coach building house, and they will be fitted by Renault Freres with an 8 horsepower two cylinder motor that has been designed particularly with a view to silent running and economical operation. Some of them are already in use, and it is said that the total number will be in service by the end of the year. Paris is bound to have motor driven vehicles which can be hired at a reasonable rate, the chief, if not the only, reason for doing away with the electric cabs being the fact that their use came too high for the average purse.

Coils of Improved Unit System.

Few owners or drivers realize what a strong influence the induction coil may have on the life of the batteries. The amount of current consumed depends to a certain extent on the adjustment of the trembler, but it may also be increased by the use of poorly designed and improperly wound coils, the efficiency of which is accordingly very low.

This will explain to many why they found it so difficult to get anything like the mileage claimed by the makers, either out of a set of accumulators or dry cells; the coil has been wasting the current to such an extent that constant recharging or replacement is found necessary.

It is a phase of the art of coil making that has been made the subject of intensive study by the Connecticut Telephone and Electric Company, of Meriden, Conn., in the design of their apparatus, and as a result, they make the claim that no case has come under their observation where one of their coils used more than one-quarter of an ampere in firing the engine, regardless of its compression. Their coils are in consequence all adjusted at the factory to consume this amount of current when running.

These coils are made on an improved unit system, each coil being entirely self contained and interchangeable with any other, while the connections are all automatic, it merely being necessary to insert a unit in the dashboard case to make it ready for working. A retaining spring coupled with the accurate fit, insures connection and prevents movement. All posts for both primary and secondary terminals are on the bottom of the case which leaves the coil unencumbered when withdrawn, as pictured by the accompanying cut of a two unit set. These posts are protected by a petticoat extending around the bottom of the case and serving to effectively exclude any moisture. Extreme simplicity has been sought after in the design of the trembler which is consequently easy of adjustment, even by inexperienced hands. Turning a self locking thumb screw up or down is the only operation involved; the contact screw on the bridge is also self locking and no tools are necessary for making adjustments of any kind. In substantiation of their success in designing an effective coil the makers point to a number of records, among them one of 12,000 miles without an adjustment.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 15½ Nassau Street, New York.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, Bevel gear drive. Very large and roomy full aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

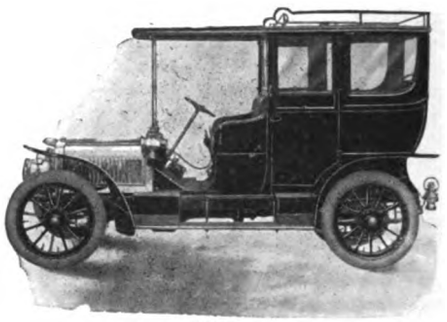
Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.



THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

WE GATHER from the good opinions expressed by many highly pleased owners of The Lozier Motor Car, that its "smooth running, ease of control and all-around reliability," covers about everything that is to be desired in a High-grade Motor Car. The item of low maintainance cost and all that it implies, was correctly calculated in its design, and is fully guaranteed in its perfect construction. Among the notably distinctive features that are embodied in

The Lozier Motor Car

may be mentioned—THE USE OF HESS-BRIGHT BALL BEARINGS in sliding gear, change speed and differential gears. WELDLESS NICKEL-STEEL FORGED I-BEAM AXLES of heavy construction. DROP FORGED STEERING KNUCKLE. BALL-BEARING WHEELS of large diameter (36 inches). PLATFORM SPRING SUSPENSION. SOLID FORGED MOTOR CRANK-SHAFT (arms being webbed out instead of drop-forged—turned, hardened and ground on its own centers). TRANSMISSION and differential shafts and flexible shaft with universal joint of *nickel-steel*. BABBITTED BRONZE MOTOR BEARINGS. LONG WHEEL-BASE, 117 inches.

1906 MODEL, TYPE C, 35 HORSEPOWER LIMOUSINES, LANDAULETS AND TOURING CARS now delivering. PRICES $4,500 TO $5,500.

POINTS ON PAINTING

Many Mixtures and Processes Necessary to Obtain Good Results—About Transparent Colors.

"In painting bodies, the first thing is the priming," says the master painter of a well known automobile and carriage factory in "The Carriage Monthly." "Be sure the surface is dry before another coat is added, which is usually half rough stuff and lead. This coat should stand for twenty-four hours, then bad places should be puttied up. Apply a coat of rough stuff the same day and a coat each succeeding day until filled. Do not let over twenty-four hours elapse between coats. Then let the work stand two or three days at least. After rubbing, let it dry out twenty-four hours before coating. After the body is thoroughly sandpapered and looked over for further puttying, it is well dusted. Dusting is often neglected. If the body is properly cleaned, dusted, colored and color varnished, there is very little left to be done.

"The next step is called 'preparation,' or surface coat. This is composed of lampblack and white lead. To this add two tablespoonfuls of oil, sufficient to coat the body in hand. This coat should stand until the next day, and should be gone over with sandpaper, lightly, not rubbed with curled hair, as this produces a glossy surface to which the second coat will not adhere as well as if it were sandpapered.

"For the second color, on the black parts add one and one-half tablespoonfuls of oil to sufficient black for one job. The black parts are ready for black japan or black varnish, the latter being preferred for various reasons. Two coats of black varnish are sufficient. Put on freely to produce a perfect surface for blue panels. On this second color, a body blue, which comes in three shades—light, medium and deep—covers better than anything, and is much more satisfactory than Prussian blue and white, which were universally used a few years ago. On this apply a coating of one-half body blue and ultramarine mixed, and with sufficient binding so that it will not dry flowery. This coat must be brushed on thin and even; if not, it will be shady or streaked.

"It is now ready for glazing with ultramarine blue, mixed with rubbing varnish; two coats, of equal strength, over the light blue. The glaze must be made weaker, or it will not turn out satisfactorily.

"For lake panel, first apply a coat of Indian red and black over the 'preparation' coat, getting the desired shade through this coat. Then apply a thin coat of Munich lake, sufficiently bound with rubbing varnish so as not to dry flowery. This coat, as the second coat of blue, must be brushed thin and level, and laid off as you go along.

"This, no doubt, will be a revelation to some oldtime painters who have always taken it for granted that transparent colors could not be successfully used in this way. If we give this two coats of Munich lake and glaze of equal strength, not rubbing the first coat but very little, we have a beautiful rich color, which can be rubbed and finished.

"For green panels, color and color varnish the panels before glazing, which can be either yellow lake or verdigris, according to the shade of green.

"To prepare a body for finishing, give it a light rub over, wash and dry sponge it. Then take a sponge with very little water in it, and rub a dozen drops of sweet oil, well worked into the sponge. Go over the entire body with this, rubbing dry as you go along, not allowing the oil to dry on the surface. Use old silk curtain for this purpose, which is thoroughly washed first, and it gives a surface that s easily dusted.

"On gears, when it is necessary to remove the paint, we burn off the wheels and woodwork and the carriage part instead of scraping, as it leaves the wood in much better shape, and it can be done more quickly. On the iron work, we use a paint remover which works satisfactorily. After the gear and wheels are properly cleaned and sandpapered, apply a coat of lead color. In mixing lead color, take dry lampblack and break it up with coachmakers' japan. Break up the white lead with turpentine and mix to the shade required; thin with turpentine before adding the oil. For the first coat, add three tablespoonsful of oil to sufficient lead to coat a coach gear. This should stand three or four days. As to putty—the less the better, in fact, if the job is properly burned off and cleaned up, there will be little need for putty. Sandpaper this coat and apply a second coat of lead, mixed with one tablespoonful of oil. Let this coat stand two days. It is very bad practice to have more time elapse between coats than here stated.

"The next step is to sandpaper for color. For black, blue, green, or dark lakes, use the same preparation for surface coat as on bodies without adding any oil. Thin with turpentine and use. Do not hair off this coat, simply dust it.

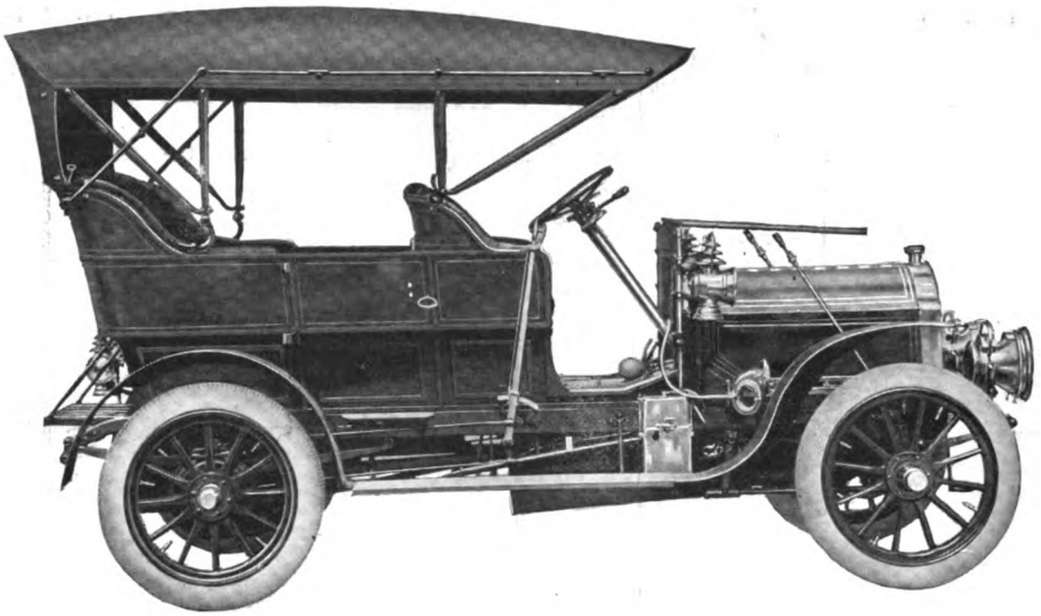
"For green gears, add one tablespoonful of oil. This will dry to be colored the same day. All dark coach greens should be colored and color varnished the same day, as they will adhere better and not chip. Use body blue on gear, adding two spoonsful of oil, and glaze with ultramarine the following day. A slow drying, rubbing varnish should always be used on gears. On lake gear, mix a preparation of Indian red and coach black, getting the desired shade. Gears should be always made somewhat lighter. Add two tablesponsful of oil, and, for the next coat, a thing coating of lake with about the same quantity of oil. It should be glazed the next day. One heavy coat of glaze or color vanish, on a gear that is properly brought up, is sufficient to make a good job.

"Silent as a ghost, powerful as a lion, trustworthy as time," are some of the recommendations urged upon the buying public of overseas by a foreign maker in favor of his six-cylinder model for next year.

HERE'S THE "TOBOGGAN"

Hails from Oshkosh and is for Winter Use, of Course—Has Spiked Driving Wheels.

The inventor who has "perfected" an automobile for winter use has made his annual appearance. Cold weather always brings him in its train, and it is somewhat to be wondered at that he has not been more numerous this year or put in an earlier appearance. This time the news comes from Oshkosh, Wis., and is in the shape of a report that a local firm has been at work for the last two months upon a motor vehicle mounted upon runners and adapted to run over snow of any depth, ice or the bare ground. Although the machine is in no way intended for summer use, it is made to run over the bare ground, to prevent being stranded.



The machine closely resembles a very much elongated automobile body resting on runners. It measures thirteen feet in length from the tip of the forward runner to the spiked driving wheels in the rear. The runners are of the usual type and about the same width as employed on the ordinary cutter, but much lower. The object of employing such a long "wheel base" is to obtain sufficient underbody to form a "toboggan," or snow sliding surface, when the depth of the latter is sufficient to bear the vehicle. Power to drive the car is furnished by a 5-horsepower, 2-cylinder air cooled engine, weighing only 150 pounds and which operates at 1,700 r. p. m. But a single divided seat is provided, although there is plenty of room for another should it be found necessary.

It is really an "auto-toboggan," the latter being the most noticeable feature of the conconstruction. It begins at the bottom of the extreme rear of the body, and extends underneath right to the front, where it is finished off with the regulation curl front to finished off with the regulation curl front to shove aside the snow. This is further supplemented by a hood four feet in length housing the engine, gasolene tank—in fact, the motive power complete, the dashboard being of the customary type and carrying the regular fittings. The body only clears the ground by 14 inches, and may be adjusted to any lesser height.

Shield for Winter Protection.

Wonders never cease, and the latest and greater wonder of them all is the device of a a British motorist who has contrived a sort of cape top to keep his feet warm. This ingenious arrangement, which is a veritable misplaced buggy top, rises from the dash and completely envelops the driver's knees, covering the steering wheel and mechanism of control. When not in use it folds down against the dash, leaving a wind shield at the sides, which also serves to complicate the difficulty of mounting and dismounting from the driver's seat.

This is the Pierce Great Arrow 28-32 H. P., with straight tonneau body, cape top and folding glass front. Price, without top, $4,000. Cape top, extra, $200.

PIERCE

The Pierce Arrow is an American car—the best American car that has been made—better in proportion to its cost than any imported French car—better for American use, American roads and the American motorist. It offers satisfaction, minimum of expense in running, perfect service, and can be operated by the owner.

The Week's Patents.

806,434. Carburetter for Hydrocarbon Motors. George M. Schebler, Indianapolis, Ind. Filed October 30, 1903. Serial No. 179,161.

Claim.—1. A carburetter consisting of a main casing having an air passage therethrough with an induction opening and an eduction opening, an air inlet structure, a throttle valve structure and means for securing either of said structures to either the induction or eduction openings.

806,452. Driving Wheel for Motor Vehicles. Charles S. Bauld, Latrobe, Tasmania, Australia, assignor of one-half to Alfred Christian Dehle, Hobart, Tasmania, Australia. Filed May 3, 1905. Serial No. 258,597.

Claim.—The combination with a driving wheeel of a self-propelled vehicle, of a hollow hub fitted with cogs, on its inner surface, said cogs having smooth surfaces on either side thereof, a T-shaped frame, rollers at the ends of the horizontal arm of the T, a spindle carried at the end of the other arm, a pinion loosely mounted on said spindle, said pinion engaging with the cogs and having smooth enlarged portions at each end engaging with the surfaces, and toothed wheels mounted on the extended ends of pinion carried on the spindle.

806,512. Carburetter for Hydrocarbon Engines. Lawrence Abraham, New York, N. Y. Filed April 1, 1904. Serial No. 201,088.

Claim.—1. The combination of a carburetter, a connection for conducting the explosive mixture, including air, from such carburetter to the engine, a throttle valve in said connection, and a separate valved inlet for the admission of air only in said connection, between said throttle valve and the engine and means for automatically moving said air inlet valve as described.

806,520. Metallic Overshoe for Vehicle Wheels. Henry L. Canne, Dingman township, Pike county, Pa. Filed February 21, 1905. Serial No. 246,724.

Claim.—1. In a metallic overshoe for vehicle wheels, comprising an endless metallic belt formed of links interlocked transversely and longitudinally, an endless chain on one side of the belt, a sectional chain on the other side of the belt, oppositely disposed links connecting the side chains with the belt at intervals, hooks for connecting the sections of the side chain, and transverse straps for engaging the rim of the wheel and connecting the side chains with each other.

806,583. Starting Mechanism for Explosive Engines. George B. Selden, Jr., Rochester, N. Y. Filed November 18, 1904. Serial No. 233,334.

Claim.—1. In starting mechanism for explosive engines, the combination of a driving shaft, a starting crank loosely mounted thereon, a member movable relative to said shaft and adapted to remain stationary when the engine is running forward and to be driven when the engine is running backward, and a cam operable by said member for disengaging the starting crank from the driving shaft, substantially as described.

806,584. Wheel. George . Sheppard, Fillmore, Minn. Filed July 18, 1905. Serial No. 270,277.

Claim.—1. The combination with a wheel including a felly having circumferentially extending openings therein, of a casing including two sections disposed at opposite sides of the felly and extending oppositely therebeyond, attaching devices engaged in the sections and lying within the openings, said devices being arranged to permit of movement of the casing radially with respect to the wheel and circumferentially thereupon, means for holding the casing yieldably against circumferential movement in one direction, a cushion disposed between the sections outwardly of the wheel, jaws engaged between the sections upwardly of the cushion and extending therebeyond, a resilient tire engaged between the jaws, and fastening devices engaged in the sections and in the jaws.

806,592. Power Transmitting Device. Clarence W. Spicer, Plainfield, N. J. Filed November 5, 1904. Serial No. 231,502.

Claim.—1. In an incased universal-joint power-transmitting device, the combination with two universal joints connected to transmit power from one to the other, of a single casing inclosing both said joints and arranged to permit angular movement, with respect to each other, of the driving and driven members of the device, said driving and driven members provided with means substantially closing the ends of the casing.

806,610. Gas Engine. Joseph Williams, Jr., Pittsburg, Pa. Filed April 23, 1904. Serial No. 204,559.

Claim.—1. In a gas engine, the combination with a crank shaft, of oppositely-disposed series of cylinders, communicating mixture-ports connecting the opposite cylinders, pistons therein connected by an intervening framework, and a pitman provided with a crank-bearing and pivotally connected with the moving piston structure, substantially as set forth.

806,612. Steering Mechanism for Motor Vehicles. Herbert W. Alden, Hartford, Conn., assignor to Electric Vehicle Company, Jersey City, N. J., a corporation of New Jersey. Filed June 16, 1902. Serial No. 111,816.

Claim.—1. A steering mechanism for automobiles comprising a rotating shaft, a bearing for said shaft supporting it solely against axially longitudinal movement, a threaded or gear portion on said shaft, engaging threaded or gear portion co-operating therewith, the latter mounted in a two-armed lever, connections from said lever to the steering wheels whereby rotation of the shaft causes a deflection of the road wheels to steer the vehicle.

806,623. Resilient Tire. William F. Beasley, Plymouth, N. C. Filed February 20, 1903. Renewed May 11, 1905. Serial No. 259,957.

Claim.—1. A resilient core for a tire consisting of a plurality of sinuous bands of rubber, . apices of the several bands being staggered in respect to each other, substantially as described.

806,654. Wheel Tire. Louis S. Flatau, St. Louis, Mo. Filed March 11, 1905. Serial No. 249,542.

Claim—1. A wheel tire of the character described, comprising a tire member and alternating metal and elastic segments or sections forming the tread, the elastic segments normally projecting beyond said metal segments.

806,657. Resilient Wheel. Irma Guiot, Puyricard, France. Filed April 19, 1904. Serial No. 203,907.

Claim—1. In combination in a wheel having a rim, a second rim of larger diameter than the first and surrounding the same and a number of india rubber blocks placed between said rims so as to form springs, said blocks having parts of vulcanized india rubber or ebonite adapted to receive the rivets for securing the blocks to the rim, substantially as described.

806,664. Sparking Device for Explosive Engines. William B. Hayden, New York, N. Y. Filed January 9, 1905. Serial No. 240,262.

Claim—1. An electrical sparking device for explosive engines, consisting of a hollow plug provided with a fixed electrode, a rock-shaft extending laterally through said plug and projecting from one side thereof, a vibratory electrode fixed to said rock-shaft and co-operating with said fixed electrode, an armature fixed to said rock-shaft, a magnet co-operating with the armature, means carried by the plug and connected with the armature for retaining it normally away from the magnet and for normally retaining the two electrodes in contact and circuit forming means co-operating with the magnet and said fixed electrode.

806,684. Steering Mechanism for Self Propelled Vehicles. Herman Lemp, Lynn, Mass., assignor to General Electric Co., a Corporation of New York. Filed January 13, 1904. Serial No. 188,848.

Claim—1. In combination, a driving and a driven member, a mechanical power multiplying connection between the members, and a device independent of the connection for preventing the transmission of strains from the driven member to the driving member.

806,714. Exhaust Muffler. John M. Porter, Parkersburg, W. Va., assignor of one-eighth to John F. Laird, Parkersburg, W. Va. Filed March 30, 1905. Serial No. 252,842.

Claim—1. A muffler comprising a series of cells or cylinders arranged one within the other, each inside cylinder being of a smaller diameter and of a shorter length, substantially as described.

806,715. Silencer for Internal Explosion Engines. Nathan W. H. Sharpe, London, England. Filed March 29, 1905. Serial No. 252,777.

Claim—1. In a silencer for internal combustion engines, the combination of parallel concentric tubes provided with openings located near their opposite ends, respectively, and an inlet tube entering the inner tube substantially parallel therewith and provided with a number of openings, and means located between said first named tubes for separating the discharge into small streams, substantially as described.

806,760. Injecting and Mixing Device for Hydrocarbon Motors. Andre S. F. van de Putte, St. Petersburg, Russia. Filed August 19, 1905. Serial No. 274,960.

Claim—1. In a hydrocarbon motor, the combination with an air inlet, of an injecting tube extending to the centre of said air inlet, a conical bottom in said air inlet and having its point in the proximity of the end of said injecting tube, a plurality of leading channels along the periphery of said bottom, an inlet valve box adjoining to said bottom, a turbine wheel below said bottom and adapted to be acted upon by the air sucked in through the leading channels in said bottom, and a spring pressed inlet valve in said inlet valve box.

806,782. Magnetic Clutch. George A. Damon, Chicago, Ill., assignor to The Arnold Magnetic Clutch Company, Milwaukee, Wis., a Corporation of Wisconsin. Filed Feb. 21, 1903. Renewed Dec. 7, 1903. Serial No. 184,229.

Claim.—1. In a magnetic clutch, the combination with co-acting members, of a yielding support for at least one of said members arranged to permit other than a right line movement of one of said members in ap-

proaching the other member, substantially as described.

806,798. Trussed Frame for Automobiles. Benjamin A. Gramm, Chillicothe, Ohio. Filed July 28, 1905. Serial No. 271,653.

Claim.—1. In an automobile frame, the combination of a beam; a hanger depending therefrom; a pair of tie rods extending from the ends of said beam to said hanger, and a pair of strut rods connecting said hanger with the axle members, and said axle members.

806,799. Elastic Hub for Wheels. Edouard Grardel, Amiens, France. Filed April 26, 1905. Serial No. 257,455.

Claim.—1. A resilient hub for wheels comprising an axle box, a sleeve to which the spokes are secured, a bag or envelope interposed between the sleeve and box, and a plurality of inflated cushions filling said bag.

806,830. Mixer and Vaporizer for Hydrocarbon Engines. James W. Packard, Warren, Ohio, assignor to Packard Motor Car Company, Warren, Ohio, a Corporation of West Virginia. Filed June 29, 1903. Serial No. 163,590.

Claim.—1. In a hydrocarbon engine, a mixer and vaporizer comprising a gasolene inlet, a casing surrounding said inlet, an air valve, adapted to be operated by suction, arranged about the gasolene inlet within said casing, a second air valve arranged outside of said casing, and means for manually operating said second air valve, said air valves being arranged to control independent supplies of air to the mixing chamber.

THE CELEBRATED BRAMPTON CHAINS

MADE FROM SELF-HARDENING STEEL

TWO PAIRS OF CHAINS IN 75,000 MILES.

EALING, LONDON, February 13, 1905.

BRAMPTON BROS., Ltd.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, running daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

can be and will be fitted with the celebrated Brampton chain if you order it that way, and it won't cost you or the manufacturer any more than an inferior chain the kind that breaks and stretches and have to be replaced every few hundred miles. All standard sizes in stock to fit American and Foreign cars.

We are Sole United States Agents for this Line of Chains, and are Ready to Quote Manufacturers Interesting Prices on American Standard Sizes.

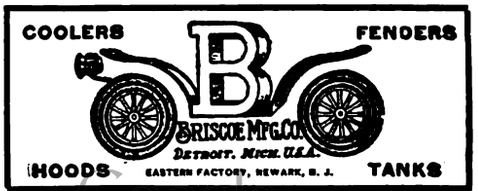
—
Baldwin Chain & Mfg. Co.,
Worcester, Mass, U.S.A.

Every Automobilist's Automobile

should be equipped with a JONES SPEEDOMETER for the reason that it is recognized as the only *practical* speed indicating device.



¶ The accuracy of the JONES SPEEDOMETER is obtained by the mechanically perfect application of an absolutely unchangeable law. Its standard of perfection will never be equalled by devices based on theories. In the development of our Speedometer we experimented with a large variety of devices, employing the principles of hydraulics, pneumatics, magnetism, electricity, etc., but after exhaustive tests, discharged them because found lacking in one essential ro another.

¶ *Theoretical* accuracy does not necessarily mean *practical* accuracy;—nor does *initial* accuracy mean *permanent* accuracy.

¶ Our Speedometer Protection Tag will protect you against unwarranted arrest; this is presented free with each instrument. Probably you may find some interesting speed items in our 'Speedometer' Bulletin. Copy sent free on application.

MOONLIGHT ON LAKE ERIE
PASSENGERS ON D. & B. LINE WITNESS A GLORIOUS SIGHT

A moonlight scene on Lake Erie is sublime. At twilight as the sun, like a golden ball of fire, gradually descends from view in the western horizon, the moon rises in its stateliness, at first modestly spreading its mellow light and, growing bolder, bursts forth in one pure sheen of grandeur.

Send two-cent stamp for illustrated pamphlet.

See 1906 Model "WHITNEY" CHAINS at the Automobile Shows.

Thousands of Chains have been damaged by interferences and unfavorable conditions.

In the future we hope for Sprockets better than the average of the past.

Send for our new Catalog and see instructions about lubrication and care of a chain.

In designing your car select the chain you consider right and leave plenty of space for a wider and larger chain.

DETACHABLE TYPE—PATENTED.

Are your Sprockets cut to the correct bottom diameter with cutters correct in form?

Are your Sprocket teeth too wide and too straight on the sides?

Have the sharp corners of your sprocket teeth been removed after cutting?

Are your sprockets in line?

As a manufacturer do you inspect every sprocket by comparing it with a correct model or do you accept anything so long as it has the right number of teeth?

THE WHITNEY MFG. CO., Hartford, Conn.

WE most heartily extend to our patrons and friends everywhere our sincere best wishes for a Holiday Season of surpassing Good Cheer.

We are not unmindful of the good-will that has been so generously manifested on the part of our patrons during the past year; and for this, and for the constantly increasing liberality of their patronage, we are deeply grateful.

We pledge you that an earnest effort will be made to merit a continuance of your valued confidence.

Morgan & Wright
Chicago

YOU MUST SEE

THE NEW FOUR-CYLINDER

TWO-CYCLE ELMORE

To be exhibited in NEW YORK at MADISON SQUARE GARDEN only.

When you have examined this practical constructed TWO-CYCLE four-cylinder car you will readily understand why it produces more power than any similar sized motor of the four-cycle type; why actually fifty per cent. of the moving parts are done away with; and why the cost of up-keep is reduced fifty per cent. A careful examination of the two-cycle Elmore will convince you that it is the most economical car in the whole world. We have the positive proof of this in facts and figures from hundreds of users.

The two-cycle four-cylinder car can go anywhere without change of gear; picks up quickly and runs smoothly and quietly up hills and over the roughest of roads. No jerking or jarring, always a steady rhythm of motion.

Besides these superior points think what it means to cut out one, two or three cylinders at will; to do entirely away with all inlet and exhaust valves, with their attendant complicated mechanism; to eliminate from 16 to 20 parts on every cylinder; to secure a steady unbroken application of power; to throttle down on the high speed to two miles an hour or fly along at the rate of 45 miles; to climb steep, difficult grades without strain or effort, holding at a high rate of hill speed.

The wonderful improvements and mechanical advantages of the 1906 Two-Cycle Elmore are covered fully in detail in our new catalogue and special literature. Write for them at once, for it certainly is worth your while to learn all you can about the most economical and sensational car of the moment.

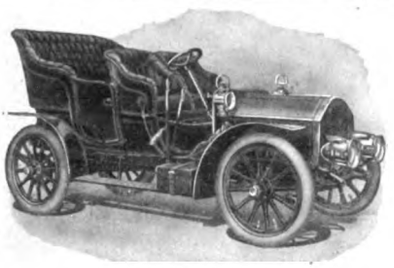
TO SELLERS AND USERS

OF

CLINCHER TIRES

We have commenced and are vigorously prosecuting suits for infringement of our patents against the Pennsylvania Rubber Company and the Michelin Tire American Agency, Inc., on account of the sale of Clincher tires.

The sellers and users of infringing tires are equally liable with the manufacturers of such tires. Whatever rights we may have under our patents will be rigorously enforced. To escape liability purchases should be made from one of the following named manufacturers, who are licensed to manufacture or sell under the G & J Patents:



G & J Tire Co.
Hartford Rubber Works Co.
Morgan & Wright.
B. F. Goodrich Co.
Diamond Rubber Co.
Goodyear Tire & Rubber Co.
Fisk Rubber Co.
International Automobile & Vehicle Tire Co.

Waltham Orient

Waltham-Orient Model R, $2,250.
The Keystone of the Air-cooled Arch.

The Car of To-day Must do More than Look its Price. The high priced, high powered motor car is all right—it has its place and its purchasers but the popular demand is for a car of moderate price, reasonable speed that will be maintained up-hill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.

It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of its Price.

FIVE TOURING MODELS FOR 1906.

Model R, a Swell Special 20 H. P.....	$2,250
Model N, 20 H. P. Tourist.....	$2,000
Model L, 16 H. P. Tourist.....	$1,750
Model M, 16 H. P. Runabout, Detachable Tonneau	$1,750
Model K, 16 H. P. Two Passenger Runabout	$1,600

Friction Drive Buckboard Model BB, $400.
The Lowest Priced Motor Car Made in the World.

A Greyhound can run a mile as rapidly as a five thousand dollar Racehorse, and he can course through the sand and up the cliffs where the thoroughbred cannot follow; which only goes to prove that price, bulk, weight and power rating do not necessarily mean the first to finish nor the one to get nearest the top of the mountain.

The Buckboard is the Greyhound of Motor Cars.

It makes no pretensions to being the thoroughbred horse, it has no five thousand dollar price tag on it, but is simply in a class of its own, equally a pleasure to its owner for it serves its purpose and serves it well.

WHY?

BECAUSE: It creates interest quicker than any car you can represent. It conflicts with no other sales It makes Motorists out of Horsemen and Cyclists. It sells to owners of the "thoroughbreds" for daily service to the station, the country club or the seashore, It sells for Rural Mail Routes, Telephone and Telegraph Linesmen, Parcel Delivery, etc. It requires less time and trouble for each sale, and less subsequent expense and repairs. It has an operating cost less than one-third of any other motor car in the world. It will run 35 miles to the gallon of gasoline, and 100 miles to the pint of oil. It has a maximum power ratio of 40 to 1. No other car exceeds 18 to 1. It will climb 40 per cent. official grade and run 30 miles or more per hour. If you will write us we will send you forty other reasons.

We are alive for live agents. Write for specifications and agency proposition.
We will exhibit only at the New York, Chicago and Boston Shows.

NO—SIXTY MILES AN HOUR IS NOT NECESSARY—

But it's a Satisfaction to know that you can attain that speed if you wish in the 50 H. P.

THOMAS

Why do we emphasize the fact that every stock Thomas is guaranteed to show sixty miles an hour before leaving the factory? Not because that is its chief claim upon your consideration. Not because the average owner cares to travel at any such speed. But because the extraordinary efficiency of the Thomas in that respect is merely an indication of its absolute perfection in every other respect.

We believe 50 H. P. to be necessary to the highest degree of smoothness, easy riding and comfort in taking steep grades or rough roads, and picking up speed quickly without changing gear on crowded streets. That is what the Thomas furnishes—full 50 Horse Power.

The Thomas does not merely court comparison with the best American Car—it invites competition for all-around efficiency under any and all conditions with the best cars made anywhere in the world.

The sixty-miles-an-hour guarantee as we have said is merely incidental to its perfection in every other point.

We would suggest that your investigation be made as early as possible. Even the increased capacity of this great factory will not entirely meet this year's phenomenal demands.

Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA."

15-20 H. P., $3,000. 30-35 H. P., $5,000,

Both with complete touring equipment.

TYPE E. 15-20 H. P. $3000.

Top and Luggage Carrier extra.

SPECIFICATIONS OF 1906 MODELS.

Type "E" Locomobile—15-20 H. P.

PRICE, $3,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; extra wide doors; fitted with top irons; color and striping optional.
MOTOR, 4-cylinder, 3¾ inch bore, 4½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action
IGNITION, make-and-break.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, placed underneath the machinery.
FRONT FENDERS, have inner wings extending to bonnet.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
RUNNING BOARDS, rubber covered and brass bound.
TIRES, 32 inch x 4 inch on all four wheels.
WHEEL BASE, 93 inches.
CONTROL, spark and gas levers on steering wheel.

Type "H" Locomobile—30-35 H. P.

PRICE, $5,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5 to 7; fitted with top irons; extra wide doors; color and striping optional.
MOTOR, 4 cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS, hardened forgings; all cams integral.
CRANK SHAFT, machined from one solid forging.

POPE-TOLEDO

Type XII.

35-40 H. P. Price, $3,500.

This car is absolutely the **fastest** and most **powerful** touring car ever built. Think of a **stock** car with regular gearing doing 76 miles an hour. Isn't this convincing that the power the **POPE-TOLEDO** motor developes is transmitted to the wheels? **Type XII** will carry seven people at 30 miles an hour, and its noiseless, smooth running engine will be scarcely more exerted than when idling.

Car has 54 pounds of total weight per horse-power, only 10 8-10 pounds engine weight per horse-power. Note this significant fact.

THE WHEEL BASE IS ONLY 104 INCHES.

Yet the car seats comfortably seven people, with room to spare.

DOUBLE DIRECT OUTSIDE CHAIN DRIVE,

of course; and a **transmission** made of specially treated steel of 225,000 pounds, tensile strength, the strongest, most efficient, sweetest running transmission ever constructed.

Send for catalogue of

Indianapolis Dunlop Tire

Open Steam Cured Fitted with Flap Wide Edges

This tire is fitted with a flap, which protects the air tube from screw heads in the rim and from moisture, and does away with the necessity of fabric-covered tubes. The special edges and the flap constrict against the channel of the rim in such a way as to prevent creeping. It is entirely open steam cured, which gives the tire exceptional strength.

OLDSMOBILE

Standard Runabout, Model "B" Price, $650.

For 1906 we have brought out, in addition to our well known curved dash runabout (the "you see them wherever you go" kind), a straight dash or "piano box" runabout, which we sell at the same price. This style appeals strongly to a certain class of drivers. It is unique and attractive and possesses all the most desirable features essential to a satisfaction-giving runabout.

It has a simple single cylinder motor, with 7 h. p. It is lever controlled. Starts from the seat; has safety device to prevent all danger of back fire; effective and easily operated brakes, and many attractive and serviceable features, making it up-to-date and desirable in every way—a big value for the money, and essentially a car for business utility.

Use the Catalog Coupon below for further particulars regarding the Standard Runabout, Model "B," price $650; the Palace Touring Car, four-cylinder, Model "S," price $2,250; two-cycle Model "L," price $1,250, or any of our commercial vehicles.

Aerocar

The Car of today, tomorrow and the years to come.
—Built by practical men.—

Here is the **one** motor car driven by a reliable, test-proven air-cooled motor.

The vital factor in every car is the motor.

All Automobile authorities – people who have had most experience—concede that many improvements are necessary in water cooled motors—too many mechanical complications, too much weight, too many troubles.

The same authorities agree that in the reliable, success-proven air-cooled motor lies the solution of most all motor car troubles.

The **Aerocar** has such an air-cooled motor. It has taken eight years of continual efforts, experimenting, testing, proving and many thousands of dollars to produce this reliable air-cooled motor, but the results sought have been secured, and they are well worth all the time, labor and money expended.

The air-cooled motor of the **Aerocar** is of wonderful efficiency in power. Runs with the uniform smoothness and rythm of an electric dynamo—under all climatic conditions, over all sorts of roads. Has strength of construction with simplicity of control, giving great durability of service, develops continuous higher power for weight, and gives greater speed than any other motor.

In the necessary, the vital qualities for satisfactory service, the air-cooled motor of the **Aerocar** is supreme—in a class by itself—the motor that "motes" when you want it to serve you.

The body of the **Aerocar** compares most favorably with any car either foreign or American. It embodies the best features of each, is graceful in line, is luxuriously roomy and comfortable; is finished and upholstered strictly up-to-date.

Aerocar 1906. 24 h.p. Four cylinders. Five passengers. 45 miles an hour. 104-inch wheel base. Shaft drive. Sliding gear transmission. Three speeds and reverse. Leather-faced cone clutch. Hollow steel dash. Four sight lubricator on dash. Tool box on running board. 34 x 4 tires. 9-inch road clearance, Weight 2,000 pounds. Fully equipped, ready for the road, including two large gas headlights, $2800 f. o. b. Detroit.

Will be exhibited and demonstrated at the Automobile shows in New York and Chicago.

The dealer who has the selling agency for the **Aerocar** will have a gold mine. Territory being rapidly taken up. If interested write us promptly.

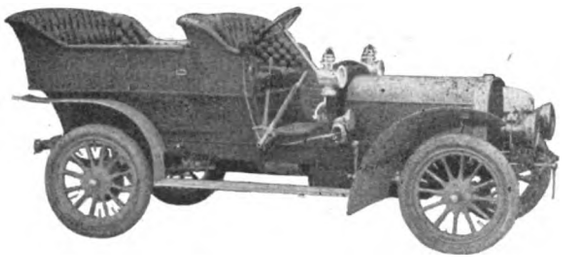
The Incomparable WHITE

The Car for Service.

THE REASON WHY

People often inquire, "Why is it that the longest tours, the hardest tours, the pioneer tours, the most interesting tours are made in White steamers?" The answer is simple: because our standing has always been to design a car for extraordinary road conditions. That is why White cars go ahead where other cars, designed only for ordinary road conditions, turn back. Another reason is that steam power, as utilized in the White car, possesses certain inherent advantages which cannot be realized through the use of other motive powers, no matter how highly developed the mechanism may be.



That readable publication, the White bulletin, describes graphically some of the more notable tours of recent years, with maps and other data of interest to all tourists. If you have not seen the last three or four issues, it would be worth your while to send us a postal asking for them.

We will exhibit at the Armory show in New York.

WHITE SEWING MACHINE COMPANY

CLEVELAND, OHIO

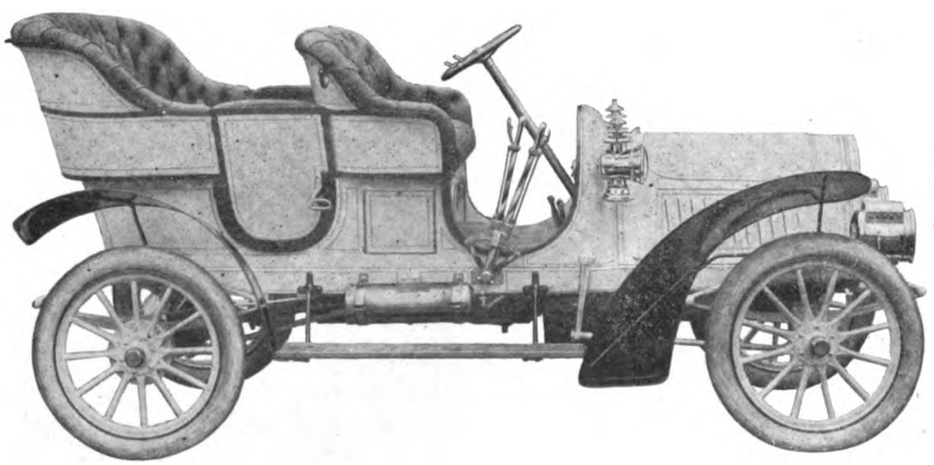
Digitized by Google

Model R--Four-Cylinder Touring Car.

HAYNES

Vertical roller-bearing engines. Cylinders cast separately, 5¼x6 inches, 50 H. P. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master Clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller-bearings throughout. 108-inch wheel base, 54-inch tonneau, seating five people. Four to 60 miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f. o. b. Kokomo. Full equipment.

If an automobile weighing 2,750 pounds, plus the weight of five passengers, is dropped over a sheer embankment of seven feet, the machinery will receive a shock of just the same severity as if suddenly checked by shifting from high speed gear at thirty miles per hour to middle speed gear at fifteen miles per hour. In the latter case the engine must act as a brake, and the entire machine is severely strained. With the Haynes transmission this cannot occur. A rachet and pawl device permit the car to coast until the speed of the car and engine are relatively equal, when the pawl and the engine take up the load. While making the change in speed from high to middle or from high to low the gears are running idle, permitting the operator to shift with perfect ease and without danger of burring or stripping the gears. With all forms of transmission except the Haynes, the shock of sudden change of gears may be, and frequently is, thrown upon the machine, a thing impossible in the Haynes car, and one of the reasons why Haynes cars are so long lived and cost so little for repairs and up-keep.



This is but one of the exclusive features of the Haynes. Others are its Roller-Bearing Engines, Master Clutch, Universal Joints that do away with wear on pins, Driving Sprocket and Roller Pinion, etc. There is perfect harmony throughout its entire mechanism, which makes its cost of operation, up-keep and maintenance extremely low.

It is perfectly finished in all respects. Only the best of tested materials are used. Body is of cast aluminum and wood, designed by a leading Parisian body maker. Hand-buffed leather and gray curled hair are used in upholstering. Other exclusive features are given in our new catalogue. For prompt attention address Desk 29.

1906—ST. LOUIS—1906

"RIGS THAT RUN"

TYPE XVI

32-36 ACTUAL H. P.—$2500.

Our 1906 Type XVI is the crowning triumph of fifteen years experience in building gasoline automobiles. This model represents EVERYTHING GOOD in modern automobile construction. You cannot afford to pay more, and you couldn't expect to pay less. Compare Type XVI with any other car listing from $3,000 to $5,000, and we doubt if you will find any vast difference in other than the price. An agent should sell a car that will instantly appeal to all classes. Thousands of prospective purchasers are in the market, a few of them will insist on paying $5,000 and over—a few more will insist on $2,000 and under, but eight out of every ten will be the BETWEEN class, if they can get the satisfaction at a reasonable price. Type XVI is between the two extremes (in price), but from closest observation, we fail to see where it will not compare inch for inch with any car built in AMERICA. A FAIR, UNPREJUDICED COMPARISON IS ALL WE ASK. It will carry five people comfortably at any speed from four to fifty miles an hour, absolutely noiseless, no vibration, will negotiate 22 per cent grade on high speed. General finish, upholstering and trimmings cannot be surpassed—no matter what the price.

MOTOR. Four cylinder vertical, under hood, water cooled, developing 32-36 ACTUAL H. P. Entire construction highest grade. Muffler reduces noise to nothing. (Quietest car in existence.)

VALVES. All are mechanically operated, generous bearings Cramps special bronze throughout. Large fan behind radiator.

CRANK CASE. Made of special metal. Instantly accessible aluminum side plates allow instant inspection of connecting rod, crank shaft, etc. Full metal pan under engine.

FRAME. Specially prepared pressed steel, channel section. 4¾ inch tapered and reinforced. Motor and transmission integral assuring perfect alignment under all conditions.

TRANSMISSION. Sliding type, three speeds and reverse, all gears made of special high carbon steel. All shifts made withone lever. Clutch metal to metal, multiple disc, load is taken up gradually. No matter how sudden the shift is made the jerk is ABSENT.

CONTROL. New style rack and pinion, with ball and socket joints to take up all wear. Spark and throttle control placed conveniently under steering wheel, also accelerator foot pedal to use if desired for QUICK SPEEDCHANGES.

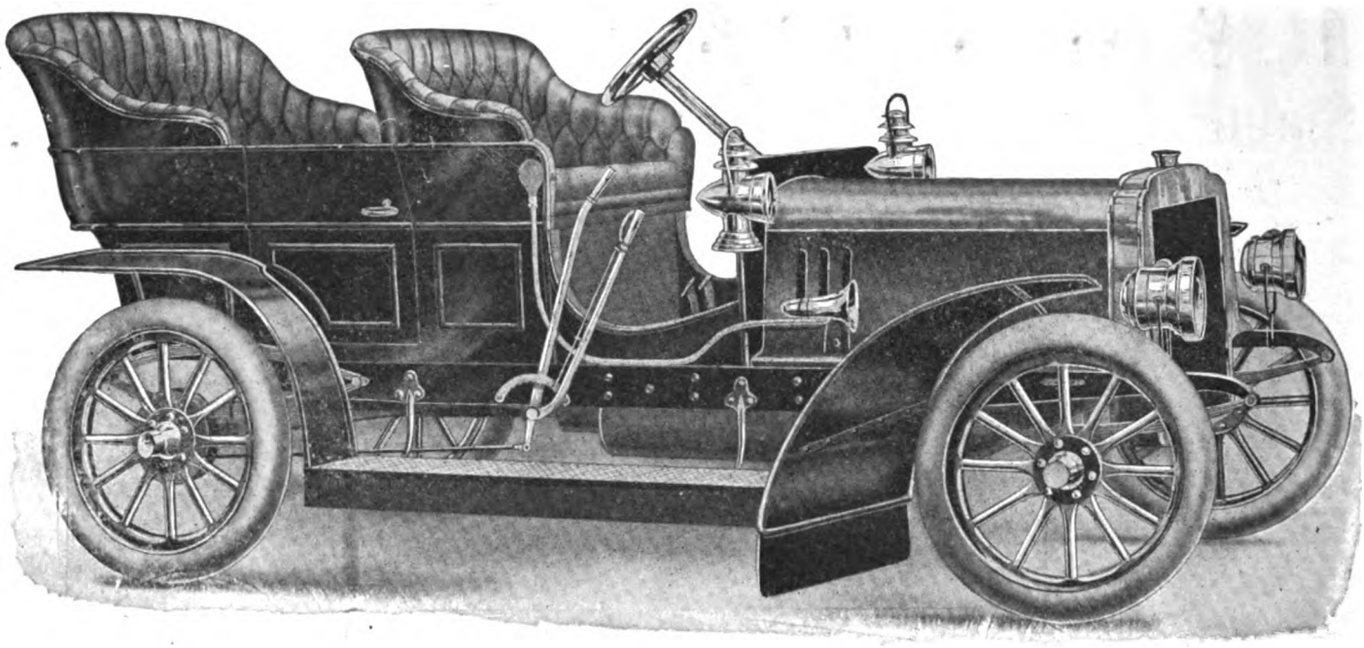
BRAKE. Three in number—any one of which will hold car on any grade. Same are controlled by both foot and lever at side of car. Application of foot brake throws out clutch, disconnecting transmission from motor.

AXELS. Front extra heavy dropped forged I beam, guaranteed not to spring. Rear axle of the floating type all equipped with Timken roller bearings throughout.

DRIVE. Bevel gear regular ratio three to one. We will furnish lower gearing upon request.

SPRINGS. Large half eleptic of the best quality obtainable. Front 38 inch, rear 48 inch. Three point suspension throughout, allowing perfect riding over the worst road conditions.

Our cars contain many individual features of merit, which we have omitted to mention. Our new elaborate catalogue explains every detail and will be mailed upon request. Fifteen years building experience has taught us the proper kind of material to use and how to use them correctly. We have simply covered the broad points of general construction that you may compare Type XVI with other makes costing nearly twice as much. Some cars may COST MORE—but none are better. We have not sacrificed one iota to cheapen our product. The material throughout is GOOD OLD ST. LOUIS quality from the ground up. Our name is on it and our guarantee back of it.



LASTLY. We are fast closing all available territory and our agency list will be closed solid before the New York show. If we are not already represented in your immediate vicinity, you had better write for printed matter AT ONCE. Don't wait until show time and be among the "ALSO RANS". Our agency proposition is most entertaining—it MIGHT pay you to investigate.

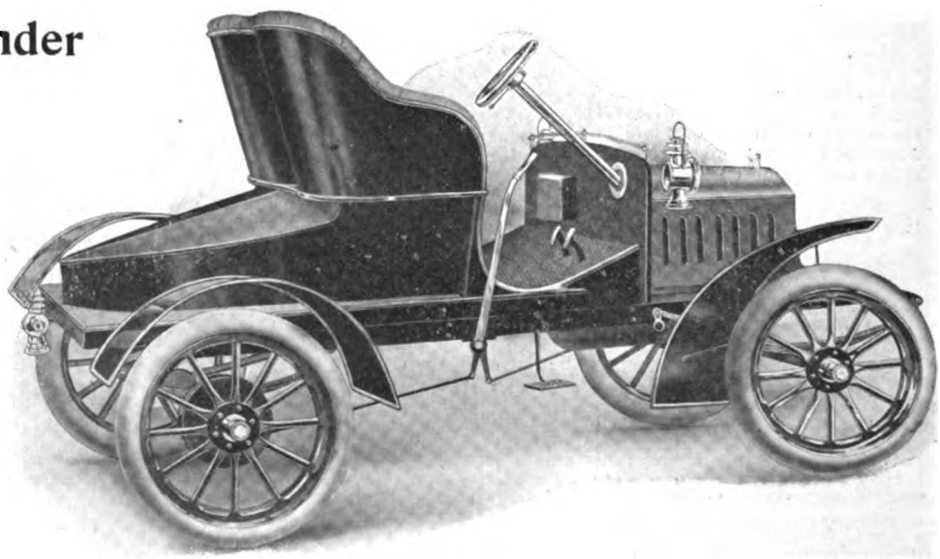
The Six-Cylinder Ford.

"Always a year or two ahead." When the single-cylinder car was "it" Henry Ford produced a double cylinder opposed motor, more powerful and at a lower price.

When the Automobile trade finally awakened to the possibilities of the two-cylinder opposed motor Mr. Ford produced a four-cylinder car at $2,000 that was in a class by itself, the public having been taught to believe that such a car could only be produced at a fabulous price.

And now, having exhausted the possibilities of the four-cylinder car in a touring car class, he has introduced it into the Runabout class, and in addition offers a six-cylinder car that is proportionately as far in advance of all competition as his first double opposed motor.

This is a wonderful car.



First, its six cylinders, with 40 horsepower, give a latitude of speed never before accomplished in a car of its class and weight, 2,000 pounds. From four miles per hour on a high gear up to fifty miles.

While one cylinder of this car will develop sufficient power to drive it along an ordinary asphalt pavement, the whole six cylinders inspire the driver with the confidence that there is an enormous latent energy in his motor, ready for any new demand without overloading the motor, making it the easiest controlled and most flexible automobile motor ever built.

When you have seen this motor in operation you will fully appreciate that we have the smoothest running automobile motor in the world.

Price, $2,500.00.

The Ford Four-Cylinder Runabout.

It is a fact that thousands of these cars are in course of construction.

Like all Ford cars, this one is a radical departure from previous and popularly accepted designs, and there is a reason behind every radical idea.

Henry Ford built a four-cylinder engine for his Runabout with fewer parts than the old-fashioned single-cylinder engine had, and the Ford Motor Co. have an enormous factory that does nothing but build motors for this Runabout, with a capacity of 100 complete engines every day.

The whole thing is very simple when you go about it right.

This is why we can build the Ford four-cylinder Runabout for less than $500.00.

We are making 40,000 cylinders,
10,000 engines,
40,000 wheels,
20,000 axles,
10,000 bodies,
10,000 of every part that goes into the car. Think of it! Such quantities were never heard of before. We buy 40,000 spark plugs—10,000 spark coils—40,000 tires—ALL EXACTLY ALIKE.

The first Runabout (Model A) we built cost $30,000—yet we sold duplicates of that model for $750.00.

It is the quantity that counts.

1906 Single Cylinder CADILLACS

Model M, Light Touring Car, $950.00

Motor, single cylinder, four cycle 5-inch by 5-inch. Ten H. P. Water Cooled. Copper water jacket. Mechanical pump feed lubricator. Jump spark ignition. Planetary transmission, two speeds forward and reverse. Pressed steel frame, channel pattern. Brake on extra large differential drums. Chain drive. Three spring suspension, rocker joint on front spring, more than doubling spring efficiency. Wheel base, 76 inches. Tires, 30x3½ on Model M; 28x3 on Model K. Bodies, Victoria pattern, strikingly beautiful. Pressed steel hollow dash. Finish, purple lake (a deep, rich wine color) on body panels and doors, with light carmine striping; dark carmine running gear. All parts thoroughly interchangeable. Cadillac quality throughout, offering values never before equalled.

Model K, Runabout, $750.00

Our four cylinder line consists of Model H, 30 H. P. Touring Car, at $2,500. Runabout at $2,400 and Coupe at $3,000. Also Model L, 40 H. P. Touring Car, at $3,750, and Limousine at $5,000. These will be announced in detail later and exhibited at New York at Madison Square only; also at the Chicago Show.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, December 28, 1905. No. 14

WANTED NO JURY TRIAL

Manhattan Storage Co. Does Not Fight Carr's Charge of Fraud and is Mulcted.

Apparently the Manhattan Storage Company believes in "Big Bill" Devery's admonition, "When you're caught wit' the goods on you, say nuthin'." As an answer to the complaint of George W. Carr, of New York, in an action brought to rescind the purchase of a "Columbia Elberon Electric Victoria," which was, in fact, a runabout, and to recover the purchase price of $300 with interest from August 18 last, they merely interposed a general denial to each and every count charging them with having made grossly fraudulent misrepresentations as to the character of the vehicle.

Like the Southern "gemmen" apprehended for invading hen roosts, they "denies de allegation and defies de alligator." As a result, Judge Moore rendered a decision without opinion in favor of the plaintiff for $329.50 on Tuesday last.

In his complaint Mr. Carr states that instead of being one year old, as wararnted, the batteries had seen three years' service; the car was of the vintage of 1903 instead of 1904; it was not even the type represented; the tires would not stay inflated for more than a few hours, and the defendants made no attempt whatever to fulfill their promise of putting the vehicle in presentable condition so far as appearances went, nor of sending a man to repair it. To none of these accusations did they find it expedient to be explicit in answering, in spite of the fact that a general denial under such circumstances is equivalent to letting judgment go by default. Nor did they wish to run the risk of a trial before a jury—a matter of right if they cared to demand it. In other words, they are apparently willing to write off to the account of profit and loss the amount it costs to defend the occasional suit of the man who does not care whether his friends know he has been "stung" or not.

Miller Locates in Detroit.

Charles E. Miller has located his new Detroit branch at 227½-229 Jefferson avenue—in the heart of that busy automobile centre.

"Borrowers" of a Good Name Enjoined.

The Columbia Dry Battery Co. and the Vim Co., both of Chicago, will have to find some name other than "Columbia" for the dry cells they have been making and selling. Although that name as applied to dry batteries long has been trademarked and used by the National Carbon Co., Cleveland, Ohio, the Chicagoans nevertheless "borrowed" it. The National Carbon Co. did not relish it, of course, and as a result Judge Kohlsaat, in Chicago, has granted an injunction forbidding the use of the name Columbia Dry Battery Co. or the title "Columbia" on any save the National Carbon Co.'s cells.

Accessions to Credit Association.

Since its organization on November 29 last, the Automobile Trade Credit Association has added the following to its membership: Brown-Lipe Gear Co., Penn. Rubber Co., Trade Advertising & Pub. Co., Automobile Supply Co., National Carbon Co., R. E. Dietz & Co., Hartford Suspension Co., Continental Caoutchouc Co. and A. H. Funke. The association has, incidentally, waived its initiation fee of $10 until February 1 next.

To Make Tires in Shelbyville.

According to a dispatch from Shelbyville, Ind., the recently incorporated Shelby Rubber Company, of that place, will erect a large factory for the purpose of manufacturing a new automobile tire. When it begins operations the concern will, the message adds, employ one hundred men and fifty women.

Changes Name and Doubles Capital.

The St. Louis Motor Carriage Company, which recently moved from St. Louis, Mo., to Peoria, Ill., has been re-incorporated under laws of the State of Illinois, the name of the reorganized company being the St. Louis Motor Car Company. The capital stock of $50,000 has been doubled, and is fully paid up.

Fisk Men Shifted About.

Three managers of Fisk Rubber Co. branches exchanged places last week. F. C. Vanderhof went from Buffalo to Cleveland, Morris Penrose from Cleveland to Philadelphia and M. Hoffman from Philadelphia to Buffalo.

OWNERS ARE UP IN ARMS

Rich New Yorkers Seek to Establish Co-operative Garage—Their Plans and Complaints.

If two hundred New Yorkers who possess automobiles will subscribe $1,000 each before February 21 next, the Motor-Car Owners' Garage Co. will be brought into being. The movement is well under way, and under auspices so different from those usually concerned with co-operative enterprises that it must command most respectful heed, and as it is in the nature of a protest against the methods that prevail in the New York trade, it is of uncommon significance.

The directing head of the movement is M. R. Speiman, of H. W. Poor & Co., the Wall street bankers. Associated with him are Mr. Poor himself and such well known and wealthy men as Atwood Violett, W. H. Wheeler, Henry Low, W. H. Chesebrough and A. S. Gorham. These are the names signed to the prospectus of the proposed company, which bears date December 21, and which is as follows:

In the interest of owners of automobiles and as a co-operative measure for their benefit, it is proposed to form a company to erect a garage to house their motor cars and to accommodate those of others, the building to be owned in fee by the company and its operations to be conducted in the interest of the owners of the cars.

Many of the public garages in this city in which automobiles are stored are operated in the interest of some manufacturer, and often to avail of opportunities for selling new cars and appurtenances and for making repairs often unnecessary and expensive, instead of giving proper attention to the care of cars intrusted to them. The result is the neglect of the real interests of the car owners.

Under the plan proposed and under the system of management contemplated, many advantages would be secured, among which are the following:

1. Elimination of exactions and unnecessary charges for repairs, new material, etc., which are often incurred without the knowledge or approval of the owner.

2. A reduction of expenses for supplies and repairs by maintaining in the garage a skilled mechanical department.

3. An improvement in the condition of the cars by securing more intelligent and continuous supervision of them.

4. The prevention of the use of the cars without the owners' knowledge, by a proper tally upon each car.

Digitized by Google

To accomplish these results it is proposed to organize a company, to be known as the Motor-Car Owners' Garage Company, with a paid-up capital of two hundred and fifty thousand dollars ($250,000), divided into two hundred and fifty shares of one thousand dollars ($1,000) each.

An eligible and convenient site is to be acquired, to be owned by the company in fee, within the boundaries of Thirtieth street, Ninth avenue, Sixtieth street and Fifth avenue.

On such a site a fireproof building is to be erected, of sufficient size to store 250 cars, and to contain a modern-equipped repair shop, supply rooms, waiting, smoking and bath rooms for patrons and chauffeurs.

The affairs of the company are to be managed by a board of five directors, who will adopt such regulations, establish a system, and maintain a discipline that will avoid many of the defects of the present methods of the public garages.

It is proposed to store and repair cars of other car owners than those who may be stockholders of the company, if deemed advisable, and to charge for such service the regular rates of the public garages.

Careful investigation, by a member of the committee, of the legitimate expenses and receipts of some of the public garages leads to the belief that the proposed company will be able to give its members and patrons the best possible service at the lowest reasonable cost, and in addition pay substantial dividends upon its capital.

The undersigned will act as a committee of organization to represent subscribers until such time as a company is fully organized and a final board of directors constituted.

The company will be organized without any commissions, promotion profits, or expenses whatever, except the necessary disbursements for legal services, printing, postage and petties.

Messrs. H. W. Poor & Co., 33 Wall street, will act as bankers for the committee, free of charge, and will receive subscriptions offered by means of the blank form opposite.

It is understood that subscriptions will not be binding unless $200,000 of the full amount of the proposed capital of $250,000 is subscribed within sixty days from this date.

When asked by a Motor World man for more specific instances of the abuses and lapses existing in the present garages, Mr. Spelman merely repeated those that have been a matter of general comment during late years.

Mr. Spelman stated that there is no dissatisfaction with the charge for storage and care, but there is dissatisfaction with the manner of care. Cars that are supposed to be cleaned, he maintains, are too often not clean. There is no very great complaint regarding repair charges, but Mr. Spelman and his associates think there are so many of them as to furnish grounds for grave suspicion. He did not hesitate to voice the oft-whispered charge that many of the repairs are "manufactured" in the garages themselves—that is, that cars are purposely deranged by some one in order that repairs may be effected and bills rendered. Finally, Mr. Spelman made plain that the "chauffeur problem" has a deal to do with the movement he is engineering. The chauffeurs and garage employes are too often hand in glove in their bedevilment, as he proved to his own satisfaction. Convinced that his car was being used without his knowledge, he played detective, with the result of discovering that the car was returned to the garage at 4 o'clock A. M. Further inquiry proved that the watchman and chauffeur had conspired at this sort of thing for several months.

The burden of Mr. Spelman's complaint is that in the existing garages there is a lack of competent inspection or supervision, a lack of trustworthy systems and checks and workmen, and a grievous lack of discipline.

TWO-CYCLE PATENT BOBS UP

Proves so Strong That the Startled Elmore People Purchase it—Assert That Others Must Now "See" Them.

That there exists a patent on the two-cycle form of motor will prove startling news to every one concerned with motors. It was as big a surprise to the Elmore Manufacturing Company as it will be to others, and they have been building two-cycle engines since they first took up automobiles—and now things are "coming their way" and the interest in that form of motor is increasing with the days. It was not until about a month ago that knowledge of the existence of such a patent was literally brought home to them. It "arrived" when a certain Joseph Day, of Rumford, England, who walked into the Elmore office at Clyde, Ohio, calmly announced himself as the owner of a United States patent fully covering the two-cycle system.

Very naturally his statement was received with incredulity, for the Becker brothers and their engine designers had carefully evolved, step by step, an engine that they firmly believed to be original. Careful comparisons of their plans with those shown in the patent, however, soon convinced them that they had, unconsciously, started in the trail blazed by Mr. Day, and, acting on the same idea, had much perfected and improved upon his engine. And yet the motor was, essentially, the legitimate child of Mr. Day's brain. There was no denying that he had a legal, unbreakable claim to the basic essentials upon which the Beckers had builded.

And then the Messrs. Becker acted with true American promptness. Were the American rights for sale? They were, and Mr. Day was perfectly willing that the men who had made the two-cycle engine the most talked about factor in the automobile world should take over the American rights.

So there is where the two-cycle engine proposition stands, and will stand for something like a year, when the Day patent expires. Other makers may manufacture that sort of engine if they wish, but the Elmore people say that it will be necessary for them all to "see" them first.

The Fading of Carey's Dream.

The Carey automobile "factory," of Fairmount, Ind., is said to be in financial straits, from which there is small hope of its recovery. The entire factory force, consisting of William Carey, owner, manager, secretary and sole workman, was busy during the three months of the factory's existence on the construction of one automobile, the only order received by the factory. The undoing of the institution was due to an untimely interference of the Westerfield Motor Company, of Anderson, Ind., in demanding payment for a gas engine, which the company bought from them and for which they allege it never paid. It is also said that the company bought many other pieces of machinery and considerable material for the manufacture of the automobile. Carey is said to have paid for none of them. Carey left Fairmount some time ago. A few weeks ago his wife shut up the shop and followed him. The automobile, which had reached a state of partial completion and could be run at a low rate of speed by one who understood its character and peculiarities, was left at the shop. It will probably be partitioned among the creditors.

Kaestner Finally Goes Under.

A receiver finally has been appointed for the Charles Kaestner Mfg. Co., of South Bend, Ind., on petition of the St. Joseph Loan & Trust Co., of that city, which claims the automobile manufacturing concern is indebted to it in the sum of $13,000. The trust company asks that the plant and property of the company be sold to go towards payment of its claim. The Kaestner Mfg. Co. moved from Chicago to South Bend about two years ago, but had not enjoyed a very roseate existence. Several months ago a receiver was applied for, but the company claimed the action to be mere spite work on the part of a creditor.

To Build Cars in Newburgh.

According to advices from Newburgh, N. Y., that city is to have a real automobile factory, General Manager E. R. Burroughs, of the Abendroth & Root Mfg. Co., having given out that that concern will begin the building of cars. The output for the present will be confined to one type—a 30 horsepower touring car. It is added that the first batch of six cars, all of which have been spoken for by local parties, will be ready for delivery March 1.

Denies Debt, Claims Damage.

In its answer to the litigation instituted against it by Alfred O. Dunk, Robert C. Yates and others, the Detroit Auto Vehicle Company denies the allegation of not paying the debts of the absorbed Detroit Novelty Machine Company, and says that it has paid more than $7,000. Instead of acknowledging indebtedness to the complainants it says that its damage amounts to $20,000.

Toronto Will Try Again.

Toronto will make another try at holding an automobile show early in 1906, and with last year's fiasco in mind, its promoters are determined to carry the project through this time. The "first Canadian Automobile Show," as it is styled, is scheduled for the first week in April. No place has as yet been selected to house the exhibits.

Torbensen Buys a Plant.

The Torbensen Motor Car Company, of Bloomfield, N. J., has purchased the property at 610 Bloomfield avenue. After alterations are completed, the company will occupy the building in the manufacture of motors and gears.

Digitized by Google

The Week's Incorporations.

Delaware, Ohio—Cook Motor Co. increases capital stock from $15,000 to $25,000.

Lansing, Mich.—Northway Motor & Mfg. Mo., increases capital stock from $30,000 to $50,000.

St. Louis, Mo.—Van Automobile Company increases capital stock from $2,000 to $10,000, increase paid; assets, $43,076.60; liabilities, $1,953.63.

Chicago, Ill.—Branstetter Motor Co., under Illinois laws, with $2,500 capital; garage. Corporators—H. P. Branstetter, H. H. Look and O. M. Schultz.

Detroit, Mich.—Gray Motor Co., under Michigan laws, with $12,000 capital. Corporators—David Gray, Paul R. Gray and Luman W. Goodenough.

New York City, N. Y.—Commercial Motor Car Co., under New York laws, with $10,000 capital. Corporators—P. S. Russell, J. Ingle, jr., and M. E. Cunliff.

Buffalo, N. Y.—Motor Vehicle Co., under New York laws, with $20,000 capital. Corporators—James MacNaughton, Louis Du Broy and M. D. Ashford.

New York City, N. Y.—Weed Chain Tire Grip Co., under New York laws, with $100,000 capital. Corporators—H. D. Weed, H. P. Denison and H. E. Chase.

New York City, N. Y.—Twombley Motor Car Co., under New York laws, with $1,000,000 capital. Corporators—C. C. Dodge, W. I. Tombley and J. W. Murray.

New Rochelle, N. Y.—Westchester Motor Car Co., under New York laws, with $25,000 capital. Corporators—K. S. W. Glasser, J. A. Mahstedt and F. W. Bender.

Bridgeport, Conn.—Miller Garage Co., under Connecticut laws, with $35,000 capital, paid in. Corporators—Willard R. Miller, Alma E. Miller and Charles E. Peck.

Portland, Me.—Snow-Webster Automobile Company, under Maine laws, with $10,000 capital; to deal in automobiles. Corporators—F. S. Webster, L. A. Webster and Nathan Clifford.

New York City, N. Y.—Lock-Switch Mfg. Co., under New York laws, with $25,000 capital; to make automobiles. Corporators—William A. Courtland, David J. Newland and William O. Hammond.

Orange, N. J.—Automotor Transfer & Storage Co., under New Jersey laws, with $45,000 capital; garage. Corporators—Isaac R. Lloyd, John Oscar Ball, L. A. McNulty and Absalom P. Bachman.

Toledo, Ohio—Atwood Automobile Co., under Ohio laws, with $40,000 capital. Corporators—H. M. Smith, Park L. Myers, Dean V. R. Manley, Rufus H. Baker, F. L. Mulholland and D. D. Flanner.

Parkersburg, W. Va.—Hambrick Motor Car Co., under West Virginia laws, with $150,000 capital; to make automobiles. Corporators—J. W. Hambrick, F. E. Clark, E. W. Strack, B. D. Kehner and D. F. Strack.

Peoria, Ill.—St. Louis Motor Car Company, under Illinois laws, with $100,000 capital. Corporators and officers—Jesse French, president; Jesse French, jr., vice-president and treasurer; Fred Simon, secretary.

Minneapolis, Minn. — Auto Construction Company, under Minnesota laws, with $50,000 capital; to make automobiles. Corporators, P. S. Evans, George A. Hughes and W. T. Hartson.

Many Changes in Minneapolis.

Several important, as well as unexpected, changes have been made in the placement of Minneapolis, Minn., agencies for 1906. The Moulton-Jordan Co. will handle the Cadillac, which was formerly sold by the H. E. Pence Automobile Co. The Moulton-Jordan Co. will also handle the Peerless and Franklin, and the Pence line includes the Stevens-Duryea, Pope-Toledo, Buick and Autocar. The Northwestern Motor Vehicle Co. has taken the Ford, which was formerly sold by Walter Benz and the Barclay Automobile Co., in addition to the Thomas, will handle the Olds line, formerly placed with F. G. Winston, Jr. The latter agent will have the Locomobile and Woods Electric. A. C. Eckbergh will handle the Moline and the Haynes, the latter car having had no Milwaukee representative the past year. The Auto Construction Co. is building a new car, which will be called the Murphy Special. Milwaukee's other agencies and the cars they handle are as follows: A. F. Chase & Co., Maxwell; G. W. Caplin, Royal Tourist; Motor Car Co., Jackson; A. C. Bennett, Winton; W. C. Thornhill, Frayer-Miller and Reo; Haynes Automobile Co., White and Stoddard-Dayton, and Fawkes Auto Co., Rambler.

Escaping Gas Damages Garage.

Ignition of escaped gas in the upper story of the Southern Automobile Company's garage at No. 167 North Third avenue, Nashville, Tenn., last Friday, the 22d inst., resulted in a fire which destroyed a number of cars. The damage to the stock of the company amounted to $1,500, upon which no insurance was carried. Several private cars that were stored in the garage also were burned, but were insured.

Wolverine May Move to Bridgeport.

The Wolverine Motor Works, of Grand Rapids, Mich., has secured an option on a tract of land on Bay street, Bridgeport, Conn., giving a frontage of 600 feet on Bridgeport harbor, and will establish its plant there if suitable arrangements can be made with the common council. President C. L. Snyder, of the company, is authority for the statement that the company will not move East for a year, at least.

Rainier Selects Chicago Location.

The Rainier Co.'s Chicago branch has been established at 1255 Michigan avenue. F. L. Cordner, for many years in the theatrical business, has been appointed its manager.

In the Retail World.

Gregoire & Pearson have opened a garage on Middle street, Lowell, Mass. They will handle several well known cars.

The West End Automobile Garage Company, of West Newton, Mass., took possession of their new premises last week. They are located at 1435-1439 Washington street.

The City Machine & Mfg. Co. is a new firm that has located at Nos. 9 and 11 Orchard street, Detroit, Mich. It will make automobile wheels and do a general repair business.

The Standard Automobile Company, Detroit, Mich., will shortly move into its big new garage at Woodward and Alexandrine avenues. The company has secured a line of "sellers" embracing the Packard, Peerless and Autocar.

W. B. Thompson will build a fireproof garage at No. 24 California avenue, Atlantic City, N. J. The plans call for a brick and stone structure with concrete foundations and steel structural work. Its dimensions will be 50 by 100 feet.

With the addition of a new blacksmith and machine shop, the Orange Automobile Garage, of Orange, N. J., boasts one of the largest and best equipped garages in the State. They now have over 4,000 square feet of floor space at their disposal.

Two pieces of property on Seventh street and Grand avenue, Milwaukee, Wis., measuring, respectively, 100x50 feet and 75x150 feet, have been purchased by the recently incorporated Welch-Esteberg Automobile Co., of that city. The erection of a $30,000 garage will be begun immediately.

Because his new car was not "all that it was cracked up to be," George Mattuck has begun suit for restitution against the Riddell Automobile Co., of Des Moines, Iowa. Mattuck claims he traded his car for one the Riddell company sold, it being represented that the new car was worth $1,500. Instead, says Mattuck, the new car was not worth $500. Result, the suit.

The Automobile Outing Co., which has been operating a line of "Seeing Baltimore" automobiles, have branched out, and on January 1 will take possession of their new garage at the corner of North street and Madison avenue, handling the Electric Vehicle Company's line of Columbia electric and gasolene cars. To enable this move, the capital stock of the company has been increased to $50,000. The company is also negotiating for a lower priced touring car and runabout.

Cramer Heads the Buffalo Dealers.

J. A. Cramer, one of Buffalo's (N. Y.) leading dealers, has been elected president of the Buffalo Automobile Trade Dealers' Association. Other offices were filled as follows: Vice-President, W. C. Jaynes; secretary, D. H. Lewis; treasurer, John J. Gibson; executive committee, P. W. Eigner, E. C. Bull and N. P. Baker.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, DECEMBER 28, 1905.

THE

NEW YORK

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 11th and 18th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

Striking at Graft.

Philadelphia automobiledom has finally risen in its wrath against the peculations of the grafting chauffeur and wishes to be understood as having taken up the cudgels to suppress at once and forevermore the type of individual who has succeeded in making himself such a bane to the seller of cars and accessories. It is a spasm of virtuous indignation that has at one time or another swept over every other automobiling centre in the country, and the Town of Brotherly Love is somewhat belated in experiencing this juvenile malady. New York and Chicago have had their turns at it, not to speak of lesser lights.

It is the same old story. Emboldened by universal concession to his demands, which are merely the result of common usage established in the first instance by the dealer himself, the knight of the wheel has come to look upon his station as one that carries with it the right to levy tribute. It is a common every day occurrence, the country over, for the chauffeur to expect that part of the purchase price of every article bought for his employer is coming to him as his due. It is a tacitly understood arrangement in garage and supply store alike, and it is something for which the man behind the checkbook is in both instances largely responsible. He did it at first because that was the generally accepted method of getting business when the establishment was new, and now that it is not alone no longer necessary, but has grown to proportions that make it an intolerable burden, there must be an end to the custom forthwith.

It is not to be inferred by any means that this is a sweeping statement that takes in the dealer at large. There are doubtless some, probably many, who have never bowed the knee and who are above such a method of doing business, but there are more than sufficient of the other kind to have fostered this illicit practice to an extent that makes it a crying evil. The Automobile Trade Association of Philadelphia is about to undertake a crusade for its suppression, and one of the methods to be adopted will be to take the name of every chauffeur who makes an open avowal of his grafting propensity which must be satisfied as a condition precedent to the closing of a sale, and report this fact to his employer. The latter should most assuredly take a personal interest in aiding to put down a practice for which he pays more than any one else. These periodical upheavals against extortion have accomplished at least one good end in uncovering this form of stealing. If in the full light of such knowledge the owner is still willing to be bled by his underling he certainly has no cause for complaint, and so many are indifferent to it that the task of eradicating the evil is a most difficult one. Only increasing competition that wipes out the generous margins which make this drain on dealer and employer profitable will ever wholly do away with it.

About Self-Starting Devices.

There is a new phase abroad of the desire for the fitting of self-starting contrivances of one kind or another. It is the outcome of the Paris show, this new development, and is merely another illustration of how short a time is necessary for an extreme to be reached, once a demand becomes at all widespread. The European builder has with one accord settled down to turn out chasses of a standard type, so that for the initiated the interest in the great aggregation of new models was confined to a search for detail, and by far the most striking result uncovered lay in the amount of attention that a number of makers had devoted to the provision of something that enabled the car to be started from the seat.

One maker has gone to the extent of installing a complete compressed air plant, every item of which, with the exception of the source of energy, represents an additional auxiliary device to further burden an already accessory loaded car. Another has aimed at the same end in a different manner, providing an elaborate auxiliary mixture generating plant and a pump and its necessary interconnections between the two to transfer this product under pressure to the compression chambers of the cylinders. These are the work of representative French makers, and where they have blazed the way it is only reasonable to infer that others will follow.

Either of these expedients represents something that is the very antithesis of simplicity, and it is fair to suppose that they will be fully as liable to derangement as any other part of the mechanism. Experience would indicate that they are apt to be more so, for they are new and untried devices. Then a descent to the time honored crank will be imperative, but with a confidence in the new devices that appears totally unwarranted, at least two or three makers have seen fit to discard this ever present aid to the discovery of internal trouble, and in such a predicament it would seem to be the hay motor or nothing.

Digitized by Google

But there is another and totally different side to the question that must present itself upon a moment's consideration. Nothing but the selling price of an expensive car could be made to include such a costly array of auxiliaries, and it is naturally on cars of this type that they have been installed. And what for? To save the lordly "hired man in a leather suit" from descending to the ground and using his biceps. To the owner of such a car, a chauffeur is an indispensable adjunct, and even if he be fond of driving himself, the hired man must do the work. There is a legitimate demand for a self-starting device and it is very general, but it must be something which in the end is as simple as the crank it displaces and as free from liability to derangement. The use of what practically amounts to an auxiliary power plant for this purpose cannot be other than a fad of short duration with a limited number of adherents.

The Master and the Man.

Somewhat after the same fashion as the doctrine of foreordination, the question of the chauffeur's license comes up for discussion about once in so often, and immediately after some mishap in which one of the fraternity has been more or less involved. Usually the subject is introduced by someone who would cast opprobrium upon the professional drivers of automobiles as a class, and wishes to place himself on record as standing for a system of universal and complex qualification of members of the class according to statutory regulation. In nearly every instance also, the opinions expressed are signalized by a broad-minded attitude which would single out the "hired help" as the butt of the measures which are advocated, leaving the owner and rightful sponsor for the welfare of the machine—sponsor, at least, according to the equitable rights of the case—free to go as far as he likes without let or hindrance.

The most recent of these splutterings has come as a result of a deplorable fatality which has nipped into the charmed circle of New York's finest. The author of the unoriginal opinion is a man well known in motoring circles, and should have had sufficient experience by this time to form an idea or two of his very own, and savoring of more originality. He has told the reporters that automobile accidents are becoming all too frequent, that something should be done to remedy the matter and lessen the peril to the motorist. He has referred to a system in use in France, and said that some such system should be in vogue in this country. He has referred to the methods of examining and licensing railroad engineers, and said that something of the same sort should apply to the professional automobile driver. Also, he is quoted as having made the following statement:

"Of course the law could not be such as to interfere with the owner of an automobile, or deprive the owners of machines from racing in the proper manner. The owner takes his own life in his hands, and if the chauffeur is willing to go with him, that is a matter which rests wholly with the chauffeur. If the owner drives his machine fast he is responsible. If the chauffeur drives faster than the law allows, no one is responsible."

In all of which he has erred to the extent of overlooking the fact that the laws which exclude from the manipulation of a locomotive all engineers who have not qualified in accordance with a set and very wise rule, also exclude all others, including the owners of the railroads themselves. No person, whomsoever he may be, is lawfully entitled to run a locomotive unless he has passed his novitiate in regulation style. And again, considering the matter of responsibility for accidents, although the yellow journals usually lay the blame of serious mishaps at the door of the capitalist owners of the railroads, the followers of the district attorney usually lay hold of the engineer and lock him up without delay, when his train has jumped a switch point or run by a block signal.

An analogy fails utterly of its purpose unless the analogue can be equally applied in all of its phases to the new case to which it is turned. Hence, either the cases of the man who drives a locomotive and the man who drives an automobile are absolutely similar, or they are absolutely dissimilar. Also, it is to be remembered that the word chauffeur, though used frequently in a restricted sense, is in France applied with equal impartiality to all men who drive automobiles —while they are driving. Therefore, if there be any logic in the matter at all, the men who cry for the licensing of chauffeurs should be prepared to sit up and pass the examination themselves. If they do not care to do that, they always may consider themselves at liberty to deal with the concrete, and let the abstract take care of itself. The world is overstocked with those who preach a gospel which applies to someone else, and disregard their own salvation. But its poor gospel that won't reach both ways.

PENNSYLVANIA OFFERS PRIZES

One Thousrnd Dollars in Nine Parcels to Demonstrate Wherein Tire Troubles Arise.

It is the belief of the Pennsylvania Rubber Co., of Jeannette, Pa., as it is the belief of very many other persons who have to do with tires, that most of the so-called tire troubles are due to either ignorance or carelessness, or both. The use of deflated tires, their improper mounting in the rim, their overloading, their injury by oil or gasolene drippings—each and all of these items are prime factors that make for trouble and expense.

The belief of the Pennsylvania Rubber Co. is so strong that they have evolved a plan to prove it true, and at the same time to effectually demonstrate that with proper care and handling here is no reason why tire costs should average anything like 35 per cent. of the total upkeep of the car, as their data embracing many cars and tires shows is the case.

The plan carries with it the offer of $1,000 in cash prizes, the amount being apportioned as follows: First prize, $500; second, $200; third, $100; fourth, $75; fifth, $50; sixth, $30; seventh, $20; eighth, $15; ninth, $10.

The prizes will be awarded at the end of the year 1906 to the owners and chauffeurs of the cars using Pennsylvania Clincher tires, which complete the twelve month, with the least tire expense per running mile.

The competition will be held under the following conditions:

Competitors may enter cars in the competition at any time during the year, but cannot hand in their records before the end of December.

The car must have traveled not less than 2,500 miles.

The distance traveled must be measured by an accurate odometer.

No bands or protective devices of any kind may be used on the tires, except that one band, covering not more than 12 inches of the tread, may be used temporarily if necessary on account of any injury to the tire.

Repairs must be charged at the rates charged by the company, and all repairs must be reported in detail at the close of the year.

Each competitor must notify the company of his intention of entering the competition and must give the number of miles registered by his odometer at the time of entering.

To assist competitors, the Pennsylvania Rubber Co. will supply what they describe as the most elaborate book dealing with the care of tires ever issued.

The Glide in Des Moines

The Bartholomew Co., of Peoria, Ill., makers of the Glide car, will establish a branch house at Des Moines, Iowa. S. W. Leonard will be in charge.

WHAT WINDAGE MEANS

Its Full Effect Little Understood—Illustrations and Figures that Make it Clearer.

Probably the average motorist has but little real conception of the importance of the factor of wind resistance, or windage, as it frequently is called, in its effect upon the performance of the machine on the road. He feels the breeze, which is of the car's own making, blowing into his face, and knows that it varies in proportion to his speed, but beyond this he is not likely to go unless his attention is called to the matter directly. It is quite true, however, that wind resistance plays a most important part in the matter, especially when high speeds are to be made, and that its importance is quite apt to be neglected when the speeding capacity of the ordinary car on the road is under discussion.

Like the other factors of rolling friction, on the road, the matter of gradient, and the power which is absorbed in the bearings and other working parts of the machine, not commonly considered as bearings, the wind resistance is proportioned to the speed attained, but instead of varying directly with it, varies in accordance with the square of the speed. Thus a factor which at moderate speeds may be of comparatively small importance in its effect upon the total amount of power consumed, becomes of greater and greater importance as the velocity is increased, until its value may exceed that of any of the others. It is for this reason that in the construction of racing machines, the amount of surface presented by the car is cut down to its lowest terms, being in many cases not appreciably greater than the necessary area of the radiator. For it is desirable to reduce the windage as much as possible, and evidently the only way to reduce it is to cut down the amount of surface which is presented to the body of air directly in front of the machine.

In an effort to further reduce the factor after the area has been reduced to the minimum amount, the contour of the body frequently is shaped according to the laws of displacement which are used in boat design, the air being just as truly a fluid and subject to the same general rules as is water or any other liquid as far as that alone is concerned. Just how far this practice serves to reduce the resistance to motion which is imposed by the air, is hard to say in general, as a great deal depends upon the shapes of the surfaces used, and in the treatment of the area which is exposed to the draught of air which is created by the car in its motion. But it is safe to say that the effect cannot be made of very great importance in the design of the ordinary touring machine, on account of the amount of space which must of necessity be taken up by the body and wings, and indeed, according to one theory, it cannot be of great value under any circumstances, since it is the total sectional area of the machine, or, roughly speaking, the shadow which it would cast upon a screen placed directly before it, which measures the area upon which the wind acts.

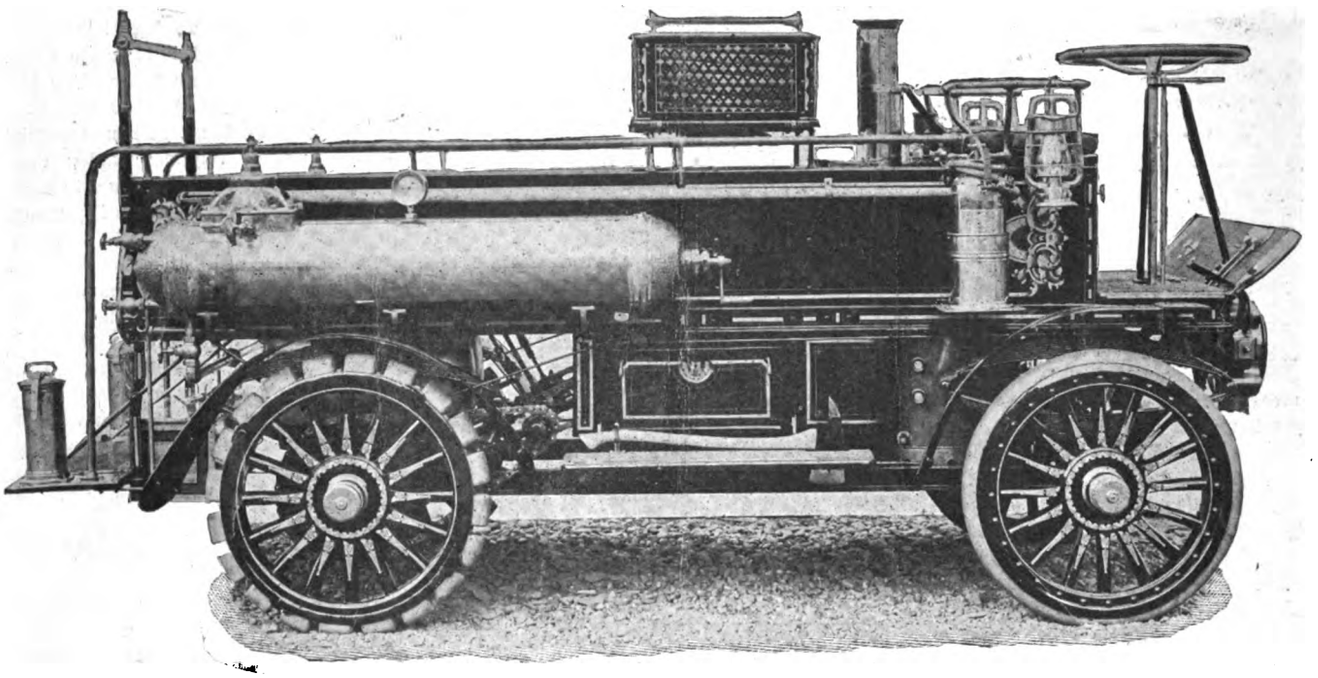
According to the results derived from his experiments years ago, Seaton established the formula:

$$W' = 0.005V^2$$

in which W′ is the pressure of the wind in pounds per square foot, and V is the velocity of the car in miles per hour, the constant, 0.005, being derived by experiment. This formula has stood the test of time, and although several others have been determined by various investigators, it is generally conceded to be fairly correct. The actual resistance which the air sets up and which opposes the motion of the car is, of course, equal to this quantity multiplied by the sectional area of the machine, or the amount of effective surface which is presented to the body of air directly in front.

From the foregoing it will be seen that even so comparatively unimportant a factor as the addition of a single passenger to the load already in a machine may have considerable effect upon its speed when it is increased beyond a certain point. Doubtless many cars have been charged with being underpowered in more instances than one because of the simple fact that they were equipped with cumbersome bodies, which presented an area so great that by only a very slight addition of weight and area the motor was loaded beyond its proper capacity.

To take a concrete example, suppose the amount of surface presented by a car of standard type, and weighing somewhere in the vicinity of 2,200 pounds, to be 16 square feet, including the driver and, say, one passenger. When it is travelling at the rate of 600 feet a minute, which is equivalent to 6.8 miles per hour, the windage per square foot is found to be 0.23 pounds. Multiplying this quantity by 16, the area of the car, the resulting amount, or 3.71 pounds, represents the total resistance which is opposed by the wind. In this case the assumption is naturally made that the air is practically at rest, and that the machine, as it were, butts into a body of stationary air. Similarly, when the machine is travelling at the rate of 1,000 feet per minute, or somewhere in the neighborhood of 11 1-3 miles an hour, the total resistance due to windage, is found to be 10.42 pounds, and, again, when travelling at the rate of 4,000 feet per minute, which corresponds to 44.4 miles per hour, the total resistance amounts to 157.2 pounds.



All of which appears to be very vague and meaningless to the unmathematical man unless he considers the resistance as being exactly equivalent to a pull of the same amount which is exerted upon a rope hitched to the rear axle of the car. Considered in that light, the importance of the windage at once becomes patent. The effect of this is, of course, to diminish the effective propelling power of the motor, which, in turn, may be likened to a pull upon a rope attached to the front axle of the car, when the analogy becomes complete. Thus, taking another example of the same sort, suppose the car in question to be travelling at the rate of 3,000 feet per minute, or 35 miles an hour, in round numbers. The draw-bar pull required under the circumstances would be, according to the Churchward experiments, recently recounted in these columns, something like 60 pounds per ton, and the weight of the machine, allowing 300 pounds for two passengers, would be 2,500 pounds. Then, the total draw-bar pull would amount to, say, 75 pounds. The wind resistance, according to the method of calculation here given, would be equal to 93.2 pounds in all. To overcome this backward pull, the same amount must be exerted in the opposite direction, or the pull upon the hypothetical rope attached to the front axle, must be increased by just 93.2 pounds, bringing the necessary draught up to 168.2 pounds in all.

Thus it will be seen that at times the factor of wind resistance may exceed that of all other factors excepting that of gradient, and may become the most important in the consideration of the possible speed of the machine. The analogy of the two ropes is the best means of studying the problem, as it presents to the mind a graphical illustration of the effects to be combatted, and is perfectly legitimate. The appended table gives a series of speeds in feet per minute and miles per hour, together with the windage in pounds per square foot, and the total windage of a machine presenting a sectional area of 16 square feet of surface, in approximate figures, and furnishes an interesting means of study:

Feet per minute.	Miles per hour.	Wind Res. lbs. per sq. ft.	Total Res. pounds.
500	5.681	0.1596	2.58
550	6.249	0.1930	3.12
600	6.818	0.2300	3.71
650	7.386	0.2968	4.75

New London's Up-to-Date Fire Fighting Apparatus.

New London, Conn., does not believe that Hopedale, Mass., is either the "whole thing" or the "real thing." Hopedale may own the electric "chemical" fire engine illustrated in last week's Motor World, but New London possesses the real snorting steamer here pictured. It was little more than a year ago that a number of New London's progressive young men banded together as Niagara Hose, No. 1, and purchased this steam propelled combination chemical hose wagon, the first, so it is claimed, to be used in this country. The expenditure involved was $5,500, which the young men raised themselves, and they are also serving the city voluntarily, risking their lives in fighting the "fire fiend."

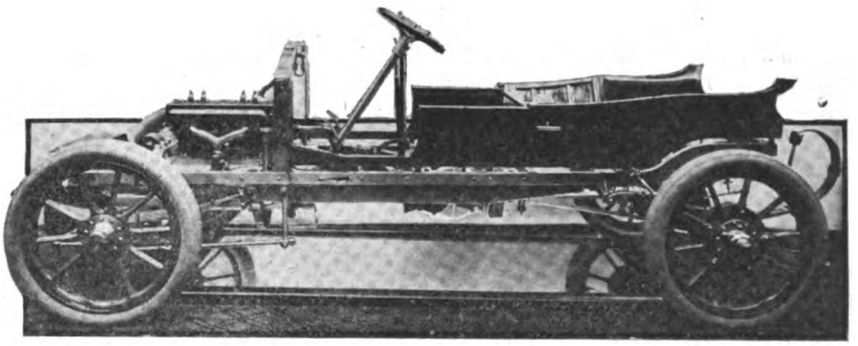
Niagara No. 1, as the wagon is styled, is the product of the La France Engine Co., of Seneca Falls, N. Y. In general appearance it follows closely the lines of the every day combination "chemical," with the possible exception of the stack forward. The engines, of which there are two of two cylinders each, are suspended under the body on pivots, at an angle of 45 degrees, and are permitted to sway just a trifle, as may be necessitated by the motion of the vehicle. Each engine is rated at 15 horsepower, permitting a speed of twenty to twenty-five miles per hour which can be easily attained.

A peculiar feature of the wagon is the fact that no differential is employed. Each engine, which may be worked independently of the other, is geared by a roller chain to its individual shaft, one on each side of the wagon, a roller chain engaging sprockets on the shaft and wheels. Despite the elimination of the differential, no perceptible skidding is said to result. The body is mounted on a channel steel primary frame, set on elliptical springs secured to a secondary channel steel frame, to which the axles are secured. An ingenious mode of steering is employed. A four-arm wheel secured to a vertical post connected to an eccentric steel plate of solid dimensions, which is secured by a collar to which a rod knuckle is secured to the left hand, comprises the outfit. The throttle, which controls both engines, is located in the centre of the driver's seat; the reverse is placed on the steering column under the wheel. The boiler is 28x30, and is composed of 1,000 half-inch copper tubes, and is tested to 1,600 pounds, but 260 pounds being maintained when the engine is housed. Three pumps supply water from two tanks of 40 gallons' capacity, sufficient for a run of nine miles. Each engine is fitted with an individual pump, while a third (automatic), acting independently, supplies water while the engine is in quarters. Two tanks, each of 30 gallons' capacity, supply fuel, but when in quarters city gas performs this function, which costs about $18 per month. Thirty-six-inch wheels fitted with four-inch solid tires are used. The chemical tanks, which extend along the sides of the car, are 30 gallons capacity each, for which 300 feet of hose is carried. One thousand feet of 2½-inch hose completes the equipment. If necessary one engine can propel the vehicle. The boiler is located in front, directly behind the front axle. The wagon was installed during September, 1904, and has rendered efficient service. That it is speedy a Motor World man can attest, as the result of a demonstration by the light of the moon. The members receive but little remuneration from the city, and this little is expended for the services of a day watchman. No night watch is necessary, as several of the volunteers occupy quarters from sun-down to sun-up.

Here's the Newest Windshield.

"Pare-brise" is the title of the newest form of glass wind shield which is being placed on the market by a French firm. It consists of the usual glass panel, but the latter, instead of being rigidly fastened, is attached to a leather apron hung on curved rods so as to be thrown in by the force of the wind until it is over the steering wheel and just in front of the driver. Its advantage lies in the fact that when the car is in motion, the glass is so close to the face of the driver that there is no chance for the wind to be drawn in behind the shield, as in the case of the fixed glass protector. The makers claim that it is unnecessary to use goggles in connection with this modified form of shield, which is made so as to be readily applicable to almost any style of top.

"Safety Valve" for Pneumatic Tires.



Whether tires have ever actually burst as the result of pumping them up with cold air and then heating them by fast running is something that cannot be said to a certainty, for when a tire has burst, it is usually rather difficult to exactly trace the cause. But, taking it for granted that this expansion is sufficient to increase the internal pressure to a degree that threatens the safety of the tire, a French inventor has devised a safety valve, termed the "Eclair," which may be set to blow off at a certain pressure in excess of the normal. Not to mention others that might come with its use, at least one drawback attendant upon the employment of such a valve would be the necessity of constantly inflating due to the loss of pressure each time the tire cooled.

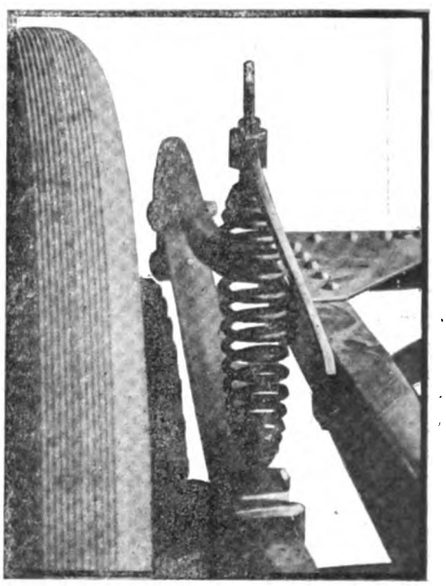
ABOUT THE PARIS SHOW

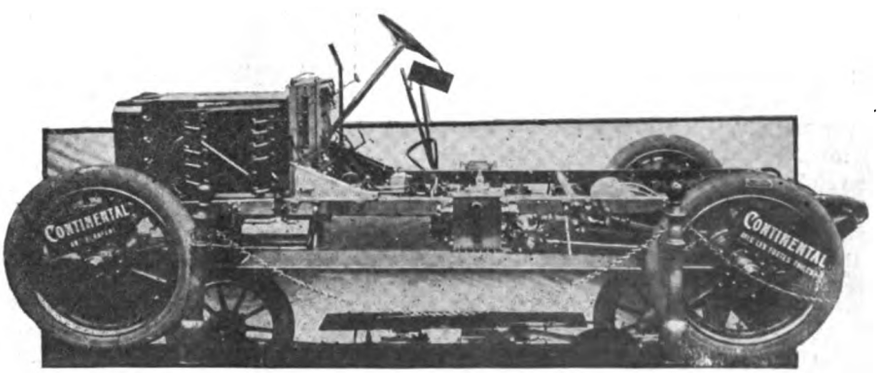
Magnificent as a Spectacle but Not Fruitful in Marked Developments—Some of the More Notable Innovations.

Paris, Dec. 12.—The annual show which was officially inaugurated in the Grand Palais by the President of the Republic on Friday has opened the eyes of a good many people who thought that the organization of automobile exhibitions had reached finality in much the same way as the cars have reached it. Only a year ago people were wondering how it would be possible to improve on that show with its then unparalleled blaze of light and decorations setting off to the best advantage a building which seems to have been specially constructed for exhibitions of this kind. But if the art of decoration appeared then to have reached high water mark it has now attained to the volume of a flood. The whole building is bathed in light which amazes, bewilders and delights the eye as it travels over the glass roof with its myriad of incandescent lamps and takes in one stand after another, each rivalling its neighbor in the beauty of its decoration.

C. G. V. DROPPED FRAME AND C SPRING.



RAPIRE WITH OUTSIDE TORTION ROD.

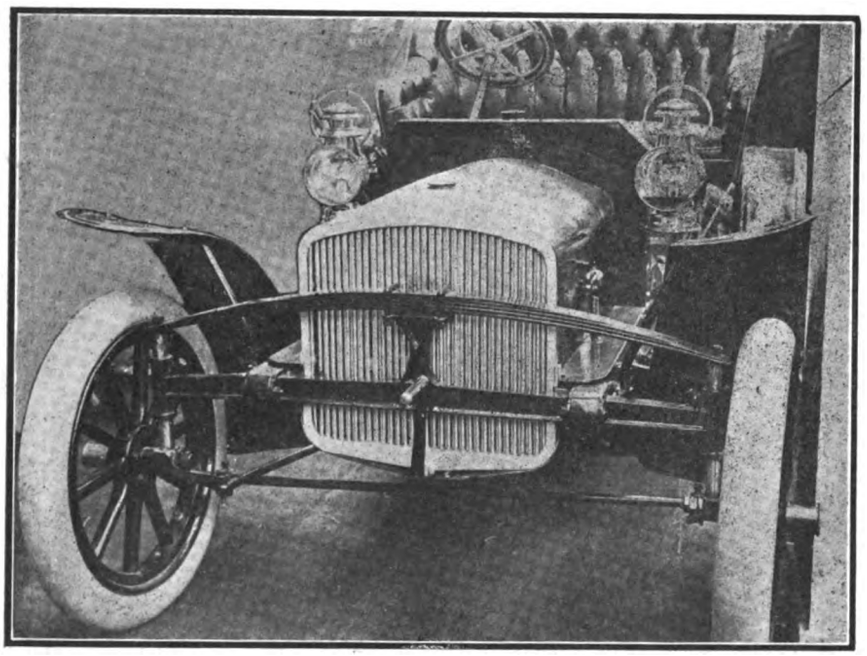


We do not propose to dwell at any length upon a subject which would delight the descriptive writer and carry his pen along for hours in a vain attempt to do it justice. It would provide abundant matter for an art publication. There are some stands that have cost $7,000, $10,000 and even more. Each is a gem of artistic decoration. There is no overloading, but the whole is characterized with the quiet restraint of the true artistic feeling, and the eye as it rests on some of the stands conveys the impression that the art of the decorator has been carried to perfection. The Panhard stand is picked out in soft white electric lights, Gillet-Forest has a luxuriant arch of rich faience, the Delahaye stand is hung with crystals, and everywhere one is charmed with the decorations which serve as a costly and beautiful setting for the vehicles exhibited. The French have never done anything better. One naturally asks whether it will be possible to improve on this magnificent display at future shows, but each succeeding one has been so full of surprises that it is futile to phophesy.

What is the meaning of this extravagant expense in decorating the Salon? Or can it be called an extravagance at all? So much money has been spent by makers that it will need a considerable amount of business to recoup them for the outlay on their stands. If they have made such great sacrifices it is evident that they see everything depends upon making the Salon an artistic success, and as a matter of fact it is because the cars are themselves no longer an attraction of themselves that it is found necessary to draw the public by appealing to their sense of sight and sound. Color, light and music appeal to all classes, whereas only a small proportion of the public are sufficiently versed in automobile mechanics to understand and appreciate the little points of detail which nowadays constitute improvements in the automobile.

Superficially there is a noticeable sense of uniformity about the vehicles exhibited, much more so than at previous shows. At first sight it appears as if the majority of makers are exhibiting the same vehicles as a year ago except that they are perhaps more highly finished and differ in powers, but when we go thoroughly into the details of construction we find many little things that show how patiently manufacturers are perfecting their cars and are bringing them to a condition that leaves us wondering

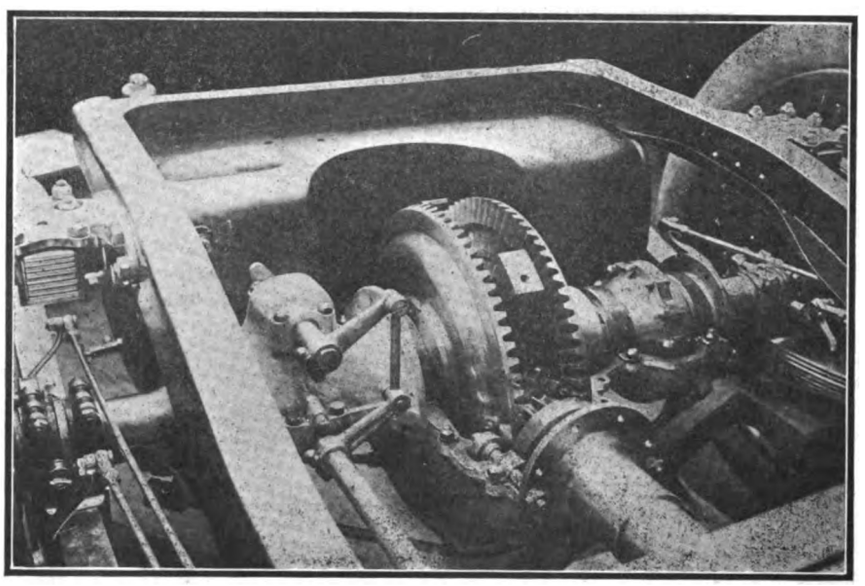
POTRON SHOCK ABSORBER.



WEIBER & RICHMOND CHASSIS.

Digitized by Google

whether it will be possible to improve them further.

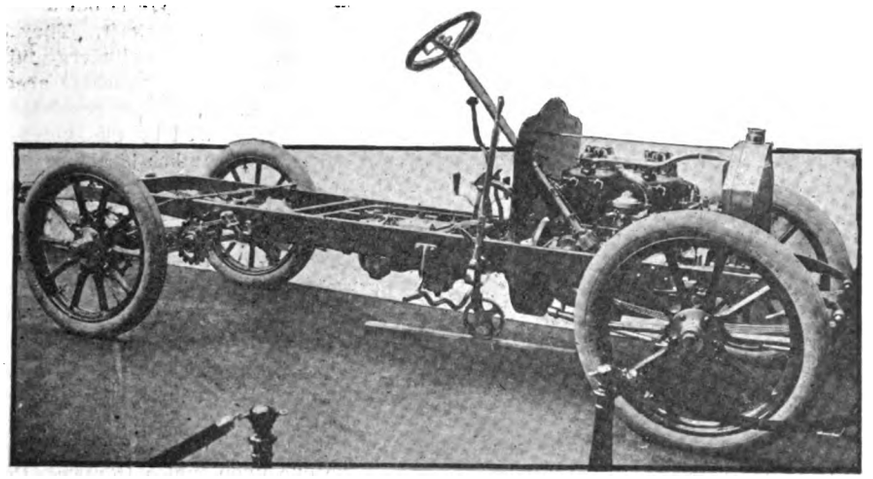


While the automobile continues to develop along its present lines we can scarcely advance much more than we have done at present, and as all those who have striven to break away from the standard design have come back to it there seems to be small

SIZIARE'S NOVEL SUSPENSION.

chance yet awhile of the industry striking out on new lines of progress. It may possibly be done in the future, but for the moment we have got into a fixed groove, and after advancing with marvellous rapidity for ten years we are slowing down like an express train which has got to the end of its journey. Whether this is a satisfactory sign or not it is at the moment impossible to say. We have yet to see what will be done in the way of improving little details, many of which are sadly in need of improvement, and there is every likelihood that the refining of all the parts and adapting them more cleverly to each other will produce a homogeneity which will result in a car that in speed and control will have all the elasticity of the steam vehicle. Makers will still have to carry out a vast amount of patient research work before attaining this very desirable end.

It is because it has become very difficult to present sufficient real novelty to attract the crowd that the organizers of the show have to adopt other expedients in the way we have already described. They have made the Salon one of the greatest functions of the year. By a free distribution of invitation tickets the building on the opening day is packed with a surging crowd, and the foreign visitor who looked down from the galleries saw a sight that could probably be witnessed in no other city in the world—a vision of a huge mass of humanity moving along the gangways, a blaze of light above, below and around him, a loud hum of a myriad of voices, and the great edifice filled with the sound of music. Since then visitors have been crowding into the building, making an inspection of the stands a matter of no small difficulty. It is too early yet to say whether the business will correspond with the popular success of the Salon, as



PILIAIN'S DOUBLE DIRECT DRIVE.

agents and others generally spend a few days in thoroughly exploring the building with its numerous galleries and rooms giving off one into the other before placing their contracts, but judging from the number of American, English and other foreign visitors it may reasonably be supposed that exhibitors will not have to complain of the amount of business done.

There is in any case nothing to show yet that the Paris Salon has been in any way affected by the Olympia Show, which was believed by the British trade to have knocked the last nail into the coffin of the French exhibition. This summary execution has not yet taken place, nor is it likely to do so for a long while to come. So far is Olympia from keeping English people away from the Salon that the number seems fully as large as in previous years, a large proportion of them being of the buying class who are on the lookout for novelties that they were unable to find at the London show. The number of American visitors also seems to be larger, though they are nearly all manufacturers and engineers who have come to see what there is to learn about Continental construction, while there is also a good influx of visitors from Germany and Belgium and other countries. This thoroughly international character of the Salon proves that it has lost nothing of its prestige, and that Paris is still the great centre of the European automobile industry.

Seeing that improvements are only now to be seen in matters of detail it is obviously impossible to deal adequately with the show until many days have been spent in a thorough examination of the exhibits. In the way of applications of mechanical principles there is nothing new, or at least nothing has come to light so far as we have gone with an inspection of the multitudinous exhibits. There is a section devoted to new inventions which may possibly reserve some surprises, but the automobile industry is so exacting that no invention which has not been proved can be regarded as having any practical value, and the most interesting things are often passed over by visitors unless it can be shown that they have been adopted by the trade. The most likely things have a disconcerting habit of failing when put to practical test, and with the increasing exactions of manufacturers the work of the inventor is becoming harder

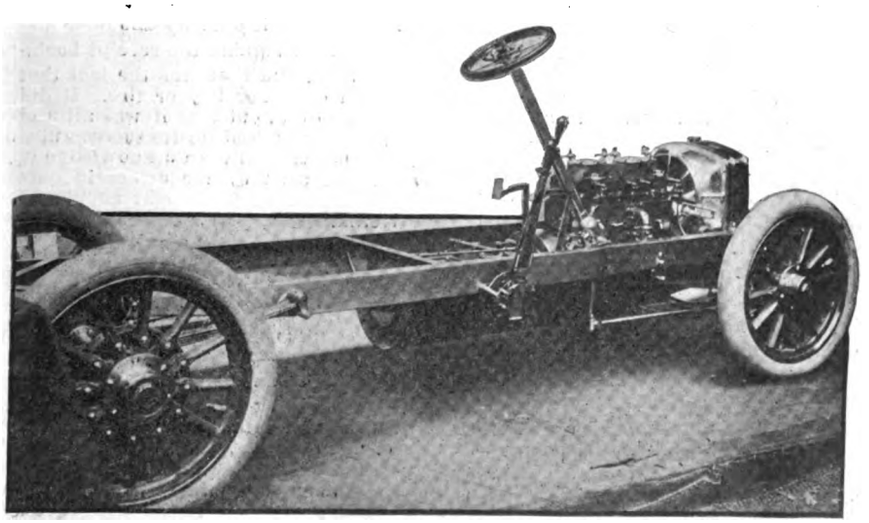
LUC COURT TELESCOPIC FRAME.

every year. In the way of gasolene cars we have seen nothing yet that shows any noticeable departure from standard patterns. There are nevertheless several interesting vehicles, notably, a new steam car by the well known engineering firm of Weyher & Richmond, and a new gasolene-electric vehicle about which a good deal is being said at the moment.



As regards the general arrangement of propelling mechanisms there are very few departures of any interest. Most of the leading firms show little change in their standard patterns. Decauville have practically the same type of car that was exhibited last year, with the exception of little changes in detail, mainly for facilitating control, while it must be admitted that the finish here, as everywhere else, is decidedly superior. In fact, it is difficult to imagine how anything better can be done in the way of adjustment and finish. A little while ago it seemed as if makers were returning to the old practice of casting the cylinders in pairs so as to facilitate the erection, but as yet we have not seen much evidence of this in the show. The general tendency is still to cast the cylinders separately, as formerly, but everything is done to relieve them of any inconvenient accessories, so that the valves and parts are easily accessible without its being necessary to remove or touch any other part of the mechanism. For the same reason on many of the cars the crank cases are rectangular with side inspection plates, while removable plates cover the camshafts.

Among steam cars Serpollet has a novelty this year in a chassis fitted with a double acting engine. Up till now Serpollet has always employed a four-cylinder single acting engine with the cylinders opposed, but in his new vehicle the clinders are side by side. He has also adopted a feed water heater in the form of a cylinder through which passes the exhaust in a spiral tube whereby the feed water is raised to a sufficient temperature to appreciably economise the consumption of kerosene. Exactly the same type of feed water heater is also employed in the Chaboche steam car, but in this case a pipe extends from the cylinder along the whole length of the frame to the boiler at the rear, this pipe being concentric so that the feed water in the outer space is brought to a pretty considerable temperature by the time it enters the generator. The builders of steam cars are obviously doing their best to give them as close an appearance as possible to the gasolene vehicle, and so far as the outside goes there is nothing to distinguish them. Steam is obviously far from being vanquished by the internal combustion engine, and to a certain extent it has even made some progress during the year, and it will be seen from the vehicles that we shall describe later on that the older power successfully fulfils the conditions of the touring carriage, and that it is not yet in danger of being finally ousted from the market.

COTTEREAU SIX CYLINDERS, CAST IN TRIPLETS.

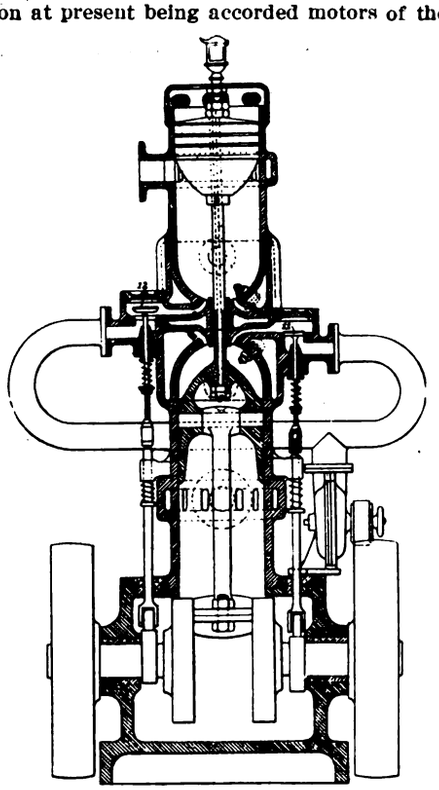
Among the many minor features of the cars which, though small in appearance, have nevertheless a considerable influence upon the control and running of the gasolene car is the self-starting apparatus, of which several specimens of different types are shown on various cars. Mors employs a system of injecting a charge into the cylinder under the action of compressed air. Bolted to the side of the chassis is a large pump of which the piston is actuated by hand. The air from this pump is forced into a small tank containing gasolene, and by means of a small lever on the dashboard which raises all the induction and exhaust valves the carbureted air passes into the cylinders. As soon as the gas has forced out the exhaust already remaining in the cylinders the valves are closed and the charge ignited. This system is shown in operation in the annex and appears to be pretty certain in action. Quite a different principle of self-starter is that shown on the Renault car, in which the flywheel is rotated by a compressed air pump.

CAMILLAC IGNITION CAM SHAFT WITHOUT PUSH RODS.

Digitized by Google

For this purpose the air in a small cylinder is kept under pressure by the exhaust, and when it is required to start the engine the air passes into a small centrifugal pump carrying at one end a pinion which is brought against the toothed flywheel. On starting, three cylinders work and the fourth recharges the compressed air tank until the maximum pressure is reached.

More attention has been devoted to the production of the "voiturette"—the light car that French manufacturers have up to the present left it to other builders to supply. The manner in which American makers have done this and made inroads on the Continental market has awakened them to a realization of the fact that it is time to get in line or it will soon be too late. One that immediately attracts the attention of the initiated eye by the peculiarity of its suspension is the Sizaire et Naudin, a head on view of which is illustrated. The runabout is numerous, but is kept more or less in the background by makers showing their more ambitious productions, and on the whole those exhibited reveal no particular novelties.



The use of "amortisseurs," or shock absorbers, is a tendency that has become general, and the prospect appears certain that the market will in the near future be flooded with devices of this kind. They range from the very acme of simplicity, as in the case of the Potron—here illustrated, which is nothing but a supplementary helical spring, the tension of which may be adjusted by means of a nut—up to those that involve endless complication, and consequently stand small chance of general adoption. Some six cylinder chasses are in evidence, such as the Coleveau, pictured here, but there appears to be no general desire on the part of the prominent makers to follow the lead of English manufacturers in this respect, although, as already stated, some firms, such as Panhard-Levassor, will make six cylinder cars for British consumption.

One detail noticeable on several cars has been the transfer of the ignition cam shaft from its accustomed place to a point directly under the ignitors in the case of those using low tension ignition, such as in the case of the Camillac et St. Benol. In almost every case the tendency to eliminate every small part from the engine that is not absolutely necessary is very noticeable, of which the C. G. V. "Voiture de Ville" and the Rapid, pictured in the accompanying photograph, may be taken as instances. The latter car also embodies somewhat of a novelty in the location and form of its torsion rods, which are placed outside the frame and are supported horizontally from the ends of extension plates. The Pilain drive, which is an ingenuous and compact adaptation of the bevel gear to the needs of the change speed, attracted considerable attention. An illustration of it with the cover removed is presented here, and it will be seen to consist of no less than three concentric bevel gears mounted on the rear axle, forming a combination that has the advantage of providing a direct through drive on the third and fourth speeds.

The seeker after novelties was not entirely disappointed, for in the Luc Court chassis at least was to be found something not hitherto considered a feature of the car. This consisted of a telescopic frame, by means of which different types of body and different lengths of chassis could be employed in connection with the same motor and transmission. As the detachable portion includes the driving wheels and rear axle, it affords the further advantage of permitting of a change of gear in accordance with the weight of the body employed. The frame comes apart just back of the dashboard, the forward part of the rear section being supported from a point under the change speed gear box on a caster, which is lowered by means of a screw.

New Ideas in Two-Cycle Engine.

In view of the increased amount of attention at present being accorded motors of the

two-cycle type, interest attaches to a novel design evolved by a French inventor, termed the Torrent motor. It consists of two cylinders superimposed with their combustion chambers abutting. They are connected through the medium of a distributing chamber of novel design which constitutes the principal feature of the invention. Instead of utilizing the crank chamber and piston to generate the initial pressure, a centrifugal pump driven by friction from the flywheel is employed. The location of this at the right hand side in connection with a manifold terminating at valves of the ordinary type in the double chamber already referred to will be noticed in the sectional sketch. It will be further apparent that both pistons are connected although there is but a single connecting rod and crank shaft. They are oppositely disposed in the cylinders and as they fire alternately the crankshaft accordingly receives two impulses per revolution.

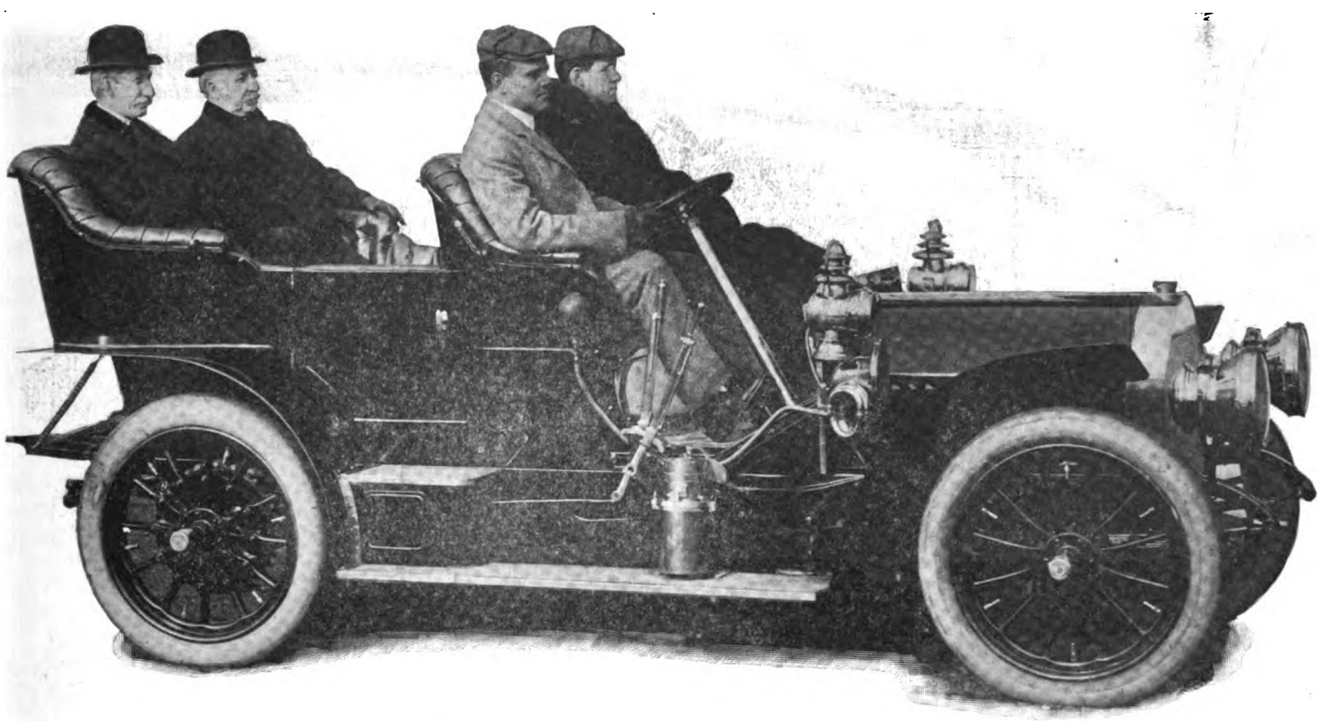
In the position pictured by the sketch the lower compression chamber is about to fire and the inlet valve 12 supplying the upper chamber is open, while 11 is closed. Both are actuated through the medium of cams on the main shaft in the usual manner. At the end of its stroke the exhaust is through a series of ports extending around the entire circumference of the cylinder in accordance with the latest approved practise for this type of engine. With the exception of the connecting rod and attachments the superimposed cylinder is in all respects a duplicate of the one upon which it rests. Cooling is by means of water circulation, the jacket, however, only enclosing the two combustion chambers. The remaining features of the construction do not differ essentially from customary practise in this respect. Owing to the great height of the motor, made necessary by placing one cylinder over the other, it can hardly be said to be a type available for automobile use.

Tire Thief "Turns" Telephone Trick.

At last the "con" man has tried his hand on the garage keeper and the particular victim, W. H. Durphy, the manager of the Electric Vehicle Company's Chicago branch, is mourning the loss of $63—the value of a brand new shoe for a tire. This is how it happened:

"This is John J. Blank's office, Mr. Blank's secretary talking," came a voice over the 'phone one morning a few days ago. "Have you a 34 by 4½ blank outer shoe?"

"Have none in stock, but can get it in a short time," Mr. Durphy hastened to reply. "Please be so kind," came the request. "as Mr. Blank is in a hurry. He will send his chauffeur for the tire."



A small boy, togged out in the usual leather cap and coat, put in an appearance a little later and asked for the tire. He was evidently equipped with all necessary information and was given the article without question. He threw it over his shoulder and disappeared after signing the receipt book, "Sid Con" (Kahn), and that was the last that has been seen of either boy or tire. It did not take long to find out that it was all a clever game, which required for its successful working no other capital than a knowledge of the size of tire used by the owner in question and the fact that he bought supplies from the victim.

Will Use the Metric System.

In reproducing the Berliet car in this country, the American Locomotive Automobile Company will adhere to the metric system in every detail, thus making the American-made car an exact duplicate of the one made in France. The initial output of the Locomotive company's plant in Providence will be 200 cars of 24-30 and 40-50 horsepower each. All will have four cylinders, of course, and "all working parts inclosed" will be one of the battle cries.

Digitized by Google

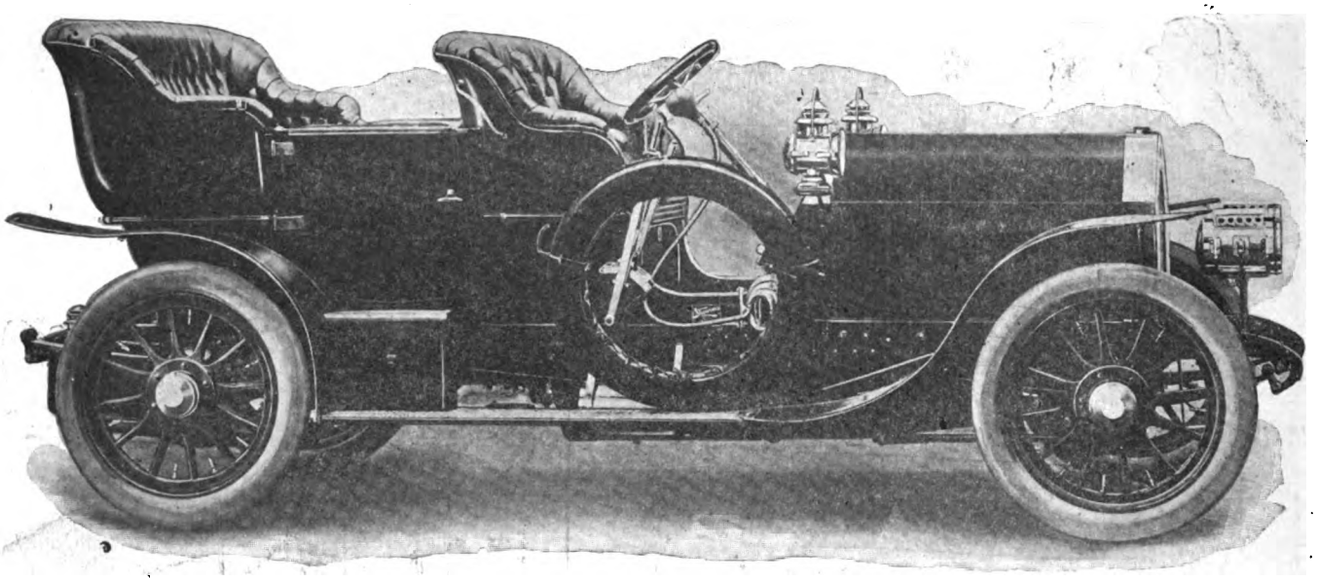
The Refinement of the Locomobile.

LOCOMOBILE, MODEL E, 30-35 H. P., $5,000.

It was hardly to be expected that the 1906 product of the Locomobile Company of America, manufacturing in Bridgeport, Conn., would incorporate any very marked departures from previous practice. To have done so would have been somewhat in the nature of gilding refined gold. By the early adoption and subsequent perfection of such advanced constructions of such features as four cylinder vertical motors, enclosed timing gears, automatic carburation, sliding gear transmission, yielding a direct drive on the highest speed, and solid forged axles, it produced a car that was a credit to the makers and to those who used it. This being the case, the designers have been at liberty to confine their attention to the improvement of the minor details from year to year, the absence of distinctly radical changes in the make-up of the machine allowing opportunity for a process of evolution and elimination in the lesser parts which has worked out a most excellent result. The policy employed in the drawing up of the 1906 models has been the same as has been previously followed; in consequence, the new cars are not essentially different from those of last year save in point of detail improvement.

The output of the coming season will comprise two models, to be known as "E" and "H," the one being of 15-20 horsepower, and the other being rated at 30-35. Both are laid along the same lines, the only differences noticeable between them being due to the difference in size. Both are of standard type throughout; are equipped with make and break ignition, the energy for which is supplied by the Locomobile's own magneto, and the Locomobile sliding gear transmission, which is practically unaltered. The frames are of pressed steel construction, the section of the members being 3-16 inch, heavily reinforced by gussets at the corners, and inset at the dash boards to give a liberal wheel clearance and wide turning radius. The spring suspensions are of the semi-elliptic type, long radius curves being employed, and the axles are of the I-beam section, drop forged from a special formula steel stock.

The changes which have been introduced in the construction of the motors comprise among others a new method of screwing the valve caps into the cylinder castings instead of clamping them in place as heretofore; a rearrangement of the water piping whereby the inlet to the jackets is through a pipe which, entering at the top, leads to the lower part of the jacket space, where it discharges, the return being from the top, in the usual way; a balanced throttle valve which operates without friction, and is not affected by the suction of the motor; and a change in the construction of the ignitors so that they are inserted into the cylinders in the form of taper plugs, instead of being faced against the outside of the castings. The action of the automatic air inlet and the governing of the motor in general have been improved, the feature of controlling the spark by shifting the ignitor cam shaft longitudinally and the use of spiral cams being retained.



The greatest of care has been exercised in the construction and testing of the magneto equipment, from the method of attachment, which has been reduced to a single nut with its lock nut and cotter pin, down to the last details of such points as the sweating in of screws which are not used for adjustment, to prevent them from backing out. The matter of lubrication also has been attended to with care, overlubrication being made impossible through the provision of overflow holes in the oil wells and the installation of protecting washers on the armature shafts to prevent the oil from working in on the windings.

The clutch is of the aluminum cone variety, leather faced, and is provided with a double universal joint in the driving shaft, to permit of automatic alignment and seating in the flywheel. The arrangement of the parts is such that either the engine or transmission may be removed from the chassis without disturbing the other mechanism, the connection between the two being broken by the removal of a single bolt in the universal joint. In the transmission the feature of a manganese bronze frame or body portion of the case is retained, guaranteeing a fixed relationship between the bearings and preventing distortion from any cause.

In the mechanism of control an alteration has been made to the extent of arranging the spark and gas levers to work over a stationary quadrant, giving them a fixed relation to the driver, irrespective of the position of the steering wheel over which they are mounted. The pedals are of the push type, very strongly made, and a foot accelerator is placed at the right side of the footboard, as in former models. The brakes are of the usual order, those upon the rear wheels being internally expanding, while the third, which is operated by a pedal, is mounted on the countershaft at the right of the steering column. This brake is distinguishable for the

The Stearns Car for 1906.

great amount of wearing surface which is presented, that of the smaller of the two cars, for instance, being 16 inches in diameter by 3½ inches wide.

Considering the two models separately, the smaller, model E, is specified as having a 3¾ by 4½ inch motor, testing up to 22 horsepower on the brake, 93 inch wheel base, standard tread and 32 by 4 inch tires. It is fitted with a characteristic side entrance body seating five passengers, and weighs something like 1,900 pounds. Model H, on the other hand, has a motor dimentioned 4½ by 5½ inches, turning up 40 horsepower on the stand, and running on 106 inch wheel base and standard tread; 34 by 4½ inch tires are used, and the side entrance body has a seating capacity of five to seven passengers. The machine weighs 2,900 pounds complete with equipment. Both cars are driven by side chains, and might be described as being of the Continental type in so far as that term signifies a sturdy and serviceable automobile.

Inclination of the Fuel Tank.

A most important point in the mounting of the gasolene tank of a car which is fed its fuel by gravity, and one which the early designers entirely overlooked and many of later enlightenment have neglected, is that of sloping the bottom toward the side from which the supply is drawn, and taking the feed pipe from the rear side of the tank rather than the front. By this means a uniform flow of gasolene may be secured until the very last drop has been consumed, and also when hill climbing, a greater head is obtained than otherwise would be possible, owing to the fluid running to the rear side of the tank. This feature is embodied in several of the new cars which are being brought out, and is worth consideration when a new machine is to be chosen.

Concerning the 1906 Stearns.

One of the "truly American" cars which always have held a reputation for substantiality and high grade appearance and action is the Stearns. Its appearance in 1906 dress, as here shown, would seem to indicate that the F. B. Stearns Company, of Cleveland, Ohio, is preparing to market during the coming season just another such machine as it built last year and one which is equally up to date. The type is that of the heavy touring car, and its capacity is five passengers normally, an additional couple being accommodated on occasion by the use of a pair of door seats. The rated horsepower is forty to forty-five.

The motor is of the regulation four cylinder type, the elements being cast in pairs. The high tension magneto system of ignition is employed, a set of dry cells being provided for emergency use, and for the cooling system a tubular radiator with forced draught is used. A sliding gear transmission giving four forward speeds and the reverse is used, the gear changes being obtained by the selective system. The final drive is by slide chains from a transverse countershaft to each of the rear wheels. The frame is of pressed steel, heavily made and put together in massive style, making that essential portion of the machine endurable beyond all manner of doubt. The emergency brakes expand internally upon drums attached to the rear wheels, while a foot brake contracts a band on the differential sleeve. The wheel base is 118 inches, the tread standard, and the tires 36 by 4 and 4½, front and rear, respectively. Fully equipped, the car weighs 3,000 pounds.

The Turbine Combustion Motor.

It should be a matter of rejoicing to every one connected with the automobile industry that an internal combustion turbine engine at length has made its appearance, after so long a period of promise and waiting. The Retz motor, which has been on exhibition at the Paris Salon, may not be in every way a successful engine; it may not be able to compete with the types of reciprocating motor which already are in use, or it may, but at all events it is a step in advance, and marks the beginning of a new epoch.

The motor in question has a series of nine cylinders arranged vertically about a central axis and all opening downward in front of the face of the turbine proper. The ends of the cylinders are tapered off to form jets through which small bodies of water, in lieu of the ordinary piston, are impinged against the vanes of the wheel by the impulse of the gas.

Paris is a long way from the Bowery, and the age of the gas turbine may be a long way off, too, but it is encouraging at least to hear of a turbine motor that will go, after all that has been said and done in this country and elsewhere, and after all the promise which has been held out to the inquirer through the columns of "The Patent Gazette."

To Keep Oil from Congealing.

It is well to remember that during the cold weather a thinner oil should be used in the motor than is employed in summer. In case a special brand of suitable oil cannot readily be procured, a simple expedient which serves to advantage is to thin the regular lubricant with a small amount of pure sperm oil, the proper proportion being two ounces to the pint or less. Sperm oil is included in the composition of nearly all, if not all, cylinder oils, and serves a useful purpose; its freezing point is very low, however, and by increasing the amount in the mixture a very good insurance against congealing is secured at low cost.

"Yes," remarked the new agent to the prospective buyer, "we have two kinds of gasolene cars—limousines and un-limousines—but, honestly, I'd recommend a four cylinder electric."

The American Car Finds Favor in Holland.

Although it is not generally known, the Mitchell Motor Car Co., of Racine, Wis., has for the past year been conducting a quiet but energetic campaign for foreign trade. Their Mr. Read has been systematically touring Europe and the far East in the interests of the company, and, of course, has established many agencies. One of his good placements was Holland, where Mr. J. D. Mijer, of The Hague, is looking after Mitchell interests in the land of dikes and windmills. The above photograph, taken while Mr. Read was in Holland, shows Mr. Mijer at the wheel of a Mitchell touring car; Mr. Read, the missionary, is beside him. It will be noticed Mr. Mijer has a small American flag, also one of his own country, mounted on the dashboard. Whether this was a token of respect for his guest, the all American car or both is not stated. Anyway, he looks pleased. Mr. Mijer recently made a non-stop run in this car from The Hague to Berlin, a distance of about 500 miles—a performance that served to turn attention to the car.

The Bull and the Red Car.

There have been rumors anent the entrance of the motor car into the arena in Spain, but the following appears to be the only authentic case on record where the automobile was used for bull fighting, and particularly where the encounter was solely of the animal's choosing. A bull escaped from a farm at Neuilly, a suburb of Paris, and found his way to the Bois du Bologne, where he immediately proceeded to lay low an enemy in the shape of a large red car. He furiously charged it from the rear, but the driver saw him coming and put on full speed ahead. Assisted by several policemen acting in the role of banderilladores, who waved their capes before the animal in true bull ring style, the driver assumed the combined parts of picador and matador, and the animal was finally cornered and shot.

France Creates an "Assembling" Record.

A record breaking feat in car assembling was performed the other day in a French factory, when the parts of an 8-horsepower voiturette, being brought together on the floor, the mechanics of the shop started to put them together in the presence of a representative of the Automobile Club of France. In just four hours from the start the car was entirely completed and out on the road in charge of its designer. As a test it was put over something like 750 miles of road at once and without being subjected to more preparation than was accorded it in the making, and covered the distance in sixty-one hours and a half.

How the Accident Happened.

A Kansas City woman, who owns and drives a neat little gasolene runabout, had an accident recently by running into a buggy. As she was moving along very slowly and the buggy was standing still, very little damage resulted. The buggy was not harmed, but the automobile's steering apparatus was slightly broken. The woman that evening was telling her husband of the accident.

"How did it occur?" he asked.

"Why," replied his wife, "I was just creeping along near the curb when a woman wearing the loveliest new polo turban I ever saw passed on the sidewalk, and"—

"That's enough; I understand," replied her husband.—Ex.

CONCERNING CADILLACS

Features of the New Models Made Public—Several Distinct Innovations Made.

If the ability to choose from a variety of machines, all constructed by his favorite manufacturer, can be considered at all as a factor for the consideration of the purchaser, then the Cadillac Motor Car Company, of Detroit, Mich., should maintain its strong hold on the public, for it is preparing to produce ten distinct and different types of car during the coming season, and all of that Cadillac quality and with those Cadillac characteristics that made those cars head the list of 1905 sellers. The 1906 line will vary in price from $750 to $5,000, and will be mounted on three different chasses rated at ten, thirty and forty horsepower respectively. In each of the models several features which are essentially Cadillac will be retained in improved form, including the independent timing of the valves, the special form of automatic carburetter, the copper water jacket and the spark plug, which latter has been used exclusively on cars of this make. On all of the cars the planetary type of transmission gearing will be used, the lower powered machines having two forward speeds, and those of thirty and forty horsepower being equipped with transmissions giving three forward speeds, in addition to the reverse.

In detail, the line will consist of a single cylinder runabout, rated at ten horsepower, a light touring car, with the same powered engine, a ten horsepower light delivery car, a car of the same power as the foregoing fitted with a novel form of folding tonneau body, and a ten horsepower coupe. Model H, so called, will be a thirty horsepower machine, fitted with a five passenger touring body, or as an option, with a runabout body. A form of coupe also will be mounted on the thirty horsepower chassis. In the forty horsepower line, two styles will be offered, namely, a touring car of roomy and excellent design, and a superlative limousine, the climax of the series.

In the smaller types of machine the single cylinder motor is used, the rating of ten horsepower given it this year being fully up to its actual ability as shown by repeated tests, and its performance in general placing it on an equal footing with other motors of the same rated output. The economical construction of the water jackets, which are without the disagreeable feature of gaskets, which might burn or blow out, and which may be replaced at slight expense in case of injury from any source, is too well known to require more than passing reference in this connection. In the construction of the motors and other working parts of the cars the Cadillac Company employs a rigid system of testing by means of limit guages, which does not permit of the passage from the plant of a part which is in any way defective or under sized, and insures absolute flexibility and interchangeability in all replacements.

The system of lubrication of the motor is one of considerable novelty, being positively fed and regulated in accordance with the engine speed. An arm, extending from the lubricator casing toward the flywheel, engages a cam, which is integral with that part, and from it receives a motion which it imparts to the force pump which circulates the lubricant. The rate of motion of the pump elements being governed by the speed of the engine, the feed is, of course, proportional to the demand for oil. Another novelty which is to be found on these machines is the safety starting device, which is nothing more complex than a little slide which is pushed over the opening, into which the starting crank is inserted, by the motion which advances the spark, and which thus prevents the crank from being applied until the spark lever has been retarded by the proper amount to insure immunity from a back kick.

The frame is of pressed steel construction, made of a special grade of stock and tested to a point far above the maximum running load. The suspension is upon three springs, two at the rear, and one in front, the latter being provided with a rocker joint which fully doubles the efficiency, and permits of great flexibility in the running gear. Artillery wheels are used, those in the rear being keyed to the live driving axle, while those in front are mounted on ball bearings. The method of control is characteristically simple, the handling of the motor being accomplished by the use of levers mounted on the steering column, while the forward speeds are controlled by a lever at the side of the car, while the reverse, and the brake, which is of large proportions and acts on the differential casing on the rear axle, are controlled by foot pedals. The gasolene capacity is seven gallons in all, including one gallon which is contained in a reserve tank, only drawn from when the main supply has become exhausted and a stop cock opened, the driver thus being guarded against running out of fuel while on the road, by automatic means.

The thirty horsepower model has a carrying capacity of five persons and runs on 32 by 4 inch tires, the wheel base being ninety-eight inches. The motor is of the four-cylinder vertical order, the cylinder dimensions being 4⅜ by 5 inches. The total weight of the machine, including the standard equipment, is 2,400 pounds. Model L, the forty horsepower car, has a 5 by 5 inch motor of four cylinders, and is mounted on a wheel base of 110 inches, the tires being 36 by 4 inches in front, and 36 by 4½ inches in the rear. Both cars are essentially similar, being designed along the same lines, and differing chiefly in the matter of power.

These machines are equipped throughout with the Hess-Bright type of ball bearing, the wheels, transmission and engine bearings being included. The transmissions are constructed in a thoroughgoing manner, all gears being cut from special stock, ground and hardened. The drive to the rear axles is by a cardan shaft, and specially hardened gears in the bevel pair. The brakes are double acting, and work on drums attached to the rear wheels, one set expanding and the other contracting upon the drums, either one being of ample power for any emergency. The spring suspensions are semi-elliptic in front and three-quarter elliptic in the rear, affording a very elastic mounting.

Among the distinctive novelties which are introduced in these cars are the commutators, which are placed horizontally on a vertical shaft, and are provided with an oil container; the carburetters, which have been worked out with especial reference to the motors, which they feed, and the bodies, which are of original and exclusive design, and appropriately drawn for the use to which they are to be put. The line is uniformly graded in character, and the elements are of sufficient variety to suit the tastes of all who buy automobiles.

Pierce to Build a Fire Engine.

Pittsburg is not the first city to adopt the chemical fire engine, by any means, but it would appear to be a pioneer in taking up the gasolene propelled vehicle for this purpose for other towns have placed their faith in steam. The machine, which will be built on a 45-horsepower Pierce chassis, with extra long wheel base, has been ordered, through the Banker Bros. Co., and it is anticipated that it will be something entirely out of the ordinary either in automobiles or fire apparatus.

It will be equipped with two 250-gallon chemical tanks, six small fire extinguishers, ladders, hose and the usual equipment of a chemical wagon, and there will be room on the footboards for ten firemen as well as the chauffeur, who will control the machine. The car will have sufficient capacity to fight small fires or to take care of the start of a big one, and one of the advantages claimed for it is its speed and the rapidity with which it can be taken anywhere. Having a speed of from forty to sixty miles an hour, such an engine could be rushed to fires in the suburban district or in the scattered resident sections of the town, where in case of a fire the building is likely to be destroyed long before horse engines and carriages can make the long run.

This machine will, if adopted by Pittsburg, create interest all over the country, for its use will interest not only the city authorities, but the insurance interests, who will see in it a new field for fire fighting and a valuable adjunct to the insurance patrols which are maintained in many cities and which are always the first at a fire.

Novelty in Headlights.

A novelty in headlight construction which has just been introduced in France is the use of an iris diaphragm at the front of the lamp by means of which the beam of light may be reduced in diameter to a very fine pencil, the mechanism being controlled from the driver's seat. By thus restricting the diameter of the beam the light is concentrated on a point far ahead of the machine and does not interfere with the vision of drivers of approaching traffic.

NON-STOP WAS SHORT STOPPED

How Two Ambitious New Y rkers Who Went to Washington Found a "Welcome."

Two persons, at least, have learned that the officials of Washington, D. C., do not feel kindly toward non-stop automobile runs, especially if they are not consulted beforehand or asked to take a hand in the play. They are C. C. Singer and R. L. Lockwood, who went down to Washington to try out a Reo in a 1,000-mile non-stop test.

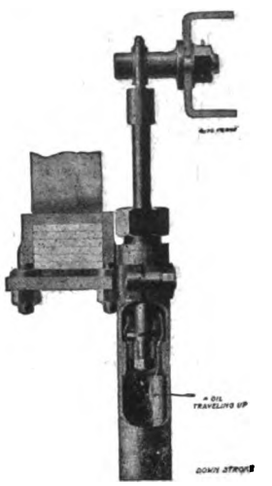
Wide, straight and asphalted Pennsylvania avenue is conducive to easy running, so with hopes high these two New Yorkers, assisted by a Washingtonian, set out on Monday, last week, to establish a 1,000-mile non-stop record, and incidentally put another feather in the Reo's bonnet. But they reckoned without their host. Early Tuesday morning Policemen Lauten and Van Horn, of the 3d precinct, were rudely awakened from their dreams, in which expected Christmas Day handouts assumed an important role, on complaint that an automobile was speeding on Pennsylvania avenue, Northwest. At the time Sergeant Hodges was watching the car near the Pease monument; Sergeant Harrison held a stop watch at the White House and Sergeant Judge stood near Washington Circle with a worried look on his face.

Lauten and Van Horn are bicycle policemen and as such are considered pretty good sprinters, so they were sent off to apprehend the nervy culprits who dared speed on Pennsylvania avenue's sacred asphalt at the uncanny hour of midnight. The cycle cops swore that although they attained a speed of thirty miles an hour they were left behind by the little car. As a last resort they lined up across the street at 15th street and Pennsylvania avenue to stop the machine on its return.

Singer was driving at the time and when he spied the line of bluecoats he realized the 1,000-miles would not be finished. He stopped.

The following day Singer was arraigned in police court before Judge Mullowny. The officers said the machine was making at least forty miles an hour. For reasons which he did not state Singer did not question the alleged speed. The 1,000-mile stopped run culminated with the payment of a fine of $30. The clerk marked the entry paid and the incident closed.

Garages on Battleships.



At last the English naval authorities have recognized the universal use of the automobile. The bicycle stable has long been a regular institution on board British battleships and cruisers and now the men-of-war contain motor garages.

In the flat space between the boiler-room bulkhead and the cook's galley plenty of room has been found in most warships to stack bicycles and several motor cars, and the boat derrick, which hoists out a steam pinnace, weighing fifteen tons, makes it a comparatively easy matter to land and reship the cars.

Motoring is becoming increasingly popular in the service, and it is found quite a comfort to the officers to be able to take their automobiles with them for spins on land.

Gabriel Evolves a Shock Absorber.

Having successfully devised a means of clearing the road, the Gabriel Horn Mfg. Co., Cleveland, Ohio, has undertaken to help

save the body from jolts and jars while on the road, even if the latter be rough. The bump-saving instrument is the Foster shock absorber of course, which the Horn Company is now marketing. While of the old dashpot principle, the Foster shock absorber is unique because of its simplicity and compactness. It is a small, light cylinder, made of cold drawn steel, containing the piston, which is attached to the frame. The lower part of the cylinder contains oil, and the sudden compression of the spring forces the plunger down against the oil, which acts as a spring. The plunger head contains two small valves, so that when the piston comes in contact with the oil, it forces it through these holes into the upper chamber. On the recoil the oil acts as a cushion, and the plunger retards slowly, the oil flowing back into the lower chamber a small portion at a time, thus relieving the strain for the springs. The Foster shock absorber weighs but two and one-half pounds, is adjustable in every direction and can be fitted to any car.

Tells a Tales of Crankshafts.

For those who are interested in the mechanical details of automobile building there are some excellent pointers in a pamphlet entitled "Fashioning a Crankshaft," which has just been issued by the Electric Vehicle Company, of Hartford, and will be sent free upon request. It illustrates various methods of turning out crankshafts and axles, dwelling at length upon the European method of machining crankshafts cold from solid slabs of steel, as is done for Columbia cars.

HACKLEY ADOPTS LINKWORK

Californian Brings it to Bear on Motor Cars—The Direct Drive That Results.

Although the methods most commonly employed for the connection of the motor and driving wheels of the automobile are those in which various combinations of toothed gearing are used, it does not follow that no more direct means of connection may be evolved for successful application, or that the ultimate concensus of opinion will fix upon the system of sliding gears, or the less cumbersome one of planetary gearing as the best for the purpose. As a matter of fact, there are most attractive possibilities, both in the friction drive pure and simple and in the methods of direct drive by means of linkwork, both of which are receiving their measure of attention in one quarter and another. Of the latter, the latest to come before the public is the invention of George T. Hackley, of Los Angeles, Cal., which combines the principles of two well known mechanical movements in a novel application to the purpose.

The Hackley system, which has been adopted by the Direct Drive Power Transmission Company, of Los Angeles, employs an adaptation of the link motion commonly applied to the reverse gear of locomotives and other steam engines, which is made to actuate a pair of roller clutches acting on the rear axle of the machine through lever arms. The latter principle is one which was at one time extensively used on bicycles of the Star type. As a result of the combination, a means of uniform gradation of speed and power is obtained, compassing the entire power range of the motor, and that with simple mechanism, which is not expensive to construct, and which requires little or no skill in manipulation.

In the only type of car to which the arrangement has thus far been applied, a horizontal motor is used with crankshaft placed transversely of the main axis, though the system is capable of adaptation to any type of machine. The crank shaft of the motor has two external cranks formed in it midway of the machine. To these are coupled a pair of connecting rods which are attached at their rear ends to the extremities of a pair of swinging links, which are slotted in the arc of a circle, the centre of which is at the centre of the crank shaft. The blocks which are fitted to these are connected by rods to the lever arms, which are coupled to the rear axle by means of the roller clutches.

By this means the rotary motion of the crank shaft is transformed into a reciprocating motion at the rear lever arms, which, by virtue of their arrangement, transmit a practically continuous rotary motion to the axle. The stroke of the final drive is regulated by means of the variable leverage which is obtained by shifting the link blocks

Digitized by Google

in the slotted links. Thus, by adjusting the mechanism for a very long stroke, the maximum of speed is obtained, while by shortening the throw of the arms, the speed is correspondingly diminished with an increase in leverage and power, up to a neutral point where no motion is imparted. The reversal in the direction of the drive is obtained by altering the arrangement of the clutch dogs, causing them to take hold on the pulling, instead of on the pushing impulse, as ordinarily.

The control of the system is entirely concentrated in a secondary wheel mounted above the steering wheel, and readily manipulated. Thus, the handling of the car is reduced to its lowest terms, practically speaking, as the control of the speed is made absolutely simple and independent of the handling of any clutch or gear mechanism. Another point which should have an important bearing upon the introduction of the system is that by its construction the machine cannot roll backward while it is in the forward gear, the entire system serving as a backstop or automatic sprag arrangement, which should be of great efficiency where hill climbing is to be undertaken. The rear axle of the machine is equipped with a differential in the usual way, so that a positive drive is secured while rounding curves.

The application of link drive to motor cars is by no means new, and as each of the two movements used in this case is of well tried worth, even though the arrangement may be totally out of the ordinary, it has plenty of recommendation to entitle it to trial and possible adoption. Up to the present time the Hackley drive has not been regularly applied to any make of car, but is manufactured under patent right by the Los Angeles company.

France May Put up Tariff Bars.

According to recent cable advices the French manufacturers are becoming alarmed to such an extent at American competition and the manner in which the products of the latter are invading their territory that they have petitioned the government with a view to the passage of a bill placing a prohibitive duty on all imported motor cars. It is the story of the American bicycle all over again. It was only by making the price of the latter exorbitant by means of a high duty that the French machine was able to hold its own.

Honolulu to Set a Limit.

A cast iron ordinance to regulate the operation of automobiles in Honolulu has been presented to the Board of Supervisors and referred to the county attorney for an opinion as to its legality. Besides making speed limits of eight miles an hour in town and four miles at the crossing, it provides that no person shall run an automobile until he or she has passed an examination and been given a certificate as a chauffeur. No car is to be allowed to run on the streets at all until it has been registered with the police, except it be that of a temporary visitor.

Here's the Genuine Automobile Bonnet.

"Gone to the head" has the automobile, bonnet, chassis, wheels and tonneau, and from the interior of the modiste's head to the exterior of the cranium of any woman,

French or otherwise, with sufficient courage to don such a creation. Even the headlights are reproduced in one of these specimens of hideous aspect, either of which would be more than sufficient to counterbalance a far

stronger claim to comeliness of ensemble than is possessed by the representatives of their sex bearing these intended-to-be adornments in the accompanying sketches, which are reproduced from photographs.

Wide Tires and Good Roads

Troy, N. Y., has as a member of its Board of Supervisors a man who has the courage of his convictions. He has accordingly drawn up an ordinance providing for the use of wide tires on all wagons carrying heavy loads through the streets of that city on and after March 1, 1907. This has been pending before the ancient city's lawmakers for some time, but, blinded to the ultimate interests of the people they represent by a lack of foresight that does not permit them to look beyond the immediate present, most of the gentlemen in question have refrained from coming to the support of the ordinance. Its chief supporter is strenuously upholding it, and the arguments he brings forth are of great interest to every community in the country, for the question of good roads is universal.

One bright supervisor from a country town admitted that he was convinced that wide tires were necessary to preserve the country roads and were an actual advantage to the farmer, still he disliked to vote for a measure that imposed an involuntary tax upon his neighbor. The much greater burden of taxation imposed upon the same farmer by the failure to use wide tires evidently never struck him. It is almost superfluous to state that wide tires are road makers and narrow tires road breakers. Nor does it require any special scientific attainments or knowledge to appreciate the amount of damage a heavily loaded wagon with the ordinary sharp, narrow and rounded tires can do on the best of roads. But beside the immense saving in road maintenance brought about by the use of tires proportioned to the load to be carried, there is the further great advantage of increased hauling capacity with the same or less power. Numerous tests with the dynamometer by national and State experimental stations have proved that ordinary teams can haul 40 per cent more weight on wagons with 3-inch tires than with 2-inch. A test in Missouri showed that 3,248 pounds could be hauled as easily on 3-inch tires as 2,000 pounds on 2-inch tires.

Mention has been made times innumerable of the system by which such Continental countries of Europe as France and Germany have maintained their vast network of floor-like roads in a condition that is equalled in no other part of the world, but it is a story that will bear endless repeating, at least until it is taken to heart. Germany requires even light vehicles to have tires of a minimum width of 2½ inches, and both this and other European governments compel all road users to construct their vehicles in a manner that will impose the least possible wear on its surface. In France every market wagon and cart is a road maker. The tires are from three to ten inches wide, the average being from four to six, and the rear axle is more than a foot longer than the fore, so that the track of the rear wheels is fully one inch outside of that of the forward pair.

Mather to Head Rhode Islands.

William Penn Mather has been nominated for the presidency of the Rhode Island Automobile Club, the annual meeting of which will be held on Wednesday next. Mr. Mather is now vice-president of the club. Other nominees are as follows: For vice-president, R. Lincoln Lippitt; for secretary, Eugene M. Sawin; for treasurer, H. D. Wilcox. Governors, for three years: C. Prescott Knight, Lowell Emerson; for two years, Darwin Almy, Charles A. Read; for one year, Charles A. Russell.

The following officers have been selected to serve the Ogden (Utah) Automobile Club for the ensuing year.: President, O. J. Stilwell; vice-president, Archibald Bigelow; secretary, Dr. U. V. Withie; treasurer, Dr. F. W. Baker; captain, L. H. Becraft.

MAY "MILK" ALL MOTORISTS

Despite State License, Pennsylvania Court Holds Local Licenses Legal—Text of the Decision.

Although Section 14 of Pennsylvania's new State automobile law, which goes into effect Monday next, explicitly states that "all acts or parts of acts inconsistent herewith are hereby repealed," it seems that Philadelphia's individual motorist mulcting system—otherwise known as the license act of 1902—is not abrogated by the legislative act of 1905. At least this is the opinion of Judges Willson, Audenried and Carr, in Common Pleas Court No. 4, in refusing to grant the injunction of the Automobile Club of Philadelphia and the Philadelphia Automobile Dealers' Association against the city authorities to restrain them from enforcing the iniquitous local ordinance requiring the display and purchase of license tags from the Bureau of Boiler Inspection.

The decision is taken to mean that all first class towns and cities throughout Pennsylvania may compel automobiles to secure licenses upon entering their sacred territory. Thus, to be allowed to travel through that State a car must be betagged and benumbered like a veritable department store many times marked down piece of goods.

Pittsburg motorists some time ago lost a similar case when they questioned the right of the city to impose a local tax on motor cars, but they took defeat stoically. Not so the residents of the Quaker City, however, for they are going to rupture time honored traditions by displaying a laudable progressiveness. Their next step will be to obtain an injunction restraining the city authorities from enforcing the new State law. Those interested will carry the case to the highest court for judgment.

In the opinion handed down by the court in Philadelphia last week the provisions of the automobile laws of 1902 and 1903 are cited, and then it goes on to say:

"It is claimed on behalf of the plaintiffs, however, that, whatever may have been the case previously, the condition of affairs was altered when the act of Assembly of April 19, 1905, came into existence. That statute enacted that no motor vehicle could be operated within the highways of the Commonwealth until the operator of the vehicle should procure a license from the State Highway Department of the Commonwealth. That department was directed to enter the application for a license in a particular book, and in a proper case to issue a license to the applicant, together with two tags exhibiting the license number and the number of the year.

"For this license, as well as for the licenses called for by the ordinance of 1902, and the act of Assembly of 1903, a fee was to be paid. It is provided in the statute that no more than one State license number should be carried upon front and back of the vehicle, and that a 'license number obtained in any other place or State shall be removed from said vehicle while the vehicle is being used within this Commonwealth.'

"In regard to the rate of speed it was enacted that 'no person or persons shall be allowed to use, operate or drive any motor vehicle on any of the public streets or public highways of the cities, boroughs, counties or townships of this Commonwealth at a speed greater than a mile in six minutes, within the corporate limits of any city or borough; while outside of the corporate limits of any city or borough the lawful rate of speed shall not exceed one mile in three minutes.'

"There was a proviso that in townships of the first class the Commissioner may by ordinance fix a rate of speed of not less than one mile in six minutes; and also that the section containing the provision as to rate of speed should not permit any person to drive an automobile faster than is reasonable, 'regarding traffic, danger of injury to property or person, at any time or at any place.'

"It is contended on the part of the automobile people that this act of 1905 must be regarded as superseding and obliterating the ordinance of 1902, and as supplying the sole method of regulating the use of automobiles within the Commonwealth. They are taxpayers within the city, and being apprehensive that the municipality in making preparation for carrying out the provisions of the ordinance for the year 1905, will be obliged to make certain expenditures of the public funds, have filed the bill in this case to prevent the public officers from taking any steps in that direction.

"It is, of course, beyond all question that if the statute and the ordinance are inconsistent, or, if the statute can fairly be regarded as intended to supplant the ordinance, the latter must give way and the statute only have effect given to it. Paramount authority of the lawmaking power of the State over the lawmaking power of the city must be conceded. The question therefore comes down to this: Is there any necessary incompatability between the statute and the ordinance, or does it sufficiently appear that the statute was intended to furnish the sole rule of conduct and regulation for the use of automobiles and similar vehicles?"

The opinion then states that the city had full power to pass the ordinance of 1902 and that this ordinance was better adapted to protect people using the streets than the act of 1905. Reference is made to the fact that under the terms of the ordinance the license to be obtained from the city is one which is based on certain examinations which the court does not regard as inconsistent with anything in the act. No satisfactory argument was presented against the right of the city to require guarantees from operators of automobiles additional to those required by the State.

"It has been argued," continued the opinion, "that the act of 1905 was intended to provide that only one license number or tag shall appear upon the front and back of the vehicle when operated on the highways, but we do not regard this to be the proper construction of the act. It is provided that only one 'State license number shall be carried upon the vehicle. There is no prohibition against the carrying of a license which was not a State license, and the limitation of the prohibition to a single class of licenses implies that it was not intended to exclude a local municipal license from being carried upon the vehicle.' As to the word 'place' used in the act, the court does not regard the term as applying to a city or municipality within the Commonwealth.

"It seems very plain," the opinion goes on to say, "that what was intended to be enacted by the clause just cited was that a foreign license number should be removed from any vehicle which comes from another territorial division outside of the State into the limits of the State. The language of the act—'while the vehicle is being used within this Commonwealth'—the court construes as meaning that the vehicle in the mind of the Legislature was one which came from outside of the State.

"It may be argued that there is an incompatibility between the statute and the ordinance in the different provisions which are contained in the two with reference to the rates of speed at which an automobile may be driven. The statute provides that no person shall be allowed to operate such a vehicle above a certain maximum speed under certain conditions. The question might arise as to what is meant by the term 'allowed,' and as to who or what authority might allow the use or operation thereof. Perhaps it would not be straining the force of language to construe this provision as referring to the constituted authority having jurisdiction over highways in any particular district. Aside from this point, however, it must be noted that the Legislature only prohibited the driving of automobiles or similar vehicles at a higher rate than the fixed maximum speed. It did not state that they might be driven at that rate, except by implication, and that implication may be regarded as having been overcome by the further provision that the prohibition against exceeding a certain maximum rate should not be construed as permitting any person to drive an automobile at a greater speed than is reasonable.

"It does not seem to us that this restriction of the force of the provision regulating the rate of speed should be regarded as applicable only to a particular case, where the question of the reasonableness of the speed might come before a jury, say, in an action for negligence. In the absence of any prohibition against local legislation it would rather seem that the Legislature intended that the local authorities having jurisdiction over such a class of subjects, and having special knowledge of the conditions of their own localities, might by ordinance determine what should be a reasonable rate of speed.

"This we believe to be a permissible construction of the statute before us, and we believe that such a construction will best pro-

Digitized by Google

mote the interests of the various communities of the Commonwealth composed of people living in closely built towns and cities, and that no unreasonable restrictions are thereby placed upon people who desire to make use of the modern horseless vehicles, with due regard to the rights of others.

"We are unable to find in other portions of the act of 1905 anything which conflicts with the ordinance of 1902, and in view of what we have already stated we have reached the conclusion that the injunction prayed for must be refused."

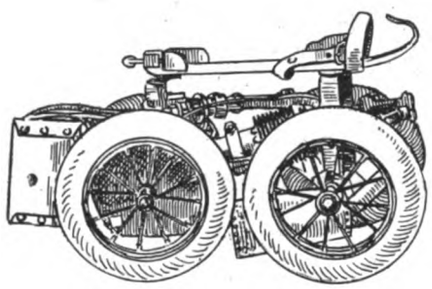
Photographs Settled Perjury Case.

In a recent trial of one of the bicycle "scouts" employed by the London Automobile Association for perjury in giving testimony as a witness in defence of a car owner mulcted for overspeeding, the police witnesses were utterly refuted by means of photographs of the scene of the "trap."

The prosecution hinged entirely upon the policeman's ability to determine when an oncoming car passed a given point, and after the manner of their kind the "bobbies" took solemn oath as to the accuracy of their knowledge. When confronted with the picture they were unable to say whether a man standing in the road apparently at the spot indicated by their testimony was in reality in that position, had not yet arrived at it or had already passed it. As a matter of fact, he had passed it by thirty yards, a distance sufficient to have a marked effect upon the result of a speed calculation based upon the running of a furlong. By such methods as this the English motorist has been squeezed to the tune of $5,000,000 in the last year.

Having "Fun" With Automobilists.

New Haven (Conn.) automobilists have recently been made the victims of that now time-worn scare carried out on a poorly lighted street with the aid of a dummy figure at the end of a rope. In this instance its perpetrators have been in the habit of taking up their stand just at a point where the driver sees a chance to "let her out a bit." As the car approaches rapidly the straw man is yanked out of the darkness directly into its path, at the expense of the driver's nerves. It means an emergency stop and a hasty search for the mangled remains, while the conspirators hot foot it down some convenient alley and make good their escape.



Why Holman Left Massachusetts.

"We have no 'auto-jims' here and no fresh cops to take you in for the sake of getting a little of your money," is the way in which an ardent automobilist who has disdainfully shaken the dust of Leicester, Mass., off his feet for the more peaceable vicinity of Daytona, Fla., expresses his sentiments. He is E. M. Holman, a retired jeweler, and owing to the treatment he and other automobilists have received at the hands of the local "cornstubbles" and tare gatherers, has sworn that he would not buy so much as a burial lot anywhere near that town. He is making it good by taking up a permanent residence in a more congenial clime.

Here's that Motor Skate.

So many conflicting reports have been circulated, and so much has been said of the "motor road skate," that has been drawn from the imagination, that many were inclined to discredit the whole story as a fabrication, and such a view was more than justified by some of the forms in which the story has made its appearance from time to time.

But the motor skate is a reality, after all. It is said to be the invention of a Swiss engineer, and is now actually on the market, samples of it being shown at the recent Salon in Paris. It consists of a small air-cooled gasolene motor, power not given, mounted upon a miniature chassis running on four wire-spoked, rubber-tired wheels, as may be seen from the accompanying sketch, drawn from a photograph. The motor is coupled

direct to the rear axle which carries the driving wheels, and lies almost horizontally under the foot of the wearer. As it is of the inside flywheel type familiar on motorcycles, it has few exposed moving parts. The exhaust is carried through a curved outlet from the valve to a muffler that is almost as large as the engine, lying parallel beneath and barely clearing the road. Ignition is by means of the usual battery and ordinary trembler coil, mounted on the chassis itself, while the fuel supply is carried in a tank belted to the waist of the passenger. The front pair of wheels is mounted on a small bogey truck in order to enable the wearer to steer a course, though just how control of a pair of these loose and ordinarily wabbly trucks is maintained, and why they do not turn at right angles and contribute toward sending the skater to the far beyond is not apparent. A speed of 25 miles an hour is claimed for the device on a level road, but no mention is made of how expert a foot-chauffeur the wearer should be to attain this. These self-propelling skates are being placed on the market at $120 per pair.

Both Speeding and Loitering Prohibited.

They bring things down to a fine point in Metuchen, N. J. Signs which hang on the outskirts of the borough bear the following inscription:

"Borough of Metuchen.
"Motor Vehicles.
"Speed Limit:
"1 mile—7 minutes.
"No begging or loitering allowed."

Dust Leads to Odd Suit and Verdict.

What is deemed to be a "somewhat remarkable case" by the foreign press has just been decided by a Paris court. On May 1 of the present year an automobile passed a cyclist on the road between Paris and Melun. The motor car raised so dense a cloud of dust that the cyclist, who was completely enveloped in it, became confused, swerved across the road into the path of an oncoming car and was killed.

Actions were instituted against the drivers of both cars, the one that had actually done the damage and the one that had indirectly been the cause of it. The verdict was a fine of $200 and compensation to the amount of $600 to the relatives of the deceased. The driver of the first car was not only relieved of any responsibility for the accident, but a claim of $40 for malicious prosecution in his favor was allowed.

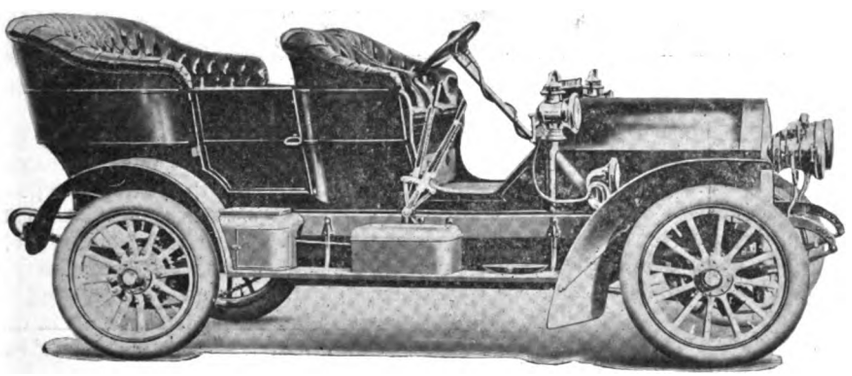
How the Horse Increases.

Many are the predictions of the passing of the horse, but there is one authority who openly declares it to be his opinion that the greater the number of automobiles the greater will be the number of horses. He is M. Lavaillard, one of the directors of a Paris omnibus company, and his contention is that successive inventions, such as the railway, have led to the transformation of the horse—not to his disappearance. He showed that since the opening of the Paris subway the Compagnie Generale des Omnibus has purchased 3,000 more horses, and that whereas there were in France 5,386 automobiles and a little more than 3,000,000 horses in 1904, the figures increased in 1905 to 17,704 automobiles and 4,228,000 horses.

Sued for Damage to Highways.

Probably the most unique bit of litigation growing out of the use of the automobile takes the form of an action brought against an express company in England for what is alleged to be "extraordinary traffic damage to the roads caused by the defendant's motors." Upon consideration it will be seen that the adverse decision of such a case would open the way to endless litigation aimed at all users of commercial vehicles. It is thought to be a question of such moment to the industry in the "tight little isle" that the Society of Motor Manufacturer and Traders has appropriated $250 to defend the action.

Even Elephants Are Being Eliminated.



There are few things which the automobile is not credited with having displaced, and if a list of those that it has done away with is ever compiled it will include the rather incongruous item of "elephants." Instead of travelling about in the gaudily caparisoned howdah, perched on the back of one of these mountains of flesh, the native East Indian of rank now affects the motor car. And his wealth is such in many instances that the European must perforce take a back seat. Most of the high priced and ultra fashionable cars are the property of the native princes.

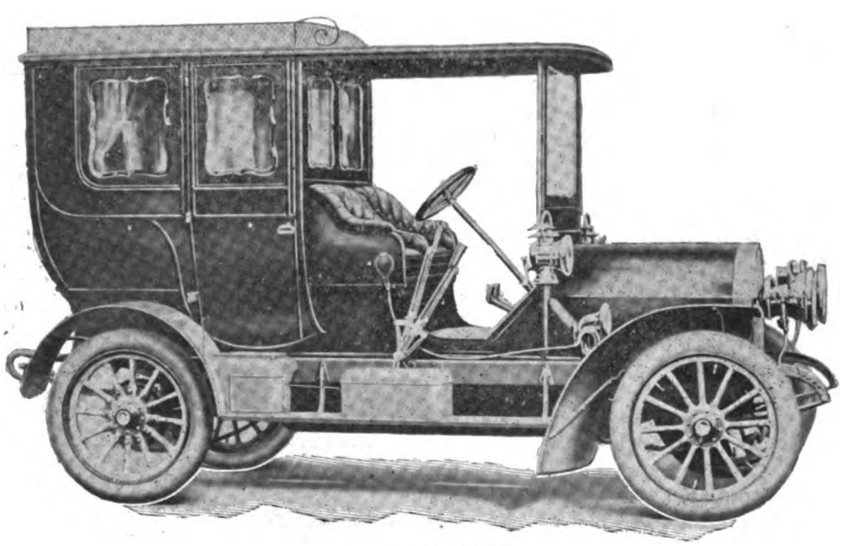
ABOUT THE NEW KNOXES

Famous Air Cooled Cars Now Right Up to Date—Full of Style and New Features.

Up to the present time cars driven by air cooled motors have been in a class by themselves in more senses than one. They have been distinguishable by an appearance totally at variance with machines of the commoner type—a thing which, although placing them in the class of the unusual, has served the

KNOX TOURING CAR.

more to emphasize the excellence of their performance on that very account. To many purchasers, however, this very fact would serve as a deterrent from investing in a machine which otherwise would be wholly to their liking, so that, all things considered, the Model G, Knox car, with front vertical motor, rated at 35-40 horsepower, capping the climax of an efficient lineage, yet comparable in power and mounting with any of the more conventional machines, should prove a good venture for the Knox Automobile Co., of Springfield, Mass., and a good and safe investment for the purchaser.

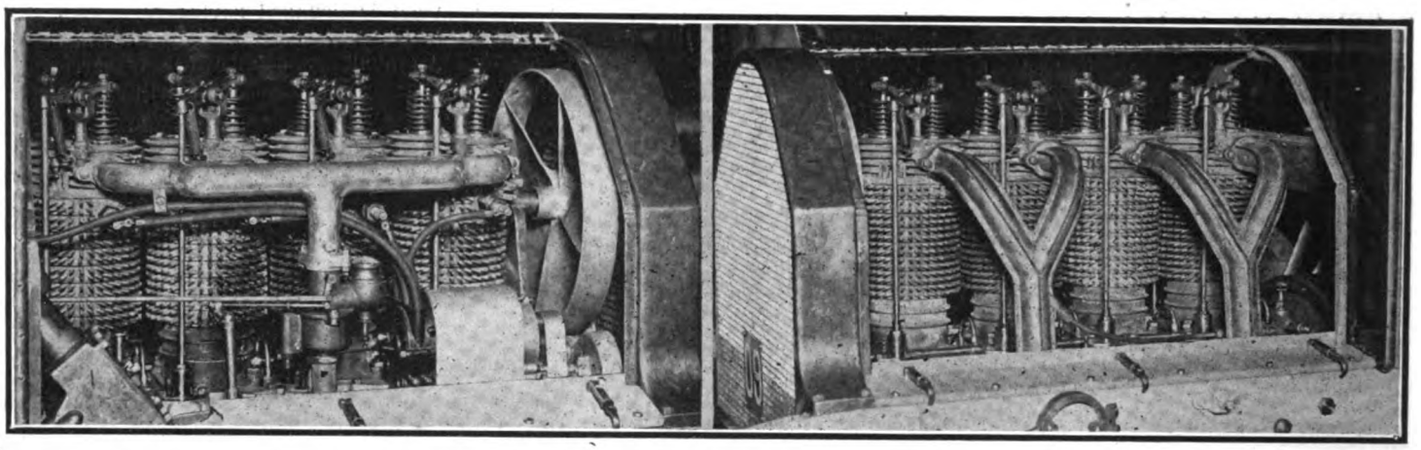


Model G is signalized first of all by the fact that it is the first air cooled car of high power to be produced as a regular stock model, and, second, by the fact that it is constructed along the general lines which have been adopted for water cooled cars of standard type, the details having been worked out with characteristic thoroughness and the entire fabric made in a manner which is authorized by good and established precedent in the industry. The cylinder dimensions are 4¾ by 5½ inches. The cylinders are cast separately, and are fitted with the system of radial grooved pins for extended radiating surface, which is a feature of all Knox machines. The air circulating fan, which completes the cooling system, is mounted at the forward end of the motor, and is driven by a belt from the crank shaft.

The valves, which are interchangeable, are mounted in the heads of the cylinders, and are actuated by short walking beams mounted on the heads, which, in turn, are actuated by push rods driven from cam shafts running in a compartment of the crank case upon either side. A notable feature in the valve construction is that the valves are mounted in cages, which are removable by the relaxation of a single nut in each case, by which means both the valve and its cage may be lifted clear of the engine for inspection or grinding. This removal of the valves may be accomplished without the disturbance of either inlet or exhaust connections, and, of course, without interfering with the timing or other adjustment of the mechanism. The cam shafts are entirely enclosed, and are driven from the crank shaft by heavy gears running steel to bronze. The crank shaft, which is made of nickel steel, cut from the solid slab, runs in five liberal bearings in an aluminum case, which is so arranged that the lower half may be removed for purposes of inspection without disturbing the adjustment of the bearings. Four of these bearings are 2⅞ inches in length, while the fifth, which is at the rear end of the motor, is 4 inches long. The wrist pins are tubular and afford a 1¾ inch bearing for the connecting rods. The connecting rod bearings themselves are of the marine type, bronze bushed.

The jump spark system of ignition is used with a high tension magneto generator, which is directly driven from the inlet cam shaft. A thoroughly modern type of instrument is installed having separate coil and high tension distributor mounted in the case. An auxiliary dry battery is carried as a standby and for use in starting the motor on occasion.

The clutch which connects the engine with the transmission is of the cone type, fully enclosed, and running in oil. Unlike most members of its class, it is without the common leather facing, working metal to metal. On this account it is absolutely free from the drawback of fierce engagement which characterizes many devices of its type, furnishing, on the contrary, an absolutely "sweet" engagement under all circumstances. The amount of oil used is very slight, and the device requires a minimum of attention. The transmission is of the sliding gear type, running in ball bearings, and adapted to yield a direct connection on the highest gear with no pinions in mesh. Other merits of the mechanism are that the shafts are so short as to preclude all possibility of their springing when running on the lower gears, and that the use of one bearing riding within another, which is found in many transmissions, is avoided, thereby eliminating a feature which introduces numerous complications.

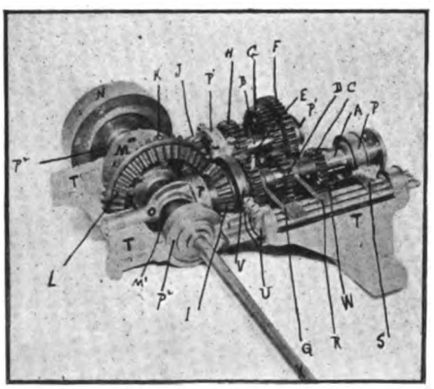


As shown in the accompanying illustration,

KNOX LIMOUSINE.

the distribution of the turning effort, of the motor is accomplished by means of a driving and lay shaft mounted side by side in Hess-Bright bearings of the automatic type. The rear bearing of the driving shaft, P, is bolted to the bottom of the case, and also is stayed to the rear of the case by means of the arm, O, which bridges over the countershaft. The sliding member carrying the gears, C and D, is splined to the shaft, A, by means of four heavy keys. In successive position it meshes with gears, F and G, for the first and second forward speeds. By meshing E and H, the third speed is obtained, the drive up to this point being through the lay shaft and the bevel gears, J and E, the latter being mounted on the

Digitized by Google



INLET SIDE. —KNOX MOTOR.— EXHAUST SIDE.

differential casing. For the fourth speed, or direct drive, the gear, E, is slipped into an internal gear, V, which is made integral with the bevel pinion, I, meshing with the second bevel gear, L, on the differential. With this connection the gears of the lay shaft are out of mesh, and in consequence it rotates idly in its bearings. The pinion, I-V, is mounted upon the shaft, A, in ball bearings, and when not in use revolves freely with little or no load upon the shaft. The reverse movement is obtained by sliding the reverse idler, W, backward in the case until it meshes at once with gears C and F.

The shifting bars which operate the gears are moved at the proper time by a single lever at the side of the car, which slides through a gridiron segment, fitted with a gate as a guard for the reverse. The shafts are all made of a special grade of nickel carbon steel, having a tensile strength of 120,000 pounds per square inch, while the gears are of a nickel chrome alloy, having a tensile strength of 175,000 pounds per square inch. The gear case is of cast aluminum, divided at the centre, and having a liberal inspection port in the top.

The running gear is of equally modern construction with the power plant, consisting of 34-inch wheels, shod with 4-inch tires in front and 4½-inch tires in the rear, the wheel base being 112 inches, and the tread standard. The axles are of I-beam construction, made of special steel testing 120,000 pounds tensile, and the steering pivots and levers are forged from the same material. The frame is of high grade pressed steel, tapered in section toward each end, and of the same width throughout. The spring horns are hand forged from the same grade of steel which is used for the axles. The spring suspension is characteristically easy, consisting of semi-elliptic elements, the front members being 42 inches long, and those in the rear being 54 inches in length. All springs are 2 inches in width. The mud guards are of liberal proportions, those in front being of the plough-share variety, both sets connecting with the running board at the side of the machine. The brakes on the rear wheels are of the internal expansion order, while a large drum, N, mounted on the counter shaft, and actuated by a push pedal, is of the external type. The control of the machine is accomplished by means of spark and gas levers mounted at the top of the steering column, and also by a foot accelerator. In addition to the action of the brakes, the motor throttle is so arranged that the compression may be used in retarding the car at the will of the operator, thus saving the wear and tear of the brakes.

In the design of the car, matters pertaining to the working out of such details as the length, diameter and spacing of the radiating pins, and the speed and pitch of the fan,

KNOX TRANSMISSION.

have been worked out with the greatest of care, and so fine has the development of the system been made, that the amount of power consumed in driving the latter auxiliary is but little more than that required to drive the circulating pump of a water cooled machine. In all other respects also, including the carburation, which is completely automatic, and the lubrication, in which the system of continuous circulation of oil through all the engine bearings by means of a pump, the amount of feed being indicated by a gauge upon the dash, has been adopted, the greatest of pains have been taken to produce a perfectly efficient motor car.

Elimination of Ignition Push Rods.

One of the drawbacks attendant upon employment of the make and break system of ignition for the high speed engine was the excessive momentum and inertia of the push rods actuating the hammer mechanism unless their weight was reduced to a point that at the outset did not appear practical. This has, however, been satisfactorily overcome by the use of rods needle-like in thinness and weight, but of a steel calculated to withstand any strain imposed upon it in this role. Now the designers of the Richard-Brasier cars have swept away the rods altogether, and with them the problem attendant on their use. The ignition cam shaft has been raised from its customary location at the level of the top of the crank case, to the top of the cylinders and above the ignitors themselves. This is driven by a small vertical shaft and bevel gearing and actuates the ignitors by means of small face cams; a modification of design that eliminates quite a number of small parts. Provision is made for automatically retarding the ignition when starting, although normally the timing is fixed.

Peculiarities of Pognon's Plug.

Automatic regulation of the sparking gap is an advantage claimed for the 1906 model of the Pognon sparking plug. Normally, which means when the points are cool—only a distance of four millimetres separates the points, but as the engine heats up the central rod carrying one of the platinum terminals expands in length from the centre of the plug and carries its point away from its fellow on the body of the plug, the amount of expansion permitted just being sufficient to cause the formation of the proper gap for the spark when the magneto is running at full speed.

For this reason it is claimed to be the plug par excellence for starting directly on the magneto. The porcelain of this plug is in three pieces, forming air chambers and passages all around the conductor, which touches the blocks only at the outer end through a fitted ring, and between the inner and centre block by means of another ring or distance disk. No cement is used in its construction, so that it may be readily dismounted.

Advent of the "Motician."

"Motician" is the newest product of word coinage. It comes from abroad, and is designed to describe an automobile engineer.

PORTO RICO'S STAGE LINE

Where Three Motor 'Busses have Replaced 33 Coaches—How Success was Achieved.

"Our actual service experience has been remarkable in a country which knows not machinery, and where the nearest repair shop is 1,500 miles away, and it takes three weeks to replace a broken part if it happens to be something you do not have on hand," says C. W. Martin, who has completed a year's operation of automobiles as common carriers between Camuy and Aguadilla, Porto Rico, a gap in the American Railroad, in telling of his experiences with the automobile in that country.

"We have been operating a stage line in the western part of Porto Rico. The distance covered is fifty-four miles (twenty-seven miles each way), completing a gap in the railroad over a section of country so rough and hilly that the great expense has prevented the American railroad from building its line here.

"Our work is to take passengers, baggage and mail from the northern railroad terminus to the southern and bring back whatever may be at the southern terminus. For this we have five hours and twenty minutes when the trains are on time (which is not always the case). We have been running now just one year without missing a single day and have carried 7,422 passengers. Not a passenger has been hurt in any way and not a domestic animal killed except one too inquisitive pig and a few dogs.

"I should like to know if there is a railroad or trolley line that can show a better record for safety and reliability?

"We have four machines, three used for passengers and mail service and one as a 'hospital car.' Two of the cars for passenger service are 8-horsepower machines, with a seating capacity each of eight and the operator, and the third is a 20-horsepower, double opposed motor, fitted with a body designed to carry fourteen passengers and operator.

"The 'hospital machine' is always kept loaded with parts and tools so that if we receive a wire that something is wrong the 'ambulance' is on the road within a minute or two after the telegram is received. It is geared pretty high and generally needs very little time to reach the cripple. Then if the trouble means an hour's work or more, passengers and mail are transferred to the 'hospital wagon,' which continues the trip, and 'Mr. Cripple' has his wounds healed right there in the road.

"Only once have we had to call on outside assistance, and that was when a crank shaft broke. Not having an extra one, we had to have the help of a team or friendly oxen. Every other machine has come in on its own power. We have had troubles and many of them, but it is not to be wondered at, as we are compelled some days to carry very much more weight than the machines are built to carry.

"One day the two eight-passenger cars were loaded to their fullest capacity and the fourteen-passenger machine with nineteen crowded into it, was drawing a trailer weighing a thousand pounds empty and loaded with fifteen hundred pounds of baggage and mail. When machines have such a strain put on them it is not surprising that parts sometimes give way.

"For a part of the way our road is very bad, and we bounce over ruts and boulders and plough through deep sand; then we have long, steep hills to climb which intensifies the strain, and the vibration, caused by using solid tires, crystallizes the axles, and they break. That trouble we have overcome by having straight two-inch axles made.

"We are three weeks from the factory, so it is often necessary to make sight draft on our ingenuity. Once the lower leaf of a spring gave way and it was impossible to proceed without fixing it. We had no rope or twine at hand, were at our most distant point from a telegraph station and had a load of passengers for the steamer that sailed next day from San Juan for the States. A crowd of natives was soon about us, and one, seeing our trouble, darted into the woods and returned in a few minutes with a vine that they use as rope. So we bound up the spring with the vine and caught the train.

"The wet battery, broken spark plug, stopped up carburettor, etc., are troubles every automobilist has, and I will not dwell on them.

"Once we burned the babbitt out of a connecting rod, owing to neglect to set up the grease cap that lubricates it. The chauffeur was certainly 'up a tree' until a passenger asked if he had ever tried leather for a bearing. Besides being a new idea, there was no leather, but since it was necessary to do something the driver cut the soles from his shoes and fitted the leather into the connecting rod. It brought the machine in in time for the train, but I do not recommend the use of leather in place of babbitt.

"We have some difficulty to secure intelligent help. I brought two men down from the factory, but through one's taking another position I was left with only one man who thoroughly understood the machine. We have taught several of the natives and two Americans, however, and now have five good men.

"Our engines are cooled by threaded pins screwed into the cylinder enough to allow thirty-two inches of radiating surface to one inch surface inside the cylinder. With this system we can take the long, hard grades with a full load without overheating, and I think have settled for all time that even in the hottest weather, such as we have here all the year, the air cooled engine is not only 'as good,' but much better than water cooled.

"When we started our line there were thirty-two coaches, each seating three people besides the driver, to do the work our machines are doing. I say 'to do the work,' but I should say to do half the work, as the travel has more than doubled since we started giving so much quicker service. The coaches died hard; they cut their price in half, and, of course, got some business, but they have all left the route now except three. These three have some business, as there are still some people afraid of the automobile.

"In the beginning we tried to keep an accurate account of the total cost per mile with each machine, but the men found it too much of a problem to keep things straight, so we can only make an average estimate. Taking the cost of all gasolene, tires and parts used and making a fair estimate of the depreciation in machines and then dividing this total by the mileage we figure the cost to have been about 5¼ cents a mile, exclusive of the chauffeur's wages. In the States it would be at least 1½ cents less, on account of cheaper gasolene, no cablegrams and no excessive express charges.

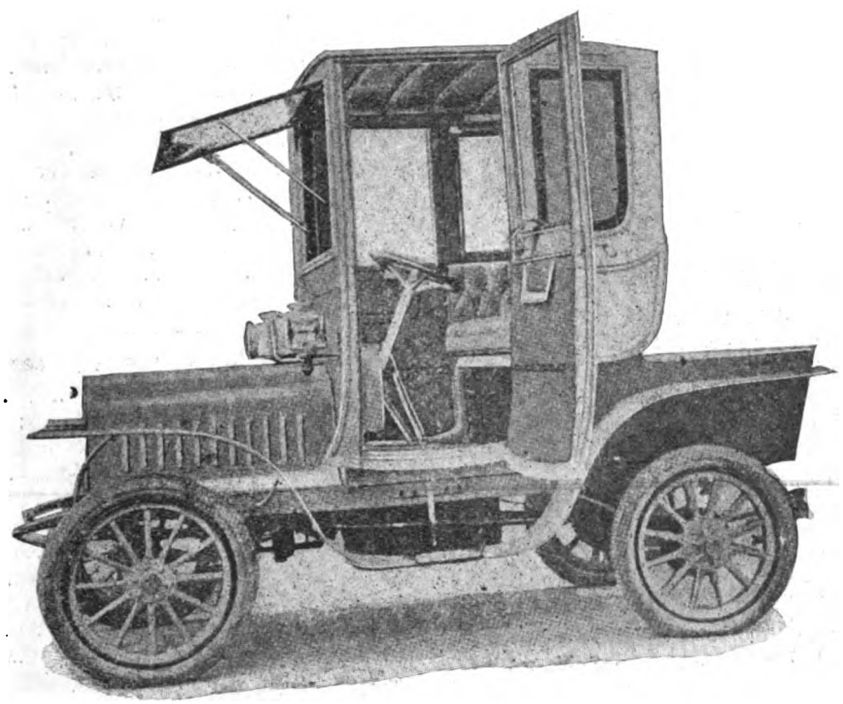
"In the face of all our competition, our troubles early in the game and the natives' fear of the machines, we will this year pay a dividend of 25 per cent. We have increased our holdings, extra parts and tools, etc., about 40 per cent., and have no kick coming on the automobile as a commercial vehicle."

Motor Bus's Revolutionizing Influence.

"It has achieved success, both financial and mechanical," says the Motor Car Journal, speaking of the London motor 'bus, "and the popular penny form of automobiling has accordingly become ubiquitous," it adds. There are few fields now left for it to conquer, for it is being chartered for theatre parties and the like, and—say it with all due solemnity—it has invaded the sacred precincts of Windsor Castle. It has also been requisitioned to convey the King's bodyguard from the barracks to the castle. It is responsible for something akin to a revolution in the fares in London, for to the coming of the motor vehicle must be ascribed the sweeping reductions made by railways and 'bus companies alike during the last month.

The celerity with which the motor 'bus takes people across and through the metropolis is only comparable to the quickening of transportation facilities that followed the introduction of the steam railroad many years ago. The extent to which London is being awakened from its century old sleep may be realized from the fact that one company already operating 100 vehicles has no less than 700 more on order, all of which are to be delivered within the next few months. London, it may be added, is poor in trolley lines.

When Accidents Usually Occur.



"Did you ever notice," remarked an observant motorist the other day, "that practically all of these accidents in which visits to country clubs or roadhouses cut a figure occur on the return journies? How many have you heard of that happened on the outgoing trips?"

DEPARTURE IN CLOSED CARS

Affording the Man of Limited Means a Car of that Type—Its Many Features.

Of the many types of closed bodies that have been devised to meet the demand for an all year car none would appear to combine comfort and convenience to the extent that has been attained in the Fouillaron doctor's coupé, recently introduced in France and pictured here. The engine is an 8-horsepower De Dion of the usual type, and is mounted on the pressed steel frame, in accordance with current practice, the remainder of the mechanism conforming to customary standards, with the exception of the Fouillaron change speed gear. The drive is through a clutch to a pulley connected to a second one by a combination chain belt of peculiar construction. Each pulley is formed of two laminated jointless cones, the arms of which are so intertwined that the inner end of each cone penetrates the interior of the other. The bottom of the pulley is represented by the circumference limiting the intersection of the two cones opposed to each other. One of these cones is movable, and can by sliding along the shaft penetrate more or less into the stationary laminated cone, and thus modify the diameter of the bed upon which the belt rests. A lever connected to a non-reversible driving mechanism enables one of the cones of each of the pulleys to slide along simultaneously, but in the opposite direction.

This movement causes a variation in the diameter of the pulleys without modifying the tension of the chain, and enables the entire gamut of speeds, ranging from a gear equal to five miles an hour up to one giving twenty-eight miles an hour, to be obtained. A spring, the tension of which may be safely regulated while the car is running, is inserted in the driving gear, and tends to augment at the same time the diameter of the two pulleys. It automatically takes up all play that might be set up by centrifugal force at high speeds, and prevents slipping of the belt. The latter consists of a series of links or blocks of chrome dressed leather, mounted on a chain of case hardened steel. The shaft upon which the second pulley is mounted is connected with the rear live axle by means of a cardan shaft in the usual manner. The speed may be varied without disengaging the gear, which enables practical advantage to be taken of all the speeds comprised between the limits available.

But it is more to the body than to the mechanism that attention should be directed, for it may be said to represent an achievement in the way of two prime attributes—comfort and convenience—that has seldom been attained, particularly in the small car. With a movable front shield and ample sized windows, it is to all intents and purposes an open car, and with these protectors in place it is closed in a manner that means the minimum waste of space and places everything at hand and under cover.

For Quick-Drying Finishes.

"Automobile painting and finishing at the present time is of the frenzied order—a sort of paint them while you wait style—and to meet this demand the automobile painter must either buy a quicker drying roughstuff than he has been accustomed to or make one as occasion demands," says the Carriage Monthly. "And on the whole, for this particular class of work, the practice of shop mixing the stuff is probably the more satisfactory, for the present at least. For an especially quick stuff suited to needs of work scheduled for a more than ordinarily rapid finish, use five pounds of any American filler of repute to three pounds of white keg lead. With equal parts of quick rubbing varnish and pale drying japan, mix this filler and lead to a paste sufficiently thick to hold upright a mixing paddle thrust into its centre. Then reduce to a thorough brushing consistency with turpentine. Three coats of this material may be safely applied every twenty-four hours, or a coat every eight hours.

"For a two-coat per day roughstuff, mix equal parts of the filler and lead, by weight, as above advised. This brings into the composition a slightly larger quantity of the oil lead, but still leaves the mixture an exceedingly quick drying one.

"In mixing these quick roughstuffs it is the better plan to mix to meet the daily demand. It insures a freer working and a surer drying material, and results in a saving of stock, because of all paint shop supplies the roughstuff supply, by reason of its mussy, pasty nature, suffers the greater loss when mixed ahead of requirements. And in quick work, such as we have above pointed out, the freshly prepared surfacing pigment that dries rapidly through and through is all important. A substantial aid to the quick drying of roughstuff consists in laying first one coat with a horizontal stroke of the brush and the second one with vertical strokes. This is an oldtime practice, but it insures uniformity of application, and therefore celerity in drying."

Now the Quick Detachable Tire Lug.

Detachability is the watchword of the tire-maker at the moment, and from present indications it would appear certain that he must make it his guiding star henceforth. In the majority of instances the lug has been discarded forthwith, but the English Dunlop company has set up a halfway mark by the introduction of a quickly detachable lug.

The tapped socket, into which this necessary but exasperating accessory of tire fastening usually screws, is split into four parts instead of being solid. These four parts are, of course, fast to a ring at their lower ends, and are supplemented by a thumbscrew slipping over them. By running the latter down to the end they may be spread apart, and thus permit of the screw being seated without turning. The thumbscrew is then brought down, closing the divided thread upon the thread of the bolt, so that it may be tightened up. It would appear to be but a halfway measure at best.

Toy miniature replicas of the modern motor car are nothing if not up to date. The latest addition is a full grown crank adorning the front of the bonnet, the same as on any man sized car. Here the resemblance ends, however, for at its hidden end the crank terminates in nothing more dangerous than a large ratchet, which produces a most soul-satisfying noise when the crank is "wound." It would indeed be an unimaginative juvenile owner who would forego this preliminary before taking his seat at the wheel.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, Bevel gear drive. Very large and roomy full aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

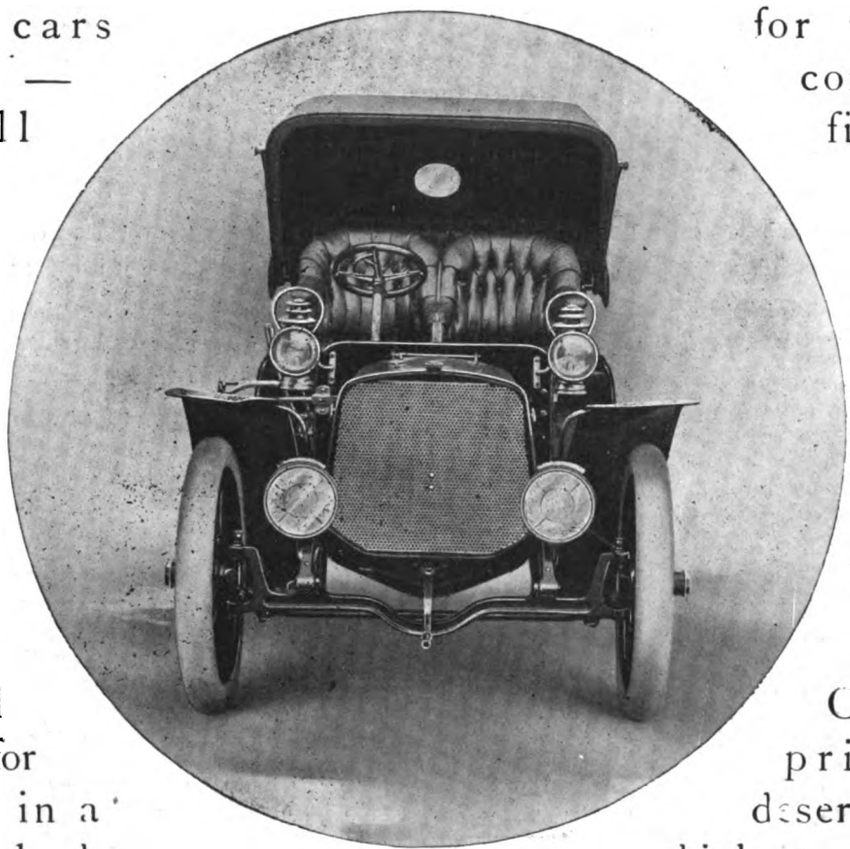
Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.



Good Agents wanted in unassigned territory.

We shall exhibit at the Armory Show in New York.

A GOOD FRONT

We believe in putting up a good front, and our cars show it — as it will also be shown in our New Building at Fifty-fifth St. and Broadway, which we hope will be ready for occupancy in a few days, and where we will have a continuous plate glass corner front, permitting LOZIER MOTOR CARS to be shown to the best possible advantage. And they will stand all the light that can be thrown upon them, for their fine construction, finish and equipment is such as invites the very closest inspection. The Lozier Car is the very largest American Car, and in price it is deservedly the highest. We are now delivering Limousines, Landaulets and Touring Cars, 35 Horsepower, Type C, 1906 Model, and every owner of a LOZIER MOTOR CAR is one of experience who has at last found the ideal in our product.

THE LOZIER MOTOR COMPANY

Temporary Quarters at R. M. Stiver's Carriage Rooms, 19 W. 62nd St., New York City

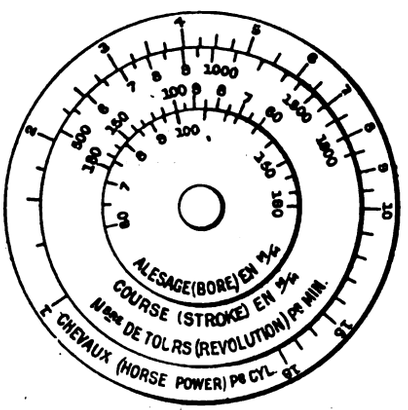
SEEKING THE LIMIT OF POWER

Some of the Many Questions Involved in the Effort to Check the Wastage.

The reactions that take place in the cylinder of an internal combustion motor are naturally more complex than those which result from the use of steam, for in the case of the latter only the simple processes of expansion have to be considered, and these have long been well known. While a complete exposition of the fundamental theory of the steam engine is a matter of many years' standing, there are still unsolved problems regarding the action of the explosion motor, particularly from the theoretical point of view.



The ultimate question is naturally, What is the greatest amount of energy that can be generated by the phenomena of combustion of the gaseous mixture when utilized under the best possible conditions? And this is something that modern theoretical chemistry has solved upon principle at least from every point of view, and practically so far as concerns the majority of important chemical reactions, to a degree more or less accurate. The influences of dissociation have been exaggerated, and it may now be said to a certainty that in practice the temperature of the explosion is but slightly affected by dissociation, this being determined by the specific heat of the products of combustion. It is a well known fact that internal combustion motors furnish notably less energy than should be obtainable from them under theoretically perfect conditions, contrary to the case of the steam engine. The speed with which the explosion is propagated is prodigious; combustion proceeds in longitudinal waves, attaining in the case of a mixture of gasolene and air a speed of 5,525 feet per second, with acetylene 9,100 feet and with hydrogen 9,360 feet per second. In a paper read before the German Union of Engineers in Berlin recently Nernst states the following conclusions, which he arrives at through extended observation:

First, the maximum amount of work that can be obtained from the combustion of a certain substance is exactly calculable in simple cases, and in others can only be approximated more or less accurately. Second, the maximum pressure developed in the explosion of a mass of confined gas has been accurately ascertained experimentally by a number of observers, and in the same way they have calculated the theoretical loss of heat at high temperatures as well as the specific heats produced by various carburetted mixtures. In the case of high temperatures the pressures observed agreed closely with those calculated theoretically, chiefly through the knowledge of the movements of the waves set up in the burned gases.

At the maximum temperature of the explosion there is established as a natural result of the great rapidity of the reaction set up an almost complete chemical equilibrium, and there is in particular at high temperatures the formation of instable products such as ozone, oxygenated water and nitrogen. The propagation of combustion in the confined mixture of gas is produced in part by thermic conduction in the same manner as in the case of slow combustion and in part purely hydrodynamically through spontaneous combustion following the propagation of a high pressure from the strong waves of compression (Berthelot's explosion waves). In mixtures susceptible of sufficiently rapid combustion, the slow burning is transformed into explosion waves of greater or less length. The formation of these explosion waves may be accelerated by the reflection of the waves of compression and also by encountering obstacles.

Ready Reckoner of Horse Power.

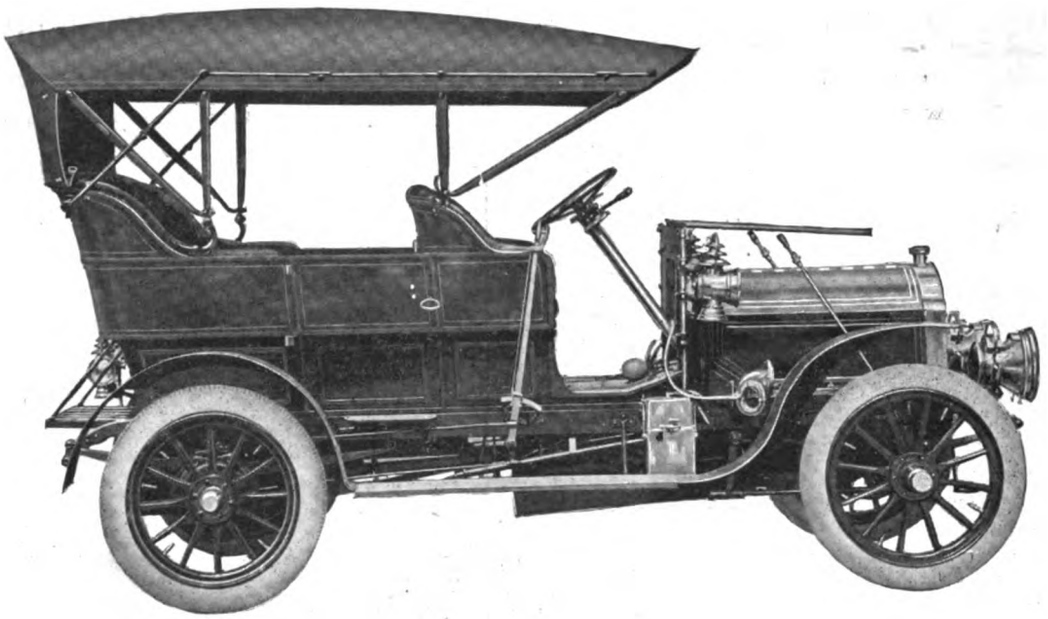
Endless as have been the explanations of simple methods of figuring horsepower, not

to take into account the numerous erudite dissertations on the same subject, it is very much to be doubted if the average layman is one whit better off in this respect than he was before some innocent member of his fraternity precipitated this mass of opaque informative matter upon his head by asking questions. A Frenchman has taken account of this and devised a rapid, vest pocket calculator which will do the trick for the veriest tyro while he waits.

This rapid, pocket calculator consists of three discs, the two small ones being mounted concentrically on the larger; the central or innermost disc may be rotated freely, but the outer ones maintain a certain rigid, relative position. The smaller disc carries at its outer edge a series of figures representing the cylinder bore in millimetres. The middle disc has two rows of figures, those on the inner circle representing the stroke in millimetre and on the outer the revolutions per minute. The figures on the large disc give the result in horsepower. The accompanying illustration pictures the instrument life size.

The simplicity of its working may be understood from the following example: Taking an engine with a bore and stroke of 100 millimetres (3.9 inches), the figures 100 on the two inner discs are brought opposite one another, the position at which they are shown in the accompanying illustration. The horsepower will now depend entirely on the speed; at 1,000 r. p. m. this will be approximately 4 1-2, and at 1,500, 6 1-2, or at 1,800, 8-horsepower. The total output of the engine is then readily ascertained by multiplying this figure by the number of cylinders. The instrument is said to be fairly accurate for anything over 2 inches bore, its calibration not being sufficiently refined for the high speeds at which smaller engines run.

RETURN OF BOTTLE GREEN



Once Fashionable Finish Due to Receive Renewed Favor—How it is Made and Applied.

Time was when bottle green passed among drivers as a strictly fashionable color, and, of all the greens, the handsomest. Other greens, less beautiful, but with more aristocratic titles, came into the field, and, to a very great extent, crowded the staid and brilliant old member of the family into oblivion. However, we are again hearing no small stir concerning this lovely color, and along speedways and swell avenues this coming season we may expect to see much of it upon the heavy pleasure vehicles, says the Hub.

In early French coach painting days it was the practice in painting bottle green to first apply a coat of lampblack, and then over this ground to apply successive coats of varnish until the desired shade of green was obtained. This method, however, was not the production of a true bottle green, such as the American carriage painter was able years later to obtain. For the benefit of readers who may wish to paint bottle green surfaces in the near future we advice the following system:

Prepare the ground color as carefully as possible, bringing the surface up from the priming coat with exceeding skill, so that no defects may interfere to mar the finished product. Over a surface thus made up add lemon chrome yellow to ivory black until a shade approximating bottle green is reached. Exact quantities cannot be given, owing to the variation existing in the strength of the two pigments as obtained from different manufacturers, hence it is a matter somewhat of color perception on the part of the mixer in striking for the shade of green desired. Whip this color up nicely and thin with turpentine. Apply to the surface with a camel's hair brush. The day following take a small quantity of Dutch pink, and add to it, sparingly, Prussian blue until a rich shade of bottle green is reached. We use the word sparingly because Prussian blue has the coloring strength of a Hercules—in fact, it is the strongest coloring pigment known, and a mere atom of it counts immensely in the mixing pot. Make this green of the consistency of ivory black thinned for use, and apply to the surface with a camel's hair brush. When this coat is dry, next apply a coat of yellow lake glaze made thusly: Stir the yellow lake into elastic rubbing varnish to make the glaze, and to a pint of the yellow like glaze add, say, one gill, minimum measure, of the Dutch pink color. Apply this glazing color freely, as you would any glazing or color, and varnish coat. Then, as into a mirror, one may look and find a surpassing brilliancy and depth of color. This color may be striped with charming effect by the use of black, gold, carmine, cobalt, cerulean or ultramarine blue, or with dainty lines of primrose or twentieth century yellow, or with some of the dashing reds now popular.

This is the Pierce Great Arrow 28-32 H. P., with straight tonneau body, cape top and folding glass front. Price, without top, $4,000. Cape top, extra, $200.

PIERCE

The Pierce Arrow is an American car—the best American car that has been made—better in proportion to its cost than any imported French car—better for American use, American roads and the American motorist. It offers satisfaction, minimum of expense in running, perfect service, and can be operated by the owner.

Catalogue and descriptive literature on request.

The Week's Patents.

806,810. Wheel Tire Attachment. Josiah F. Horn, Hazleton, Pa. Filed June 21, 1905. Serial No. 266,283.

Claim.—1. In a device of the class described, a non-elastic tire casing, and spaced lugs secured upon opposite sides of and arched above the casing.

806,822. Carburetter. Orson Millard, Flint, Mich. Filed April 18, 1905. Serial No. 256,323.

Clai.—1. In a carburetter, the combination with an air induction conduit, of an oil inlet connected therewith, a valve controlling said air inlet, an electromagnet for lifting said valve and means for energizing said magnet during the induction of air.

806,860. Spark Igniter System for Explosion Engines. David L. Winters, Chicago, Ill. Filed March 6, 1905. Serial No. 248,433.

Claim.—1. In an electrical ignition system for explosion engines, the combination of a plurality of battery cells, a pair of switch arms, a working circuit having terminal connections with the pair of switch arms, each of said switch arms having an individual contact point and a contact point in common, and three connections between the plurality of battery cells and the aforesaid contact points to divide the battery cells into two portions which may be switched into the working circuit separately or together by means of the pair of switch arms aforesaid, substantially as set forth.

806,916. Clutch Controlling Mechanism. Charles A. Rich, Providence, R. I., assignor to Brown & Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Filed February 5, 1904. Serial No. 192,153.

Claim.—1. The combination with a clutch, of a cam shoulder thereon, an abutment engaging said shoulder, a trip for operating said abutment, a travelling dog for operating said trip, and means for freeing the dog and trip independently of the travel of the dog, substantially as described.

806,933. Motor Vehicle. Terry Stafford, Topeka, Kans., assignor of one-half to L. Anton Smith and Clement Smith, Topeka, Kans. Filed April 5, 1905. Serial No. 254,014.

Claim.—1. In a motor vehicle, the combination of a frame, a rear axle connected with the frame, a gear case connected with the rear axle, a socket carried by the forward portion of the frame, a ball complementary to said socket arranged and movable therein and having a bore, a transmission gear case fixed with respect to the ball, a shaft connecting the gearing in the two cases, a tube interposed between and connected to the two cases and inclosing the said shaft, and a shaft connected with the gear in the second mentioned case and journalled in the bore of the ball and provided in front of said ball with means whereby the shaft may be connected with a motor.

806,957. Vehicle Brake. John Curry, Vancouver, Wash. Filed November 16, 1904. Serial No. 232,986.

Claim.—1. In a vehicle brake, the combination of a brake drum B, having a securing fulcrum plate G and the brake rope opening 9 and slot 11 therein and means to secure the drum to the axle; the two armed frame C, formed as shown in Fig. 5 with one side curved, and partly grooved on the side, and having means to secure it to the axle; a transverse brake bar D, having the bell crank lever 16, the triangular bell crank lever E, grooved on its shorter sides, and means to secure the brake bar to the axle; a wheel provided with a cylindrical metal hub casing H and means to secure the same to it; the coil brake rope 10 having means to secure one end thereof to the triangular bell crank lever E and the other to the frame C, and having the brake shoe K provided with the segmental friction pieces formed as shown in Fig. 6 and having means to secure them to the brake rope; power transmitting mechanism, having means to connect the same with the brake bar D and the brake; all substanially as described.

807,032. Coupling for Tire Charging Valves. George W. Kellogg, Rochester, N. Y. Filed February 1, 1905. Serial No. 243,699.

Claim.—1. In a coupling, the combination of the hose fixture a coupling to connect said fixture with a hose, the rotatable tube 12 having one end screw threaded and having at its other end a stop 5, the externally threaded sleeve situated between the tube and fixture to connect the same, and means for rotating the tube to screw it into a corresponding tube or nipple.

807,038. Reversible Variable Speed and Power Transmission Mechanism. John G. MacPherson, Philadelphia, Pa., assignor, by direct and mesne assignments, of two-thirds to Robert P. Murphy and one-third to Ralph L. Galt, Washington, D. C. Filed October 18, 1904. Serial No. 228,919.

Claim.—1. In a forward and reverse variable speed and power transmitting mechanism, the combination with a fixed speed continuously revolving driving shaft, a driven shaft and an intermediate driven shaft, of a variable speed and power transmitting mechanism connected with the driving shaft and the intermediate driven shaft and consisting of a pair of rocking frames for regulating the speed of the intermediate shaft, rods having one end slidably mounted in said rocking frames, so as to be limited in their forward and rearward movement, and a series of gripping members for regulating the direction of the movement of the driven shaft, said gripping members being so constructed as to grip the entire surface to which they are attached.

807,048. Transmission Gear for Gas Engines. Anson G. Ronan, Toronto, Canada. Filed August 11, 1904. Serial No. 220,363.

Claim.—1. In transmission gear, the combination with the engine casing; a first toothed pinion; the engine pitman operating same; a second toothed pinion, and engine pitman operating same, of the drive shaft journalled in said engine casing, and a toothed wheel keyed to said drive shaft and in mesh with said pinions from which it receives energy.

807,104. Change Speed Gearing. Larz W. Anderson, Cincinnati, Ohio, assignor to The Cincinnati Shaper Company, Cincinnati, Ohio. Filed June 17, 1904. Serial No. 212,978.

Claim.—1. A change gear device comprising a driving shaft, a driven shaft, similar reversed cones of gears keyed to each shaft, a shaft eccentrically journalled with means for rotating it, a frame journalled on said shaft, an intermediate gear carried by said frame and sliding on said frame in a direction parallel to the axes of said cones of gears, said intermediate gear being adapted to engage any two of the opposite gears of said cones, and means for locking said frame in position, substantially as described.

807,126. Oleaginous Mixture for Sprinkling on Roads, &c. Charles V. Potter, Balwyn, Victoria, Australia, assignor to Robert Maxmillian Hahn, Melbourne, Victoria, Australia. Filed December 20, 1904. Renewed November 16, 1905. Serial No. 287,680.

Claim.—The herein described mixture for the purpose specified consisting in the combination of carbolic acid, oil, powdered asphaltum, tar, glycerin refuse and water in the proportions mentioned and prepared substantially as described.

807,131. Carbureter. John B. Salo, New York, N. Y., assignor of one-half to Andrew H. Hoag, New York, N. Y. Filed October 9, 1903. Serial No. 176,355.

Claim.—1. In a carbureter, an absorbent member having a thickened edge portion, and a plurality of air circulation openings.

2. In a carbureter, a plurality of members each consisting of a flanged and perforated absorbent cake of solid porous material, the perforations in contiguous cakes being out of alignment, said members being superposed one upon the other and spaced by the flanges thereof to produce air circulation channels between their opposing surfaces.

807,144. Carbureter. Benjamin F. Walker, Bridgeport, Conn. Filed January 16, 1905. Serial No. 241,198.

Claim.—1. In a carbureter the combination with a body having an air inlet and a central fuel spraying nozzle, of a cone shaped coil spring air throttle through which air passes and whose smaller coils surround and rest upon the spraying nozzle and means for closing the coils to shut off the passage of air.

807,156. Steering Mechanism. William K. Cleveland, St. Petersburg, Fla. Filed May 12, 1905. Serial No. 260,183.

Claim.—1. In an apparatus of the class described, means for supporting and moving a vehicle body comprising a bracket provided with a casing, a drive shaft journalled in the casing and composed of a central section and two end sections, the end section comprising a cylindrical inner portion and a squared outer portion, trunnions on the ends of the central section, trunnions on the inner ends of the end sections and arranged at right angles to the trunnions on the central section, split rings encircling the junctions of the sections and provided with radial openings to form bearings for the trunnions, hollow spindles mounted on the cylindrical portions of the end sections and having cup shaped inner ends to receive the split rings, ball races on the outer surfaces of the hollow spindles, trunnions on the inner ends of the hollow spindles and in line with the axes of the drive shaft section couplings, yokes journalled on the drive shafts and provided with bearings to receive the trunnions on the hollow spindles, braces connecting the yokes with the body supporting bracket, hubs journalled on the hollow spindles and provided on their interior surfaces with ball races for coacting with the races on the hollow spindles, balls in the races, diaphragms on the hubs and provided with squared openings to receive the square portions of the end drive shaft sections, and crank arms on the hollow spindles for turning them on their trunnions.

807,167. Chain Armor for Pneumatic Tires. Edward B. Hazleton, Sheffield, England. Filed December 29, 1904. Serial No. 238,707.

Claim.—1. A chain armor for a pneumatic tire, said armor extending entirely around the tire and inclosing a part of the sides

Digitized by Google

thereof and being provided with the side extensions having eyelets, and wire cords passed through said eyelets and secured to the rim of the wheel, substantially as shown and described.

807,186. Sanding Device for Automobiles. Augustus L. Moss, Sandusky, Ohio. Filed February 8, 1905. Serial No. 244,727.

Claim.—1. An automobile provided with a sanding device having pipes terminating in nozzles and extending at an angle toward the path to be travelled by the driving wheels, but terminating away from the wheels, at the inner side of said path, for scattering sand over a roadway in front of the driving wheels of the automobile and across their pathway.

807,216. Variable Speed Driving Mechanism. Radford Stockbridge, Worcester, Mass., assignor of one-half to Arthur W. Beaman, Worcester, Mass. Original application filed October 24, 1902. Serial No. 128,552. Divided and this application filed December 9, 1903. Serial No. 184,393.

Claim.—1. The combination with a slotted vibrating pitman and a crank plate engaging the slot of said pitman, said crank plate having a radial slot, of a rotating gear journalled concentrically with said crank plate and having a radial slot and a rotating ring interposed between said gear and said crank plate and having its axis eccentric to the axis of said gear and said crank plate, said eccentric ring engaging the slots in said crank plate and said gear, whereby the rotation of said gear is imparted to said crank plate with a variable movement.

807,255. Clutch Mechanism for Coupling Rotatable Parts. Joseph Evans, Birmingham, England. Filed January 30, 1905. Serial No. 243,395.

Claim.—1. A governing device for clutch mechanisms, comprising the combination with a driving and a driven element adapted to interlock one with the other, of locking means carried by one of said elements and engaging the other of said elements for preventing the operation of the driven element by the driving element until said elements are in position to interlock, and means provided on the other of said elements and adapted to release said locking means to permit of the interlocking of the said element so that the two elements can be operated together.

807,296. Lamp for Autos and Other Vehicles and Purposes. Nicolas Lowenstein, Philadelphia, Pa. Filed June 26, 1905. Serial No. 267,081.

Claim.—1. In a lamp, a reflector composed of members, the rear one of which is in the form of a prolate spheroid, and the front one of which is that of a cone, the reflecting surfaces of said members being practically continuities and in unbroken planes, the burner of the lamp occupying the rear member of said reflector and located entirely within the same, a casing and a plurality of differential lenses on said casing, one behind the other and both in front of said reflector, the inner lens being supported by arms, so that comparatively unobstructed space exists in the casing around the periph ery of said lens.

807,311. Tire for Vehicles. Rienzi B. Parker, Hartford, Conn. Filed February 25, 1905. Serial No. 241,281.

Claim.—1. The combination, with a wheel, of a plurality of tire units each conforming to the periphery of said wheel; a circular binder for clamping the units to the wheel, and devices secured to the wheel and serving to separate the units from each other.

807,322. Exhaust Muffler. Henry R. Selden, Rochester, N. Y. Filed November 16, 1904. Serial No. 233,034.

Claim.—1. In an exhaust muffler, the combination of a casing into which the exhaust is delivered and which is always open to receive the exhaust, and spring operated means fitting in said casing, to receive the force of the exhaust and to allow the burned gases to expand, said casing being provided with means whereby the burned gases may escape therefrom, substantially as described.

807,338. Motor Operating with Heavy Hydrocarbons. Emile L. P. Turenne, Paris, France, assignor to the firm of Barbier Benard & Turenne, Paris, France. Filed June 5, 1905. Serial No. 263,837.

Claim.—1. In a motor of the kind described, the combination, with a cylinder in which a piston is actuated, an explosion chamber, means for injecting a charge of finely divided liquid fuel into this chamber and means for producing the ignition of the charge, of a tube or channel passing through said explosion chamber and communicating with the cylinder, a chamber for air and water, a valve between this chamber and the said tube, means for admitting air to the chamber for air and water, and means fo supplying the said chamber with water, the said valve opening during the suction stroke of the piston into the cylinder for the purpose of causing the mixed air and the water to pass from the said chamber for air and water to the said tube, substantially as described and shown and for the purposes set forth.

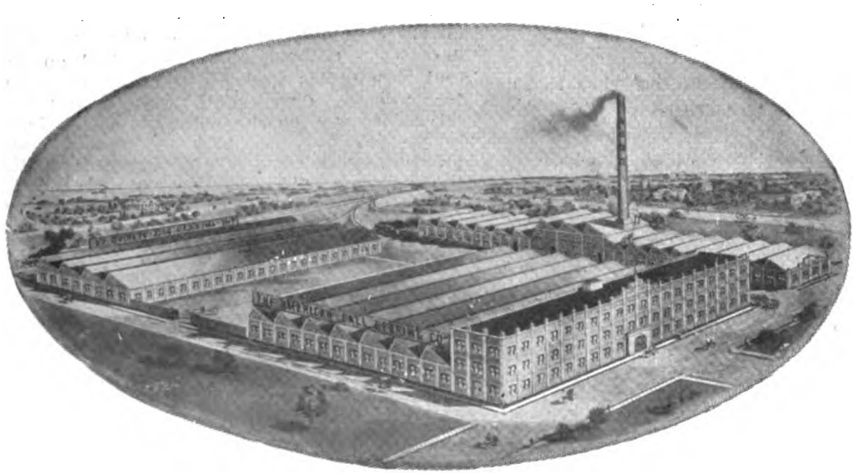
807,350. Resilient Tire and Means for Securing Same in Place. William F. Beasley, Plymouth, N. C. Filed February 20, 1903. Serial No. 144,337.

Claim.—1. A resilient tire section, consisting of a strip having wedge shaped notches diagonally disposed in its inner and outer faces, and having apertures of substantially rhombic shape formed in its middle portion, whereby a series of intersecting trussed walls are formed, substantially as described.

807,351. Pneumatic Tire. John H. Bleoo, New York, N. Y., assignor to Abraham B. Levy, New York, N. Y. Filed March 2, 1905. Serial No. 248,002.

Claim.—1. A tire comprising rubber having a plurality of series of spring protectors embedded therein, spaces being provided between the edges of the protectors of each series, a layer of rubber being between the protectors, a layer of rubber within the inner protectors, a layer of rubber over the outer protectors, and rubber extending between the edges of the protectors of each series and uniting the adjacent layers of rubber, the rubber being vulcanized upon the protectors, substantially as described.

807,354. Gas Engine. Franz Burger, Fort Wayne, Ind., assignor of three-fourths to Henry M. Williams, Fort Wayne, Ind. Filed February 13, 1902. Serial No. 93,945.



Claim.—1. The combination in an internal combustion engine, of a cylinder having a transverse partion forming a chamber at the rear of the cylinder, a port in said partition, means for introducing air into said chamber and for compressing the same, a gas nozzle for delivering gas through said port, and an igniter in said port, substantially as described.

807,391. Hydrocarbon Motor. Abbot A. Low, Horseshoe, N. Y. Filed February 20, 1905. Serial No. 246,418.

Claim.—1. In combination with a hydrocarbon motor, a mixing chamber, an inlet valve interposed between said mixing chamber and the combustion chamber, means for injecting alcohol, naphtha and kerosene oil either independently or simultaneously into said mixing chamber, and means for introducing compressed air into said mixing chamber, and means for introducing compressed air into said mixing chamber for the purpose described.

807,419. Motor Propelled Vehicle. Edward S. Clark, Boston, Mass. Filed February 26, 1902. Serial No. 95,758.

Claim.—1. In a motor propelled vehicle, the combination of a rotatable steering post, a steering lever for rotating said post and pivoted thereto to swing in a vertical plane, a cam on the head of said lever, a fuel supply controlling rod mounted parallel with said post and bearing endwise against said cam, whereby the fuel supply is regulated by the pivotal movements of said lever and cam, substantially as set forth.

The output of complete Front and Rear Automobile Axles of this plant exceeds the capacity of all competition combined.

GET ACQUAINTED WITH THE GROUT.

The Car of Quality and Simplicity.

A Four Cylinder Water-Cooled car of 30-35 H. P. with slide gear transmission, built on sound, sane principles, lacking not one of the accepted attributes of a high-class car, and listing at $2,500.

SPECIFICATIONS:

30-35 H. P., 4 cylinder, balanced motor, high tension ignition using one coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse actuated by single lever.
Wheels, 32 inch wood artillery, ball bearings, 4 inch tires.
Armored Frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication, mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.
Top and headlight with generator.

JAMESTOWN, N. Y.

Digitized by Google

We believe that a very large portion of the tire-trouble suffered by Motorists is due to their ignorance in regard to the care and proper manipulation necessary for the preservation of motor-tires.

We also believe that, with the proper encouragement and instruction from the Manufacturer, the Driver of a Car can materially reduce his tire-expense, which is now so large an item in the cost of operation.

We have, therefore, decided to offer cash prizes to the amount of

$1,000.00

for a TIRE ECONOMY COMPETITION to continue throughout the year 1906.

Every Owner or Driver of a motor-car is eligible to enter this contest.

The prizes will be awarded according to the tire-expense per running mile. Contestants may enter at any time during the year, but must complete 2,500 miles before the close of the competition.

We will forward particulars of this competition and instructions for the care of tires on request.

PENNSYLVANIA RUBBER COMPANY

JEANNETTE, PA.

"Firestone"

Side-Wire Tires

are used on nine-tenths of all the commercial vehicles manufactured. Why? Because manufacturers of commercial automobiles have learned by *hard experience* that the *"Firestone"* is the only tire that will withstand the hard knocks that are inseparable from commercial machines.

Firestone Tires wear like iron. They hold their shape—they give satisfaction.

Then Why Not "Firestone?"

How to Know When Your Tire Gets Flat

HOW much money would it save you in a season if a bell rang as soon as one of your tires began to get flat?

Supposing this were possible.

For you know the *ordinary* tire begins to rim-cut as soon as the air begins to leak out.

And generally you don't know a thing about it until you are riding on the rim. Then it's too late, for the damage is done.

Nothing remains for you to do but say things unfit for publication and make the best of it. Isn't that gospel truth?

* * * *

Now there's a sure way to know when your Tire is leaking—without watching it—without worrying about it—without getting out of the car.

If you have the Goodyear Universal Rim on your car, it will sound an alarm before the air in your tire is exhausted to a rim-cutting point. And this is the way it does it:

The flanges of the Goodyear Universal Rim (which hold the tire in place) are circles of steel which slide on and off the base of the rim, as a ring slides on and off your finger. When both flanges are in place, a "key" ring or locking ring, keeps the outer flange from being forced off by pressure of the tire. When used for Goodyear Universal (the tire that wipes out 90 per cent of all tire troubles) the Universal Rim would be assembled like Fig. 1.

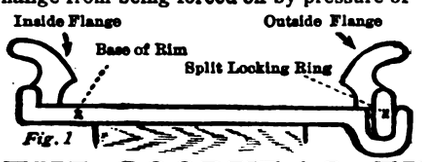

Fig. 1

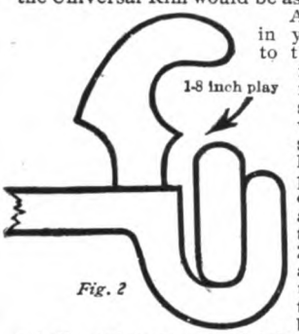

Fig. 2

As soon as the air in your tire leaks out to the danger point, it lets the outer flange slide inward slightly, except where the valve stem comes. This leaves about ⅛ inch play between the top of the locking ring and the bottom of the flange (see Fig. 2,) and just as soon as the air leaks out to the danger point, this binding ring begins to tinkle like a bell, saying to you plainly and unmistakably: "Shut Down! Stop!! Your Tire is beginning to rim-cut!!!" If you *heed* this call, you have saved the cost of a new tire.

* * * *

This is only *one* of the reasons why the Goodyear Universal Rim will preserve *any* tire to a hale old age.

There are others of even greater importance.

If you get a puncture, you can remove your tire to make the repair in 30 seconds—and it requires no tools but the hands. It's as easy to remove and put back a tire on a Goodyear Universal Rim as it is to put on and take off your cuffs, and it takes but little more time.

This is all there is to removing a tire from the Universal Rim. See how *easy* it is.

Unscrew the Thumb Nut which holds the valve stem tight against the rim. Push the valve Stem up into the Tire (this lifts the steel plate which holds the flanges in position.)

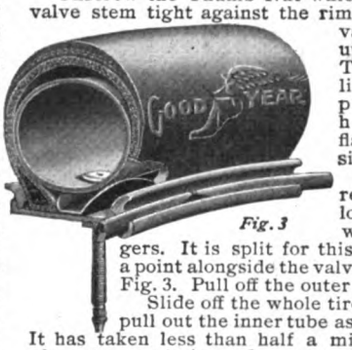

Fig. 3

Spread and remove the locking ring with your fingers. It is split for this purpose at a point alongside the valve stem. See Fig. 3. Pull off the outer flange ring.

Slide off the whole tire, or simply pull out the inner tube as you prefer. It has taken less than half a minute. And after the repair is made, another 30 seconds and you are ready to pump up.

* * * *

The Goodyear Universal Rim will take any Goodyear Tire (Detachable or Clincher) or *any standard clincher tire on the market*. If your car has Goodyear Universal Rims, you can have a tire of a different make on *each wheel* if you wish. And it will take less than a minute per wheel to change from one make of tire to another, *without the use of a single tool.*

* * * *

Get our "Good News Book" and see the many other convenient, money saving and time saving features of the Goodyear Universal Rim when used in connection with the Goodyear Detachable Auto Tire. This book will be found intensely interesting to the Manufacturer, Dealer or Rider, because it shows a sure way of relief from all tire troubles.

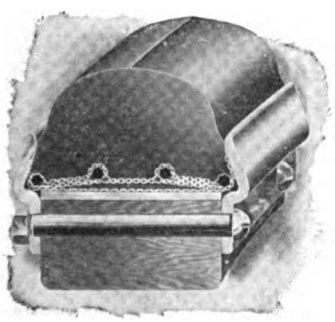
Timken-Lemoine Front Axle.

Much of the satisfaction resulting from the use of Timken Roller Bearings is due to the simplicity of construction,—few parts and every part a special feature.

We think this explains why it is easy to sell so many of them and why owners of machines demand them.

A good automobile is no stronger than its weakest part. Can you afford to have anything but Timken bearings?



Positive adjustment. No loose parts. Perfect end thrust and you can take up the wear.

All types front and rear axles, Lemoine or Elliott knuckles, direct and chain drive rear axles, truck axles, wheels, channel rims.

TIMKEN ROLLER BEARING AXLE CO.

THE CELEBRATED BRAMPTON CHAINS

MADE FROM SELF-HARDENING STEEL

TWO PAIRS OF CHAINS IN 75,000 MILES.

EALING, LONDON, February 13, 1905.

BRAMPTON BROS., Ltd.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, running daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

can be and will be fitted with the celebrated Brampton chain if you order it that way, and it won't cost you or the manufacturer any more than an inferior chain the kind that breaks and stretches and have to be replaced every few hundred miles. All standard sizes in stock to fit American and Foreign cars

We are Sole United States Agents for this Line of Chains, and are Ready to Quote Manufacturers Interesting Prices on American Standard Sizes.

Catalogue Mailed on Request.

THE STANDARD AMERICAN COOLER.

THE WHITLOCK COOLER

was used on the

LOCOMOBILE RACER that finished THIRD

in the

VANDERBILT CUP RACE.

It was never touched during the race. It did its full duty.

It held its water and kept the engine cool.

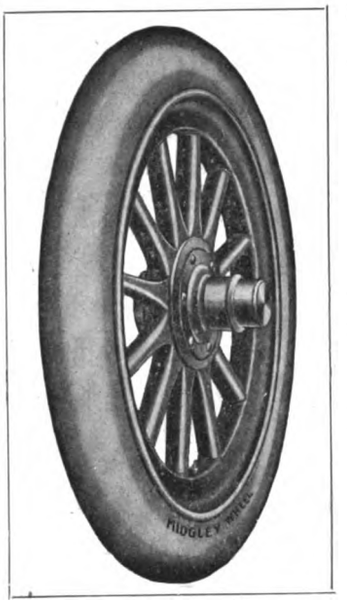
THE ONLY CELLULAR COOLERS MADE IN AMERICA

that were used in the 1905 and 1906 Vanderbilt Cup Races, also the 1906 Gordon Bennett Race.

Quality and efficiency only figure in an event of this importance.

We make coo ers of the HIGHEST EFFICIENCY.

The leading makers of automobiles have recognized this fact by adopting



THE WHITLOCK COOLERS

continuously for the seasons of 1903, 1904, 1905, 1906.

TRUFFAULT-HARTFORD SHOCK ABSORBER

AN AUTOMOBILE NECESSITY.

The automobile fitted with the Hartford Shock-Absorber rides like a rocking chair. There is no jolting, no pitching, no skidding, no lost power.

It prevents the breaking of springs BECAUSE it absorbs the shock and checks the rebound.

It DOUBLES the life of tires because there is less slipping and skidding.

It increases the speed because it saves slowing down and prevents lost traction.

All the great speed contests of 1905 PROVED it to be an absolute necessity to racing cars.

It is even more valuable, however, to the man who wishes to take his motoring comfortably. It is the only device that makes the automobile possible for old people or invalids.

Write for booklet and testimonials.

Every Automobilist's Automobile

should be equipped with a JONES SPEEDOMETER for the reason that it is recognized as the only *practical* speed indicating device.

¶ The accuracy of the JONES SPEEDOMETER is obtained by the mechanically perfect application of an absolutely unchangeable law. Its standard of perfection will never be equalled by devices based on theories. In the development of our Speedometer we experimented with a large variety of devices, employing the principles of hydraulics, pneumatics, magnetism, electricity, etc., but after exhaustive tests, discharged them because found lacking in one essential ro another.

¶ *Theoretical* accuracy does not necessarily mean *practical* accuracy;—nor does *initial* accuracy mean *permanent* accuracy.

¶ Our Speedometer Protection Tag will protect you against unwarranted arrest; this is presented free with each instrument. Probably you may find some interesting speed items in our 'Speedometer' Bulletin. Copy sent free on application.

Aerocar

The Car of today, tomorrow and the years to come.
—Built by practical men.—

Here is the **one** motor car driven by a reliable, test-proven air-cooled motor.

The vital factor in every car is the motor.

All Automobile authorities - people who have had most experience—concede that many improvements are necessary in water cooled motors—too many mechanical complications, too much weight, too many troubles.

The same authorities agree that in the reliable, success-proven air-cooled motor lies the solution of most all motor car troubles.

The **Aerocar** has such an air-cooled motor. It has taken eight years of continual efforts, experimenting, testing, proving and many thousands of dollars to produce this reliable air-cooled motor, but the results sought have been secured, and they are well worth all the time, labor and money expended.

The air-cooled motor of the **Aerocar** is of wonderful efficiency in power. Runs with the uniform smoothness and rythm of an electric dynamo—under all climatic conditions, over all sorts of roads. Has strength of construction with simplicity of control, giving great durability of service, develops continuous higher power for weight, and gives greater speed than any other motor.

In the necessary, the vital qualities for satisfactory service, the air-cooled motor of the **Aerocar** is supreme—in a class by itself—the motor that "motes" when you want it to serve you.

The body of the **Aerocar** compares most favorably with any car either foreign or American. It embodies the best features of each, is graceful in line, is luxuriously roomy and comfortable; is finished and upholstered strictly up-to-date.

Aerocar 1906. 24 h.p. Four cylinders. Five passengers. 45 miles an hour. 104-inch wheel base. Shaft drive. Sliding gear transmission. Three speeds, forward and reverse. Leather-faced cone clutch. Hollow steel dash. Four sight lubricator on dash. Tool box on running board. 34 x 4 tires. 9-inch road clearance. Weight 2,000 pounds. Fully equipped, ready for the road, including two large gas headlights, $2800 f. o. b. Detroit.

Will be exhibited and demonstrated at the Automobile shows in New York and Chicago.

The dealer who has the selling agency for the **Aerocar** will have a gold mine. Territory being rapidly taken up. If interested write us promptly.

The Aerocar Company, Detroit, Michigan

The Largest Factory in the World

Devoted to the Manufacture of High Powered Automobiles

now in course of construction will be taxed to the full limit of its capacity to meet the extraordinary demand for the magnificent

50 H. P.

THOMAS FLYER

The story is the same in every big city in the country—the complete supremacy of this wonderful car conceded on every hand and agents begging for a larger allotment. There is nothing accidental about this extraordinary enthusiasm. It is the logical outcome of years of painstaking experience and preparation, culminating in a car which represents the most costly and the most perfect possible construction throughout. The 1906 Thomas marks the arrival of the long-expected American car which will wrest supremacy from the finest foreign product. Just one indication of its marvelous efficiency is the fact that

Every Stock Thomas is Guaranteed to Show Sixty miles an hour before leaving the Factory.

We are merely consulting your own interests when we advise you to get in touch with the nearest Thomas representative at the earliest possible moment.

The Autocar

Two types for 1906

Type XII, - - - $2600

The Autocar Factory will produce two models during 1906: A modern-to-the-minute, five passenger tourer of extraordinary car-power and buoyancy; and the widely-known Autocar Runabout—power increased, and control changed from left-hand lever steer with spark and throttle levers, to right-hand wheel steer with spark and throttle control grips in the rim of wheel.

The Autocar new Type XII is the biggest, broadest and most powerful car ever produced in The Autocar Factory. Four-cylinder vertical motor; water cooled; 24 (James Watt) horse power. Sliding-gear transmission; three forward speeds and reverse. Shaft drive. Internal and external hub brakes. Characteristic Autocar control—right-hand wheel steer, with spark and throttle control grips in rim of wheel. Satisfying in looks, luxury, speed and performance, and moderate in price. $2600.

Type X, - - - $1000

The Autocar Runabout has 12 (James Watt) horse power, two-cylinder horizontal opposed motor, in front; it has shaft drive with sliding-gear traismission—three forward speeds and reverse. That it is the best runabout built has long been a settled fact. It is distinguished as being the first and only motor-car which is

Reliability

Indianapolis
Dunlop
Tire

Open Steam Cured Fitted with Flap Wide Edges

This tire is fitted with a flap, which protects the air tube from screw heads in the rim and from moisture, and does away with the necessity of fabric-covered tubes. The special edges and the flap constrict against the channel of the rim in such a way as to prevent creeping. It is entirely open steam cured, which gives the tire exceptional strength.

OLDSMOBILE

The Palace Touring Car, Model "S"
Price, $2250.00.

If you want STYLE—you have it in Model S, the latest and most approved European theories and designs, thoroughly adapted to American requirements. The front door, first introduced by us, keeps out cold, dust, and adds to the finished appearance of the car.

If you want SPEED—you have it in Model S, surplus power for hill climbing and difficult roads, and all the "legs" you can possibly use.

If you want STABILITY—you have it in Model S, high-grade material, careful workmanship and every part thoroughly inspected and tested to do its work and do it right.

That's Model S—STYLE, SPEED, STABILITY.

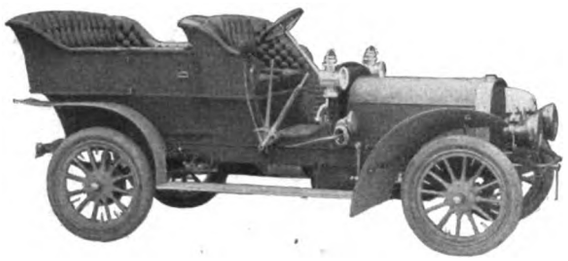
The Incomparable WHITE

The Car for Service.

NEW WHITE CATALOG.



There has been just issued a new catalog of the White steam car which we believe will prove of interest to all motorists, actual and prospective. The catalog comprises a brief historical sketch, tracing the development of steam machinery; a concise and lucid description of the White system; references to the continuous successes of White cars, commencing in 1901; and full specifications, prices. etc., of the Model "F" side-entrance White cars, of which we can make immediate deliveries—touring cars, victorias, limousines, runabouts, landaulets and extension landaulets. The catalog is printed in three colors and is handsomely illustrated.

Sent free upon request.

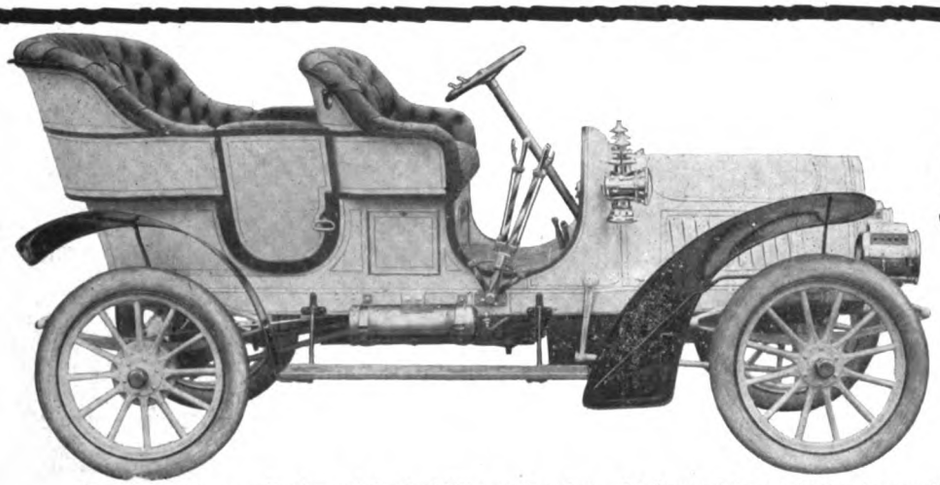
Model R--Four-Cylinder Touring Car.

HAYNES

Vertical roller-bearing engines. Cylinders cast separately, 5½x6 inches, 50 H. P. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master Clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller-bearings throughout. 108-inch wheel base, 54-inch tonneau, seating five people. Four to 60 miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f. o. b. Kokomo. Full equipment.

If an automobile weighing 2,750 pounds, plus the weight of five passengers, is dropped over a sheer embankment of seven feet, the machinery will receive a shock of just the same severity as if suddenly checked by shifting from high speed gear at thirty miles per hour to middle speed gear at fifteen miles per hour. In the latter case the engine must act as a brake, and the entire machine is severely strained. With the Haynes transmission this cannot occur. A rachet and pawl device permit the car to coast until the speed of the car and engine are relatively equal, when the pawls engage and the engine takes up the load. While making the change in speed from high to middle or from high to low the gears are running idle, permitting the operator to shift with perfect ease and without danger of burring or stripping the gears. With all forms of transmission except the Haynes, the shock of sudden change of gears may be, and frequently is, thrown upon the machine, a thing impossible in the Haynes car, and one of the reasons why Haynes cars are so long lived and cost so little for repairs and up-keep.



This is but one of the exclusive features of the Haynes. Others are its Roller-Bearing Engines, Master Clutch, Universal Joints that do away with wear on pins, Driving Sprocket and Roller Pinion, etc. There is perfect harmony throughout its entire mechanism, which makes its cost of operation, up-keep and maintenance extremely low.

It is perfectly finished in all respects. Only the best of tested materials are used. Body is of cast aluminum and wood, designed by a leading Parisian body maker. Hand-buffed leather and gray curled hair are used in upholstering. Other exclusive features are given in our new catalogue. For prompt attention address Desk 29.

Premier

"The Quality Car"

(AIR COOLED)

DECIDEDLY THE SEASON'S SENSATION

If orders are a criterion of desirability and value: if demand is an index to merit, the Premier for 1906 will meet with popular favor.

The car is not "freakish" in any sense, but is an elaboration of former fundamental Premier ideas, to meet the demand for a larger, more powerful, faster car.

It embodies a 20-24 H. P. motor, four cylinder, vertical, set longitudinally upon a pressed steel frame. Transmission of selective type, three speeds forward and reverse; shaft drive, bevel gear. Long wheel base, large wheels and tires, curved cast aluminum dash, sight feed precision oiler, full equipment of five handsome lamps, generator, and tube horn, together with full set of tools and tire repair outfit.

Body is of graceful tulip design, splendidly upholstered in best quality hand buffed, water grained leather, hair padded; comfortable, roomy tonneau, carrying five passengers without crowding; luxurious full elliptic springs with special shock absorbing head. It is a splendid, handsome looking car—one of the most ornate and artistic we have ever seen, *and fully as good as it looks.* Plenty of power, and all the speed you can use.

Two styles of touring car body on practically the same chassis, eacn offering phenomenal value.

$2,000.00 and $2,250.00 F. O. B. Indianapolis.

1906—ST. LOUIS—1906

"RIGS THAT RUN"

TYPE XVI

32-36 ACTUAL H. P.—$2500.

Our 1906 Type XVI is the crowning triumph of fifteen years experience in building gasoline automobiles. This model represents EVERYTHING GOOD in modern automobile construction. You cannot afford to pay more, and you couldn't expect to pay less. Compare Type XVI with any other car listing from $3,000 to $5,000, and we doubt if you will find any vast difference in other than the price. An agent should sell a car that will instantly appeal to all classes. Thousands of prospective purchasers are in the market, a few of them will insist on paying $5,000 and over—a few more will insist on $2,000 and under, but eight out of every ten will be the BETWEEN class, if they can get the satisfaction at a reasonable price. Type XVI is between the two extremes (in price), but from closest observation, we fail to see where it will not compare inch for inch with any car built in AMERICA. A FAIR, UNPREJUDICED COMPARISON IS ALL WE ASK. It will carry five people comfortably at any speed from four to fifty miles an hour, absolutely noiseless, no vibration, will negotiate 22 per cent grade on high speed. General finish, upholstering and trimmings cannot be surpassed—no matter what the price.

MOTOR. Four cylinder vertical, under hood, water cooled, developing 32-36 ACTUAL H. P. Entire construction highest grade. Muffler reduces noise to nothing. (Quietest car in existence.)

VALVES. All are mechanically operated, generous bearings Cramps special bronze throughout. Large fan behind radiator.

CRANK CASE. Made of special metal. Instantly accessible aluminum side plates allow instant inspection of connecting rod, crank shaft, etc. Full metal pan under engine.

FRAME. Specially prepared pressed steel, channel section, 4¾ inch tapered and reinforced. Motor and transmission integral assuring perfect alignment under all conditions.

TRANSMISSION. Sliding type, three speeds and reverse, all gears made of special high carbon steel. All shifts made withone lever. Clutch metal to metal, multiple disc, load is taken up gradually. No matter how sudden the shift is made the jerk is ABSENT.

CONTROL. New style rack and pinion, with ball and socket joints to take up all wear. Spark and throttle control placed conveniently under steering wheel, also accelerator foot pedal to use if desired for QUICK SPEEDCHANGES.

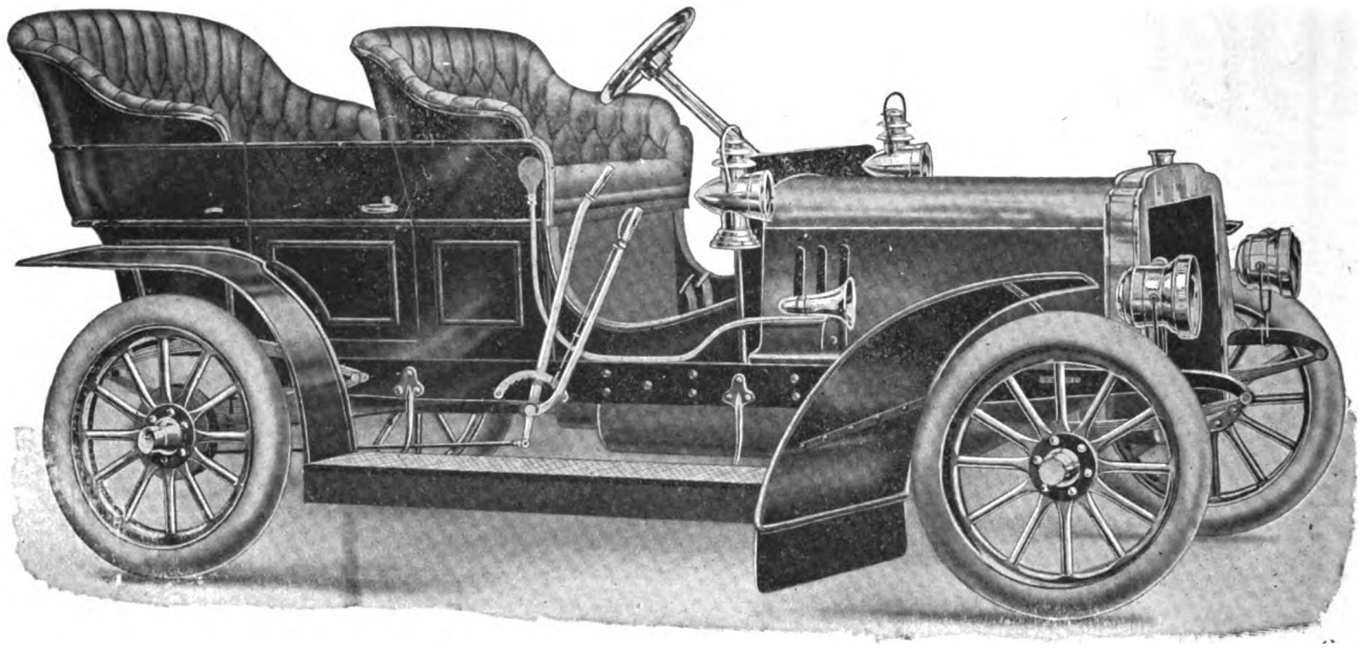
BRAKE. Three in number—any one of which will hold car on any grade. Same are controlled by both foot and lever at side of car. Application of foot brake throws out clutch, disconnecting transmission from motor.

AXELS. Front extra heavy dropped forged I beam, guaranteed not to spring. Rear axle of the floating type all equipped with Timken roller bearings throughout.

DRIVE. Bevel gear regular ratio three to one. We will furnish lower gearing upon request.

SPRINGS. Large half eleptic of the best quality obtainable. Front 38 inch, rear 48 inch. Three point suspension throughout, allowing perfect riding over the worst road conditions.

Our cars contain many individual features of merit, which we have omitted to mention. Our new elaborate catalogue explains every detail and will be mailed upon request. Fifteen years building experience has taught us the proper kind of material to use and how to use them correctly. We have simply covered the broad points of general construction that you may compare Type XVI with other makes costing nearly twice as much. Some cars may COST MORE—but none are better. We have not sacrificed one iota to cheapen our product. The material throughout is GOOD OLD ST. LOUIS quality from the ground up. Our name is on it and our guarantee back of it.



LASTLY. We are fast closing all available territory and our agency list will be closed solid before the New York show. If we are not already represented in your immediate vicinity, you had better write for printed matter AT ONCE. Don't wait until show time and be among the "ALSO RANS". Our agency proposition is most entertaining—it MIGHT pay you to investigate.

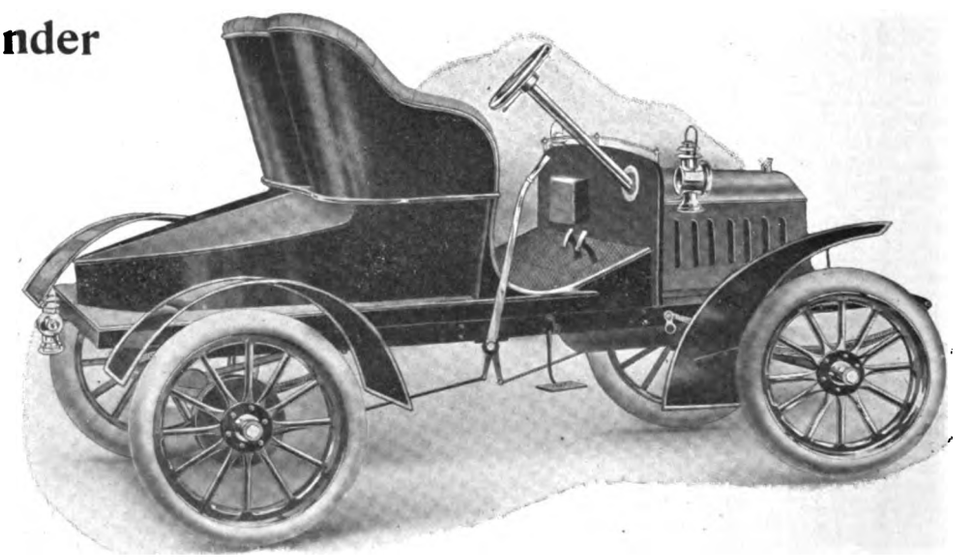
The Six-Cylinder Ford.

"Always a year or two ahead." When the single-cylinder car was "it" Henry Ford produced a double cylinder opposed motor, more powerful and at a lower price.

When the Automobile trade finally awakened to the possibilities of the two-cylinder opposed motor Mr. Ford produced a four-cylinder car at $2,000 that was in a class by itself, the public having been taught to believe that such a car could only be produced at a fabulous price.

And now, having exhausted the possibilities of the four-cylinder car in a touring car class, he has introduced it into the Runabout class, and in addition offers a six-cylinder car that is proportionately as far in advance of all competition as his first double opposed motor.

This is a wonderful car.



First, its six cylinders, with 40 horsepower, give a latitude of speed never before accomplished in a car of its class and weight, 2,000 pounds. From four miles per hour on a high gear up to fifty miles.

While one cylinder of this car will develop sufficient power to drive it along an ordinary asphalt pavement, the whole six cylinders inspire the driver with the confidence that there is an enormous latent energy in his motor, ready for any new demand without overloading the motor, making it the easiest controlled and most flexible automobile motor ever built.

When you have seen this motor in operation you will fully appreciate that we have the smoothest running automobile motor in the world.

Price, $2,500.00.

The Ford Four-Cylinder Runabout.

It is a fact that thousands of these cars are in course of construction.

Like all Ford cars, this one is a radical departure from previous and popularly accepted designs, and there is a reason behind every radical idea.

Henry Ford built a four-cylinder engine for his Runabout with fewer parts than the old-fashioned single-cylinder engine had, and the Ford Motor Co. have an enormous factory that does nothing but build motors for this Runabout, with a capacity of 100 complete engines every day.

The whole thing is very simple when you go about it right.

This is why we can build the Ford four-cylinder Runabout for $500.00.

We are making 40,000 cylinders,
10,000 engines,
40,000 wheels,
20,000 axles,
10,000 bodies,
10,000 of every part that

goes into the car. Think of it! Such quantities were never heard of before. We buy 40,000 spark plugs—10,000 spark coils—40,000 tires—ALL EXACTLY ALIKE.

The first Runabout (Model A) we built cost $30,000—yet we sold duplicates of that model for $750.00.

It is the quantity that counts.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, January 4, 1906. No. 15

DEVELOPMENTS IN DIAMONDS

Akron Manufacturers Present Some Unexpected New Things in Tires and Tubes.

Those "gentle intimations" which during recent weeks have radiated from the Diamond Rubber Co., and which indicated that there would be "something doing" when the Diamond's 1906 announcement was made, "came true" late this week. It then became known that the Diamond Rubber Co. have not less than four distinctly new developments in tires ready for presentation to the public.

There is a brand new solid tire and a flat tread pneumatic tire, but from the standpoint of general interest probably what is termed the Diamond Diaphragm tube constitutes the most sensational departure. In brief, this is a tube within a tube. If the outer or normal tube is punctured, the inner tube or emergency tube can be inflated without removing the tire from the wheel. The outer tube can be repaired in the usual way and made to serve again and again. The interior tube is for emergencies only. The Diamond flat tread tire is of the regular Diamond wrapped tread construction, with an extra thick tread made perfectly flat. The extra thickness increases the wearing possibilities of the tire and the flatness of the tread tends to prevent slippiny and skidding.

The Burnham tire protector also is something of a novelty. It consists of a heavy shoe of rubber and fabric much resembling a tire casing without the beads or clinchers by which a tire is secured within the rim. The shoe is placed over and around a worn tire, and when the latter is inflated the shoe is held immovably in place. In effect this protector amounts to a tread which can be removed or applied at will.

While enthusiastic over all their productions, the Diamond people are particularly enthused over their new solid tire, which they believe marks a new era in that department. This new tire has what is known as a wire mesh base, one of the advantages of which is that it can be attached to a wheel without the aid of machinery. The side wire type of solid tire also will be retained, and, almost needless to add, the famous Diamond wrapped tread detachable clincher tire, which outwardly differs little, but which nevertheless has been improved by reinforcements and a tougher tread.

Whiting to Succeed Brock.

When M. I. Brock drops the reins as sales manager of the Autocar Co., Ardmore, Pa., to become assistant manager of the Association of Licensed Automobile Manufacturers, they will be taken up by Allen H. Whiting, who has been selected to fill the vacancy. Mr. Whiting, who is a brother-in-law of A. L. Riker, of the Locomobile Company, is no stranger to the trade, having been sales manager of the Edison Storage Battery Company. Previously he was connected with the Electric Vehicle Company and the Lansden Company.

End of the American.

The Prudential Trust Co., as receiver for the American Motor Carriage Co., of Cleveland, Ohio, has filed its final report and closed up the affairs of that concern. The statement shows that the cash on hand, according to the report of October 29, 1904, was $18,765.27. A dividend of 30 per cent. was paid the stockholders, which amounted to $18,314.69. The remainder was paid out as court costs and for records.

Extending the Berkshire Branches.

The Douglas Andrews Company, sole distributors of the Berkshire cars, have practically completed arrangements for the opening of branch houses in Boston and Chicago. The latter will be in charge of N. H. Van Sicklen, Jr. The Andrews people already have a branch in Pittsfield, Mass., and, of course, headquarters in New York.

Picard to go to Philadelphia.

In addition to the new place in Chicago, the Ranier Company are making ready to open a branch house in Philadelphia. A. J. Picard, who recently resigned the sales management of the Walter Automobile Company, will be installed as manager.

"CLUB GARAGE" UNCOVERED

Its Sponsors Located by The Motor World—Their Story of Their Big Project.

Coincident with the issue of a tastefully printed prospectus by the "Club Garage of America" giving as its address, 51 Broadway, the Automobile Club of America apparently deemed it advisable to again call attention to the fact that there is no connection between this projected garage and the A. C. A. garage which is now being built for the club uptown; the notice reminded the members that the club has not indorsed the "Club Garage of America" and warned them that there appears to be a desire on the part of the promoters to trade on the name of the organization.

As this was the second notice of like import that had emanated from the Automobile Club of America, and as the printed matter of the "Club Garage" was suspiciously barren of names it appeared that fire must be lurking amid the smoke.

"Room 41, at 51 Broadway," which is the building of the Wells, Fargo Express Company, proved to be the office of the St. Louis Car Company; the door bears this sign, also the title "The Club Garage of America.—D. M. Harvey."

When approached by a Motor World man and asked for explanations, Mr. Harvey was found quite worked up over the A. C. A. warning. He immediately disclaimed any intention of trading on the name or repute of the Automobile Club of America.

"This is not a brand new scheme that has just cropped up overnight, or within a month or two, as this notice would seem to imply," said Mr. Harvey, with considerable heat. "It is practically a year ago that the Club Garage of America was incorporated under the membership corporation law of the State of New York as a co-operative organization—sometime before the A. C. A. had decided to build its own garage. I do not wish to claim any credit for it, but, as a matter of fact, it was not until they determined not to entertain my proposition that the club voted to build its own garage.

"With George Kobusch, president of the St.

Digitized by Google

Louis Car Company, as my financial backer, I proposed to the A. C. A. to put up a building the greater part of which was to be used by them as a garage, while I was to use a portion of the same place, but entirely independent of them, for the same purpose, that is, a public garage.

"They were to have all the space they required for storage and other purposes and nothing but their own sign was to be used on their part of the building, facing on Broadway, while an entrance on 62d street was to be used for the remainder. The club declined my proposal, but it did not cause the collapse of my plans.

"To show you that there is something more substantial than air back of the project, here is the lease of the northeast corner of 62d street and Broadway from George C. Boldt to Mr. Kobusch personally. It is to run for ten years with the option of a renewal for the same period, and a contract already has been placed with the General Supply and Construction Company for the erection of a six story and basement building to be completed by May 1 next. It will be of reinforced concrete construction, and will have 13,350 square feet of space on each floor."

Mr. Harvey exhibited the lease in proof of his statement. He also stated that Leander Richardson, Editor of the New York Inquirer, a weekly publication of the "gossipy" type, is president of "The Club Garage of America." This is the language in which the prospectus outlines the project:

This organization has been formed to lift a great weight from the pleasure of motoring, and bring within reason the expenses attached to keeping cars in proper condition.

The main objects of the Club Garage are to keep machines in first-class condition and to put a stop to extortions that are known to have been practised.

Another aim of this organization shall be to supply efficient and safe chauffeurs. The club has subscribed to a clipping agency for all matter printed in reference to automobile accidents, and these accidents will be investigated to determine whether or not the chauffeur is responsible. By this method it will be possible to eliminate all undesirable and unsafe men. Waiting rooms will be provided for chauffeurs on duty, with direct telephone communication.

In order that you may know that your machine is not being used by others, especially your chauffeurs, without your permission, a record will be kept of every time your machine goes out and how long it is gone. A duplicate of this will be mailed you every day.

The Club Garage will not under any circumstances pay commissions to chauffeurs on the purchase of any supplies, equipment, repairs, etc. This is one of the most extravagant evils of motoring, and can only be eliminated through the instrumentality of an organization of this character, which has been formed solely to protect its members by conscientious service and respect for their rights.

The receipt system will be used entirely.

The services of the Club's legal agent will be at the disposal of members day and night for the purpose of furnishing bonds, etc.

The Club Garage of America will operate garages of similar character in Boston, Philadelphia, Chicago, St. Louis, etc., and branches at the principal resorts during the season. The courtesies of membership are interchangeable, thereby assuring you a uniformly high-class service wherever you go.

By joining in this movement you can aid in placing motoring on a business basis, whereby the expenses can be kept within a reasonable limit and the efficiency and service at least doubled.

Initiation fee for membership in the Club Garage of America is $25. There will be no dues except storage fees, etc.

In the Retail World.

The White Sewing Machine Company have established branches in Troy, N. Y., and New Haven, Conn.

John Pflieger, 1602 Bushwick avenue, Brooklyn, is establishing a garage at that address.

Snyder & Smith, Orange, N. J., have added an electrical charging and repairing plant to their establishment. It measures 80 by 40 feet.

The latest addition to the Philadelphia automobile dealers is the Hamilton Automobile Company, located on Broad street, above Race. They will handle the Stoddard-Dayton.

Plans have been filed with the Manhattan Buildings Bureau for the remodelling of the two story and attic stable at 347 Amsterdam avenue, New York City, into a garage for Eugene Meyer, jr.

Nolan & Smith, Los Angeles, Cal., are having built for them on Main near Tenth street, a steel and brick garage. It will be one-story high, measure 85x174 feet, and cost about $15,000.

A brick addition, 40x85 feet, is being built to the two-story building at 535-537 South Los Angeles street, Los Angeles, Cal., for Richard P. Blaisdell. It will be used for a garage and will cost $9,000.

Edward Borderwisch has been elected president of the recently incorporated Borderwisch-Glancey Automobile Co., of Dayton, Ohio. Dr. I. Y. Cooper is vice-president, and E. M. Glancey, secretary-treasurer.

The Lowell (Mass.) Automobile Corporation has changed hands. N. D. Goff has withdrawn, and Harry Noyes and William H. Greene, formerly connected with the business, will be associated with H. H. J. Read.

The firm of Clark & Matthews, machinists and electricians, Rutland, Vt., has taken O. H. Coolidge into partnership and changed its name to the Rutland Machine & Automobile Co. A new plant is contemplated.

John E. Lloyd has leased the new three-story and basement building at No. 220 West Thirtieth street, New York City, for a long term of years at an aggregate rental of $60,000. It will be used as a garage.

George C. Boldt, proprietor of the Waldorf-Astoria, has sold the 116x106 northeast corner at Broadway and Sixty-second street, New York City, to the American Co. A six-story garage will be erected.

The Chadwick Motor Company, which has just been incorporated, will locate on 34th street, New York, in the former Decauville establishment. The Chadwick car will be handled. C. S. Jackson, former manager of Wanamaker's automobile department, will be the active man in the new concern.

The Maine Motor Carriage Co., of Portland, the oldest agency in the State of Maine, has so outgrown its present location at 44 Plum street that it has been forced to erect a new garage, which is now in course of construction at the corner of Free and South streets, convenient to hotels and theatres. It will be open night and day. The Maine Motor Carriage Co. has also made a change in its line, having taken on for 1906 the Thomas, Stevens-Duryea and Olds.

The Week's Incorporations.

Syracuse, N. Y.—Brown Lipe Gear Co., under New York laws, with $150,000 capital. Corporators—A. T. Brown, Willard C. Lipe and Penfield Chapin.

Bay Shore, L. I.—Covell & Crosby Motor Co., under New York laws, with $20,000 capital. Corporators—A. A. Crosby, C. H. Covell and W. M. Allison.

New York City, N. Y.—Chadwick Motor Car Co., under New York laws, with $50,000 capital. Corporators—A. W. Pross, C. E. Reed and George Muirer.

Brooklyn, N. Y.—Carlson Automobile Co., under New York laws, with $15,000 capital. Corporators—C. A. Carlson, Chalmers Dale, Jr., and C. W. McKelvey.

New York City, N. Y.—Ansonia Automobile Co., under New York laws, with $5,000 capital. Corporators—E. G. Potter, G. R. Kelso and F. W. White.

Boston, Mass.—Boston Auto School, under Massachusetts laws, with $5,000 capital; to conduct automobile school. Corporators—W. E. Cooper and E. F. Edwards.

Brooklyn, N. Y.—Hicks Speed Indicator Co., under New York laws, with $3,000 capital; to manufacture speed indicators. Corporators—E. P. Hicks, C. R. Johnson and Carl Knoff.

Watertown, N. Y.—Watertown Automobile & Supply Co., under New York laws, with $5,000 capital; to deal in automobiles and supplies. Corporators—Lincoln G. DeCant, Merley A. Pitcher and Joseph A. McConnell.

New Orleans, La.—The Tracy Automobilium, under Louisiana laws, with $50,000 capital, to deal in automobiles. Corporators—W. J. Tracy, William P. Tracy, William Bradley, L. A. Ducros and A. D. Henriques, Jr.

Salt Lake City, Utah.—Sharman-Ottinger Automobile Co., under Utah laws, with $25,000 capital; to deal in automobiles. Corporators and officers—President and treasurer—Samuel H. Sharman; vice-president, Adolph Ottinger; secretary, A. Scheider.

Montgomery, Ala.—Van Dusen Motor Car Co., of Jefferson County, under Alabama laws, with $25,000 capital. Corporators—A. S. Kahin, E. W. VanDusen, Jr., C. S. Creelman, R. D. Johnston, Jr., and B. C. D. VanDusen.

A delegation of forty Mormons, headed by President Joseph Smith, visited Kenosha, Wis., Thursday, of last week, and were taken through the factory of Thomas B. Jeffery & Co. One of the party was Norris Farr, who proudly boasts of eighty grandchildren. Whether Mr. Farr ordered Ramblers for the little runabouts is not stated.

HOW EXPORTS ARE SWELLING

October Shipments Still Further Increase the Handsome Total—Where Goods are Going.

Judging from the second detailed monthly report, American automobiles are going strongest in England and the British possessions, as next to the English item of $27,005, comes British Australasia, with $25,571—the largest items on the list—and British North America with $11,996. The only others approaching these are Other Europe, with $15,085, and Mexico, $12,738.

As compared with October a year ago, the increase is relatively substantial—slightly in excess of 25 per cent., though actually not very large; from $106,117 to $129,389. But in the case of the totals for the period of ten months ending with October in the past three years, the increase is vastly greater, the amounts being $1,419,481 for 1903, $1,682,994 for 1904 and $2,449,010 for 1905.

The detailed report for the month of October and for the ten months ending with October, 1905, is as follows:

Exported to—	October.	10 Months Ending October.
United Kinguom	$27,005	$631,787
France	8,028	262,058
Germany	1,808	103,806
Italy	5,580	159,905
Other Europe	15,085	237,902
British North America..	11,996	513,761
Mexico	12,738	162,780
Other West Indies and Bermuda	6,809	131,361
South America	6,974	55,912
British East Indies	2,495	31,097
British Australasia	25,571	111,119
Other Asia and Oceanica.	287	60,878
Africa	4,791	33,528
Other countries	222	3,116
Total	$129,389	$2,499,010

The Garage Keeper and the I. O. U.

When it was announced that an anti-graft law had been passed at Albany the sufferers from the wiles of the importunate chauffeur heaved a mighty sigh of relief for they thought in their simplicity that their troubles from that source were at an end. Bright young manhood refuses to be squelched, however, and now the man in the leather coat, who formerly levied direct tribute from the garage keeper, borrows from him small sums of the needful, giving in return his modest little "I. O. U," which, at the end of the month, the downtrodden G. K., above mentioned, twists up tightly and uses to light his pipe, in which capacity it serves a useful end, and seems to infuse a taint of sober reflection into the fumes of the bowl.

Evidence of French Fearfulness.

France is awaking to the fact that America has sapped the foundations of her trade in more ways than one and that unless something be done the structure is apt to topple. The publishers of L'Auto, the official organ of the Automobile Club of France, and the semi-official representative of a number of manufacturers, have accordingly decided to establish in New York "a bureau of information," a sort of private consulate as it were, to keep an eye on American trade conditions. The idea is to aid the French maker in taking advantage of the American market. Georges Dupuy, a well known explorer and writer on sports, has been delegated and will have charge of the bureau, which will have to do not alone with the importation of French cars, but also with the exportation of American cars to France.

Rogers' Wide Sweep of Country.

G. Vernor Rogers, secretary of the Mitchell Motor Car Company, Racine, Wis., touched New York last week in the course of a sweep around an unusually wide circle; in fact he probably has covered more territory during the last few months than any other man in the automobile business. His route carried him through the South and to Cuba; then to the Pacific Coast, which he traversed from Seattle to Los Angeles, and then to New York. As a result, the output of the Mitchell Motor Car Company is practically sold.

With conditions in general Mr. Rogers was more than satisfied and he spoke in high terms of the future of the Northwest as an automobile centre. His mention of streets a quarter of a mile wide rather staggered his hearers, but when he explained that over the hard, level prairie a driver could make his own road the meaning was made plain. He also stated that the prairie turf is so hard that the rains, even through the long rainy season, do not effect it and in consequence there is good driving the year round.

Landgraf Obtaining More Room.

Landgraf Brothers, or rather the Simplex Automobile Co., who build a car by that name at Mishawaka, Ind., are enlarging their plant. Another story is being added to the present building, and two two-story additions measuring, respectively, 50x24 feet and 70x24 feet, are in process of construction.

Pontiac Chooses Its Officers.

The Pontiac Motor Co., recently organized in Detroit, Mich., to manufacture commercial and combination commercial and pleasure motor vehicles, have elected the following officers: President, Dr. H. V. Welles; vice-president, George E. Fisher; secretary, Albert Burton, and treasurer, F. I. Perry.

Was Wheeler, Now Rands.

The Wheeler Mfg. Co., Detroit, Mich., makers of tops, has changed its corporate name to the Rands Mfg. Co., after W. C. Rands, its manager. In all other respects the concern remains the same.

The Ruggles Automobile Company, of Ware, Mass., has completed its first car. It is a delivery wagon and will be tested by a local butcher.

BILL FOR FREE ALCOHOL

Introduced into Congress for Third Time—What it Proposes and the Stumbling Block.

What is thought to be the beginning of the end of the three years' campaign for free alcohol backed by a number of the most powerful industrial interests in the country, was brought about last week by the introduction of a bill to that effect before Congress by Representative Calderhead. This is the third time the matter has been brought before Congress, only to be sidetracked and lost in the mass of proposed legislation which comes up for consideration annually, but which seldom sees the light. In the present instance, however, its introduction is the culmination of an educational propaganda on a scale rarely resorted to as a means of influencing legislation and only possible to large interests, for more than $50,000 has been spent in the preparation and dissemination of literature on the subject, principally in agricultural communities.

There has been considerable difficulty in convincing the "solons" at Washington that the public revenues were not in danger, and that the measure was not one on which the "booze" interests took an antagonistic stand. The excessive tax of $2.07 per gallon on commercial alcohol has practically prohibited its use except for such purposes in which denaturized alcohol is not available. Another difficulty was the matter of regulating the process of denaturing the alcohol and prescribing what substance could be employed, and it will be noticed that this has been left entirely to the Secretary of the Treasury.

The provisions of the bill are as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

That on and after the passage of this act no internal revenue tax shall be levied or collected on ethyl alcohol of domestic production which has been rendered undrinkable or unfit for use as a beverage, prior to withdrawal from distillery bonded warehouse.

Sec. 2. The Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, shall prescribe the necessary regulations to carry this act into effect.

Sec. 3. That any person, or persons, who shall rectify or purify ethyl alcohol which has been removed from distillery warehouse free of tax, under the provisions of this act, so as to remove or separate therefrom by any process whatever the substance, or substances, which have been added thereto for the purpose of rendering such ethyl alcohol undrinkable or unfit for use as a beverage, shall, on conviction, be subjected to a fine of not less than five hundred dollars nor more than five thousand dollars, and be imprisoned not less than six months nor more than three years.

FISK TIRES

SAVE TIME, MONEY AND TEMPER

WITHOUT Fisk Tires you are simply wasting Time, Money, Temper,—and Comfort. They are the only tires constructed on Strictly Scientific and Practical Principles.

Positive Locking Device, insuring SAFETY
All Air Above the Rim, affording COMFORT
Superiority of Quality, guaranteeing DURABILITY

Our production for '06 is the finest that we have ever offered, representing, not merely high-grade exterior evidences, but Honest Quality—"Fisk Quality" that is at present unsurpassed.

Truly, 'twill be Worth Your While To Buy Fisk Tires.

We should like to send you a little printed article on tires

THE FISK RUBBER CO.,
Chicopee Falls, Mass.

CADILLAC UTILITY

THE SINGLE CYLINDER CADILLAC
Will climb any hill that any automobile will climb.

THE SINGLE CYLINDER CADILLAC
Will travel any road that any automobile will travel.

THE SINGLE CYLINDER CADILLAC
Will travel as fast as anybody ought to ride.

THE SINGLE CYLINDER CADILLAC
Costs less to operate. Costs less to Maintain.
Requires less attention than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined, and won for them the unquestioned distinction of

AMERICA'S LEADING MOTOR CARS.

CADILLAC MOTOR CAR CO. - - - - Detroit, Mich.

Members Association of Licensed Automobile Manufacturers.

WE WILL EXHIBIT IN NEW YORK AT MADISON SQUARE GARDEN ONLY, JANUARY 13-20, 1906

SHOW NUMBERS

of

THE MOTOR WORLD

Will Bear Dates

January 11th and 18th.

As always, they will deal with the subject intelligently and well and be thoroughly representative of the industry.

Giving the Devil his Due.

Due to the occurrence of the occasional accident, which from the prominence of those who suffer the consequences is given wide publicity under scareheads inveighing against the criminal recklessness of the automobile driver has become general. That there is ample cause for at least a portion of the tirade that springs into new life the country over under frequently recurring stimulus, cannot be controverted, but if the numerous reports of mishaps that give rise to eloquent editorial flights on the part of the wielder of the pen to "abolish these rampant juggernauts," be carefully investigated, the conclusion is inevitable that the amount of smoke is utterly disproportionate to the fire behind it.

Apart from the fact that more attention is accorded one trivial accident in which an automobile is concerned than three fatal horse runaways, it is really about time that the "devil got his due." The chauffeur, even though he be the "imported reprobate" who is credited with stopping at nothing short of murder and arson, is only a human being and to state that he becomes transformed into a monster merely through the act of seating himself at the wheel of a high powered car is childish. More than that, he is only a servant. While the accident occurs while the car is under his sole guidance it may be taken for granted that the disaster was due to a disregard of common sense on the part of the driver, if nothing worse, and facts have borne this out in such a number of instances that it has come to be looked upon as a conclusive presumption. It is merely the old, old story of "when the cat is away."

But when the owner of the car is in it, his servant must do as his superior wills. The importance of the chauffeur is usually much exaggerated, and the fact that he must obey orders and disregard his own judgment as if he had none is too often overlooked. Except in the case of the owner who is dominated by his chauffeur, and the latter incumbent frequently takes his cue from the ruler of the kitchen, the car is virtually under the control of the man who pays the bills, and a refusal to carry out orders would simply mean the necessity of seeking another berth. The owner is at all times morally and legally responsible for the acts of his servant, and the fact that disaster and death follow compliance with his orders by the chauffeur should certainly not be cause for casting the onus entirely on the latter. There is scant doubt that he sins as much as if not more than, he is sinned against, but it is at least fair that the faults of his master should not be laid at his door as well.

The Men at the Show Stands

As the maker's plans for the show season are being matured and his preparations brought down well toward a state of completion, there is one matter which should not escape his attention, and one which, trivial and unimportant though it may seem, is by no means of slight import to his interests. He may have upon his stand the best of machinery, tastefully displayed and well finished; he may have prepared the public for its reception of his various little "surprises" with all the assiduity which is possible in a well planned advertising campaign; he may have a good location, good surroundings, good neighbors and good attendance, and yet fall far short of the mark which he has set down as a probable result of the week's business, if he has not also taken the greatest of pains to train and properly equip the staff of assistants who are to handle the tiresome business of explaining and demonstrating his wares to a weary and footsore public.

The task of repeating an explanation of a certain train of comparatively simple mechanism over and over again through the entire duration of the show season is by no means an easy one. Every exhibitor is straining his every nerve to capture and hold the attention of the visitor. The visitor, whether he means "business," or whether he is prompted merely by idle curiosity, soon becomes wearied of the strain of submitting to a tedious cramming process and soon enough ceases to accept with credulity and interest the usual statements as to excellence of quality and perfection of workmanship. He wants to know what is new; he wants to know "how it works," and upon the demonstrator devolves the troublous task of determining whether or not he is worth considering in the light of a probable purchaser, or whether he is merely being amused.

Because of the drudgery which is connected with this task many exhibitors are wont to put upon their stands one or two young men who are notable for their glib tongues and their ability to parry embarrasing questions. Such as these are to be seen at every show in far too great abundance, either for the gratification of the earnest public which has come to be shown, or the maker who has come to show. Often

Digitized by Google

enough they are but little acquainted with the business, know far too little of the details of the machine they are attempting to demonstrate and are apt to be inclined toward freshness, and have a leaning toward the fair sex, when evening comes and the real work of the day is to be done. Such youths, either through lack of knowledge or sheer inefficiency, frequently turn away an inquirer with an insufficient answer, leaving him to shift for himself, or, if he be persistent, give him such a smart rebuff that he is fain to leave forthwith. Others, in a desire to shine as great white lights in the business, tell all they know and a great deal more, revealing in the process some most astonishing gaps in their fund of information.

That it is almost as difficult a task to find good show men at reasonable prices as it is to perform well in the capacity itself, is known only to those who have been through the mill themselves. The average maker is loath to break up his force for so short a time and cart around with him a lot of men who would be worth more to him in the shop than on the road. And again, he is hampered by the fact that the men who are most fitted with the technical knowledge, usually cannot tell what they know in intelligible language. His office force, on the other hand, knows little or nothing of the mechanical end of the business, as a rule. Hence, in many cases, he feels obliged to pick up some hanger-on at the show as a demonstrator, trusting to him to turn over to some of the regular salesmen such of the flotsam and jetsam as seem likely to prove worth talking to. The result, however, is not always of the best, from the credit standpoint.

Probably the best demonstrators and salesmen are those who have "graduated" from the shops and have undergone a considerable training on the road. They are not easy to find, except in the pseudo type, which is never stationary in any capacity long enough to learn its ins and outs, nor are they easy to procure as a general thing, for those who are worthy are always fully engrossed at show time. Whoever they be, they must be gentlemen, in the sense of white linen and black shoes; they must be polite, and patient, and intelligent; they must be well informed on the whole of the business, and, above all, they must not be "knockers." The show attendant may seem of less importance than the show, but he is a factor to be chosen with care and trained with precision.

Concerning Prompt Deliveries.

Prompt deliveries have ever been the guiding star of the most successful manufacturers and they obviate a deal of worry as well as the necessity for much diplomatic lying on the part of the agent who has to act as the go between to pacify the customer anxious to possess his new car. But good intentions even when backed by well laid plans based on the output of ample manufacturing facilities often become impossible of fulfilment long before the time comes to carry them out. This has been the case in every selling season during the past three years and there is no reason why the cry of "cars, send us the cars," will not rise from the agent all over the land before 1906 is far advanced.

True, most of the larger makers had their plans for 1906 cars worked out and the cars themselves on the road in the hands of testing crews months in advance of the time that this was considered necessary in previous years, and hundreds of cars of next year's model have been turned out—a goodly number of them sold—long before the close of the present year. This, as a rule, is only possible with an organization complete enough to build the car from the ground up, and there are not a great many such. There are, in fact, comparatively few makers who do not now rely upon the partsmaker for at least some of the components of their vehicles.

The parts specialist fills a gap not provided for by any other factor in the manufacturing economy of the small builder and it is not too much to say that without him the same number of makers could not flourish. But he is apt to prove a thorn in the side during the coming season, for, overwhelmed with orders, the matter of deliveries is bound to be a bone of contention and few of the dates contracted for are apt to see the arrival of the parts at the builder's factory. "Held up for parts without which it is impossible to ship the car" is not at all likely to be given as an excuse to the buyer, but whatever form the jollying condolence handed out by the agent to smooth over the impatience occasioned by enforced waiting, this will be in numerous instances the substance of the hidden reason.

Refinement Rather than Experiment.

While it is evident beyond the shadow of a doubt that the cry of those who predicted radical changes of many kinds in this year's cars has been utterly refuted by what has already been brought to light both here and abroad, it must not be concluded that the detailed changes chronicled are merely matters of personal taste on the part of the various designers.

The seeker after novelties at either of the foreign shows must have come away disappointed, for there was a decided lack of innovation in evidence, whether on the part of old established houses or of newer and smaller builders, who are more prone to bring forth such attractions. Further, the instances in which any departure from previously accepted standards were present were so far from being numerous that it was necessary to sift a great deal of chaff to find any wheat—the searcher found it incumbent upon him to inspect a great many cars and to look them over closely in order to discover their distinguishing features.

Nevertheless, when the detail uncovered here and there is added to that discovered on all as a whole, it will be found that there is more or less food for reflection on the part of the designer and that several modifications of what has hitherto been considered as settled practice are due to pass through the test of daily use on the road for the next six or eight months. Considered in the aggregate, it must be conceded that the occasional departure was so slight in many instances that none but a keen observer, familiar with all that has gone before, would be competent to detect it or to recognize in what respect it differed.

It would appear that not a few builders have apparently come to the conclusion that the most profitable policy by far is to let well enough alone, and the great measure of success attained in the last year, both mechanically and financially bears this out so strongly that it were folly not to take advantage of the precedent thus set.

Some sagacious personage would have it that when you have taken a piston out of its cylinder for any reason the proper thing for you to do before you put it back is to turn it down around the head a little bit, so that it will go back again more readily than it otherwise would. That may be true enough, but if you do, you had better order another can of compression before you start in, as you will be likely to need it before you have finished.

No word is forthcoming from France to say whether the light runabout which was thrown together in four hours and then driven over 750 miles of country road in less than sixty-two hours was afterward relegated to the scrapheap or preserved for exhibition as a relic.

HERE'S THE MOTOR COMEDY

It's Written Around the Vanderbilt Cup and Oldfield Will Help Supply the Thrills.

The automobile play has "arrived." It will stage under the title "The Vanderbilt Cup," an "eight cylinder musical comedy, with three shoes and eight tubes." It is now on the road—"being tried on the dogs," is the theatrical expression—preparatory to its presentation at the Broadway Theatre, New York City, during the automobile shows. It is billed for two weeks hence, when "Veronique" will vacate the Broadway.

Although their names do not appear in the cast it is understood that Barney Oldfield and Tom Cooper will make their debut as real actormen and supply the climaxing thrill in the second act, which represents the scene in front of the grandstand at Mineola at the finish of the race for the Vanderbilt Cup. These two racing "cracks" will drive real racing cars on rollers and to give the touch of realism to the scene the moving picture machine will be brought into play. It will be remembered Oldfield went through a fence—it was a paper one, though—at Poughkeepsie last summer, while a moving picture camera recorded it. The cast includes some well known stars and catchy songs without limit. There will also be lots of ulsters, leather caps, goggles and the like. Miller, the New York supply man, having furnished some $400 worth of such "artistic touches."

Some idea of the magnitude of the elaborate production may be gleaned by a perusal of the artists in the cast as well as the synopsis of scenes:

Newt. Offut, a hill climber, Will T. Hodge; Mrs. Willetts, mother of Dorothy, Grace Gaylord Clarke; Theodore Banting, an equitable attorney at law, and other things, Otis Harlan; Miss Carstairs, Dorothy's music teacher and chaperon, Marie Stone; Dorothy Willetts, Elsie Janis; Dexter Joyce, a lightning conductor, Aubrey Boucicault; Clerk of the Marjorie Wellington Hotel, Charles Abbe; Mrs. Hillrave, Blanche Chapman; Mrs. Sylvester, Kate Mayhew; Mrs. Filestrom, Grace Griswold; Mrs. Herkimer, Blanche River; Mrs. Dillenberg, Sallie Berge; Mrs. Ostrand, Marie Messner; (Stockholders in the Marjorie Wellington Hotel, known as the Six Crusty Dames.) Winnifred, first bell girl of the M. W. Hotel, Violet Duval; Gwynne, second ditto, Edith Spofford; Pearl, third ditto, Margaret Love; Celeste, elevator girl of the M. W. Hotel, Kate Buckley; Kate Crooks, the porter, Ella Hatten; Inkie North, Western Union Messenger girl, Lilliam Nicholson; Gaspard, an honest French chauffeur, Henry Bergman; Curt Willetts, who "got rich quick"; uncle of Dorothy, Henry V. Donnelly; Clarinda Larkspur, who objects to a speed limit, Edith Decker; Senator Boxwood, of the State of Washington, Jacque Kruger; Arthur, his chainless hopeless, F. Newton Lindo; Rose, Dorothy Kent; Lily, Annette Steele; Violet, Eloise Steele; Pansy, Elsa Rhinhard. (Four flowers of the comic opera.)

Synopsis of Scenes—Act. 1.—Scene 1. The Willetts's Home—(No Gasolene). Scene 2. En Route to New York—(Get a Horse). Scene 3. The Marjorie Wellington Hotel, New York City—(An Up-to-Date Garage).

Act 2.—Scene 1. The Veranda of the Garden City Hotel, L. I.—(The Perfect Clutch). Scene 2. Parking place at Mineola, L. I.—(Space $50 a foot). Scene 3. In front of the Grand Stand, Mineola, L. I.—(100 Miles an Hour).

Act 3.—Scene 1. Boat Loft at the Brooklyn Navy Yard, Converted into a Reception Hall. Scene 2. Another Part of the Brooklyn Navy Yard. Scene 3. Launching a Battleship.

Oldfield Gets the Medal.

Barney Oldfield has been presented with the gold medal emblematic of the National Circuit championship of the American Automobile Association, which petered out to as near nothing as possible before the season's end. He scored 26 points. The others who figured in the running and their scores are as follows: Louis Chevrolet, F. I. A. T., 13 points; Webb Jay, White, 10; Charles Burman, Peerless, 6; Dan Wurgis, Reo, 6; Guy Vaughn, Decauville, 4; Emanuel Cedrino, F. I. A. T., 4; Earl Kiser, Winton, 2; Herbert Lytle, Pope-Toledo, 2, and Montague Roberts, Thomas, 2.

"Bell's Palsy" a Winter Affliction.

"Bell's palsy" is the latest affliction to visit itself upon the motorist, and a physician is authority for the statement that it is the result of driving an automobile in winter weather when one side of the face is exposed to the cold more than the other. The most recent sufferer is said to be suffering from paralysis of the entire left side of his face and is not alone in his misery, for he is claimed to be the third victim. It apparently travels in threes, for the doctors state that three weeks are required in which to gain relief.

Milwaukee Pays a Motorist's Bill.

Because workmen carelessly left a manhole unlighted the city of Milwaukee, Wis., will be forced to pay for the automobile of Dr. A.C. Sidler, which was completely demolished in a collision with the standpipe. The blame has been sifted through the various heads of the departments until it finally has been placed upon the men who last worked on the manhole. Therefore the city will pay the cost rather than fight the case.

Coplay Exacts its "Blood Money."

Taking advantage of the present discussion anent Pennsylvania's new automobile law, the borough council of Coplay has enacted a law to mulct motorists while it may by providing for an annual tax of $3, limiting the speed to eight miles an hour and stipulating the usual regulations regarding lights, brakes and horns. Violations are punishable by a fine not exceeding $100 or imprisonment of not more than thirty days.

MOTOR CARS AS BAGGAGE

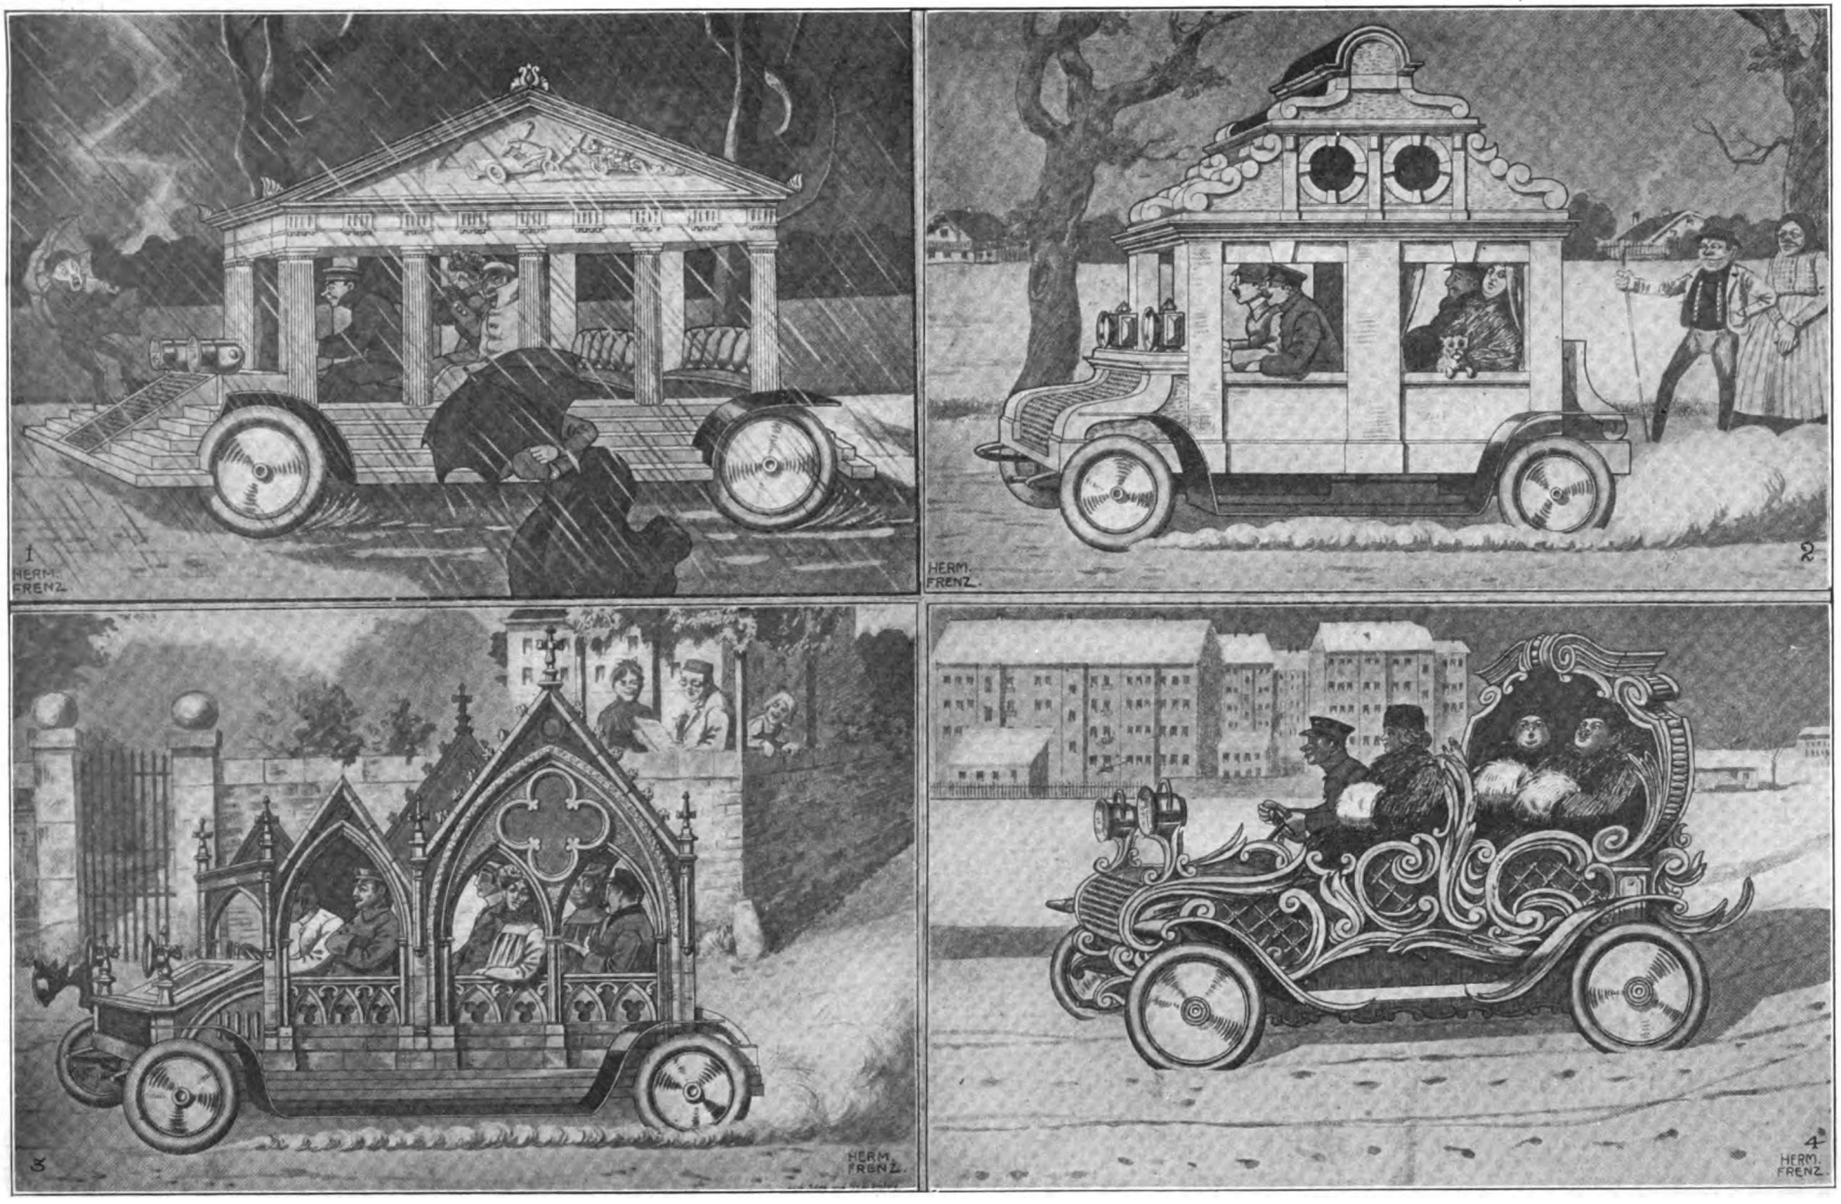
Result is a Railroad Car of New Design—May be Used for Horses, also.

It has been a problem of growing importance for the railroads how the elaborate equipment annually carried to the summer home is to be transported, particularly when the distance is represented by the stretch from Chicago to Bar Harbor or something similar. The matter has been brought to a climax by the appearance of the automobile as one of the most important of these household chattels for which special provision must be made and some of the Down East lines are already planning ahead for next summer's demand. This is true of the Boston and Maine Railroad, which has already ordered a combination automobile, carriage and horse baggage car that will form part of the regular express trains, so that together with his trunks and band boxes, the summer visitor may have his stud of both cars and horses dumped on the platform when he alights at his destination.

On the outside the car will look like an ordinary baggage coach having a "monitor" roof with ventilating windows on each side above the curved part. At the ends of the car will be large double doors opening out from the middle, seven and a half feet wide and eight feet one inch high. On each side of the car also will be doors, two of them, one eight feet and the other four feet wide. Inside will be sliding stalls for the accommodation of sixteen horses; and gates to shut the horses in are also provided. When there are only a few horses, or when carriages or automobiles are to be shipped instead, the unused partitions for the stalls will be slipped back against the sides, giving a clear passage through as large a part of the car as desired.

There will be, of course, a man to travel with the horses and feed and water them or to look after the carriages and automobiles. The private coachman or chauffeur will be allowed to watch his charges closely.

Reduced Rates to Florida.



Reduced freight rates on automobiles to Florida will prevail from now until spring. The Florida East Coast Railway is to grant a half rate of $1.93 per 100 from New York or Boston to Ormond, Daytona, or any other point on the line of that railroad. This rate will hold throughout the winter and is not limited to the twenty days embracing the tournament season.

Hemery Cracks Kilometre Record.

Cables from Paris report that on December 30, Hemery, driving an eight cylinder, 200-horsepower Darracq machine, from a flying start, covered a kilometre in 20 3-5 seconds; equivalent to doing a mile in slightly over 33 seconds. This beats the previous record by four-fifths of a second. The dispatch does not state where the trial was made or whether it was officially timed or not.

WILL TEST MORE THAN TIRES

British Promoters "Take on" Lamps and Speed meters—How these will be Judged.

In conjunction with England's tire trials, which are to be held in the early part of next month, it has been decided to "ring in" a few side lines, such as trials for speedometers and lamps.

It will be recalled that, as published in the Motor World when the conditions of these trials were first made public, the entrance fees are very stiff—$500 per set of tires being the minimum in case not more than ten sets were entered, and $250, should thirty or more be entered. This has considerable bearing upon the additional trials proposed, for according to the conditions of the latter, it will be the pleasure of all entrants of the minor accessories to help defray the expenses of the tire trials. In explanation, it is naively stated that as "Those who enter tires in the competition will have to provide cars and drivers," and pay roundly for the privilege, which is not stated, "some reimbursement will be made from the fees received from the accessories." An entrance fee of $125 will be charged in the case of speedometers, $75 of which will be placed to the credit of a common fund to be distributed among the tire entrants as a contribution toward the cost of running the cars. The entry fee for lamps is somewhat less, and of the latter 25 per cent. will be devoted to the same end. Entries for both close January 31.

The conditions of the trials for the accessories are as follows:

The speedometers entered for trial (which shall be chosen from stock by the club) will have to be provided and fitted by the entrant. The instruments will be required to run during the whole of the tire trials, or such shorter distance as the club may determine, and no adjustments will be permitted except in the depot either before or after a day's run. All instruments entered for trial will have to be fitted with a mileage recorder. The entry fee, which must accompany the application, has to be made on the official form of the club, and will be $125 per instrument.

The speedometers entered for trial will be observed on the road, and they will be calibrated both before and after the trials. The following points, inter alia, will be taken into consideration in making the awards, viz.: Accuracy, durability, the effect of reversing the car on the subsequent accuracy of the instrument, price, rapidity of response to variations of speed, simplicity of construction and attachment, steadiness of reading.

The instrument adjudged to be the most meritorious, provided there are at least three entries, shall receive the club's gold medal, and the second best, provided there are at least six entries, shall receive the club's silver medal. A certificate of performance will be issued to each competitor. At the end of the trials the speedometers used during the trials shall remain in the possession of the club, to be dealt with as the club may decide.

In connection with the lamps there will be sections for gas and oil lamps. In the former category it is provided that all generators shall be charged once a day by the entrants, and that the entries shall be divided into three classes, as follows: A. Generators, the points to be taken into consideration, including the cubic feet of gas generated, the dryness and steadiness of generation, ease of cleaning, smell, power of retaining charge, and cost of gas supplied. B. Lamps, without generators, the tests to be concerned with the candle power of the central beam of the lamp per cubic foot of gas consumed per hour, the distribution of light over an agle of 35 degrees in a horizontal plane, the non-tarnishing of the reflector, freedom from fracture of the exposed glass, quality of construction and of attachment, fitting, ease of cleaning, price and condition after trial.

In Class C. (for self-contained lamps) all the points enumerated will be taken into consideration.

With regard to oil lamps these will be placed in three categories, viz., head, side and tail lamps, and in making the awards regard will be paid to the candle power of the central beam of the lamp, time of burning with one filling of the reservoir, ease of filling, trimming and lighting, the attachment of the reservoir to the lamp, the device for raising and lowering the wick, non-tarnishing of reflector, quality of construction, and absence of defects during the road test. In connection with tail lights, regard will also be paid to the means afforded to the driver for ascertaining if the tail lamp is alight, and the adaptability for the purpose of illuminating the number plate without unduly projecting behind it.

Bay State Elects Officials.

At the annual meeting and election of the Bay State Automobile Association, Boston, Tuesday afternoon of this week, the reports of the several officers and committees showed the club to be in a healthy condition. Numerically it numbers 394, while financially it is strong and vigorous, having, with all bills paid, over $3,000 cash balance. These officers were elected: President, Lewis R. Speare; vice-president, Harlan W. Whipple; treasurer, Herbert L. Bowden; secretary, J. Fortescue; directors, John C. Kerrison, Charles E. Fay, E. A. Gilmore, F. A. Hinchliffe and J. A. MacAlman.

Regulating the Searchlight.

The searchlight evil has been mitigated in Philadelphia, or at least in Fairmount Park. The Park Commission decided that with the beginning of the new year automobilists may carry as many lights as they please on their cars when riding through the park, but that no movable searchlight will be permitted.

LOCAL LICENSE IS HELD UP

Pennsylvania Supreme Court Grants an Injunction—Much Mixed State of Affairs.

Philadelphians have won a point in their fight against the iniquitous double taxation system now in vogue in the City of Brotherly Love. Briefly, the situation is this: An act of Legislature declares that automobiles must carry a State license tag, but no other tag. An ordinance of the Philadelphia Councils declares that all automobiles must carry the city license tag.

Thus, motorists were placed between the devil and the deep blue sea. If they showed the city license, they smashed the statute and subjected themselves to the penalty in such case made and provided. If they failed to show it, they broke the ordinance into smithereens and became liable to the punishment which the ordinance prescribed. The law laid hold of them "coming and going" and likewise down the middle, and the only way they could avoid becoming law-breakers was to leave their cars in the garage. That this absurd and anomalous condition of things should continue was, of course, out of the question. The Automobile Club of Philadelphia and the Philadelphia Automobile Dealers' Association took it upon themselves to see if the law could play both ends against the middle. But Common Pleas Court No. 4, as told in last week's Motor World, decided that the local ordinance must be complied with.

To have the law defined beyond question, an appeal was immediately taken to the Superior Court. In the meantime Highway Commissioner Hunter said that if any automobilists carried other than the State license upon their cars they would be liable to arrest. In spite of this, Chief Lukens, of the Bureau of Boiler Inspection of Philadelphia, went ahead and ordered his local tags, 2,500 of which arrived last Friday.

"The best laid plans of mice and men gang oft awry," and so it proved in this case. Late Friday afternoon Chief Justice Mitchell, of the Supreme Court of Pennsylvania, issued an order which effectively restrained the local authorities from enforcing the ordinance until the argument is heard in the case. That means that one license tag only, that issued by the State Highway Department, will be sufficient until the case is decided by that tribunal. If the regular proceedure is followed, it will not come up until March, but Attorney Ira J. Williams, for the automobilists, has petitioned for a hearing next month. The official order of Judge Mitchell reads as follows:

"It is ordered that the appeal heretofore taken in this case shall be supersedeas, and the respondents and the City of Philadelphia are enjoined from enforcement of the ordinance of December 22, 1902, pending the appeal."

HE OBJECTS TO "BLOWERS"

Also to Armored Tires—Says they Destroy Roads, Hence Pile on Taxation.

Schemes to regulate mechanically propelled vehicles are like the poor—they are omnipresent. Bills asinine and bills more so, some even attaining the superlative degree of irrationality, have come and, like Caesar's ghost, have as unceremoniously disappeared, but each legislative season is, and seems destined to be until the end of time, productive of a prolific crop of motor regulative measures raised by cornfed sophisticated legislators.

The latest scheme is to tax automobiles on the basis of damage they occasion to the public highways. This is the feeble excuse for another chance to get a whack at automobilists, and, as yet, has only reached the suggestive stage, but as that anglicized Irish revolutionist, George Bernard Shaw, expresses it, "You never can tell just what'll happen." The suggestion to tax automobiles on this basis is made by State Road Commissioner E. C. Hutchinson, of New Jersey, in his annual report which has just been submitted to Governor Stokes. The commissioner only makes the suggestion, but hopes some member of the Legislature will take it up. The commissioner believes that if high speed machines are to be allowed the use of the highways, and, he naively acknowledges, there is no imminent indication of their prohibition, they should be taxed in proportion to the maximum speed of which they are capable, which, he claims, is a fair measure of their powers of destruction.

To offset the "increasing havoc wrought by automobiles," the passage of "restrictive legislation to eliminate armored tires, chain tires and blowers" (presumably meaning mufflers) is also urged. In that part of his report bearing on the use of highways by automobiles, Commissioner Hutchinson says:

"The automobile is now a recognized means of conveyance, and as such is entitled to the use of the highways, but there are certain appliances used upon them which are very detrimental to our roads. They are the armored tire, the chain tire and the blower. The damage done to the surface of our macadam and gravel roads by these appliances is so great that the question of remedy is creating considerable agitation all over the different counties of the State. The temptation to get all the speed possible out of any means of locomotion is irresistible; therefore, no one should be allowed to run a machine upon our public highways without first obtaining a license, granted after proper examination, as the majority of accidents are caused by the incompetent chauffeurs. If the high speed machines are to be allowed on our highways, they should be taxed in proportion of the maximum speed of which they are capable. In other words, they should pay for the damage they do, and all money paid into the State treasury for such licenses should be applied to the maintenance and repair of our roads.

"The dust raised by an automobile, when running at the rate of less than twenty miles an hour, is not any worse than that raised by many wagons, but when this limit is exceeded, the automobile becomes the dust nuisance. Many cures for the dust annoyance have been suggested, as the sprinkling of roads with crude oil and different solutions of absorbent salts. These will prevent the dust, but are too expensive to be generally used. Our remedy, therefore, would be the strict enforcement of the speed limit, the abolition of armored tires, chain tires and blowers, and a sprinkling of all improved roads early in the morning and in the evening. This would preserve the roads and would reduce the cost of repairs very materially, at the same time giving us a better, smoother and more dustless surface than we now enjoy. There is no better or cheaper way of preserving our roads than by sprinkling. Water for that purpose can be obtained at neighboring streams, and in those sections where there are none, from wells driven beside the road. In either case it is better and cheaper to pump the water into a tank, from which it can be drawn into the wagons, thereby saving much time."

As to the damage wrought by narrow gauge tires, Mr. Hutchinson says: "There is one other cause of unnecessary wear and damage to our roads that should be removed. It is the narrow tire on heavily loaded wagons. The present law provides that townships may allow a rebate of taxes to all owners of wagons or carts, used for the transportation of merchandise, having tires of not less than four inches in width. We would suggest that this law be amended so as to include every municipality in the State. The premium of $1 per year for each wheel would be money well and profitably expended, as the resultant saving of our road covering would be many times this amount, to say nothing of the added comfort to all. Massachusetts and Connecticut have gone still further and impose a penalty not exceeding $100, on all wagons having tires of less than a prescribed width for a given size of axle. As they are, next to New Jersey, the leading good roads States, we think that their example might be profitably followed by us.

"The enforcement of the requirement of the new road law, passed last winter, that the counties should keep the roads, built under State aid, in good repair, or have the moneys due them withheld until the State Commissioner of Public Roads should certify that they have been placed in good repair, has had a marked effect upon the condition of our roads. Their surface is smooth, their sides are free from weeds and grass, the gutters and ditches are clean, and unsightly and injurious pipes and culverts have been removed. The change is so marked in some sections that the roads are hardly recognizable, but if our vigilance relaxes, we fear that the local authorities will become careless. The result would be that New Jersey would lose the reputation which it now has for being the home of good roads. Other States claim pre-eminence in agricultural products or manufactures, but New Jersey's position as the first good roads State in the Union is as yet unchallenged. As we have so long excelled, we are naturally anxious to hold the high position we have gained."

The report shows that during the year 1905, 67.78 miles of roads were paid for under the State aid act. The total cost to the State was $164,648.99. The regular appropriation for the year was $270,000, and there was an additional appropriation of $15,000 in the supplementary bill. The balance available for roads under construction is $120,583.54. Since the passage of the State aid law in 1892, 1,111.31 miles of road have been built in the State under the act, the total cost of which to the State was $1,925,441.14.

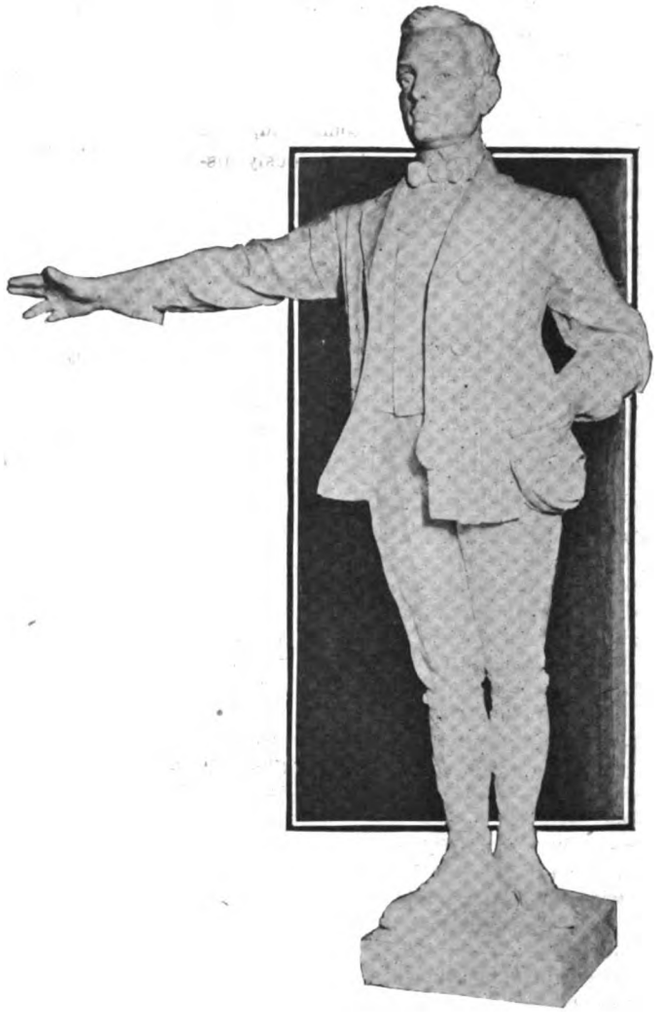
The result of the year's work, in brief, is 67.78 miles of road finished and 38.46 miles in process of construction, a total of 106.24 miles. The commissioner says that when the above roads are paid for the appropriation will be so nearly consumed that road work for the year 1906 will have to cease, unless the Legislature sees fit to grant an appropriation of at least $130,000 in the supplemental bill.

To Make "Borrowing" a Misdemeanor.

Without waiting for promised legislation, F. G. Robinson, manager of the Automobile Storage & Trading Co., of Albany, N. Y., has taken the initiative towards the introduction of a bill in the present session of the Legislature, making it a misdemeanor for garage employes or chauffeurs to take cars from garages without permission. Mr. Robinson's bill, which he has drafted and will have introduced, is far-reaching and is designed also to protect owners who leave their cars in the street. It is one of the inexplicable vagaries of the law that a chauffeur cannot be convicted for taking a car and returning it, unless there is intent to steal. Mr. Robinson asks every owner in the State to write his Assemblyman or Senator to vote for his measure.

The Ghost is Here, too.

It took a long time to materialize, but the automobile ghost is now here. It appeared almost simultaneously in localities widely separated. A Pittsburg, Pa., cemetery claims its motor "hant," and all Surrey, in far off England, is said to be perturbed over the appearance of a "phantom white motor car driven by a woman muffled and swathed in cloudy chiffons." Rabbits' feet are reported to be at a premium in both places.



Welch Buys Ross's "Tea Kettle."

Andrew J. Welch, of Hartford, Conn., has bought the freak Ross steam car which was driven at Florida last winter, but which disappeared from view after it plunged through the fence at Brighton Beach in May, nearly killing Joe Nelson, its driver. Welch will use it for exhibition purposes at Charter Oak Park, Hartford, next summer.

The Lady and the "Tiger."

The Association of Licensed Automobile Manufacturers is going to reveal to the public the typical "Automobile Girl," also the typical chauffeur, at the Madison Square Garden show. They are after-thoughts, but will be in harmony with the prevailing design. The lady and the "tiger" have been created of white staff, more than life size, and will be useful as well as ornamental. The figures are to be placed on pedestals, the outstretched arms denoting the route to the concert hall. The "girl," who already is being used on the show posters, has been evolved of a shell and will support the monogram of the association. From the top will extend streamers of electric lights, giving the effect of strings of pearls. Both she and the chauffeur are deemed works of art. They are depicted by the accompanying illustrations.

Evolving the Motor Fire Escape.

An automobile fire escape is the latest addition to the ranks of the thousand and one uses to which the motor vehicle is being put. The apparatus is but an enlarged edition of the jack in the box idea—the lazy tongs, on a scale commensurate with the height of modern buildings. The frame work of the lazy tongs is constructed in such a manner that the external places of junction of every second pair of legs are adjusted to serve as supports for platforms which can be put up to correspond with the various heights of the floors of a burning building. A gangway is hinged to each platform, from which descent may be had with the aid of a rope ladder.

Of course, these are all details that have little bearing on the question of the motor vehicle transport which is to convey the apparatus to the scene of operations, but that is a matter of secondary importance, and to tell the truth, the inventor has not had time to consider it, nor for that matter, the actual working of his fire escape, for it has not got beyond the paper stage as yet.

What "Batch" Can Do Blindfolded!

Speaking of the genial secretary of the A. A. A., one of his admirers, a country daily, says: "Mr. Batchelder is an expert motorist, and it is said that blindfolded he can take an automobile entirely apart and put it together again." What Batchelder said when he read this admiring comment is not a matter of record.

When Careful Driving is Necessary.

A timely warning has prevented many an accident, but there are signs of danger apparent to the careful and observant driver which are not to be gleaned from guide boards. And one that it is particularly advisable to bear in mind at this time of the year is the fact that a fresh fall of snow is apt to smooth over some bad ruts, as well as other depressions in the road. They may be anywhere from an inch or two to half a foot in depth and with the earth frozen solid, form a trap for the wheel that may tear off the tire if it does no greater damage in the shape of overturning the car, as has been known to occur. Slow and careful driving should be the rule over all such seemingly innocent surfaces.

GOOD ROADS MOST POPULAR

Official Canvass of Vote Proves it—Preparing Now to Build the Roads.

Not until this week was it officially announced that the $50,000,000 good roads appropriation had been passed at the last general election in New York State, along with the six other constitutional amendments which came up for decision at that time, and that, too, with practically a two-thirds majority.

Although it had been understood pretty generally that the amendment had been passed, the exact figures were in considerable doubt, and the full significance of the victory for the good roads movement could not be appreciated. The results, which were duly certified to on Thursday by the State Board of Canvassers, at Albany, show that this sixth clause, which is technically known as an amendment to Article 7 of the Constitution, received nearly six thousand more votes than did either of the other measures, and that it passed by a majority of 383,188 for, as against 117,181 in opposition to it.

As will be remembered, this result completes the ratification of an amendment which was first passed by the legislature of 1903, was again sanctioned by the legislature of 1905, and has now become fully established by the final decision of the people. As it stands, it permits the executive body of the State to bond itself annually in the sum of $5,000,000 for ten years, the entire amount to be outlaid in the construction of State highways according to a most ingenius system of division of the cost between the corporations of the towns which receive the most direct benefit from the improvement, the counties in which they are situated, and the State: by which means the quality of the roads constructed will be absolutely uniform as far as is possible, and the cost to the local, and frequently impoverished communities, which are most in need of the improvement, will be merely nominal.

The work of constructing the highways is already well under way, in accordance with the provisions of the Fuller-Plank law, and the Higbie-Armstrong Good Roads law, several thousand miles being already complete and as many more being in immediate contemplation. The passage of the new law will, however, forward the work considerably, and will insure the completion of 1,400 miles of road, which are included in the scheme within the period covered by the bond issue. As summed up in his recent annual report, State Engineer Van Alstyne gives the conditions which at present obtain, practically as follows:

Since the Higbie-Armstrong Good Roads law went into effect in 1898 up to December 1 last, fifty-one counties have petitioned that 6,900 miles of roads be improved. Of this amount plans for such improvements have been approved by county boards of supervisors, embracing 2,038 miles of road.

Of the 2,038 miles approved by supervisors, 704 miles have been constructed, leaving 1,334 miles, the total estimated cost of which is $12,627,398, of which the counties have appropriated one-half, or $6,313,699. The State has appropriated nothing toward the other half.

From the above statement it appears that the coming legislature should appropriate $6,313,699 to provide the State's share of those roads that have already been approved by the various boards of supervisors, who have made an equal amount of money available. It is probable that before the legislature adjourns at least $1,000,000 more will be appropriated by the counties, making it necessary for the legislature to provide about $7,000,000 during the session of 1906 to equal the amount appropriated by the counties. It is very desirable, says the State Engineer, that this or some other amount of money be made available as early as February, 1906, so that the roads may be advertised and the contractors can make arrangements to secure the necessary plant, machinery, tools, labor, etc., for starting their work at the earliest possible date.

The State Engineer recommends that the roads improved under the Higbie-Armstrong Good Roads law be maintained by the State from funds obtained by the taxes now paid by the abutting property owners and from a tax to be paid by owners of automobiles for licenses, supplemented by such State money as might be necessary to keep the roads in a proper state of repair. The last amount should not be much greater than is now paid out by the State under the Fuller-Plank law toward maintaining the State built roads in the money system towns. To carry out the provisions of the Fuller-Plank law next year the State will have to appropriate $500,000.

It is probable that in the near future the State will have to provide a new prison. The State Engineer recommends that the site of this prison be located where the able-bodied male prisoners may be usefully employed in operating a plant for crushing stone to be used in the building and repairing of State, county and town roads and such other improvements as may require the use of broken stone. During the construction of the barge canal there will be millions of cubic yards of rock excavated at different places along the line of the canal and placed in spoil banks, where, under the terms of the contract, the excavated rock remains the property of the State.

The State Engineer suggests that the site of the prison be located on the west bank of the Hudson River, where trap rock can be used without injury to the scenery of the Palisades, or adjacent to one of the spoil banks, where the stone necessarily excavated for the barge canal may be crushed for use on the public roads and works of the State.

He also recommends that the Higbie-Armstrong Good Roads law be amended to permit the planting of shade trees on roads that are macadamized. These trees will eventually keep the shaded macadam roads from drying and ravelling out and thus decrease the cost of maintenance.

How Wide Tires Help Highways.

Troy, N. Y., has as a member of its Board of Supervisors a man who has the courage of his convictions. He has, accordingly, drawn up an ordinance providing for the use of wide tires on all wagons carrying heavy loads through the streets of that city on and after March 1, 1907. This has been pending before the ancient city's lawmakers for some time, but, blinded to the ultimate interest of the people they represent by a lack of foresight that does not permit them to look beyond the immediate present, most of the gentlemen in question have refrained from coming to the support of the ordinance.

One bright supervisor from a country town admitted that he was convinced that wide tires were necessary to preserve the country roads, and were an actual advantage to the farmer, still he disliked to vote for a measure that imposed an involuntary tax upon his neighbor. The much greater burden of taxation imposed upon the same farmer by the failure to use wide tires evidently never struck him. It is almost superfluous to state that wide tires are road makers and narrow tires road breakers, nor does it require any special scientific attainments or knowledge to appreciate the amount of damage a heavily loaded wagon with ordinary sharp, narrow and rounded tires can do on the best of roads. But beside the immense saving in road maintenance brought about by the use of tires proportioned to the load to be carried, there is the further great advantage of increased hauling capacity with the same or less power. Numerous tests with the dynamometer by national and State experiment stations have proved that ordinary teams can haul 40 per cent. more weight with three-inch tires than with two-inch. A test in Missouri showed that 3,248 pounds could be hauled as easily on three-inch as 2,000 pounds on two-inch tires.

Mention has been made times innumerable of the system by which such Continental countries of Europe as France and Germany have maintained their vast network of floor-like roads in a condition that is equalled in no other part of the world, but it is a story that will bear endless repeating, at least, until it is taken to heart. Germany requires even light vehicles to have tires of a minimum width of 2½ inches, and both this and other European governments compel all road users to construct their vehicles in a manner that will impose the least possible wear on the road surface. In France every market wagon and car is a roadmaker; the tires are from 3 to 10 inches wide, the average being from four to six inches, and the rear axle is more than a foot longer than the fore, so that the track of the rear wheels is fully one inch outside of that of the forward pair.

RULES FOR TOURIST TRIALS

Revised Regulations that Will Apply and that Will Discourage the "Freaks.

Conditions under which the contest for the Tourist Trophy is to be run off this year have just been made public by the Automobile Club of Great Britain, and while the distinngnuishing characteristic of this event—a limited fuel allowance—has been retained, a number of changes have been made that are of interest. The date is to fall between May 31 and October 1 in each year, definite notice being given not later than February 1. Although not definitely announced, it appears to be considered settled that this year's event will be run in May. Despite the great amount of comment raised last year over confining steamers to the same allowance as gasolene cars, it will be noticed that this has not been altered, and any steam cars entered will be restricted to one gallon of fuel for each 25 miles run. As 10 to 12 miles represents the maximum of which the steamer is capable under favorable conditions, this is a prohibitive restriction.

"The competition shall take the form of a race for touring cars, irrespective of the country of their origin, with a limited amount of fuel, under the following conditions," in brief sums up the raison d'etre of the event.

The following is a résumé of the more important conditions governing it:

The race shall be held under the competition rules for the time being of the club. Cars may be entered by members of the club or of any recognized foreign or colonial automobile club.

Special awards may, at the discretion of the club, be given to those cars competing in the race which are entirely of British manufacture, such cars to comply with the Bennett Cup rules so far as the country of origin is concerned. The distance of the race, including controls, shall be not less than 150 and not more than 300 miles. The car completing the course in the shortest time shall be the winner, subject to compliance with these regulations, and the entrant of the car shall, on signing the bond and effecting the insurance required by the club, become holder of the trophy.

The fuel to be used shall be provided by the club, and shall be petroleum spirit having a specific gravity of 0.695 to 0.705 at 60 degrees Fahrenheit. For 1906 the allowance for both gasolene and steam cars shall be one gallon for every twenty-five miles, if the course be in the Isle of Man, and shall be an equivalent amount if the course be elsewhere.

The weight of the chassis shall be not less than 1,275 pounds. Accumulators and other ignition apparatus, the tires on the wheels, the bonnet, tanks (empty), and dashboard, shall be treated as part of the chassis. The load carried by the chassis, exclusive of fuel, oil and water, spare tires, spare parts, luggage, and provisions, shall be not less than 1,125 pounds, made up of: The body and accessories, such as mud guards, and the driver and one passenger, with ballast not to exceed 300 pounds.

The chassis shall be in all respects of the ordinary touring type, and the car shall conform in all respects to the requirements of the British law. The chassis shall have not less than four road wheels. The tread shall not be less than 4 feet, and the wheel base shall not be less than 8 feet. All tanks shall be fixed in the ordinary standard position.

Efficient silencers must be fitted to all cars, and no form of auxiliary exhaust release will be permitted. The number of gears in the gear box shall be restricted to not more than four speeds forward and reverse, except in the case of a variable speed gear. Every competing car shall be required to show that it is capable of being driven half a mile at twelve miles an hour on the level on the top forward gear and without the manipulation of the clutch. Every competing car shall be required to show that it is capable of ascending a hill of 1 in 6 on the high gear without a flying start.

The body shall be in all respects of the ordinary touring type, substantially constructed, properly upholstered and furnished, comfortably seated for driver and three passengers facing forwards, two in front side by side, and two behind side by side.

The body of the car shall be easily removable, and this removal shall not entail disconnecting any part of the ignition apparatus, lubricator connections, fuel pipe work, the fixings of any tank, or any pipe connections to the tank.

Between the start and finish of the race the driver and his mechanic only shall be permitted in any way to assist a car, and no stores, supplies (except water), spare parts or spare tires, other than those actually on the car at the start, shall be taken on the car during the race. Everything (except fuel) which is on the car at the start must be carried throughout the race.

Not more than two cars by one manufacturer will be accepted.

The entrance fee for 1906 has been fixed at $100 per car.

Every car entered for the 1906 race shall be provided with fuel tanks of a capacity and description to be specified, which shall be made, fixed and connected in accordance with the specification to be issued by the club not less than three months before the race.

Any loose ballast required by these regulations shall consist of canvas bags of sand containing not more than 50 pounds each, and shall be provided by the competitor.

If after the race the weight of chassis and weight of load carried, respectively, are found not to conform to the regulations, the car shall be disqualified. The club reserves the right to cut open any of the fuel tanks and to take such other steps as it may deem necessary to examine the fuel system of any car on the conclusion of the race. In any case the fuel tanks of the first three cars will be cut open on the conclusion of the race.

FIVE TIED FOR TROPHY

Remarkable Result of Australian Reliability Test—"Run-off" Failed to Break Tie.

One of the most uncommon events ever held was the Dunlop Motor Reliability contest, November 14 to 18, from Melbourne to Sydney, Australia. It was uncommon in that seven of the contestants went through with perfect scores, necessitating, under the rules, a run off. In this only two cars dropped out, and as five cars again scored the maximum points, it was decided to call the contest at an end and inscribe the names of the five on the trophy. If one of these contestants wins the contest next year, the trophy will become his property.

Four classes were provied for in the contest: Motor bicycles, single cylinder cars, cars up to 12 horsepower and cars of more than 12 horsepower. The distance from Melbourne to Sydney is 572 miles, but the journey was divided by days, Euroa being the destination on Tuesday, Albury on Wednesday, Gundagai on Thursay, Goulburn on Friday and Sydney on Saturday. In all thirty-one machines started, three of which were of American manufacture, Oldsmobiles. Until Goullroid the contest was easy, although bad roads were encountered for the greater part of the journey. From Goulurn to Sydney, 129 miles, the last stage of the contest was in the nature of a non-stop run, and as hills of more than ordinary grades were encountered, the trial was rigorous. However, seven contestants scored the maximum number of points as follows: S. H. Day, 8 horsepower De Dion; W. B. Wilkinson, 8-10 horsepower Talbot; George Hobbs, 18-28 horsepower Mercedes; W. A. Grimwade, 10 horsepower Argyle; H. Tarrant, 8-10 horsepower Tarrant; A. Fauvel, 12 horsepower Richard-Brazier, and J. W. Moffatt, 10 horsepower De Dion.

As these were all tied for first honors, a non-stop test was then run over a distance of 132 miles, from Sydney up to Medlow Bath, on the Blue Mountain, and return. No finality was reached, however, as Fauvel was the only contestant to drop out, his defeat being caused by a broken spring.

As these contestants were on even terms, it was decided to hold the run-off on the return trip to Melbourne, under non-stop conditions, three points being deducted for every minute or part thereof spent in repairs during the return trip, any contestant losing 10 points to drop out of the contest. The start was made Thursday, November 23, and the destination was Goulburn, 129 miles. At Goulburn Hobbs, Moffatt, Day and Wilkinson had perfect scores, and Tarrant and Grimwade were charged with 3 points each, the former having lost one minute replacing the cooling fan belt, and the latter having accidentally stopped his motor while getting out of the car. Friday's run was from Goulburn to Gundagai, 121

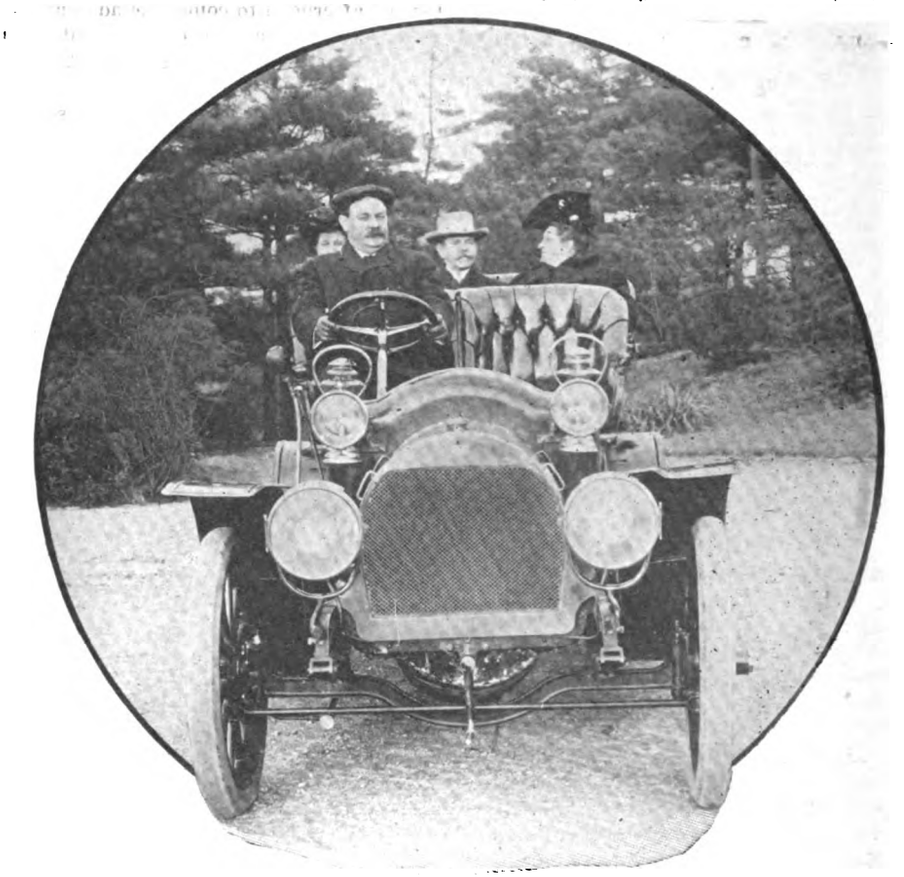
Digitized by Google

miles. It was marked by an accident to Moffatt, in the De Dion, which puts him out of the running for good and all. He ran into a culvert and the car capsized, smashing the front wheel. Hobbs again ran with a clean score; Day was given 2 points for changing a sparking plug, and Wilkinson scored 3 on account of accidentally stopping his engine while filling the gasolene tanks.

Saturday's journey was from Gundaiga to Albury, 121 miles, and not one of the contestants was penalized. The last and final run was to Melbourne, the most severe of the series, 136 miles of the 201 being classed as bad. All the cars finished within the time limit, although Grimwade scored 3 points for accidentally stopping his engine at Euroa, and Wilkinson was given 3 through for the same reason. The total points debited for the return trip were: Hobbs, 0; Day, 2; Tarrant, 3; Grimwade, 6; Wilkinson, 9. As none had been debited with the 10 points which were necessary to count out, all five were declared winners and their names ordered engraved on the trophy.

Priests Apply for Papal Permission.

Having duly received the official sanction of the head of the church, it would appear that the automobile is due to become an official institution of Catholicism, for in view of the Pope's example, several of the younger cardinals are anxious to do likewise, and have accordingly asked Pontifical permission to employ the motor car for their diocesan visits. "So much time is lost by delay on the railroads," constitutes the burden of their lay by which these prelates of the Church hope to open the way to the enjoyment of a privilege which they have long envied, but hesitated to adopt for lack of precedent. The latter takes the form of a permit to Cardinal Satolli.



Linking the Past and the Present.

"A living anachronism" is the most apt description that can be accorded an electric vehicle built in France for a Paris perfumery house and exhibited at the recent Salon, for, with its ornate body in the style of Louis XV, resting on pneumatic tires and guided by a wheel rising behind the regulation bonnet, it combines the sixteenth and the twentieth centuries. With its bright colors and artistic panels, it is said to have formed a most striking exhibit, and is but another illustration of the fact that there is no phase of the carriage maker's art that is not readily applicable to the motor car.

Germany to Pile on Taxation.

That portion of the automobile industry which centres its interest in Germany is greatly alarmed over the proposed motor tax. This, according to a calculation based on the probable rate of 100 to 150 marks per car, would involve an annual increase in the internal revenue of something like 3,500,000 marks, or $833,000—an amount which is not likely to be overlooked as a possibility when the national expenses are rapidly increasing and the necessary funds are much needed.

The Minstrel and the Motor Car.

LEW DOCKSTADER IN HIS 1906 RANIER.

Christie and the Cow.

Walter Christie tells the following story on himself:

"One day in August," he said, "I was down in Southern New Jersey and took a run out into the country, and somehow got lost. On toward dusk I found myself at the meeting point of four crossroads and unable to tell which road would lead me back home.

"So I pulled up and waited, and soon a boy driving a cow appeared.

"'My lad,' I said, 'I want to get to Cape May.'

"The little fellow stared at my big racing car, and then he said calmly:

"'Well, just foller this cow an' ye'll get thar.'"

Scorching as an Aid to Bankruptcy.

"Fined for furious driving on ten or twelve occasions, costing in all about $1,250 in penalties and costs," was one of the causes of his bankruptcy, attributed by a recent applicant for legal relief. The unfortunate was a London publisher.

Hill Heads the Brocktons.

The Brockton (Mass.) Automobile Club has elected the following officers for 1906: President, G. W. R. Hill; vice-president, H. R. Burbeck; secretary, Dr. Edward Bryant; treasurer, Albert Leighton.

Now Comes the Motoring Dentist.

"No one who has ever faced the ordeal of convoying a shrinking, shrieking child for a much needed visit to the dentist would fail to appreciate the dental practitioner who makes his rounds in an automobile," says a disciple of the drill and forceps, who is likewise a devotee of the motor car to an extent that leads him to believe in the efficacy of bringing the dentist to the patient where the latter prefers it, whether from taste or necessity. "I can pack my entire paraphernalia, including my big drill with its painful pointing finger, and an assistant into my car and be off at five minutes' notice," he adds.

How to be Safe in a Fog.

A paternal government not having seen fit to prescribe a code of rules and regulations for the guidance of land navigation in a fog or to adopt those already established for marine use, the irrepressible S. F. Edge has taken it upon himself to fill the gap for foggy, murky London. He says the best way to drive in a fog is to sit very low and to have a lookout man seated on the footboard, so as to take advantage of the side lights. Likewise, keep as close to the curb as possible. It might be added "go slowly," but no mention is made of this particular, possibly because Edge, who gives the advice, is not generally reckoned a "slow coach."

STEER ROPING, NEW STYLE

Accomplished in Record Time but it Was Exciting While it Lasted.

Pursuing a steer from a standing start across a large arena, roping, throwing and tieing it in the remarkably short time of thirty-one seconds, is a record that stands alone in the history of the motor car.

This was accomplished in the full view of thousands of spectators at the last convention of the National Association of Cattlemen held in Fort Worth, Texas, not long ago. The performance was the outcome of a bet of $500 between two wealthy cattlemen of the State, one of whom was an automobile enthusiast, having unbounded confidence in the ability of the motor car.

C. J. Corkhill was attending the convention in the interest of the Oldsmobile Company, and was induced by the cattlemen to make the attempt, and tells of its accomplishment as follows:

"The first that I knew of the idea," said Mr. Corkhill, "was when E. B. Walters and A. H. Wharton talked about the relative merits of the automobile and the pony. Walters was saying that the machine could not be used on the ranch and consequently it was of no use to him. Wharton, who has owned an automobile for several years, replied: 'Now, I know better than that. You can catch and rope a steer just as well with a bubble as with a pony, and I'm willing to bet money on it.'

"'I'll just take you on that. You cannot catch a steer in an automobile to save your life,' was Walters's answer.

"The conversation went on in this wise for half an hour or more, and sums ranging from $10 to $1,000 were mentioned. Finally, however, $500 was agreed upon as a bet.

"The next thing was to pull the affair off as soon as possible, and it was decided that the feat should be tried the next day, some time during the roping contest. I knew both of them well, but of course it was up to Wharton to make the arrangements, as he was the one who had to prove that it could be done.

"I was standing near, so he turned to me at once with the remark, 'Well, Corkhill, I guess it's up to you to help me put this through. Will you take your runabout into the ring to-morrow, and make a try at a steer? Don't be afraid of the machine; smash it to smithers if you have to.'"

"First of all I looked up Bill Dillingham, one of the best ropers on the ranges. I explained what I wanted, and he readily agreed to do anything he could. Wishing to make sure of it, the next morning we took the car, which was an ordinary seven-horse power runabout, and went out to experiment a little. We cut a steer out of a bunch after a little maneuvering, and succeeded in roping him.

"Thus encouraged, we waited confidently for the afternoon to come around. The steers were penned in a corral at one side of the grounds, and let out one at a time by means of a narrow chute. The grand stands and the bleachers were packed by thousands of people from all the surrounding territory. The bet had circulated throughout the whole town, for it was different from anything that they had ever heard of, and naturally they favored the bronchos, having always been accustomed to place their faith in them.

"When about ten or a dozen had been roped in the usual way by the cowboys, one of the judges strode over to us and said, with a broad grin, 'Well, get your cow pony out, and let us see what you can do.'

"Without further ado, we drove over to a position alongside the chute, and a steer was let out. We took up the chase immediately, but were handicapped more than one on a pony, for he can attain full speed in a couple of jumps, while we had to warm up more gradually. So he had a pretty good lead when we hit our gait. It did not take us very long, however, to close up once we were started. We followed him across the enclosure, but had to come quite close, for Dillingham always works with a 28-foot rope.

"Just as the steer commenced to turn Bill gave the lariat a swift fling, landing the noose squarely over the horns. As it settled along his flank I turned the machine sharply at right angles with the course, gave the rope a twist around the steering post, and then, sudden as a streak of lightning, you might say, came the strain. The machine spun half way around, something snapped and the frame quivered and shook. But the steer was thrown hard and flat on the ground. I can still hear the thud as it struck.

"The crowd set up a cheer that I have never heard equaled. They stood on top of the chairs, waved their hats, and yelled as if mad. Without waiting to look around Bill jumped out of the car, ran over to the steer, hog-tied it, and held up his hands for time. From the instant that the steer had been let loose, until he was thrown and tied, the stop watches had been held on us, and the whole operation had consumed but thirty-one seconds, while the best time made with a pony was 1:11. A just comparison of the two cannot be made, though, for only one can work with a pony, while in the car there were two of us, one to run it and the other to do the roping.

"On carefully examining the car I found that one of the lamps had been broken off, but no further damage was sustained, although I had expected all the time to find the frame rather badly loosened up all around.

The Latest Shade—When on earth I was a motorist.

His Satanic Majesty—Then you can crawl under this furnace and see what is the matter with this grate. It seems to be clinked up.—Ex.

HORSEMEN ERECT A GARAGE

Brooklyn's "Swell" Club Now in Possession —Its Many and Varied Conveniences.

With the completion of the new fireproof garage of the Brooklyn Riding and Driving Club in connection with the other club buildings facing the Prospect Park plaza in Brooklyn, the automobile has invaded precincts where for years Dobbin has reigned supreme. It was formally opened by the club last week and is believed to represent the finest example of its kind of which Brooklyn can boast. In connection with the opening there was a small exhibition of cars furnished by dealers for the occasion. The automobile has not been Dobbin's only rival, for ten years ago when the club's large coach house was built an elaborate bicycle room was included and at times it sheltered hundreds of the silent mounts, which, however, have long since disappeared to make way for their four wheeled, power driven competitors.

Thirty-five thousand dollars have been spent on the new building and as it is the result of more than a year's study of the best examples of its kind, both at home and abroad, nothing has been left undone to provide for the comfort and convenience of car owners.

The garage has a frontage of fifty feet on Plaza street and of 110 feet on Flatbush avenue. It is a two story and basement structure. Although it is proposed in time to add a third story so as to balance the three-story clubhouse at the other end and complete the symmetry of the group of buildings.

Aside from the outside brick facing the garage is entirely of heavy concrete construction. The walls, the floors, the staircases, the roof are all of concrete. There is scarcely a sliver of wood in the entire structure. It is believed to be absolutely fireproof. But as an extra precaution each of the rooms in the building and the staircases are provided with metal doors, fitted with a device that would automatically close them in case of a fire starting among any of the machines. The action of heat would melt a soft metal strip, releasing weights that would close the door. The "gas house" is an entirely separate building in the rear, 6 by 12 by 8 feet. It has a capacity of 280 gallons of kerosene and 560 gallons of gasolene. The fuel is drawn into the garage as wanted, by a system of improved pumps.

The basement is intended for the accommodation of electric machines. Here are ten outlets from the electric switchboard, through which the current comes from the street, and ten machines can be charged at the same time. Near by is a shop for the repair of that class of machines and the adjustment of batteries. There is a hydraulic lift in the floor which renders the attaching of batteries to the machines an easy matter. The big switchboard is a spe-

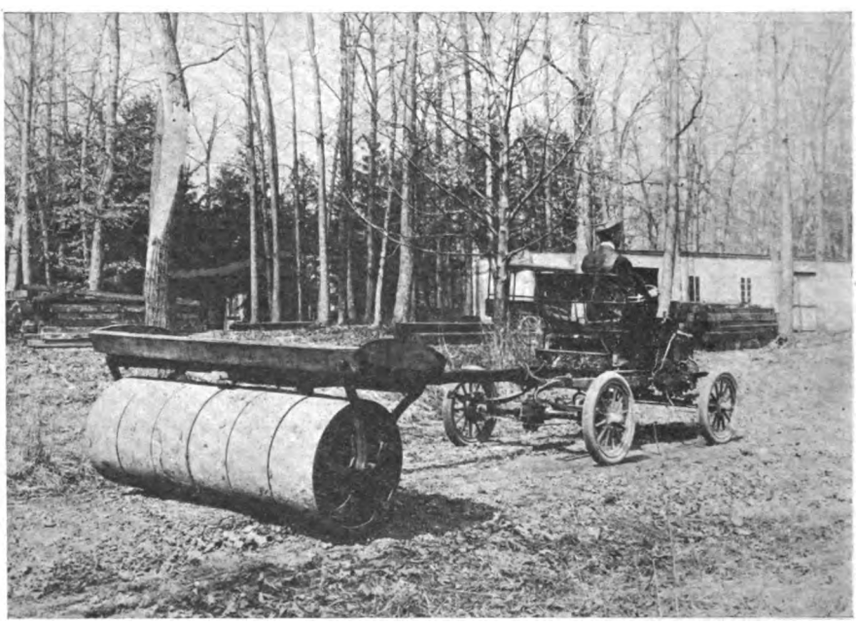
Digitized by Google

cial design of J. Ford, the superintendent of the garage. It allows for ten outlets with only two meters, and each line is independent.

The east side of the basement is to be reserved for "dead" storage; that is, cars that are not being used from day to day. In the basement, as well as on the first and second floors there are a turntable and a washstand. The latter is supplied with water from a swinging arm overhead, so that the hose does not encumber the floor. There is an incident in connection with the turntables that shows how rapidly automobiles are developing. A year ago when the plans were drawn the largest turntable in any garage in the city was ten feet in diameter. It was thought that eleven foot tables would certainly be large enough for all the purposes of the new garage. But now that the building is done it is found that a fifteen foot table is needed to accommodate some of the machines. It has proved to be a difficult task to rip out the concrete in which the tables are set, so that it may be decided to superimpose a fifteen foot top on the present table, lapping over all around.

On the way up from the basement, it may be well to describe the elevator, or lift, which is the latest type of electric manufacture and big enough to accommodate the largest private car. It has a safe capacity of 6,000 pounds. The doors on each floor part horizontally, half going up and half sliding down. These ride against the doors on the other floors, so that it is impossible to have the doors on more than one floor open at the same time. The halves of each door counterbalance, so that it is no trouble to operate them by hand.

On the main floor there are three entrances for machines from Flatbush avenue, and an emergency entrance from Plaza street, to be used in case the approach to Flatbush avenue is blocked.

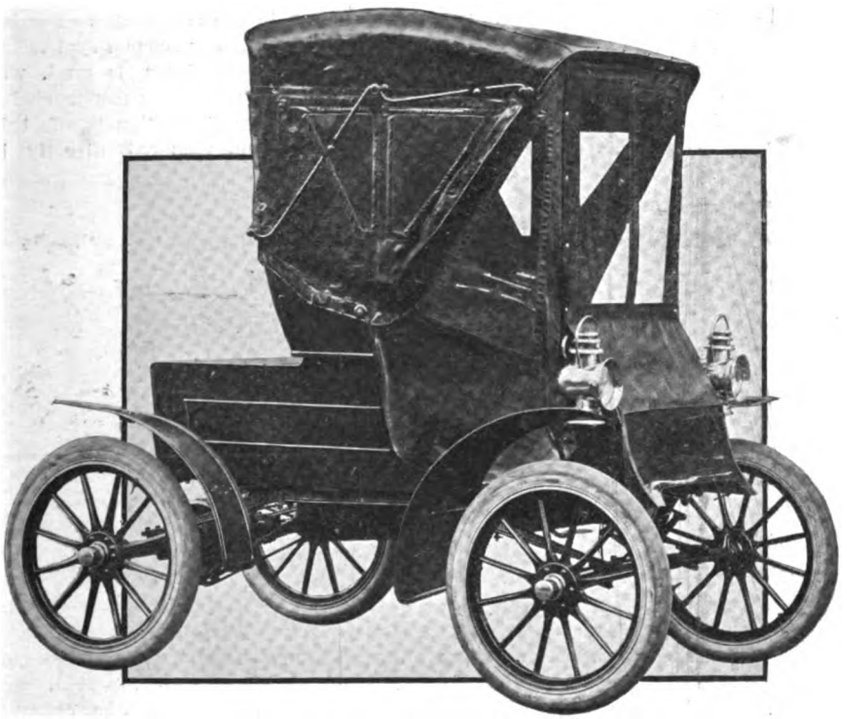


In addition to the room for cars on the second floor, there is a large, light machine shop, where expert machinists will be on duty constantly. It is fitted up with lathes, electric milling machines, shapers, grinders, a power hack saw, a 20-inch power drill, a 14-inch sensitive power drill and an electric air compressor for pumping up tires. There is an inspection pit five feet deep. In connection with the machine shop there will be a storeroom and a stockroom. Here will be kept a large supply of tires and parts for various machines, so that there may not be any delay in fixing up a serious break. One of the features of the second floor is a good sized room for chauffeurs, fitted with rugs, tables and chairs. It has a good view upon the park plaza, and will be supplied with reading matter. There are lockers for the chauffeurs, and a special telephone for them. The walls of the building are sixteen and eighteen inches in thickness. The finish inside is white. The building is heated throughout with steam from the main power plant in one of the other buildings and lighted by electricity. It has a capacity for the storage of about one hundred cars.

The Motor Car as a House Climber.

"Climbing the side of a house," is a figurative expression which is literal in this case, as the roof only constituted the sides of the house referred to. The foregoing photograph shows that even buildings are one of the obstacles it is easy to surmount in Sweden. It depicts F. Karlstrom going over the apex of a brick structure at Landskrona to win a wager. It is of particular interest to Americans, as the car employed was an American creation—an Orient buckboard—the feat giving a good idea of the power added by the new friction drive adopted by the Waltham Mfg. Co.

The Motor Car as a Road Roller.



"When horses fail, the automobile is usually impressed into service," observed a disciple of economic labor the other day. Such seemed to be the case at Tarrytown, N. Y., recently when, through failure to obtain horses to pull the heavy rollers over a new piece of road, it was in danger of not being completed for weeks and perhaps ruined by rains. The Maxwell-Briscoe Motor Co., which has its home in Tarrytown, filled the deficiency to a nicety, however. The heavy roller was hitched to an 8 horsepower runabout, and the little car started up the road with its load as though such was an everyday occurrence in its career. Tarrytown people were dubious as to the result, but when, two days later, they woke up and saw the rough surface rolled as smooth as asphalt, they opened their eyes wider. The horses would have taken three times as long to do the work, to say nothing of the increase in the cost.

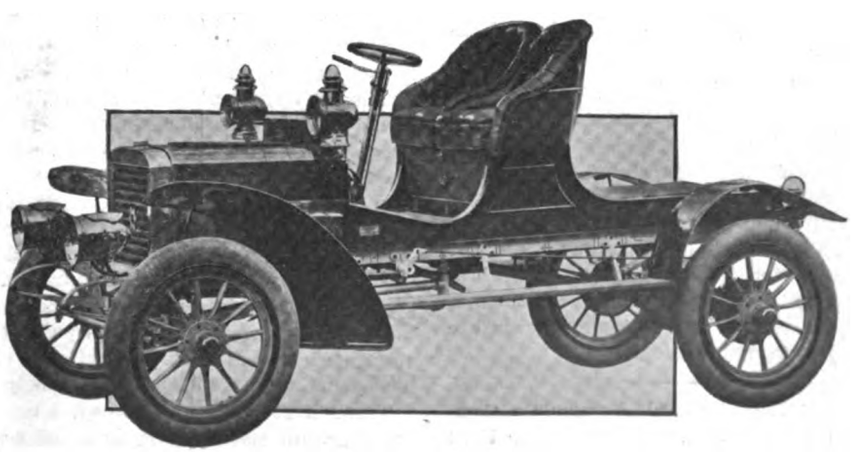
ABOUT THE NORTHERNS

Old Models Improved and New Ones Embody Striking Departures—Air Clutch Included.

One of the distinctly sensational innovations of the show period will be the new four cylinder Northern car, upon which the Northern Manufacturing Company, of Detroit, Mich., will install a complete air control, as recently stated in the Motor World. For this, the Northern people claim distinction as being the first machine to be equipped with an air clutch and air brakes. In addition to this, the line will be complete in that it will comprise no less than four other types of machine, based on two different types of chassis, both of which though known to the market already are much improved in detail construction.

NORTHERN RUNABOUT WITH NEW "DOCTOR'S TOP."



The headliner, will be a 2,250-pound machine, of generally standard construction as far as many of its features are concerned, will stand on 112 inch wheel base, and be rated at 30-horsepower. The cylinder dimensions will be 4½ by 5 inches, and the cylinders will be cast separately with the jackets and heads integral. Both sets of valves will be mechanically operated and placed directly in the cylinder heads where they will make for the greatest possible power. The features of radiation, carburation, and ignition, will be perfectly normal and according to the tenets of common practice, the latter function being accomplished by the jump spark method, storage batteries supplying the necessary energy.

The transmission is to be of the cardan shaft type, the change speed gear being mounted on the rear axle according to a most successful precedent, three forward speeds and a reverse being secured by the combinations. For changing the speeds, a small wheel is placed above the steering wheel, which handles all forward motion in conjunction with the clutch, while the reverse is obtained by means of a foot pedal. The engagement of the clutch which is entirely controlled by compressed air, is one of the most attractive points about the machine, and one which is likely to cause it considerable notoriety. The operation of one of the brakes by compressed air, also is a novel feature and one which taken together with the air clutch will make the machine of exceedingly smooth and simple manipulation.

The hand brakes which are of the contracting band type, and are actuated by an interlocking lever, are lined with camel's hair belting, and act upon pressed steel drums which are installed on the rear wheel hubs. The mounting is upon 32-inch wood artillery wheels, fitted with 4-inch tires, and the modern type of body is slung on full elliptical springs both front and rear. The compressed air for the clutch and brake mechanisms is furnished by a small pump installed on the motor, while a constant supply is held in a large tank mounted on the chassis. The hand levers for controlling the clutch, air brake, throttle and gas valves, are mounted on the steering post in close proximity to the steering wheel. The trial car, which is now in the road, has given a good account of itself over many miles of country highway, and is capable of developing full sixty miles an hour.

The two cylinder Northern touring car for 1906 will contain all the essential features of the 1905 prototype, including the fully enclosed mechanism and combined flywheel-fan arrangement. It will embody also several improvements, among which will be an increase in power which is made possible by the enlargement of the cylinders. The dimensions of the new type are 5½-inch bore by 5¼-inch stroke, and the rating will be 20 horsepower, as against 18 in the corresponding type of last year. The wheel base has been increased to 106 inches, and the springs lengthened out appropriately, so that a considerable improvement in the riding qualities of the car has resulted. The brake pedal is now fitted with a ratchet, and the brake bands are lined with camel's hair belting. The drums are now made of pressed steel, and are very strong, which fact, taken in connection with their exceptional size, the bands being three inches wide, gives a most complete control of the car at all times.

The specifications not included in the foregoing comprise, 30 by 4 inch tires, ¼ by 2 by3-inch angle steel frame; automatic compensating carburetter, of Northern design; bevel gear drive; direct connection on the high speed with a driving ratio of 3-1; low and reverse gear ratio of 9-1; foot throttle and hand lever control, and weight 2,000 pounds. The machine is mounted with an attractive type of body of special design. The Detachable Tonneau two cylinder car is a machine of practically the same type as the touring car, except for the body, which will have a removable rear seat of the Surrey type mounted without doors. In all other points, the construction of the two cars will be the same. Also, the Touring Runabout, which

NORTHERN TWO-CYLINDER RUNABOUT.

Digitized by Google

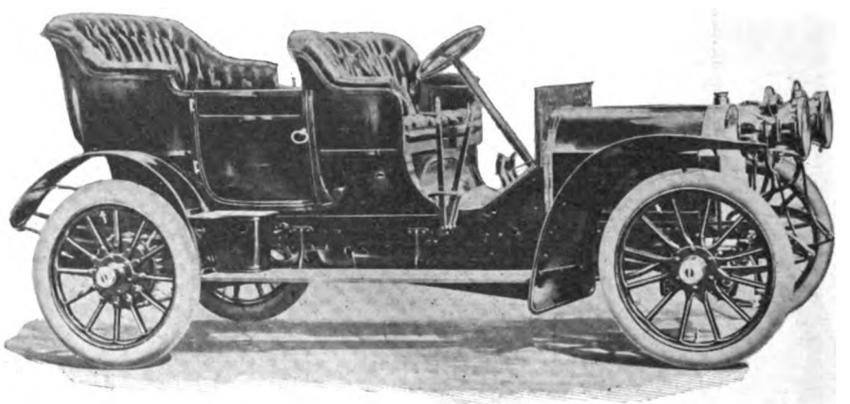
will be another of the features of the line, will be of the same basic type, the body being distinctive, however, and the wheel base optional, the choice of 88, 100 and 106 inch length being given the purchaser.

The 7-horsepower Sturdy Northern Runabout, remains practically the same in design as it has been during the last year. The feature of the trunion body hanger upon which its reputation for easy riding has been based, will of course be retained, as an exclusive detail. The general particulars of the machine are as follows: Wheel base, 70 inches; tread, standard; tires, 28 by 3 inches; control, by foot throttle and hand spark advance. The engine dimensions are 4¾ by 6 inches, and the speed of the motor varies from 150 to 800 revolutions per minute. The speed ratio on the high gear is 3-1, and on the low and reverse, 9-1, the transmission being by single chain to a live axle, and the change speed gear being of the planetary type. Ignition is by jump spark, two sets of five dry cells furnishing the current. The carburetter is of the Northern compensating type, and the total weight is 1,000 pounds.

Reversing the Motor on New Plan.

In an effort to do away with the transmission mechanism, a Belgian inventor has adopted the somewhat doubtful and wholly novel expedient of providing for the reversal of the motor by arranging the distributing mechanism of the gas and ignition in such a way that it can be altered by the simple manipulation of a couple of levers mounted above the steering wheel and ordinarily performing the usual functions of the throttle and spark advance. These levers have a neutral point midway of their travel at which the valves are not lifted and the ignition circuit is open. Motion in one direction from this point gives a distribution suited to the forward rotation of the motor, and in the other, that suited to the reverse rotation. The alteration in the distribution is effected by the use of a duplicate set of cams, while the alteration of the point of ignition is carried out in the usual way. The starting of the motor in the reverse direction depends upon the use of the charges compressed in the cylinders at the time when it was last stopped, and evidently the success of the scheme depends entirely upon the makers' ability to produce a motor which will invariably start on compression.

Protecting the Steering Gear.



One of those little refinements which "help some," which was to be seen on several of the cars at the Paris Salon, was a flexible brass covering for the joints of the steering gear, which up to the present time have been left unprotected for the most part, or at best wrapped up in leather bags. The contrivance was simple, easy of application and seemed to fulfil all of its requirements.

For 1906 the Standard Automobile Company, of Utica, N. Y., will handle the Ford line in that city.

LOCOMOTIVE COMPANY'S CAR

Features of the French Machine Which the Big Concern Selects for Reproduction Here.

It is not difficult to imagine that the task which confronted the promoters of the American Locomotive Automobile Company, of New York, when having decided to produce a motor car, they began to cast about them for a machine all ready made which would satisfy the complex requirements of a most exact manufacturing system, and at the same time meet an existing demand in the market, was one of extraordinary difficulty. Their ultimate choice of the Berliet, as being most suitable for the purpose, is not simply extremely flattering to M. Berliet, its designer, but at once stamps the car as being of the most thoroughgoing excellence, for the decision was not arrived at until a thorough canvass had been made of all the leading makes of car, and their respective merits put to a most discriminating comparison.

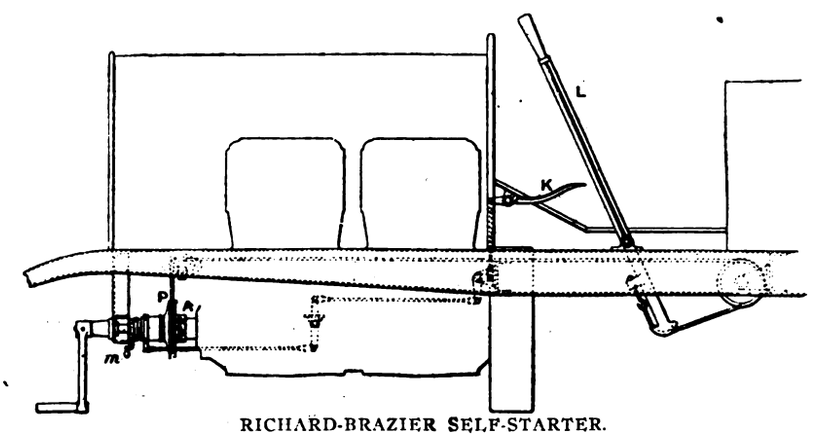
24-30 H. P. BERLIET CAR.

The points in the construction of the Berliet which lead to its adoption for American manufacture under the protection of the gigantic locomotive corporation were, that it was one of the very few machines to have undergone little or no radical alteration in its make-up from the time of its first construction; that it had been the first to embody in its construction the features of make and break ignition, honeycomb radiator and mechanically operated valves; that it was essentially a simple car, and that its original maker had continued to use only such materials of construction from the first as would contribute to the successful performance of a first-class automobile. Having fixed upon the type of machine, the next step was to arrange in full detail for the construction of an American replica of the car built under American shop methods, and according to the American standards of shop production. These now having been completed, the American Berliet is presented to the American public at the beginning of the new year in types of 25 and 40 horsepower.

Throughout it is of the so-called continental type, all parts being made of selected stock, carefully machined and rigidly put together. The frame is made of imported pressed nickel steel, and is inset at the front to permit of properly swinging the steering wheels and securing a wide turning radius. The construction of the engine frame and gear case is such that the frame is sufficiently strengthened without the use of cross members, and the stability of the structure by no means lessened in the simplification. The cylinders are of twin construction and are fitted with interchangeable valves of standard type. The lubrication of the motor is by the conventional force feed system, from a lubricator mounted on the dash, and from splash in the crank case. For ignition the Simms-Bosch low tension system is used.

A honeycomb radiator is used, with induced draught from a fan constructed in the flywheel. Water circulation is effected by a centrifugal pump mounted directly behind the radiator. The control of the motor is maintained by means of a ball governor mounted on the end of the exhaust cam shaft, and actuating a throttle valve within the carburetter. The latter is of the float feed spray type, designed to automatically yield a uniform mixture under all circumstances. The manipulation of the functions of ignition and throttling is accomplished by a pair of levers mounted above the steering wheel, a foot pedal being used largely as an accelerator.

Through a metal to metal clutch taking hold of the interior of the fly-wheel, the power of the motor is transmitted to a four-speed sliding gear transmission of approved pattern. The gear changes are obtained by the selective system, and the mechanism involved is simple and positive to the last degree. A specially treated chrome nickel steel is used both in the gears and shafts, insuring for them long life and good action. Throughout the machine, wherever possible, the D. W. F. type of ball bearing is used. thus making the car at once easy running in all its component parts, and free from any possibility of derangement through poor adjustment.



A noteworthy characteristic of the 1906 models of the leading Continental builders is the increase in the width of the brake drum, some of the cars on view having brake drums four inches wide.

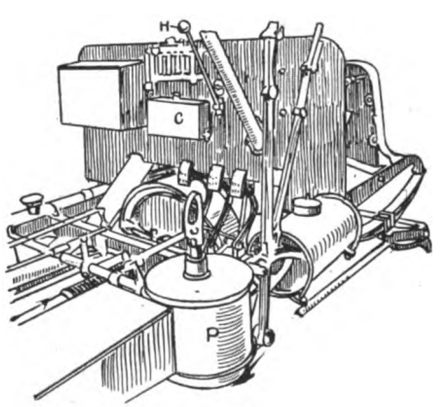
SELF-STARTING DEVICES

Details of those Employed by Two of the Big French Manufacturers.

Self-starting has finally assumed a degree of importance where it has come to be regarded as indispensable by a number of prominent makers, and it goes without saying that the coming season will see a greater variety of devices for this purpose in use than was hitherto thought possible. At least three of the foremost French builders, Renault Freres, Richard-Brasier and the Mors, have attempted the solution of the problem in a manner that involves quite an imposing array of accessories. Of the three none is more elaborate than the Renault.



RICHARD-BRAZIER SELF-STARTER.

It consists, in brief, of a complete compressed air plant. The storage tank has a capacity of five cubic feet and is situated under the driver's seat. It is charged from the compression chamber of the rear cylinder of the motor through the usual check valve. To the rim of the flywheel is bolted a gear which meshes with the pinion of a small and very compact three cylinder motor. Normally the two are not connected, a lever on the dash simultaneously putting them into mesh and opening the compressed air valve of the small auxiliary motor which turns the engine over. Opening the throttle and turning on the current will then cause the motor to take up its usual cycle of operations without further extraneous aid, and a reverse movement of the lever referred to severs all connection with the starter.

Next to this, measured from the point of its elaborateness, comes the Mors self-starting device. As a matter of fact, there is little to distinguish them on this score, except that probably the first cost would be less in the case of the latter. This contrivance takes the form of a means of supplying the cylinders with an explosive mixture under pressure directly instead of resorting to an outside source of mechanical power to accomplish the same end indirectly. It consists of an auxiliary carburetter, C, mounted on the dashboard as shown in the line sketch of the device herewith; a hand pump, P, attached to the chassis in a position convenient to the hand of the driver and a means of diverting the carburetted mixture into the cylinders, which is controlled by the handle, H, mounted on the dashboard alongside the tank carburetter, that has been given the euphonious appellation of "dynamogene." In order to start, the driver simply draws the lever H toward him and works the handle of the pump, which is then in communication with both the carburetter and the cylinders; the last step in the process is switching on the ignition.

The Richard-Brasier cars are to be equipped with a self-starting device, which is as yet said to be in the experimental stage and will not be adopted until more thoroughly tried out; but, judging from the lines along which this firm is working, the result will not alone be far simpler, but is apt to prove more effective and less liable to derangement. The sole object in view has been to provide a means of turning over the engine by hand without the necessity of leaving the seat. Nor has this firm been so ready to discard the crank altogether. It has been retained in its usual form, as will be apparent from the accompanying line sketch. If a start is to be made with its assistance, the lever M is pulled, which, by means of a fork, pulls the free wheel, P, cut with ratchet teeth, into engagement with the ratchet hub A keyed to the engine shaft. In case the start is to be made from the seat, it is only necessary to depress the foot pedal K, which insures the meshing of the ratchet; the lever L is then drawn back sharply, and this, through the medium of the cable and pulleys shown, turns the wheels P and with it the hub and motor shaft. When the lever L is returned to its normal position the wire cable is tautened by a spring, which prevents it from becoming slack. As the amount of movement obtainable in this manner is necessarily limited, any slackness of the cable would impair the efficiency of the device. The makers claim that it is nothing unusual for the motor to start on one pull of the lever.

MORS SELF-STARTER.

The Belt Bobs Up Again.

Nothing short of actual experience will suffice to convince the man whose gray matter becomes thoroughly permeated with an idea. Regardless of the utter lack of success that has attended the efforts of others in the use of the same device and its total abandonment for something proved to be infinitely better, he is bound to have his fling at it, cost what it may.

Thus it is that one of the light cars shown at the Paris Salon was equipped with the ancient and exasperating belt drive. The latter is not depended upon entirely, as gears are used in combination. The car is a light, two-seated runabout, with a single cylinder, 8 horsepower vertical engine, set at right angles to the customary position. That is, facing across the car instead of fore and aft. A train of sliding gears adapted to give two speeds forward and reverse is housed in an extension of the crank case, the shaft projection beyond the casing carrying on its end a pulley of the usual type. Through the medium of two belts, fixed together at intervals with spring pieces, this is connected with a double pulley mounted on a countershaft at the rear. The latter is practically in two parts, each having connected to it at the inner end one-half of the double pulley, the other end terminating in a pinion, which meshes with an internally toothed ring attached to each of the driving wheels, which are supported on a fixed axle. By the use of a double pulley and the divided countershaft the necessity of a differential is obviated, the belt slipping slightly on the corresponding part of the pulley in rounding a corner.

The need of a clutch is likewise overcome by mounting the gear box so that it may be swung backward slightly, thus slackening the belt, which is entirely encased from end to end—an expedient of doubtful value to take the place of the customary "idler," which had such an exasperating habit of "snipping" the belt in two when applied over precipitately. Despite the costly experience of pioneer makers with this form of transmission, there are still those who are willing to pin their faith to it, particularly in England.

The business of the W. F. Stewart Co., manufacturers of automobile and carriage bodies at Flint, Mich., has so grown that the company will build a large brick addition to its plant. It will be U-shaped, three stories high, measuring 600 by 60 feet.

NEW TRUCK FROM BUFFALO

Characteristics of the New Vehicle—Even Sand Boxes are Provided.

One of the 1906 products of the Auto-Car Equipment Company, of Buffalo, N. Y., will be the three ton gasolene truck here illustrated, which, judging from its stable appearance should prove a most efficient factor in its own line of work. It is of thoroughly approved design throughout, and is built of well tried materials worked up in thoroughly workmanlike style.

The frame is made of seasoned oak, of 7 by 2½-inch section, mortised at the corners and armored throughout with steel plates, 3-16 by 6 inches. The wheel base is 95 inches, and the tread 52 inches, although upon order, a 75-inch tread will be furnished. The artillery wheels are of wood, fitted with fourteen spokes, two inches wide, and adapted to take on 36-inch tires. Endless rubber tires are used, being four and five inches in width in front and rear respectively. The frame is mounted on semi-eliptical springs in front, and platform suspension in the rear, all springs being 2½ inches wide and ribbed to preserve the alignment of the leaves. The axles are of hand forged solid stock, both being of 2½-inch square section. The steering arms are drop forged, and are of ample proportions.

The motor is located in the fore part of the machine under the driver's seat, in a vertical position. It is of the four cylinder pattern in common use, and develops 34-horsepower on the brake running at 1,000 revolutions per minute. The valves are mechanically operated, and are constructed of a special brand of stock which is particularly suitable for the work. Jump spark ignition is used with multiple distributor and single vibrator coil. The water circulating pump is gear driven from the main engine shaft and draws from the cellular radiator mounted in front under the footboard.

The transmission is of the sliding gear type, giving three speeds in advance, and a reverse, the final drive being by side chain from a counter shaft enclosed in the gear box, to the rear wheels. The gears are all of 6-pitch size, with one inch face, hardened. The differential, which is enclosed in the case is equipped with Timken roller thrust bearings to take up the strains of the bevel gears. The clutch shaft is fitted with a universal joint of approved type which serves to secure a free drive under all circumstances. The counter shaft is supported at the main frame members by means of heavy brackets which are fitted with especially long bearings. The chains used for the final drive are of the roller type with 1¼-inch pitch.

The mechanism of control is centred about a heavy vertical pillar topped by a 16-inch wood rimmed wheel. There are two sets of brakes, those for emergency use being of the internally expanding variety, setting up on drums cast with the rear sprockets, and bolted to the rear wheels. The normal speed of the machine is ten miles per hour, subject, of course, to the conditions of the road. The top as here shown, is made integral with the body, and is of the stationary type, but variations from this can be secured at the option of the purchaser. At the front of the driver's seat is a glass screen or wind shield, which reaches from the footboard to the top. The remainder of the enclosure is secured by means of heavy duck storm curtains which can be rolled up when not in use. The body is fitted with a drop tail gate and chains, while a pair of side gates are also fitted for greater convenience in loading under certain conditions.

One very noteworthy feature which though counting abong the lesser details, is still of no little importance to the driver, is that the rear wheels are fitted with sand boxes which can be made to discharge by opening a set of valves accessible from the seat. In general appearance, the neat and rational lines of the structure, taken together with its evident usefulness, furnish a pleasing basis, which is well set off by a plentiful amount of brass trimming, serving to accentuate its combined utility and symetry.

"Newness" in Ignition!

British ingenuity has just devised what is known as a "new" ignition system, which, upon analyzation, resolves itself into a jump spark system, the primary energy being furnished by a patent generator, which feeds the induction coil through an automatic switch, which throws in a set of accumulators when its voltage varies above or below a certain standard. The accumulator series is broken up into two sets for ignition, each set being used alternately, while the entire series is used for lighting purposes. Considering the invention merely in the light of the principles involved, it would seem as though the inventor had been conning over the old files of some of the American trade weeklies.

Increased Uses of Plate Glass.

A noticeable feature in the construction of several of the more elaborate closed bodies to be seen on the stands of foreign exhibitors at London and Paris, is the use of small French plate windows of heavy beveled glass. The object in their use is probably to increase the sumptuousness and cost of the structure, and it cannot be denied that the effect is pleasing insofar as mere appearance is concerned. The necessary increase in the amount of sash must, however, cut off a certain amount of light and dissect the view of the occupant into a group of thumb nail pictures.

"Invasion" that does not Invade.

Lend ear to the startling statement that the "Humber cars have invaded America." Of course, it is not mentioned whether it is North, South or British America that has been invaded. From the same source comes the statement that it is "surprising to the average American buyer" that accessories are furnished with the cars in question.

TIRE TENDENCIES ABROAD

Paris Show Produced Little that is New—Non-Skid Devices Show Novelty.

But for the extent and variety of the devices designed with a view to preventing slipping, the exhibit of tires at the Paris Salon is said to have been commonplace and uninteresting. In fact, the ingenuity of the French maker seems to have been directed entirely to this end, so far as touring car tires are concerned. For heavy trucks the Ducasble tire, consisting of rectangular blocks of vulcanized rubber attached to a flat section rim and encircling it in two rows with their edges overlapping, presented a departure from customary practice in this regard sufficient to attract more than passing attention.

Quite a novelty in the design of a tire with the non-skidding device integral is termed the Gallus. On to this tread and engaging on each edge with the bead are placed a number of plates with their edges turned in. Each plate extends across the tread and over each edge, and is about an inch wide. Spaces of something like a quarter of an inch are left between them. The plates are kept in position by steel rivets passing from end to end and right through the thickened rubber tread of the tire sideways. While the beaded edge of the tread prevents lateral movement, the long rivets keep them the proper distance apart and prevent them from closing upon another under the tangential strain of the drive.

One of the novel modifications of the typical non-skidding device of continental origin embodied not alone a departure in design, but also a new material—vulcanite fibre. In the shape of bars about one and a half inches wide and three-eighths of an inch thick, these were fastened to the usual covering of chrome leather, vulcanized on the regulation flat tread tire. On each of these bars, three in a row, are rivetted hardened steel studs, the idea evidently being to supply a material in which the rivets will have a much firmer seat than in leather.

Of the detachable variety of anti-slipping and skidding devices, the Herault, appeared to be in a class of its own.

It consists of a complete chrome leather band encircling the wheel, and having scalloped edges. Each scallop terminates in a metal hook or grapple, which hooks under the beaded edge of the wheel rim. All round the centre of the band is fixed another thick leather band or belt about two inches wide, and at intervals of about an inch all along this belt are rivetted a number of malleable flat iron plates rectangular in shape. These project considerably above the surface of the tire, and form not only an efficient non-skid appliance, but also allow of a good grip being taken of the ground in greasy weather and prevent that slipping round of the wheel on the road which conduces so much to the rapid wearing out of tires and tire covers. Owing to the number of the hooks by means of which it is attached to the rim, there is little danger of its creeping or coming off the tire.

The demand for means of readily detaching the heavy touring car tires appears to be as strong on the Continent as elsewhere, and several makers have attempted to meet it by supplying a variety of devices, the majority of which take the form of the detachable edge rim. A typical example of this is that used on the Peter's Union tire, of German make. The detachable edge of the steel channel rim has on its inner periphery a circular bead or channel, fitting into a corresponding groove in the wheel rim. This edge is slipped over the bed of the rim and is drawn down into its groove by a right and left hand sleeve operated by a turnbuckle. In order to detach the tire, the strain on this sleeve is eased off a few turns, which permits the lifting of the detachable edge and the complete tire can then be slipped off the rim. In placing the tire, the inner tube is first inflated so as to be perfectly snug in the outer cover, thus preventing its being nipped between the rim and bottom of the shoe in putting it on.

That old and familiar friend, the pneumatic ball tire, which has clung to existence despite the lack of appreciation shown it by users, came forth at the show in a new guise. It is now as a component part of Le Securitas metal elastic wheel that it is again on the scene. The latter consists of two flat steel rims on a wooden felloe, the space between them being occupied by a number of inflated rubber balls, while the outside rim carries a solid rubber tire. The rims are held in position by side plates bolted on and adapted to slide over each other. The latter also prevent any injury to the balls as well as the ingress of dirt.

Davenport Dealers Agree on Rates.

Davenport, Ia., automobile dealers have mutually agreed upon a schedule of prices for renting and storing machines for the ensuing year:

Gasoline—Any quantity, per gallon, 17½ cents. Gas engine oil—Any quantity, per gallon, 75 cents.

Storage of cars—No insurance; runabouts, per month, $9; touring cars, per month, $15. Price includes washing and polishing all brass parts once a week. Delivering cars and calling for same, extra, per month, $3.00. Extra washing—Runabouts, 50c; touring cars, 75c. Extra polishing—Runabouts, 25c; touring cars, 50c.

Dead storage—Runabouts, per month, $3.00; touring cars, per month, $3.00.

Livery—First hour, $3.50; second hour, $2.50; and every hour thereafter. To Rock Island Arsenal, per person, 50c; return, from Rock Island Arsenal, per person, 50c; call at residence, extra, 25c; return to residence, extra, 25c.

Labor—Automobile repairs, per hour, 60c.

NEWNESS IN MAGNETOS.

Of Two New Systems that Appeared at Paris One Seems Full of Promise.

A review of the tendency of French design in regard to ignition appliances as represented by the exhibits at the recent salon may be briefly summarized in the single word, "magneto." The continental maker now pins his faith so strongly to the alternating current machine, and particularly to the low tension type, of late that it is surprising to note that but one or two new claimants for fame in this field put in appearance among the many shown. The several makers whose machines have come to be known as standard were, of course, amply in evidence, and it is worthy of note that even in minor detail their designs have not undergone a change. Considering the fact that it has been customary to make changes as often as three times a year in some cases this would appear to bear testimony to the fact that some approach to finality of design has been reached.

Probably the only really new magneto shown was that placed on view by the Maison Brignet, of Paris.

In this type there are four sets of field magnets mounted in the form of a hollow cylinder through which the armature with four pole faces rotates on ball bearings. The armature has a primary and a secondary winding, and four distinct breaks of the magnetic field are obtained at each revolution of the armature shaft. A very simple high tension distributor is used, and the whole takes up much less space than is the case where the horseshoe type of permanent magnet is employed, while owing to its construction it can be run at half the speed for a given purpose than is the case with the usual type.

In the Carron system there would appear finally to have been evolved an arrangement beautiful in its simplicity and lack of parts. It is what may best be termed a purely electrical system of ignition as apart from the power taken from the motor to drive the magneto and generate the current; the latter performs all the offices of exploding the charge. It is something that numerous American experimenters have long sought, but apparently none of them have ever gone beyond designing the plug. The latter is nothing more or less than the familiar electro-magnetic device operated electrically by the same current that is relied upon to produce the spark. Probably half a dozen such have been evolved in this country in the past few years, none of which has up to the present met with any general success, some of them never having passed the experimental stage. These plugs consist of nothing more or less than the time-tried solenoid and plunger—in daily use to the number of thousands throughout the country, principally in the form of circuit-breaker actuating

Digitized by Google

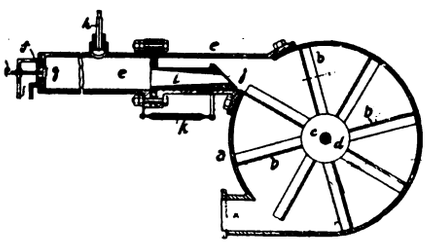
devices on generator switchboards. They are relied upon through the actuating impulse given them by the current to operate the circuit make and break in the cylinder, in place of the mechanically moved hammer and anvil which they displace, and neither in principle nor design has any inherent defect been found to characterize them. But their use in connection with batteries or any other source of energy requiring to be constantly renewed has proved impractical owing to the large amount of current consumed. This would appear to be the only reason that has militated against their adoption.

In the Carron system this is overcome by the employment of a substantial low tension generator of the simplest type, with the single wound, H type of armature. The operation of the plugs in which the plunger is held under the tension of a spring against the magnetic pull, is timed so as to coincide with the period of highest induction in the magneto armature—the crest of the wave, or point of maximum output of the machine, which results in a very heavy spark. For show purposes a huge model of the plug was exhibited in connection with the lighting mains, and the resulting spark is said to have been blinding.

Gabriel's Newest Horn has Eight Notes.

The person who wrote the perverted proverb, "By their toots ye shall know them," must have had the Gabriel horns in mind when he rhapsodized for the saying is applicable. The Gabriel Horn Manufacturing Company has been making two, three and four chime horns that jerk out discordant and unmusical notes, but their latest creation—an eight chime horn—is claimed to be musical. Like the other models the new horn uses the engine exhaust for "breath," the exhaust being regulated by a valve and worked by a foot lever. The eight pipes are made of brass, lacquered to prevent tarnishing, and can be attached to either side or under the car. A keyboard arrangement is placed on the side of the seat to sound the notes. It is claimed that any ordinary tune, of one octave range, without sharps and flats, can be played upon it. If such is the case its scope of utility would therefore be unlimited.

Names for Motor 'Buses.



Soon London's motor 'buses will be in the same position as Pullman cars and apartment houses in this country—hard put to it for want of appropriate names. "Pioneer," "Vanguard" and "Arrow" have already been pre-empted by some of the first comers in the field, and are said to recall the old time horse-drawn affairs that were considered wonders in their day, some of which were known as "Marvels," "Monsters" and "Favorites," the last of which still exists. The rush for names is said to be such that it is the custom to incorporate nominally with a capital of $500, merely to pre-empt a name, some of those said to be "ear-marked" for future exploitation being the "Mercury," "Rocket," "Dart" and "Express."

EVOLVING THE GAS TURBINE

Another Effort in that Direction Makes its Appearance—How it Operates.

Somewhat similar in its construction to the Retz motor, to which reference was recently made in these columns as having been the only gas turbine on exhibition at the Paris show, and the first ever to be seen at an exhibition of the sort, the Ekersley rotary motor, another unlooked for outcropping, is however, constructed on the jet principle. In the latter the action derived from the exploded gas is wholly impulsive, no attention whatever being paid to the expansive properties of the working fluid, once they have reached the rotary member of the motor.

As will be seen from the accompanying diagram, it consists essentially of a cylinder fitted with an automatic admission valve and means of ignition in the usual manner, which, however, is not fitted with any form

of piston, and which terminates in a sort of jet, the opening from which is closed normally by a valve held to its seat by a spring of just sufficient strength to retain it in the closed position except during the period of explosion. The cylinder is mounted in close connection with the casing which encloses the rotary member, the axial line being tangential to the periphery of the latter. The rotary member itself consists of a series of radial vanes of V-shaped cross-section, which are mounted on a common boss or hub, which is fast upon the driving axle of the motor.

In action, a mixture of gas and air is admitted under pressure to the cylinder, where it is retained by virtue of the tension of the spring, k, the valve, g, closing the admission port, f, as soon as the cylinder or combustion chamber is filled. The ignitor, h, then fires the charge, and the sudden increase in pressure causes the valve, j, to open against the tension of the spring, k, and the burning charge issues with great velocity against the vanes, b, of the rotor, c-d, causing it to revolve with great rapidity, the spent gases issuing from the exhaust port, X, after having done their work. Some sort of carburetter and compressor are, of course, essential to the device.

It is evident that the effect of the expansion of the charge against the vanes of the rotor would be precisely the same as though the gas were a perfectly inelastic fluid, and the action and power derivable from the motor would be similar to that obtained from a water wheel of similar construction. Despite this drawback, which would apparently deprive the gas of all further usefulness as soon as any one portion of it became imprisoned between a pair of vanes by the passage of the second of them by the port or opening into the cylinder casing, e, the principle seems readily applicable enough, and should produce a rapid and smooth working motor, albeit one which would not be over-efficient.

Protecting the Machinery from Dust.

In the refinement of the motor and its housing, no attempts have been made up to the present time to guard the external parts from the clouds of dust which are constantly being sucked into the hood from the radiator, both under the induction of the fan and from the natural draught of the machine itself. As all the exposed parts of the mechanism are more or less fully coated with oil, the result is that they soon become gritty and carry more or less of foreign matter into the bearings in which they work.

This effect is even more marked in machines of the type in which the fan is incorporated in the flywheel, for there the draught carries all foreign matter through the entire length of the hood and drops it behind the flywheel, while in the type in which the fan is mounted directly behind the radiator the greater portion of the dirt falls on the fore part of the motor, leaving the valve stems and other parts comparatively free. Evidently the remedy is to be wrought out by some method of screening the blast after it has done its work in the radiator, or else by deflecting it away from the motor altogether and relying entirely on the efficiency of the water jacket to maintain the proper working temperature.

Motors to Oust More Mules.

Mexico Consolidated, a mining company in the country from which it derives its name, has ordered a motor truck, according to Boston advices, with the view of replacing the old method of transporting ore by mule teams. The present cost for hauling ore is $21.50, Mexican currency, per ton, and it is calculated the new method will reduce the cost of haulage $6 or $7 per ton. So far as known, it will be the second time the automobile has been used for this purpose.

What the Thieves Found.

According to advices from Utica, N. Y., thieves entered the old plant of the Black Diamond Automobile Co., at Niagara and Broad streets, one night last week and removed a quantity of brass pipe and five-cent novels. Just what part the novels played in the former manufacture of automobiles is not stated.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau street, New York.

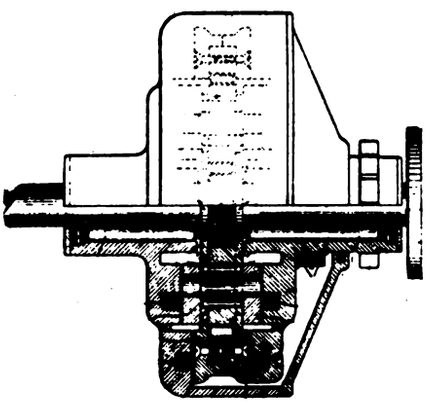
ELECTRIC CHANGE GEARS

Invention is Persistent Despite Failure of Early Type—Two of the Late Comers.

Despite the small amount of success that has thus far rewarded the efforts of those who are seeking the perfected change speed gear through channels that involve the use of electricity, there appears to be no let up on the part of these investigators, as it is attested by the frequent appearance of such devices in the patent records.



As has been referred to in these columns on several occasions in connection with descriptions of similar devices previously brought out here and abroad, there would appear to be no inherent defect in the use of electricity and its related force, magnetism, for this purpose. Experiments carried out with widely varying types of apparatus all, however, based upon the same principles, have demonstrated beyond a doubt that an electro-magnetic clutch or change speed gear, is not alone a possibility, but holds forth alluring promise of simplicity and flexibility.

ELECTRIC TRANSMISSION.

But a condition precedent to its successful application on the every-day car involves a solution of the problem that has bothered automobile builders for years—the maintenance of a satisfactory source of current on the vehicle.

Probably the generation of a small amount of current at a much higher voltage than that usually employed for ignition purposes—such as 50 or 100 volts by means of a small direct connected generator driven by the engine, may not be attended by the same difficulties that have made themselves felt in the use of small direct current generators of any kind on the automobile. With a speed constantly fluctuating between such widely varying limits, it has been found a difficult matter to prevent the dynamo from being burned out through overspeeding, or failing to generate sufficient current when the speed dropped too far below normal. There is, of course, the possibility that with the aid of such a change speed gear the engine could be run almost continuously at a speed that would always approximate the normal, regardless of the road condition, load or grade. Numerous forms of governors have been devised to prevent such a mishap in the case of the small ignition dynamo, but as the speed of the average automobile motor varies so rapidly and through such an extreme range this has been found difficult and it is nothing unusual to burn the armature out.

PLANETARY CHANGE SPEED GEAR WITH ELECTRO-MAGNETIC CLUTCHES.

Whether with the aid of a change speed gear that promises so much in the way of flexibility it would not alone be possible but practical under ordinary conditions to have the motor run at a rate of speed so nearly uniform as to render its rise and fall a negligible factor, remains to be seen.

In the most recent attempts at the solution of this problem of which two have appeared recently, both being credited to the General Electric Company, it is noticeable that for the first time, an effort has been made to apply the principle to the planetary type of change speed gear, the latter, a half-sectional elevation of which is shown in the accompanying sketch, makes use of independent magnetic clutches so arranged as to hold either the internal gear or the axis of the planetary gear stationary, and to lock either or both to the driven member. As will be seen, the general principle of the gear is in general the same as in the purely mechanical type, the gear on the driving shaft being surrounded by the usual plurality of pinions, a new feature consisting of the use of a ring-shaped member surrounding the shaft and which is supported on the axes of the gears. There is, further, the usual internal gear, revolubly mounted, and the magnetic clutches are adapted to hold either this or the ring-shaped member referred to stationary, or to lock either or both to the driven member.

The second follows in the main the lines laid down by previous investigators in this field; that is, the use of two generators, or rather a generator and a motor. In this case, as will be seen in the illustration, the change speed gear box itself is made to act as a common field piece for both, to which the pole pieces are bolted. The driving shaft enters at the right hand side, and instead of carrying the armature directly upon an extension of it, the drive is through planetary gearing, which is visible in partial section. The two machines are interconnected, both electrically and mechanically and means are provided for varying the speed and torque of both.

How Price of Rubber is Affected.

It used to be a common remark that so narrow is the margin between the production and consumption of rubebr that the loss of a single cargo at sea would notably influence prices, says The India Rubber World. The assertion has had partial proof of late, though as yet no important cargo of rubber has ever been lost on the high seas. But recently a shipload of 210 tons went down in the Amazon, and the first effect was an advance in London prices.

This was only temporary, however, since stocks were larger than for some time, and the hope prevailed that the sunken rubber would be raised. It now appears that all of the Cyril's cargo has been salved but seventeen tons. But a single ship has sometimes carried a thousand tons of rubber from the Amazon, and the loss of such a quantity in midocean would indeed upset all market calculations. The shippers might be protected by the insurance companies, but the world would miss the rubber. A consoling feature of the Cyril's case is that rubber is not injured by so slight an accident as being dumped in the bottom of a river for a few weeks. It is, indeed, subject to fewer ill influences than almost any other cargo known to commerce.

More Room for Boston Show.

In order to provide as much space as possible for the Boston show almost all the seats in the balcony of the Mechanics' Building, where it is to be held, will be removed. The additional room thus created will be divided among the applicants who unfortunately found themselves in the discard on the first allotment.

To Sell the Simplicies.

The work of winding up the affairs of the Simplicities Auto Company, of Middletown, Conn., which was first marked with considerable trouble, is progressing rapidly. The property has been inventoried, and an attempt will be made to sell the plant as soon as the affairs are in shape.

The Week's Patents.

808,221. Speed-Changing Gear. Charles G. Simonds, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York. Filed August 27, 1904. Serial No. 222,374.

Claim.—1. In a speed-changing gear, a driving shaft, a pinion thereon, a planetary gear engaging said pinion, a revolubly mounted internal gear concentric with said pinion and engaging said planetary gear, a driven member, and magnetic clutches adapted and arranged to hold either said internal gear or the axis of said planetary gear stationary and to lock either or both to said driven member.

808,237. Tachometer. Caryl D. Haskins, Brookline, Mass., asignor to General Electric Company, a corporation of New York. Filed March 29, 1900. Serial No. 10,593.

Claim.—1. A magnetic speed indicator, comprising a field magnet, a movable armature and a movable low-resistance part in separated parts of the field of force of the magnet, one of the movable elements being revoluble and the other being oscillatory but biased to a normal position of rest, substantially as described.

808,263. Power Transmitting Mechanism. Elihu Thomson, Swampscott, Mass., assignor to General Electric Company, a corporation of New York. Filed November 26, 1902. Renewed August 22, 1904. Serial No. 221,706.

Claim.—1. The combination of a motive device, a current generating device having relatively movable members, connections between one of said members and said motive device, means for transmitting power through the medium of the reactive force exerted between said members when current is being generated thereby, and means for transforming a portion of the electrical energy of said current into mechanical energy, and applying it to the connections of the motive device.

808,289. Clutch. Alfred Lee, Bellingham, Wash. Filed December 20, 1904. Serial No. 237,702.

Claim.—In a device of the class specified, a loose member having an annular flange, a flanged disk arranged within said flange and provided with a radially-arranged recessed arm, said disk being provided with a peripheral groove terminating at one end in a stop-shoulder, a band arranged within the groove and having one end fitting against the shoulder, and its opposite end extending partly over the recess of said arm, a lever pivotally supported within the recess and having its outer end engaging against the free end of the band, a set-screw carried by the inner end of the lever, and a cam pin movable through an opening in said arm and serving by engagement with the set-screw to operate the lever.

808,306. Transmission Gear. Bennard H. Pomeroy, St. Louis, Mo., assignor, by mesne assignments, to St. Louis Car Company, a corporation of Missouri. Filed August 22, 1904. Serial No. 221,661.

Claim.—1. In a transmission gear, the combination of a driven shaft, a series of driven gearwheels of varying diameters fixed to said shaft, a drive shaft, a series of driving gearwheels of varying diameters loosely surrounding said driving shaft and having tapering faces at their sides, a slide collar provided with tapering faces adapted to engage the tapering faces of the driving gearwheels to permit the collar to pass into the central openings of the driving gearwheels, means for reciprocating said slide collar, shoes carried by said slide collar, and means for spreading said shoes to said driving gearwheels, substantially as set forth.

808,307. Clamping Device for Pneumatic Tires. Harry K. Raymond, Akron, Ohio; Maximilian C. Schweinert, West Hoboken, N. J., and Henry P. Kraft, New York, N. Y. Filed March 18, 1905. Serial No. 250,769.

Claim.—1. In a clamping device, the combination of a main nut and a lock nut, telescopically connected, and being capable of relative rotation.

808,336. Internal Combustion Heat Engine. John L. Bogert, New York, N. Y. Filed October 26, 1904. Serial No. 230,017.

Claim.—1. An internal combustion heat engine comprising two cylinders, one being a firing cylinder, and both provided with compression spaces that communicate by a passage, a check valve in the passage opening away from the firing cylinder, pistons in said cylinders, and a shaft having cranks respectively connected with said pistons, one of said cranks being located in advance of the other so that one of the pistons will have passed its inner dead point at the moment of ignition of a charge compressed by the other piston, substantially as described.

808,423. Vertical Explosive Engine. Alexander Winton, Cleveland, Ohio. Filed November 12, 1904. Serial No. 232,488.

Claim.—1. A vertical explosive motor for motor vehicles, comprising a vertically arranged crank case with an open side ending at practically the centre of the crank shaft axis and cylinders supported by the upper portion of the crank case and partly overhanging the open side of the casce, the said crank case forming an immovable support for itself and the cylinders with their cooperating parts, and a removable cap portion for the open side of the crank case adapted to be laterally removed therefrom, whereby access to the crank case can be readily obtained from the side thereof for the purpose of inspection, adjustment or substitution of the parts therein, substantially as described.

808,426. Cushioned Tire. Charles W. Adsit, Owatonna, Minn. Filed March 3, 1905. Serial No. 248, 202.

Claim.—1. The combination with a wheel rim of the two series of spring plates detachably clamped to said rim and making up a resilient sectional tube, a spring hoop having grooved edges with which the inturned ends of said spring plates interlock, and a sheath inclosing said rim, spring plates and spring hoop, and having its edges clamped to said rim, substantially as described.

808,572. Gas or Gasolene Engine. John Palmer, Philadelphia, Pa., assignor, by direct and mesne assignments, to F. S. Rutschmann, trustee, Philadelphia, Pa. Filed July 16, 1904. Serial No. 216,841.

Claim.—1. The combination, in a gas or gasolene engine, of a cylinder containing two separated chambers, each with an exhaust therefrom, connected pistons, one in each chamber, an inlet for the motive fluid, communications between the inner and outer ends of each cylinder chamber, said communications being independent of the exhaust passages, and valve mechanism independent of the piston and operated from the engine shaft, said valve mechanism providing for the flow of motive fluid from one end of the cylinder to the other, while the exhaust from the latter end of the cylinder is open, whereby the first inflow of said motive fluid serves to expel the spent gas from said end of the cylinder, substantially as specified.

808,579. Rotary Valve for Gas Engines. Fayette M. Seeley, Lansing, Mich. Filed July 14, 1904. Serial No. 216,510.

Claim.—1. In a rotary valve, the combination with an engine cylinder having a cylinder port, of a valve housing, the said housing having circular, depressed valve seats provided with inlet and exhaust ports in communication with the said cylinder port, the said housing having a shaft bearing extending centrally between the said valve seats, a shaft revolubly in said bearing, disk valves arranged in said seats and secured to the shaft, the said valves having suitably disposed ports, and detachable heads covering the said valves, substantially as described.

808,551. Ignition Device. Leon J. Le Pontois, New Rochelle, N. Y., assignor to Polyphase Ignition Company, a corporation of New York. Filed November 7, 1903. Serial No. 180,176.

A sparking system comprising two or more insulated electrodes located in the ignition chamber of an internal combustion engine, ground connections for said electrodes, and means to simultaneously disconnect said electrodes from their ground connections so that the respective circuits of a polyphase current generator leading to said electrodes may be simultaneously interrupted.

808,552. Magneto Alternator. Leon J. Le Pontois, New Rochelle, N. Y., assignor to the Polyphase Ignition Company, a corporation of New York. Filed September 24, 1904. Serial No. 225,853.

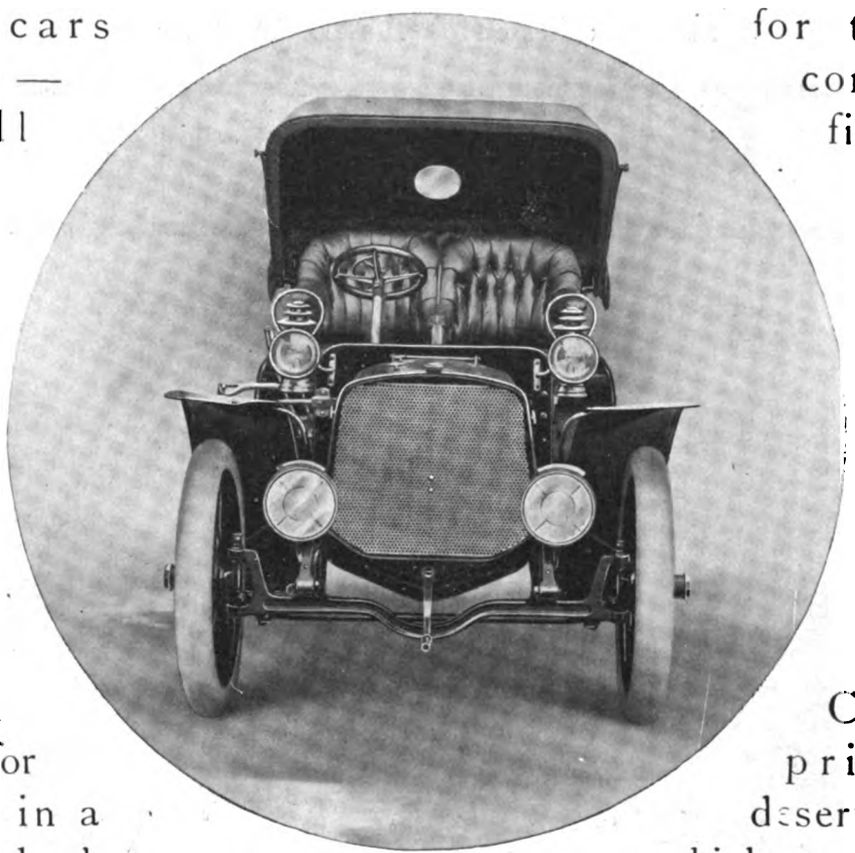
A polyphase alternator comprising a rotor consisting of a permanent magnet, having a plurality of separately magnetized steel laminae, substantially annular in shape and so magnetized that two consequent poles are formed at opposite ends or the same diameter.

808,553. Method of Igniting Combustible Mixtures. Leon J. Le Pontois, New Rochelle, N. Y., assignor to the Polyphase Ignition Company, a corporation of New York. Filed September 24, 1904. Serial No. 225,854.

The method of producing sparks suitable for igniting combustible mixtures, consisting in alternately short circuiting, one of two alternating currents differing in phase from each other near the period of minimum intensity of its alternation and while it is short circuited interrupting the other, at or near the period of the maximum intensity of its alternation.

808,554. Apparatus for Generating and Utilizing Polyphase Alternating Currents for the Ignition of Explosive Mixtures. Leon J. Le Pontois, New Rochelle, New York, assignor to the Polyphase Ignition Company, a corporation of New York. Filed October 7, 1904. Serial No. 227,548.

A system for igniting combustible mixtures in internal combustion engines, comprising a polyphase alternating current generator, having its rotor driven at a speed proportional to that of the engine shaft, and means for varying the time of operation of the sparking device constructed to connect electrically said device to the generator at the time of generation of either of the alternating currents or both of them jointly according to the respective intensities.



808,307. Clamping Device for Pneumatic Tires. Harry K. Raymond, Akron, Ohio, Maximillian C. Schweinert, West Hoboken, N. J., and Henry P. Kraft, New York, N. Y. Filed March 18, 1905. Serial No. 250,769.

Claim.—1. In a clamping device, the combination of a main nut and a lock nut, telescopically connected, and being capable of relative rotation.

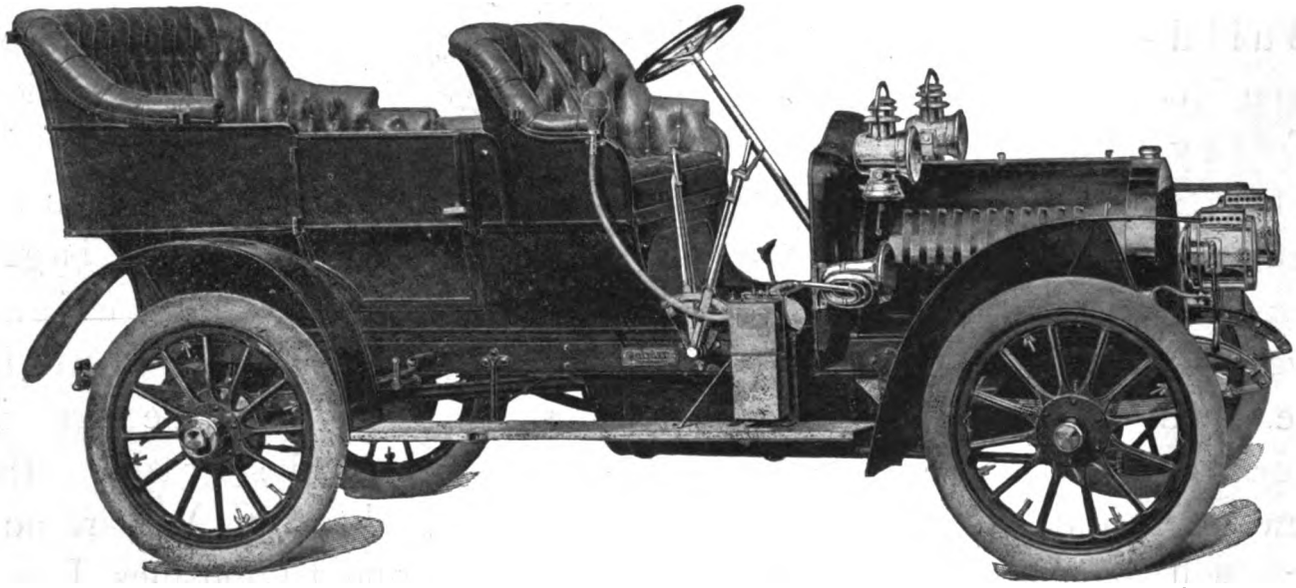
A GOOD FRONT

We believe in putting up a good front, and our cars show it — as it will also be shown in our New Building at Fifty-fifth St. and Broadway, which we hope will be ready for occupancy in a few days, and where we will have a continuous plate glass corner front, permitting LOZIER MOTOR CARS to be shown to the best possible advantage. And they will stand all the light that can be thrown upon them, for their fine construction, finish and equipment is such as invites the very closest inspection. The Lozier Car is the very largest American Car, and in price it is deservedly the highest. We are now delivering Limousines, Landaulets and Touring Cars, 35 Horsepower, Type C, 1906 Model, and every owner of a LOZIER MOTOR CAR is one of experience who has at last found the ideal in our product.

THE LOZIER MOTOR COMPANY



Temporary Quarters at R. M. Stiver's Carriage Rooms, 19 W. 62nd St., New York City

Rainier

The Pullman of Motor Cars

Catalogue and Cars Now Ready.

1906 MODEL B, 30-35 H. P. PRICE, $4,000.

GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

During 1905 the Rainier was the hit of the season in New York, the most critical of markets. Not a single dissatisfied customer and orders galore for the new car from former users. Only favorable comments everywhere. Before you decide, investigate the Rainier, carrying the world's broadest automobile guarantee.

Make and break spark. Simms-Bosch Magneto. Bevel gear drive.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Chicago Branch: 1253-1255 Michigan Ave. (after January 15th).

Boston Agents: MORRISON-TYLER MOTOR CO., 121 Massachusetts Ave.

Good Agents wanted in unassigned territory.

We exhibit in the Armory Shows in New York and Chicago.

The Week's Patents.

807,457. Driving Attachment for Automobiles. Benjamin A. Gramm, Chillicothe, Ohio. Filed July 28, 1905. Serial No. 271,652.

Claim.—1. The combination with the frame and driving mechanism of an automobile, a shaft readily attachable to and detachable from said mechanism; and a support for said shaft readily detachable from and attachable to the outside of said frame.

807,479. Carburetter. Julius H. Mason, Duncan Falls, Ohio, assignor of one-fourth to Wilson S. Sprague, Zanesville, Ohio, and three-eighths to Spencer M. Garrett, Philo, Ohio. Filed March 10 1905. Serial No. 249,358.

Claim.—1. In a carburetter, the combination with fuel supply means, of a mixing casing, a valve yieldably held to normally cut off the supply of fuel, an air admitting valve having a stem adjacent the fuel valve, and means carried upon the stem of the air valve for moving the fuel valve to admit fuel when the air valve is moved, and means for adjusting the said last-named means to vary the relative movements of the valves.

807,536. Vehicle Wheel. Stanislaus Berens, Lagrange, Ill. Filed April 14, 1905. Serial No. 255,479.

Claim.—In a vehicle wheel, the combination with a hub having a series of radial sockets, a series of rods secured in said sockets, a tubular section loosely surrounding each of the said rods at their outer portions, a spring located in each of the tubular sections between its outer end and the inner end of its rod, means on each of the tubular sections to regulate the tension of the spring therein, and a rim secured to the outer portions of the tubular sections, substantially as described.

807,537. Pneumatic Tire. Edgar M. Birdsall, Buffalo, N. Y., assignor of one-half to Mary B. Birdsall and one-half to Fletcher J. Barron, Buffalo, N. Y. Filed January 26, 190. Serial No. 261,665.

Claim.—1. The combination of an inflatable tire section, a connecting tube arranged in the end of the section and communicating with the air chamber thereof, and an inflatable packing interposed between said tube and the surrounding portion of the tire section, substantially as set forth.

807,569. Explosion Motor. Barton S. Molyneux, Buffalo, N. Y. Filed March 5, 1904. Serial No. 196,657.

Claim.—1. A motor comprising a movable impulse member, a pressure chamber having an outlet whereby the contents of the chamber are directed against said impulse member, a valve controlling said outlet, and a piston arranged to be acted upon by the pressure in the chamber and operatively connected with said valve, substantially as set forth.

807,611. Non-Skidding Cover for Tires. Edward Fairburn, Brighouse, England. Filed July 24, 1905. Serial No. 271,086.

Claim.—1. In a tire armor, the combination, with a channel-shaped ring of leather, of a series of leather rings, a series of rings formed of metallic links, both series of rings being arranged in the said channel-shaped ring, and pins pivoting the said links together and passing through the said leather rings and the flanges of the said channel-shaped ring.

807,612. Vehicle Spring. Samuel Furmidge, St. Louis, Mo., assignor to Supplementary Spiral Spring Company, St. Louis, Mo., a corporation of Missouri. Filed November 16, 1904. Serial No. 232,934.

Claim.—1. In an auxiliary or supplementary vehicle spring, the combination of a means for connecting same with the vehicle supporting spring, a separate means for connecting same with the leaf-spring, a pair of helical springs connected to said first-mentioned means, members rigidly connected to said helical springs connected also with said second-mentioned means, said helical springs being wide enough across the top to accommodate all lateral play of the parts in rigid connection therewith which connect same with the leaf-spring, substantially as described.

807,623. Motor Vehicle. John W. Lambert, Anderson, Ind. Filed April 3, 1905. Serial No. 253,469.

Claim.—1. In a motor vehicle the combination of a driving disk, a driven disk and a shaft carrying this latter disk, movable bearings on this shaft, means for shifting these bearings to engage and disengage the driven disk, springs pivotally depending from the frame of the vehicle and supporting the rear axle thereof, so that said axle may move bodily forward and backward, sprocket wheels connected to the rear wheels, sprocket wheels on the driven shaft and chains connecting said sprocket wheels, and adjustable rod connections between the rear axle and said movable bearings, for the purpose set forth.

807,627. Power Transmission Device. George W. Marble, Chicago, Ill. Filed December 7, 1904. Serial No. 235,867.

Claim.—1. The combination with a friction wheel of a friction disk on each side thereof, means for adjusting said friction wheel radially of said disks, adjustably connected levers engaging the outer sides of said disks and means engaging the same acting to move said disks simultaneously one into and the other out of engagement with said friction wheel.

807,633. Tire. John F. McCanna, Chicago, Ill. Filed August 15, 1904. Serial No. 220,726.

Claim.—1. A device of the class described, consisting of a rim, and a series of circumferentially-abutting blocks having flat tread-surfaces and inclined sides and ends and radial abutting portions.

807,692. Yieldable Gear. Harry B. Stilz, Philadelphia, Pa. Filed January 14, 1905. Serial No. 241,089.

Claim.—1. The combination of a shaft, a wheel secured to the shaft, a gear concentric with and rotatable relative to the shaft and having a friction surface, a split band loosely fitted around the circumference of the wheel, a key secured to the wheel in a position to react upon the thrust end of the band, and a mechanism by which a force is applied to the slack end of said band for actuating the band upon the said friction surface.

807,744. Vehicle Tire. Charles A. Immler, Akron, Ohio. Filed January 26, 1905. Serial No. 242,790.

Claim.—1. The combination with a clencher rim having inturned flanges forming channels, of a solid rubber tire to fit said channel, having a longitudinal convex or oval bead at the centre of the side of said tire, having at intervals loop springs containing one or more convolutions at their centre, and embedded transversely across said tire and near the base of said tire with their ends extending outward and slightly upward to the outer edge of the said tire and contained within the inturned flanges of the clencher rim, with key made with a washer at end to be inserted in the base of said tire, said key to have a hole or opening through its end near the washer for the purpose of permitting the ends of the longitudinal wire to pass through, said key to have a square end to pass through an opening in the clencher rim and felly and to be held in place by the felly plate, which has a square opening in its centre and which plate is made to fit over the felly, all as substantially shown and described.

807,748. Elastic Vehicle Tire. Godfred Knadler, Akron, Ohio. Filed July 31, 1905. Serial No. 272,089.

Claim.—An improved tire for a vehicle wheel consisting of an endless body of elastic material, provided throughout with an approximately centrally disposed annular opening elliptical in cross-section, the major axis of which is radial with the wheel on which the tire is mounted, and further provided with a cut extending from said opening to the base portion of the tire circumferentially throughout the entire tire body, the base portion of said tire being so formed as to fill and be compressed by the rim in which said tire is mounted whereby the edges of the base portion along said cut are maintained in constant contact excepting under the influence of excessive pressure applied to said tire, said tire body being further provided with a convex tread and side portions united by concave lines and concave portions extending from the lateral convex portions to the base portion of the tire.

807,771. Speed Changing and Transmission Gearing. Irvin H. Pleukharp, Columbus, Ohio. Filed May 10, 1905. Serial No. 259,804.

Claim.—1. The combination with a gear wheel, of a larger gear around the same, ratchet means connecting said gears, pinions in mesh with the respective gears, and means for turning either of said pinions.

807,789. Guiding Device for Motor Vehicles. Zachary T. Sweeney, Columbus, Ind. Filed June 22, 1905. Serial No. 266,452.

Claim.—1. A guiding device for motor vehicles comprising a hood carried by a steering wheel of the vehicle and extending forward therefrom, adapted to contact with an obstruction and to deflect the steering wheel to guide the vehicle past the obstruction.

807,831. Folding Foot Rest for Automobile Tonneaus. Ralph A. Leslie, Cleveland, Ohio, assignor to The Winton Motor Carriage Company, Cleveland, Ohio. Filed July 15, 1905. Serial No. 269,836.

Claim.—1. The combination with a vehicle having a front and a rear seat, of a folding foot rest located between the seats and adapted to be supported in a rearwardly inclined position in front of the rear seat to form a foot rest for the passengers of the rear seat.

807,832. Steering Axle for Motor Vehicles. Thomas J. Lindsay, Indianapolis, Ind. Filed July 14, 1905. Serial No. 269,677.

Claim.—1. The combination of a T-shaped spindle structure embodying bearing portions and ends beyond the bearings to receive a steering arm, a steering arm adapted to be removably secured to one of said ends, a two-part bearing structure in which said spindle structure is mounted, an axle, and means whereby said two-part bearing structure is securely united to said axle.

807,839. Flexible Rim for Vehicle Wheels. William G. Marr, Springfield, Mass., assignor of one-third to James P. Hillard and one-

Digitized by Google

third to Richard J. Talbot, Springfield, Mass. Filed March 1, 1905. Serial No. 247,902.

Claim.—1. In combination with a wheel for vehicles, sections, each having a spiral spring, a metal rod, a socket for said rod and a cover, fitted to the spokes or on the rim of a wheel, a flat spring between each spring section curving in the centre toward the hub of said wheel, a sectional tire, each tire section bearing on two spring sections and on the spring between each of said spring sections, substantially as specified.

807,949. Magneto Alternator. Leon J. Le Pontois, New Rochelle, N. Y., assignor to PolyPhase Ignition System Company, a corporation of New York. Filed October 20, 1904. Serial No. 239,310.

Claim.—1. An alternating current generator having a field magnet consisting of a permanently magnetized ring formed of a continuous steel ribbon, pole pieces located at opposite ends of the same diameter and coils supported thereon, and an inductor mounted to rotate in close proximity to said pole pieces.

807,950. Gas Engine. Robert Longtine and Edward Double, Los Angeles, Cal. Filed August 17, 1904. Serial No. 221,062.

Claim.—1. In a gas engine, in combination with the cylinder and piston, an exhaust valve, means for opening the exhaust valve by the pressure of the exhaust gas, a rod carried by the exhaust valve having a notch, a pivoted locking bar for engaging the notch, and means co-operating with the piston for actuating the locking bar.

807,958. Motor Vehicle Running Gear. Ransom E. Olds, Lansing, Mich. Filed October 29, 1904. Serial No. 230,470.

Claim.—1. In a motor vehicle running gear, the combination with the front and rear axles, of a rigid underframe comprising front, rear and side members, the rear member forming the rear axle sleeve and central gear casing inclosing the transmitting gear for the live axles, and the side members composed of forward and rear portions, the forward portions of which form the sides of a semi-independent forward portion of the frame and support the frame upon the forward axle and the rear portions of which are separably connected with the rear corners of the forward portion of the frame, one of said rear portions forming with part of the rear member and gear casing an independent detachable part of said underframe.

807,961. Metallic Tire. Walter J. Paton, Galva, Kans. Filed June 14, 1905. Serial No. 265,251.

Claim.—1. A tire composed of a plurality of tubular sections, each section consisting of relatively movable members, means connecting said members, and a spring interposed between said members.

807,968. Suspension Device for Vehicles. Peter H. Seery, Newark, N. J. Filed July 14, 1905. Serial No. 269,604.

Claim.—1. A member having a cam projection on one face, a second member having a depression on its face constructed to receive said cam projection, means for holding said faces in resilient contact and means for rotating one of said members.

808,002. Differential Gear. Robert H. Brockman, New York, N. Y. Filed July 27, 1904. Serial No. 218,360.

Claim.—1. The combination of two driven members, a belt connecting the two, a member engaged with the belt intermediate the driven members, and a gear wheel adapted to receive a driving movement, the gear wheel having an orifice therein in which the last-named member is loosely mounted.

808,047. Differential Gearing. Frank M. Haldeman and Bluford W. Brockett, Cleveland, Ohio. Filed September 29, 1905. Serial No. 280,582.

Claim.—1. In a differential gear, the combination with the axle sections, of driven gears upon said axle sections, beveled driving pinions diametrically opposed to each other with respect to said driven gears for driving the same, and spur gear differential driving mechanism for said pinions wholly within the peripheries of said driven gears.

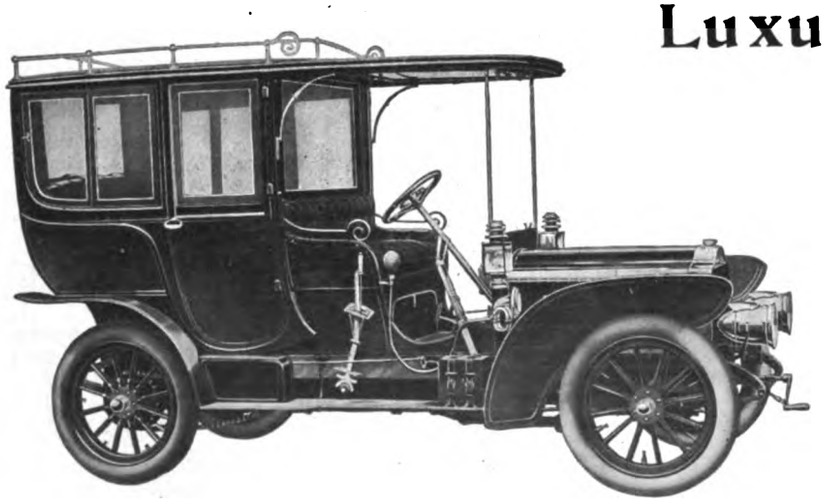
808,074. Tire-Cover. Jean C. Dufour, Charenton, France. Filed April 3, 1905. Serial No. 253,513.

Claim.—1. In protective and non-skidding tire covers for the wheels of automobile carriages or other vehicles the combination of a double tread placed exteriorly on a leather cover which completely surounds the air tube; studs or rivets on the tread band to produce an unpuncturable and non-skidding pneumatic tire; means for preventing the leather of the cover to be cut by the rivets, said means consisting in an intermediate leather band and washers; a leather crescent-shaped layer composed of two parts with a free space or gap between them; another similar continuous layer.

808,208. Jack for Automobiles. Lee R. Maxwell, Cedar Rapids, Iowa. Filed November 11, 1904. Serial No. 232,337.

Claim.—1. A jack for elevating automobiles or other vehicles, comprising base bearings, supports fulcrumed in said bearings, trackways secured to said supports and adapted to be tilted by the weight of the automobile, and means of maintaining the trackways in substantially horizontal position.

808,210. Internal-Combustion Engine. Edward S. Palmbla, Waukegan, Ill. Filed December 14, 1904. Serial No. 236,784.



Claim.—1. In a device of the class described, the combination with a cylinder of an engine having an inclosed crank case, of a piston movable in the cylinder and opening between the cylinder head and crank case, a check valve closing said opening, an exhaust port opening from the cylinder head and an inlet port opening into the crank case, valves controlling said ports and means for operating said valves to produce two-cycle and four-cycle movements of the piston.

808,220. Power-Transmission Mechanism for Automobiles. Charles D. Simonds, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York. Filed June 22, 1904. Serial No. 213,642.

Claim.—1. In a power transmission mechanism, a driving shaft, a gear carried thereby, a driven shaft, a gear carried thereby, a dynamo-electric machine, a shaft carried thereby, two gears carried by said shaft and engaging the first two gears respectively, and a second dynamo-electric machine connected in circuit with the first.

808,234. Emergency-Brake. Walter M. Gooch, Dayton, Ky. Filed March 27, 1905. Serial No. 252,136.

Claim.—1. In an emergency brake, a head suitably mounted, a member movably secured thereto adjacent a wheel, a rack on said member, a toothed wheel adapted to engage said rack, a shaft on which said toothed wheel is mounted, a chain secured to said shaft and adapted to be wound thereon and means for unwinding said chain.

BIG SALE OF
Fur Coats
$15.00, 19.00, 25.00 and 29.00.
All worth double the price.

FUR LINED COATS
$24.00, 29.00, 35.00 and 39.00.
All marked down to 1-2 their value.

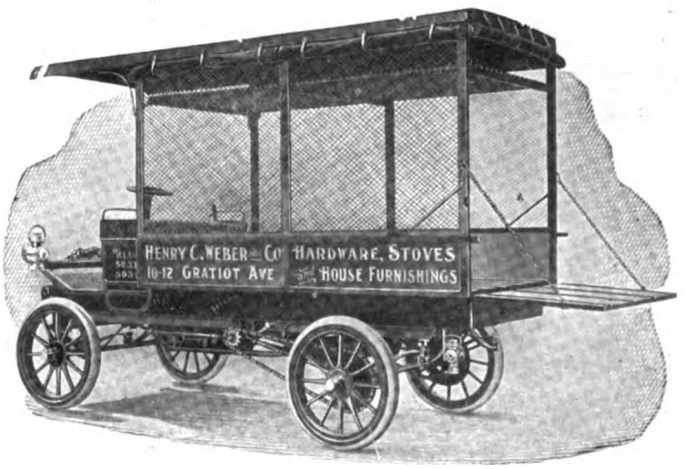
E. J. WILLIS CO.,
8 PARK PLACE, NEW YORK

The Rapid Motor Commercial Vehicles

Our entire organization has from the very first been devoted exclusively to the building of Commercial Vehicles.

The success of "Rapid" motor wagons is due to the fact that they are built with the idea of giving heavy continuous service, and carrying heavy loads.

The wagon illustrated weighs 2230 lbs. and carries 3000 lbs. easily. Rear Wheel measures 34 inches; front wheel 32 inches; solid tires. The double side chain drive insures a maximum of power delivered to the 2-inch solid steel axles. The cut illustrates only one of our many bodies. Size and style of body furnished to meet your requirements.



One Ton, $1,400; 1 1-2 Ton, $1,800.

GUARANTEED FOR ONE YEAR.

Agents can secure territory by writing me now, before all choice allotments are gone. Our new factory is a guarantee of prompt delivery.

Address F. R. HENRY, Sales Manager,

RAPID MOTOR VEHICLE CO., Pontiac, Mich.

WE ARE IGNITION SPECIALISTS

If you have any trouble with your ignition, write us about our **Apple Automatic Battery Charger.** No trouble to put on any car or engine. For full information write, **Dayton Electrical Mfg. Co., 91 Beaver Bldg., Dayton, O.**

PIERCE

This is the Great Arrow Victoria Tonneau, 40-45 H. P. with semi-enclosed top. Price without top, $5,000. Semi-enclosed top, $350 extra. Cape top, $200 extra. Folding glass front, $50 extra.

One convincing proof of the excellence of Pierce cars is the fact that they appeal most to the most mechanical minds. An automobile is a machine. The more a man understands about the principles of mechanics, the better he appreciates the way in which the Pierce Arrow is made.

The initial cost of a Pierce Arrow is greater than that of any automobile made in this country, but the price seems low when compared, not only with the small cost of maintaining, but with the long time of service given.

Pierce Arrows are never out of date as far as effective service is concerned.

Catalogue and descriptions mailed on request.

Wayne

ONE OF OUR 1906 MODELS

Wayne Model H, $800. Two-Passenger Runabout.

MOTOR, 2-cylinder opposed under hood. Cylinders, 4½ x 4, developing 14 H. P., water-cooled. TRANSMISSION, planetary gears, with DIRECT BEVEL GEAR DRIVE. Control is by a single lever, which engages the high speed clutch and reverse. The brake and slow speed are controlled by foot pedals. WHEELS, 28 x 3. EQUIPMENT, complete set of tools.

The strong features of this car are the extreme simplicity of the engine and transmission. The crank case and transmission case form one casting, and the entire engine can be taken apart or assembled in half an hour.

MODEL F, 4 cylinder car, cylinders 5½ x 5, 50 H. P. Seating 7 people....	Price, $3,500
MODEL K, 4 cylinder, 5 passenger touring car. 35 H. P. Sliding gear transmission	Price, $2,500
MODEL B, 4 cylinder, 5 passenger car, 24-28 H. P. Sliding gear transmission	Price, $2,000
MODEL C, 5 passenger car. Double opposed motor, 20 H. P. Planetary transmission	Price, $1,250

THE "Maxwell"

Perfectly Simple Simply Perfect

The Evolution of the Maxwell Doctrine–Maxwell Cars

The Doctrine:

1st. A cylinder of 5 inch bore with 5 inch stroke is ideal for a double opposed gasoline motor.

2nd. A double opposed motor, 5 inches by 5 inches, when properly made, develops, about **20 ACTUAL** horsepower.

3rd. To use four cylinders for motors of 20 or less horsepower is unnecessary because thereby the number of wearing parts is unnecessarily increased.

4th. **20 ACTUAL** horsepower, not momentum or fly-wheel horsepower, is enough for every requirement except excessive speed or extreme fashion. Therefore, a two cylinder, 5"x5" double opposed motor is the best, and **IT IS AS EVENLY BALANCED AS FOUR CYLINDER CONSTRUCTION,** is very much less complicated and much more reliable. It would take four 4"x4" cylinders to develop the same power as two 5"x5" cylinders, properly made.

5th. Four cylinder cars appeal largely to "Fad and Fancy" only; **TWO CYLINDER CARS PRODUCE RELIABLE SERVICE.**

The unprecedented successful record of the Maxwell cars during the season of 1905 prove the **WISDOM** of the above written **DOCTRINE.**

Reasons for the SUCCESS of the MAXWELL.

Common sense was the motive of its construction, not the impulse of "fad and fancy."

A 5"x5" horizontal double opposed motor for a touring car and a 4"x4" for a tourabout have been proved the *ideal* types for *service and reliability.*

MAXWELL HORSEPOWER is demonstrated by the **ACTUAL CONTINUAL TEST,** not by the flash system of testing which includes that resulting from the inertia of the fly-wheel. Therefore, **MAXWELL HORSEPOWER is ACTUAL HORSEPOWER.**

MAXWELL CARS ARE SPLENDIDLY MADE AS WELL AS PERFECTLY DESIGNED.

MAXWELL FEATURES in the PERFECT MAXWELL CAR.

MULTIPLE DISC CLUTCH, encased and running in oil, self-adjusting.

BEVEL GEAR DRIVE, combined with double universal joint avoiding filthy stretching chains.

THREE POINT SUSPENSION, resulting in the adaptability of the car to the unevenness of the road without straining the mechanism.

NATURAL CIRCULATION OF WATER, automatic in action, and eliminating all pump troubles.

METAL BODIES, eliminating the opening up of seams and the checking of bodies.

GREATEST SIMPLICITY, RELIABILITY AND ECONOMY, resulting in the lowest cost of upkeep, maintenance and operation.

Model H. 16-20 H. P. Touring Car,
Price, $1450.00.

It doesn't take a mechanic to adjust, to maintain and to run a MAXWELL car. MAXWELL CARS are sold under the *positive* guarantee that AS GOOD A CAR cannot be sold at a lower price.

Model L. 10 H. P. Tourabout.
Price, $780.00.

A New Pneumatic Tire

MADE BY

Firestone

THE RUBBER TIRE SPECIALISTS.

After exhaustive experiment and careful study of the requirements of pneumatic tires, we have invented a tire which has every possible good feature of the best, with practically all of their objectionable features eliminated.

Firestone pneumatic tires have withstood the most exacting tests during the past two years, and we can assert positively that we have more nearly reached the point of absolute perfection than has yet been attained by pneumatic tire makers.

Firestone Tires are sightly on the wheels. Good, practical common sense and accurate knowledge of the rigorous requirements of a good tire are apparent to the most casual observer. The fastening device is positive and will securely hold the tire under all conditions, and, whether inflated or deflated, there is no possibility of creeping or rim cutting. The most inexperienced person can easily remove the tire in two minutes and replace it in the same time, and he *cannot pinch the inner tube,* because in the Firestone construction it simply *cannot be pinched.*

For many years the name FIRESTONE has stood for the highest grade of excellence in solid tires. We know the tire business in every detail. We know we have a pneumatic tire which is without a peer—a tire which will receive and merit an extensive demand. To enable us to meet any demand which may be made, we have erected immense new buildings and equipped them solely for the manufacture of pneumatic tires.

OUR FACILITIES ARE ENORMOUS. OUR TIRES ARE RIGHT. Our successful business career has demonstrated our ability to accomplish what we undertake.

We want you to know more about Firestone Tires. Study them. Examine them as closely as you please, and we know you will be a Firestone customer.

THE SIMPLEST ENGINE IN THE WORLD.

THE TWO-CYCLE ELMORE

When you understand that the two cycle Elmore engine does away with 18 to 20 parts on each of the four cylinders, and absolutely eliminates all inlet and exhaust valves with their attendant mechanism, you'll agree with us, won't you, that this is the simplest engine in the world?

Do we need to point out that this also reduces the cost of operation and upkeep to the minimum and makes the Elmore the most economical as well as the simplest of engines in the world?

From whatever standpoint you examine the two-cycle Elmore, equally impressive and sensational features present themselves. The four cylinder car produces approximately as much power as would eight cylinders of the four-cycle type—produces it in a continuous and unbroken application that will carry the car indefinitely on the high speed under any and all road conditions.

Again, it is the most successful self-starting engine in the world. Again, you can cut out one, two or three cylinders at will, both spark and gasoline. With one cylinder cut out the difference is imperceptible except in speed; with two out, barely noticeable. Do you see the economy of this?

Again, you can throttle the Elmore engine on the high speed down to two miles an hour. Again, the Elmore will take a 16 per cent. grade on the high speed with approximately as much ease as it travels on the level road.

It starts with a smooth gliding motion that is delightful, and dips down and over uneven spots with a minimum of jolt or jar.

The four cylinder Elmore at $2500 and the two cylinder Elmore at $1500 are two cars whose manifold exclusive features demand your most serious consideration. Learn all the wonders of the two-cycle type by getting in touch with the nearest Elmore agent or by writing for our new descriptive catalogue and books of information.

THE ELMORE MFG. CO., 1104 Amanda St., Clyde, Ohio

Members Association of Licensed Automobile Manufacturers.

The Connecting Link Between Home and Office.

Isn't it significant that most men who can afford more than one motor car own a **POPE-WAVERLEY ELECTRIC?** The reason is simple. Without cranking, oiling, or soiling the gloves it starts right off in any weather. No water to freeze up, **always ready,** simple and safe. It is in a class by itself—an ideal about town carriage for the trip to and from the office, the theatre, the shopping tour, calling, or the spin to the suburbs or the country club.

We make Runabouts, Surreys, Stanhopes, Chelseas, Physicians' Road, Station and Delivery Wagons. Also trucks on specification.

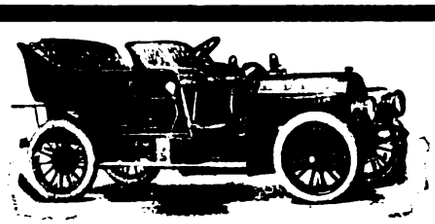
YOUR TIRE OFF AND ON IN LESS THAN A MINUTE

Tells exactly what is accomplished by means of the

Goodrich Quick Detachable Construction

And a visit to our Exhibit at the New York Automobile Show, Madison Square Garden, will afford you the opportunity to see our claims proved.



Perhaps you may wish to make dead sure and detach and attach the tire yourself. It is a pleasant little pastime with all the old time hard work features cut out. You will enjoy the experience and be impressed with the fact that the Goodrich Quick Detachable Tire and Rim is a great achievement in automobile tire building.

Space in Central Boxes directly over Madison Square entrance.

What Royal Tourist Owners Are Writin'.

"More pleased with Royal than any car I have ever owned. Have owned about 25, both foreign and American."

"Mine has run about 4,000 miles this season, and has had absolutely no repairs."

"Since June 22d I have toured about 6,000 miles, and during this time I have never once stopped on the road to make a single repair or adjustment."

"The Royal Tourist which I purchased of you has run about 6,000 miles, over hard country roads and sharp hills, and total cost of repairs will not exceed $3.00."

"I have run this car about 6,000 miles and have given it some hard usage. The expense for repairs has been $3.25."

"Am delighted with my Royal. Have run it nearly 2,000 miles, and have had no repairs."

"We have been over 7 500 miles, at this date, without a repair or replacement of any kind or description, except to tires."

Ask any of our Agents to show you reproduction of letters from which these remarks were taken.

Change Tires 30 Seconds Goodyear Universal Rim

SUPPOSING you were 25 miles from home, and your tire exploded. And you hadn't another with you. And when you stopped at the garage, the man said: "I'm sorry, but I haven't a single tire of that make."

Wouldn't it make you mad?

Of course it would, if you had an *ordinary* rim.

But if you had a Goodyear Universal Rim, you would smile and say: "Bring on any old tire, as long as it's a clincher my rim will take it." And in less than three minutes you would be enjoying the scenery once more.

Because it *isn't* an all-day job to take off and put on a tire when your car has Goodyear Universal Rims. Just jack up the wheel and in 30 seconds the old tire is off, and in another 30 seconds the new tire—ANY kind—is on. You need no tools but the hands—and are "fixed up" and on the road while the man with *ordinary* rims is hunting for his crowbars and levers.

Figure 1

You see the flange comes right off on Goodyear Universal Rims, like Fig. 1.

And then a 30-inch tire (for example) slides right on to the 30-inch rim like Fig. 2, as easy as you would put on yoor hat. On an ordinary rim you would have to pry that 30-inch tire over a 31-inch flange. You know what a profanity-inspiring job that is, and it doesn't do the tire any good, either.

Figure 2

Now this is all there is to taking off and putting on a tire when you have Goodyear Universal Rims. See how simple and easy it is.

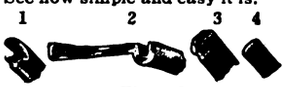

Figure 3

The rim is made up of four parts, like Fig. 3.

Nos. 1 and 3 are the removable flanges (rings), which can be adjusted to any clincher tire.

No. 2 is the base of the rim attached to the felloe of the wheel. It can be used without fitting on any standard wheel built for the standard clincher rims.

No. 4 is the locking ring, which holds the flanges in place.

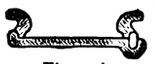

Figure 4

If you have decided to relieve yourself of all tire troubles and in consequence ride Goodyear Detachable Auto Tires, a section of the rim, when put together, would be like Fig. 4.

Or, if you ride an ordinary clincher tire, the rim section would look like Fig. 5.

The ring which holds the flanges in place is split at a point alongside the valve stem, like Fig. 6.

Figure 5

It can't be removed (and, of course, the tire can't come off) while the flange presses against it.

This flange is kept tight against the ring by a plate which slips over the valve stem, like Fig. 7.

Figure 6

When you wish to remove the tire, loosen the nut which holds the valve stem down, and push the stem up through the rim. This pushes up the plate and lets the flange ring slide inward, like Fig. 8.

Then lift out the locking-ring, slip off the flange, and pull off the tire.

Time, 30 seconds. No tools but the hands.

Figure 7

Figure 8

Those who are weary of tire troubles are specifying Goodyear Auto Tires on Universal Rims. This equipment *costs no more* than the ordinary kind, and multiplies the pleasures of motoring many times.

Ask for our "Good News Book" and find out all the good points of the Goodyear Auto Tire and Universal Rim. It's of vital interest to the Manufacturer, Dealer or User who is satisfied with nothing but *the best*.

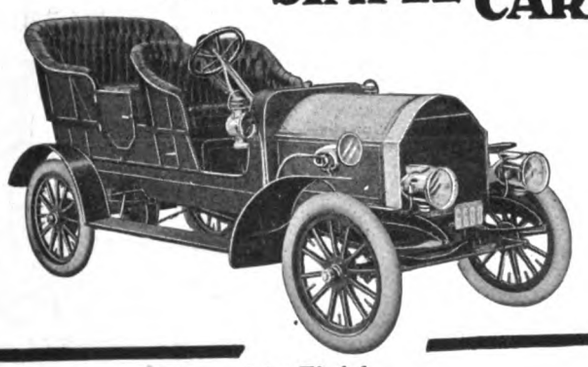
Strength and Compactness Smooth, Quiet Running

GUARANTEED FOR 365 DAYS

Acme Motor Cars are built entirely and wholly by the Acme Motor Car Company, which means there are no bought parts for assembling—**no unknown quantities.**

TYPE XIV—$2750. Of the same practical construction as type XV. Greatly improved in arrangement and larger body than last year. Three Speed Sliding Gear Transmission 30 Horse Power, 4 Cylinder Vertical Engine. Speeds up to 50 miles an hour. Demonstration by appointment.



1906 Acme Cars—Specifications, Type XV

Price	$3500. Complete with two side Oil Lights, two Acetylene Head Lights and Generator, Tail Light and Horn.
Type	Touring Car.
Seating Capacity	7 persons.
Weight	2600 lbs.
Wheel Base	114 inches.
Tread	56 inches.
Clearance	10 inches.
Body	Double Side Entrance Tonneau, divided Front Seats, made of best seasoned Ash, Poplar and Basswood.
Seats	Soft Edged, Spring Cushioned Seats and Backs, width, front, 19 in., depth, 18 in., width, rear, 52 in., depth, 18 in.
Leather	Best Quality, Hand Buffed, Pebble Grained, French Finished.
Frame	Cold Rolled Nickel Steel, 180,000 lbs. tensile strength.
Axles	Front Nickel Steel, drop forged, "I" Beam Spring Seats integral with Axle; rear 1½ in. square, Nickel Steel forged.
Engine	40 H. P. Vertical, 4 cylinder, mechanical valves.
Clutch	Multiple Disc, running in oil, self-contained, no end thrust on bearings.
Transmission	Practically indestructible, Selective Sliding Gear, direct drive on 3rd speed.
Speeds	4 speeds forward and one reverse on one lever.
Gears	Chrome Nickel Steel, oil tempered, 212,000 lbs. tensile strength.
Bearings	Annular Ball, full type non-adjusting, Lemoine pattern.
Sprag	Internal Rachet in Sprocket of eacn Wheel.
Bolts and Nuts	All Bolts and Nuts throughout car, case hardened, and locked with Spring Lock Washers and Cotter Pins.
Gearing	Speed up to 50 miles an hour.

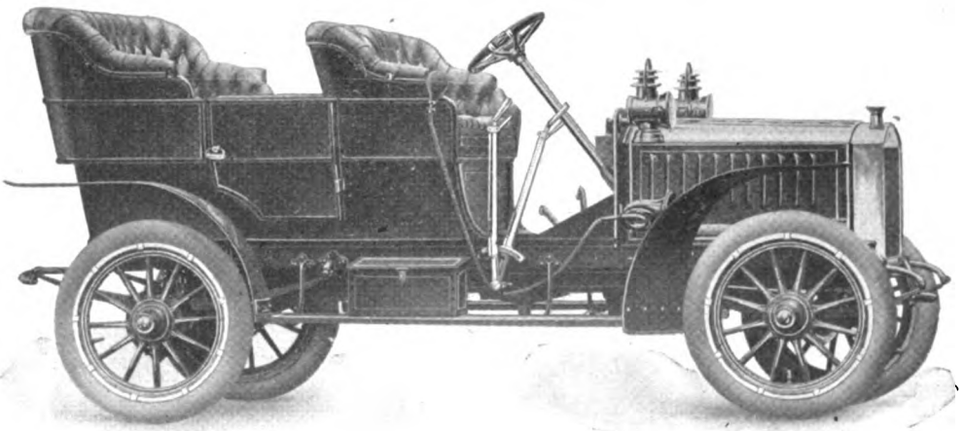
Autocar Control

is simple, easy and absolutely reliable. It is far in advance of any other motor-car control yet devised, and is, in itself, of such importance and advantage as to make The Autocar the most desirable car on the market—American or foreign.

Throttle and spark are accurately and positively governed by the grips in steering wheel: An exclusive Autocar idea that appeals to novice and expert alike; and particularly to the man who desires to drive his own car.

The Autocar driver is free from complicated apparatus. Guidance and speed-regulation are simultaneous; and the control of the car becomes as natural and automatic as walking.



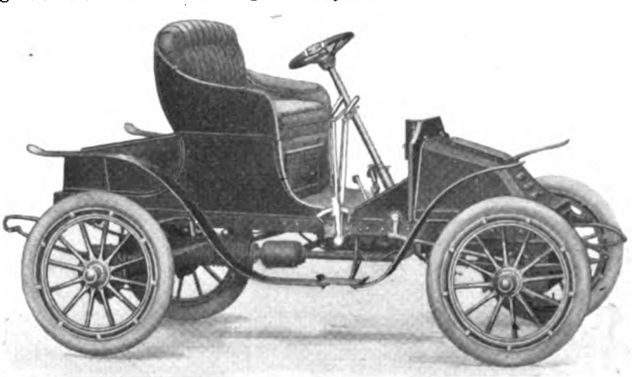
The clutch is operated by a foot-pedal. Another foot-pedal controls the brake.

The gear shift lever, outside car-body, gives ready control of speed changes. The emergency brake is controlled by a second outside lever, interlocked with the clutch; applying the brake throws out the clutch, rendering the motor powerless to move the car.

The Autocars are exhibited in New York only at Madison Square Garden

The Autocar

TWO MODELS FOR 1906



TYPE XII. Five Passengers. $2,600.

Four cylinder vertical motor—24 James Watt horse power (26 h. p. on test)

Shaft drive. Sliding-gear transmission. Three speeds and reverse. 100-inch wheel base. 56-inch tread. 32"x4" Fisk "Heavy Car" type tires. Internal and external hub brakes—no brake on driving shaft. Holley vaporizer, Autocar type, at side of crank case. Coil radiator. Crank shaft bearings oiled directly. Speed 40 miles. Climbs grades up to 15% on direct drive.

Big, broad and luxurious—extraordinary in road-covering and hill-climbing ability—unexampled reliability—with exclusive simplicity of control, and moderate in price. The logical selection of the greatest number of touring car-buyers.

TYPE X. Two Passengers. $1,000.

Two horizontal-opposed cylinders, in front—12 James Watt horse power (13 h. p. on test)

Shaft drive. Sliding gear transmission. Three speeds and reverse. 76-inch wheel base. 54-inch tread. 28"x3" Fisk "Heavy-car" type tires. Mechanical (gear-driven) oiler on crank case. Holley vaporizer at right front of motor. Speed 35 to 40 miles. Climbs grades up to 15% on direct drive.

The best Runabout; ***made better*** and **standardized.** Higher-powered and changed from left-hand lever steer to right-hand wheel-steer with characteristic Autocar Control.

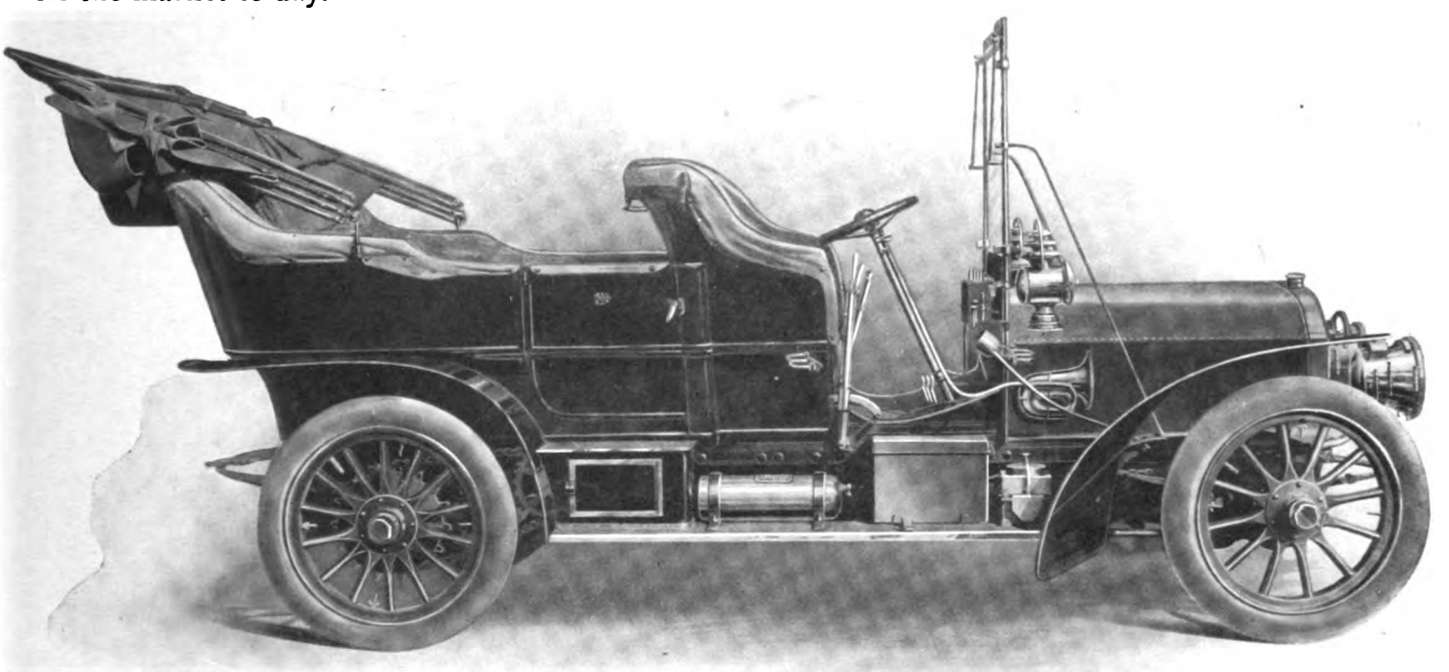
Wheel Base.	101 incnes.
Transmission.	Sliding gear.
Front Axle.	Solid-Forged.
Ground Parts.	All cylinders, pistons, piston rings, crank shafts, valves, universal couplings and transmission shafts.
Equipment.	Five lamps, horn, tools and storage battery.

We also have an 18 h. p. two cylinder car with detachable side door tonneau list a $1100.00, and a runabout 12 h. p. at $800.00.

Write us for complete details and agency proposition; it's so interesting that our factory is already a bee-hive of industry. Better get in line now.



C. H. BLOMSTROM MOTOR CO

DETROIT, MICH.

Digitized by Google

We will Exhibit in Madison Square Garden Automobile Show January 13-20. Space No. 39.

The "Matheson" touring car is designed to compete principally with the very finest and highest priced cars of foreign make. Its exceptional qualities and superior operation can only be fully appreciated by ***actual comparison*** with others, ***part for part,*** and by ***actual long-distance road demonstration.*** It is, without any exception, far and away the most thoroughly mechanical, the strongest built, the most powerful, the fastest, the handsomest and the most completely equipped car on the market to-day.

CHARACTERISTIC FEATURES:

Self-starting from the seat
Make-and-break ignition with magneto.
Four-cylinder vertical engine.
All valves in the head mechanically operated.
Valves never require regrinding.
All valve-actuating mechanism, on top of engine quickly accessible.
Absence of Vibration.
Noiseless in operation.
Automatic, wide-range, multiple-spray carburetor; will stay adjusted and vaporize any grade of gasolene.
Automatic speed control by governor.
Automatic lubrication, multiple, positive, force feed.
Clutch, multiple-disc, metal to metal. Will run thousands of miles without adjusting.
Sliding-gear transmission, chrome nickel steel.
Roller bearings on all wheels.
Double Chain drive.
Extra large bearings throughout, insuring long life.
Hess-Bright (imported) ball bearings on transmission shafts, differential shafts, steering knuckles, and in clutch actuating mechanism.

Four especially powerful brakes; two are water-cooled.
Hill-pawl prevents car backing down grade.
Irreversible steering gear.
Axles, special nickel-steel forgings; I-beam pattern.
Nickel-steel frame, cold rolled pressed.
Flexible reciprocating rotary spring suspension, eliminating all torsional strains on front and rear springs.
Long half-elliptic springs front and rear.
Radiator, honeycomb type.
Gasolene tank, capacity 20 gallons.
Metal pan underneath car.
Tires, 36 x 4 inches front; 36 x 4½ inches rear.
Wheel base, 40-45 H. P., 112 inches. 60-65 H. P., 118 inches.
Side-entrance aluminum bodies, superbly finished; the unparalleled production of J. M. Quinby & Co. and Moore-Munger Co., luxuriously upholstered.
Weight, 40-45 H. P., 2,960 lbs.; 60-65 H. P., 5,160 lbs.
Speed guaranteed: 40-45 H. P., 60 miles per hour. 60-65 H. P., 70 miles per hour. Geared for greater speed, if desired.

"America's Finest Motor Car."

"Matheson"

40-45 H. P. $6 000. 60-65 H. P. $7,500.
With Complete Equipment Below.

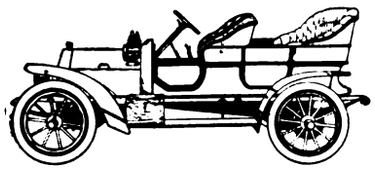
Our Complete Equipment Consists of

Cape-Carte top.
Storm curtains,
Standing glass front,
Detachable folding seats, with lazy backs,
Foot cushions,
Mats front and rear,
Large leather wallet,

Toilet set of comb, brush, mirror, whisk broom and soap case,
Tool and accessory lock drawers,
Folding baggage rack,
Tire irons for carrying extra tires at side of car,
Tire covers, waterproof,
Coat rail,

Truffault-Hartford shock absorbers,
Acetylene generator or gas tank,
Acetylene headlights, oil side lamps, tail lamp,
Large dragon horn,
Chime horn,
Gasolene gauge,
Grademeter,

Reserve tank lubricating oil,
Jones Odometer-Speedometer,
Water-gauge,
Dashboard 8-day clock
Monogram on doors,
Complete set tools and tire repair outfit,
Extra parts, etc.



Complete catalogue giving full details mailed on request.

HAYNES

The Car of Many Exclusive Features

The Haynes has many exclusive features that assure for it a wonderfully low maintenance and up-keep expense.

In a 6,000 mile trip, made in early winter, from Kokomo, Ind., to New York and Boston via Albany, returning over the Allegheny Mountains by the National Road, the repair expense was but $1.50.

Roller-bearings throughout, make the loss of power between the motors and rear tires less than 10 per cent, and account for the ease with which the car went up the longest and steepest grades in crossing the mountains.

The Haynes exclusively has roller-bearing engines; a Master Clutch with no wearable surfaces, which takes hold without jerking; a transmission that positively prevents burring and stripping of gears; and a roller pinion and rear axle that overcome every objection to shaft driven cars.

Other exclusive Haynes features are given in our new catalogue. For prompt attention address Desk 66.

Model "R" Four-Cylinder Touring Car.

Vertical roller-bearing engines. Cylinders cast separately, 5⅛x6 inches, 50 H. P. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master Clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller bearings throughout. 108-inch wheel base, 54-inch tonneau, seating five people. Four to 60 miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f. o. b. Kokomo. Full equipment.

Mod l "O' Four-Cylinder Touring Car.

Cylinders cast in pairs 4¼x5 in., 28 to 30 H. P. Transmission, cooling system, lubrication, master clutch, shaft drive, universal joints, sprocket, roller pinion and roller-bearings and body same as on Model "R." 97-inch wheel base. 4-inch tires. Tonneau seating three persons. Four to 40 miles an hour on high speed. Price, $2,250, f. o. b. Kokomo. Full equipment.

Columbia

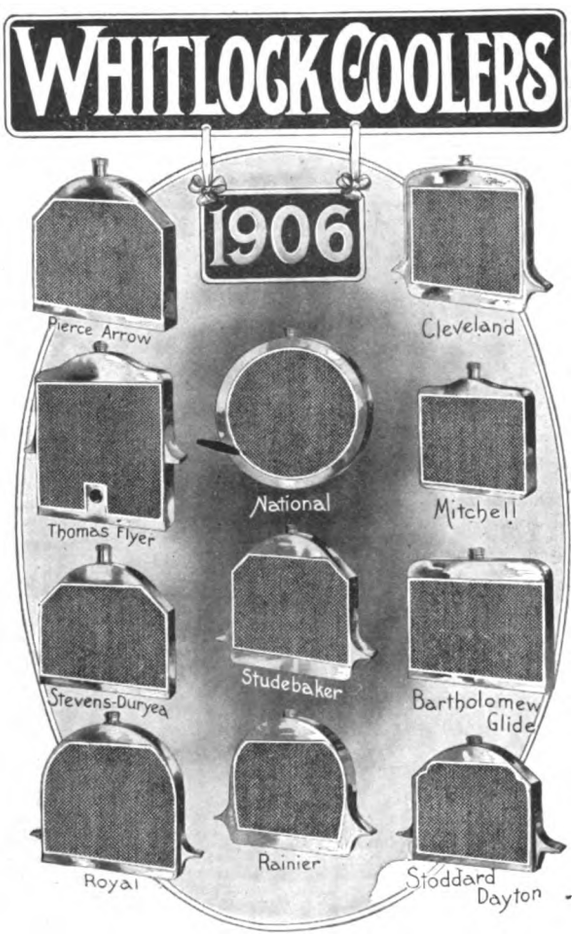
New Electric Carriages

COLUMBIA ELECTRIC BROUGHAM, MARK LXVIII.

IN New York, London, Paris and other large cities Columbia Electric Broughams, Landaulets and Hansoms are the favorite vehicles of people who demand and have the best of everything.

These carriages are made for private use only and no others compare with them for motive efficiency, exclusiveness of design, perfection of detail and finish, and luxury of furnishing. For town use they provide the ideal motor service.

At the AUTOMOBILE SHOW, MADISON SQUARE GARDEN, we are exhibiting a complete line of these superb carriages—also the lighter COLUMBIA ELECTRICS, VICTORIA-PHAETON and RUNABOUTS which, in their class, are no less distinctive in point of exclusive design, and equal superiority.



Catalogues of all Columbias, Electric and Gasolene, on request.

Perfectly Simple
Simply Perfect

Notice to Automobile Buyers

YOU OWE it to yourself TO MAKE a careful investigation BEFORE making your selection. Too many people buy motor cars nowadays WITHOUT SUFFICIENT scrutiny, and ARE GUIDED by a too implicit confidence in the advertised claims, many of which ARE NOT borne out by past records or the facts.

Paint and varnish are put on by one manufacturer about as well as by another, but paint and varnish are but a SMALL PART of an automobile. Some motor cars resemble, metaphorically speaking, the Isle of Cyprus, "Fair without, but filled within by dead men's bones."

The POWER of an explosive motor is in direct ratio to the size of its cylinders. Cylinders with a 5 inch stroke and a 5 inch bore. when properly constructed, DEVELOP about 10 ACTUAL horse power. THIS IS ACTUAL HORSE POWER, not advertised horse power.

The cubical measurements of a 4x4 inch cylinder are about half of those of a 5x5, and consequently it will develop but half the power. By using four 4x4 inch cylinders, therefore, NO EXTRA horse power results thereby, yet there is in this amplification of parts ALWAYS a likelihood of disorder.

Perhaps you are not up in the manner of measuring the horse power of a gasoline motor. There is NO GREATER FAKE in any industry than the horse power fake in automobile advertising.

The manner actually used for ascertaining horse power it may be well to explain. A brake is constructed of a band with a fibre or wood lining. This band partially surrounds the periphery of the flywheel. To one end of this band is attached a lever. The other end is held to the floor or frame of the testing stand. A spring balance of the same form as is ordinarily used by butchers and grocers is fastened to a hook in the floor or frame out towards the end of the lever. The revolutions of the flywheel exert a pulling pressure through the band and the lever on to the spring balance. The number of pounds pulled on the spring is then computed according to an accepted formula into horse power. The principle of the formula is so many feet of travel of the rim of the flywheel to so many pounds pull on the spring, figuring the length of the lever, and the result is foot pounds, there being 33,000 foot pounds to 1 horse power.

Where the Fake Comes In

SOME manufacturers speed their motors up at a terrific rate, and then for A SECOND or a fraction of a second apply pressure on the brake band, thus throwing the inertia of the flywheel, IN ADDITION to the power of the motor, against the spring. This method, therefore, represents not only the pulling power of the flywheel, BUT, ALSO, the additional force necessary to reduce the momentum. You have often watched a butcher weigh meat. He will throw a pound on his spring balance, and before the hand has a chance to settle back into its true place he will collect pay for two pounds from his customer. This illustrates the wrong way.

THE ONLY TRUE AND PROPER WAY is that which is USED BY THIS COMPANY, which is to apply the test for HOURS at a time, providing means for keeping the brake band cool.

That is why the MAXWELL Tourabout and the "Gentleman's Speedster," though rated by us AT ONLY 10 HORSE POWER ACTUAL, is the EQUAL in results, hill-climbing and general road performance to many cars of several times its rated horse power.

Digitized by Google

THE "Maxwell"

Perfectly Simple Simply Perfect

The Evolution of the Maxwell Doctrine—MAXWELL CARS

The Doctrine:

1st. A cylinder of 5 inch bore with 5 inch stroke is ideal for a double opposed gasoline motor.

2d. A double opposed motor, 5x5 inches, when properly made, develops about 20 ACTUAL horse power.

3d. To use four cylinders for motors of 20 or less horse power is unnecessary, because thereby the number of wearing parts is unnecessarily increased.

4th. 20 ACTUAL horse power, not momentum or flywheel horse power, is enough for every requirement except excessive speed or extreme fashion. Therefore, a two cylinder, 5x5 inch, double opposed motor is the best, and IT IS AS EVENLY BALANCED AS FOUR CYLINDER CONSTRUCTION, is very much less complicated, and much more reliable. It would take four 4x4 inch cylinders to develop the same power as two 5x5 inch cylinders properly made.

5th. Four cylinder cars appeal largely to "Fad and Fancy" only; TWO CYLINDER CARS PRODUCE RELIABLE SERVICE.

The unprecedented successful record of the Maxwell cars during the season of 1905 prove the WISDOM of the above written DOCTRINE.

Reasons for the SUCCESS of the MAXWELL:

Common Sense was the motive of its construction, not the impulse of "fad and fancy."

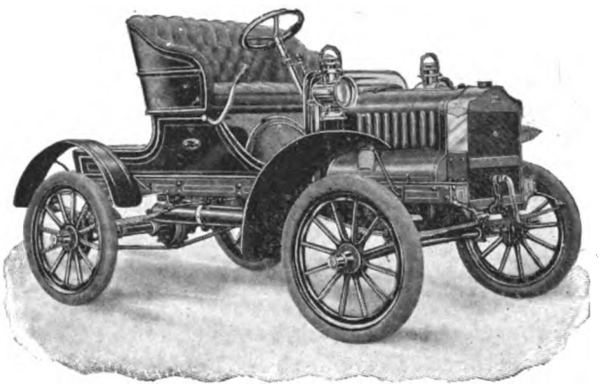
A 5x5 inch horizontal double opposed motor for a touring car, and a 4x4 inch for a tourabout, have been proved the ideal types for service and reliability.

MAXWELL HORSE POWER is demonstrated by the ACTUAL CONTINUAL TEST, not by the flash system of testing, which includes that resulting from the inertia of the flywheel. Therefore, MAXWELL HORSE POWER is ACTUAL HORSE POWER.

MAXWELL CARS ARE SPLENDIDLY MADE AS WELL AS PERFECTLY DESIGNED.

Maxwell Features:

Multiple Disc Clutch.	**Bevel Gear Drive.**	**Three Point Suspension.**
No Pump.	**Great Reliability and Economy.**	**Metal Bodies.**



MAXWELL CARS are sold under the positive GUARANTEE that AS GOOD A CAR cannot be sold at a lower price.

The Car for today, tomorrow and the years to come.
—Built by practical men.—

Aerocar

The one motor car powered and driven by the one practically tested reliable air-cooled motor—with a record of 3500 miles without an adjustment to connecting rod or bearings being necessary.

AEROCAR SPECIFICATIONS.

MODEL—A.
PRICE—$2800, f. o. b. Detroit.
BODY—"Side Entrance" Tonneau.
COLOR—Royal Blue.
SEATING CAPACITY—Five persons.
TOTAL WEIGHT—2000 pounds.
WHEEL BASE—104 inches.
WHEEL TREAD—54 inches.
TIRE DIMENSIONS—Front, 4x34.
" " rear, 4x34.
STEERING—Worm and nut.
BRAKES—Two (rear hub) and transmission.
GASOLINE CAPACITY—20 gallons.
FRAME—Pressed steel.
MOTOR POWER—24 h. p.
NUMBER OF CYLINDERS—Four.
CYLINDERS ARRANGED—Vertical in line.
COOLING—Air.
IGNITION—Jump spark with storage battery.
DRIVE—Shaft, bevel gear.
TRANSMISSION—Sliding gear.
CLUTCH—Leather-faced cone clutch.
SPEEDS—Three speeds forward and reverse.
ROAD CLEARANCE—9 inches.
STYLE OF TOP—Extension.

DETAIL INFORMATION.

The frame is of pressed steel, and sufficiently strong so that there is no possibility of its sagging or becoming distorted from the hardest possible use to which the car may be put.

The four cylinders of the motor are cast separately and are of a peculiar, symmetrical, flanged construction. The bore is 4 inches by 4 inches stroke. Both cylinders and pistons are made of a special gray iron mixture, very hard, fine grained, and close, and without speck or blow hole. The construction of piston and rings is such that it prevents an excess of lubrication accumulating on top of piston, obviating the usual deposit of carbon, generally found on either air or water cooled motors.

The crank case is in two pieces, and are fine specimens of aluminum castings, with handhole plates, making bearings and connecting rods easily accessible to inspection.

The mechanically operated valves, located in the cylinder head, are interchangeable and made of nickel alloy.

The crank shaft is of generous proportions, made from high carbon steel, hammered, forged, rough-turned and ground to size. Phosphor bronze and nickel Babbitt bearings, of ample wearing surface, are found throughout the motor.

The commutator is placed in a vertical position, which is very accessible. Both primary and secondary wiring are incased in fibre tube.

Carburetor is thoroughly automatic, making starting almost instantaneous and fuel consumption very economical.

Lubrication is of the splash system, through the agency of a Hill Precision Oiler.

(In addition to the peculiar construction of the cylinders to facilitate air cooling, a 15-inch fan is used the six blades of which are made of sheet brass. It is carried on Hess-Bright ball bearings. The construction of this fan is theoretically and practically correct, the blast being concentrated directly on the cylinders. On a still day, against the wind, the fan is unnecessary, the motor cooling entirely by the movement of the car. Some of these motors have been run 3500 miles, without an adjustment to the connecting rod or bearings being necessary.)

If possible, examine the **Aerocar** at the Automobile Shows. Let us give you a practical demonstration of its running merits.

Illustrated descriptive literature mailed on request. Won't you send for it.

The selling agency of the **Areocar** will prove a bonanza of profit. Territory going fast. If interested write promptly.

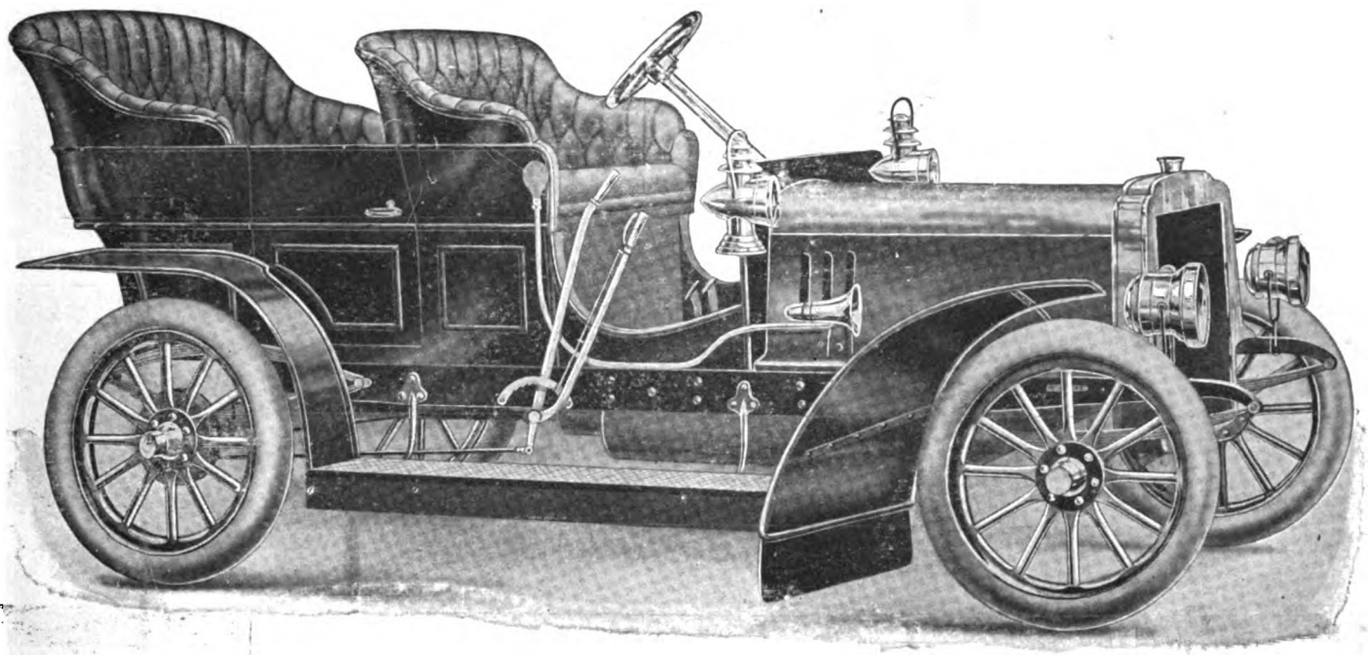
ST. LOUIS
1906
"RIGS THAT RUN"

TYPE XVI
32-36 ACTUAL H. P.—$2500.

Every AUTOMOBILE, no matter what the PRICE, STYLE or CONSTRUCTION, contains some individuality which, in its builders' estimation places it above its competitors. Every manufacturer strives to have the best, and undoubtedly some one HAS THE BEST, but a fair verdict cannot be rendered by any one man. ONE exclusive feature does not constitute an entire MOTOR CAR no more than one individual constitutes a MILLION DOLLAR ORGANIZATION. An engine may be absolutely perfect, but if the power is not transmitted correctly to the rear wheels the car is a FAILURE, and vice-versa. To build a successful car, the manufacturer must give as much attention to the smallest details as the largest. THE ST. LOUIS MOTOR CAR COMPANY are the Pioneer Automobile Manufacturers of the UNITED STATES. FOURTEEN YEARS of BUILDING EXPERIENCE has taught us CONSIDERABLE. We know the material and style of construction best adapted for AMERICAN roads and CONDITIONS. We know how to manufacture intelligently and economically. WE KNOW that TYPE XVI is equal to any AUTOMOBILE built in America. Our claim is not based upon any ONE exclusive feature. It's "RIGHT" all the way. Compare our specifications with cars listing from $3000.00 up, then make arrangements for demonstration at any of the coming shows. We still have some valuable territory at our disposal and our AGENCY PROPOSITION is just as thorough as our car.

AGENTS who have already contracted for over two-thirds of our '06 product tell us that "TYPE XVI" will be the car of the year. We KNEW this four months back. If you are INTERESTED, it will be a pleasure to tell you WHY.



ENGINE. 32-36 ACTUAL H. P. 4 cylinder water cooled.
IGNITION. Jump spark. Splitdorf coil. Pitsfield timer. Storage battery and dry cells.
TRANSMISSION. Sliding train. Three forward and reverse.
REAR AXLE. Floating type, bevel, Timkem roller bearings throughout.
FRONT AXLE. I section, drop forged, roller bearings.
FRAME. Cold rolled pressed steel, special stock, channel section, full pan in under hood covering entire engine.
WHEEL BASE. 110 inches.
WHEELS. Superior quality; second growth hickory.
TIRES. 32 by 4 inches; optional.
VALVES. Mechanically operated; all interchangeable.
CARBURETTER. Float feed; automatic governor requiring no adjustment.
BRAKES. Transmission, foot and emergency lever, 5 in number.
BODY. Exceptionally roomy; will carry seven people; upholstering, general appearance and workmanship unsurpassed.
EQUIPMENT. Two brass side lights, one tail light, two head lights, full tool equipment, baggage haul, etc.

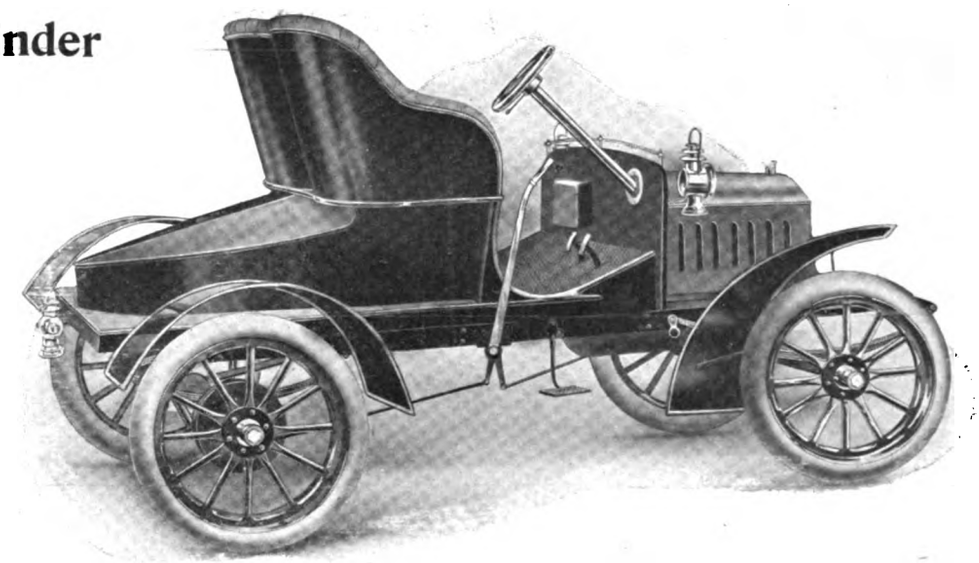
The Six-Cylinder Ford.

"Always a year or two ahead." When the single-cylinder car was "it" Henry Ford produced a double cylinder opposed motor, more powerful and at a lower price.

When the Automobile trade finally awakened to the possibilities of the two-cylinder opposed motor Mr. Ford produced a four-cylinder car at $2,000 that was in a class by itself, the public having been taught to believe that such a car could only be produced at a fabulous price.

And now, having exhausted the possibilities of the four-cylinder car in a touring car class, he has introduced it into the Runabout class, and in addition offers a six-cylinder car that is proportionately as far in advance of all competition as his first double opposed motor.

This is a wonderful car.



First, its six cylinders, with 40 horsepower, give a latitude of speed never before accomplished in a car of its class and weight, 2,000 pounds. From four miles per hour on a high gear up to fifty miles.

While one cylinder of this car will develop sufficient power to drive it along an ordinary asphalt pavement, the whole six cylinders inspire the driver with the confidence that there is an enormous latent energy in his motor, ready for any new demand without overloading the motor, making it the easiest controlled and most flexible automobile motor ever built.

When you have seen this motor in operation you will fully appreciate that we have the smoothest running automobile motor in the world.

Price, $2,500.00.

The Ford Four-Cylinder Runabout.

It is a fact that thousands of these cars are in course of construction.

Like all Ford cars, this one is a radical departure from previous and popularly accepted designs, and there is a reason behind every radical idea.

Henry Ford built a four-cylinder engine for his Runabout with fewer parts than the old-fashioned single-cylinder engine had, and the Ford Motor Co. have an enormous factory that does nothing but build motors for this Runabout, with a capacity of 100 complete engines every day.

The whole thing is very simple when you go about it right.

This is why we can build the Ford four-cylinder Runabout for $500.00.

We are making 40,000 cylinders,
10,000 engines,
40,000 wheels,
20,000 axles,
10,000 bodies,
10,000 of every part that goes into the car. Think of it! Such quantities were never heard of before. We buy 40,000 spark plugs—10,000 spark coils—40,000 tires—ALL EXACTLY ALIKE.

The first Runabout (Model A) we built cost $30,000—yet we sold duplicates of that model for $750.00. It is the quantity that counts.

The Incomparable

WHITE

The Car for Service.

STEAM IS THE WORLD'S STANDARD MOTIVE POWER.

On land and on sea, steam power is recognized as the most reliable, the simplest and the safest. No power other than steam is ever seriously considered by engineers for important work. The tremendous development of electrical machinery has served only to increase the importance of the steam engine which is, in almost every electrical installation, the "prime mover."

In adapting steam power for use in the automobile, it was early found that some radical changes would be necessary in the conventional designs of steam machinery. The White System, introduced in 1901, has from the first furnished a complete solution of the problem, as has been abundantly demonstrated by five years' of continuous White success.

The achievements of White cars in all endurance and reliability contests and the notable tours made each year by White owners are the most inspiring and convincing chapters in the history of American automobiling.

See our exhibit at the Armory Show in New York.

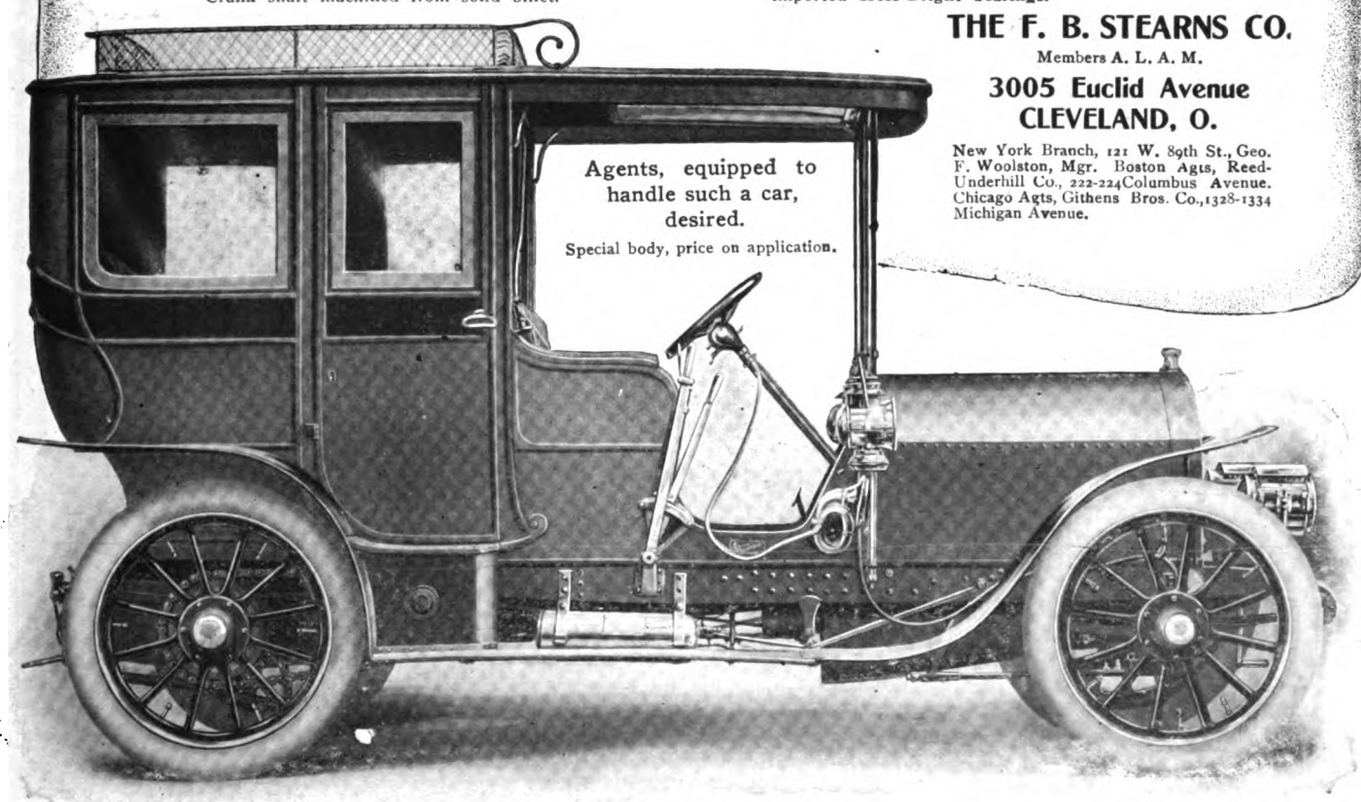
A fulfillment of Prophecy

One Model 45 Horse Power

Produced by a determination to fulfill NOW the prophecy of ultimate supremacy for American Automobiles—the result of devoting one factory for 10 years to one perfect model.

We buy material in any country that produces the best for the purpose; but American machinists finish it all—they spend over two thousand hours on each car finishing parts otherwise complete. More time and care than any other touring car receives.

Fitted parts are required when picked up at random to snap together like your watch lid, hang tight, yet part in the hands.



By what process could any maker anywhere produce a better car? Where is another so made?

After producing this car we figured the cost and selling price. We were pleased to find that the duties and excessive commissions on our only competitors, make our charge—$4,250—barely half the cost of any foreign car that makes a comparison possible.

We seek communication with those who will appreciate this car. For such it will give a service greater than any other mechanism the world has produced. Shall we send our book of details?

SPECIFICATIONS

40-45 h. p.
4-cylinder motor, forward under hood.
Transmission 4 speeds forward, one reverse, selective type.
Ignition, jump spark with magneto, batteries and coil.
Carburetor, double automatic.
Gears and shafts, special chrome nickel steel.
Crank shaft machined from solid billet.
I-section axles, forged in one piece.
Frame, pressed steel.
Wheel base, 118 inches.
Double chain drive.
Transmission equipped with Imported Hess-Bright bearings.
Wheels, 36 x 4 front, 36 x 4½ rear, mounted on imported Hess-Bright bearings.

Agents, equipped to handle such a car, desired.

Rambler

Model 14

Positive action brings positive results.

The steady consistent efforts of the Rambler factory to produce a perfect car for the purposes of their various models have resulted in Model 14.

In this car is exemplified that staunchness of construction, simplicity of control and perfect accessibility that have been the features of the earlier models.

It is a medium weight five-passenger touring car, with a four-cylinder motor, 20-25 horse power, sliding gear transmission and shaft drive.

Every detail is strictly up to the minute, and an examination will convince you that it is easily the car of the year.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, January 11, 1906. No. 16

RAILROADS TO REDUCE RATES

Eastern Lines Will at Last Reclassify Tires—Now Pressing Westerners.

The tire manufacturers have drawn "first blood" from the railroad companies. Following a cry of "don't shoot," the latter literally have "come down," that is, in their rates. The Eastern Freight Association Committee has given assurances that after February first rubber tires will be given the benefit of third-class rates, instead of being mulcted first-class as at present. The carload rate will also be reduced.

It has taken several years' effort on the part of the manufacturers to bring about this result, which, however, will apply only to shipments east of the Mississippi River and north of Washington, D. C. It was not achieved until the railroads concerned were threatened with being haled before the Interstate Commerce Commission and it was made plain that the tire interests had accumulated a mass of evidence to support their allegation of excessive and discriminating rates. This evidence all tended to show that goods of far greater value and occupying more cubic space were being accorded far more favorable rates.

It is expected that the Western railroads, against which the Fisk Rubber Co., acting for the tire industry, filed a bill of complaint with the Interstate Commission, also will now begin to see the light. The Fisk complaint is directed against the Atchison, Topeka & Santa Fe, the Chicago & North Western, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, the Colorado Midland, the Denver & Rio Grande, the Great Northern, the Missouri Pacific, the Oregon Railroad & Navigation Company, the Oregon Shirt Line, the Southern Pacific, the Union Pacific, the Wabash and the Wisconsin Central Railway Companies.

These railroads are exacting a rate of two and one-half times first-class, which makes the charge on less than carload lots in excess of the express charges. The action taken by the Fisk Company is not in any way connected with the present railroad rate agitation, and its only significance is in the classification of rubber tires in general.

Importer is Permanently Enjoined.

Stephen de Feher, who traded in Philadelphia under the high-sounding title, the German and French Automobile Industrie, has been "tied up" by a Selden injunction. After he had imported a number of unlicensed cars, he was sued in the United States Circuit Court for the Eastern District of Pennsylvania, for infringement of the Selden patent, No. 549,160. de Feher filed an answer denying the validity of the patent, but submitted no proofs and interposed no defense. Judgment was therefore entered in favor of the Electric Vehicle Co., and Horace Pettit, Esq., appointed master to assess the amount of damages, following which a perpetual injunction was issued.

Dolsons Become a Corporation.

The Dolson Automobile Co. is the new corporate name for John L. Dolson & Sons, Charlotte, Mich., the carriage makers who build the Dolson car. The company has been reorganized with a capital of $100,000 and will devote its time to automobiles exclusively. John L. Dolson has been made president, D. Elmore Dolson, secretary, and W. Elton Dolson treasurer of the new company.

Leavitt and Bill Separate.

Leavitt & Bill, of San Francisco and Los Angeles, one of the important jobbing houses on the Pacific coast, unexpectedly dissolved partnership on the 1st inst. The senior partner of the firm, J. W. Leavitt, who is at present in the East, will retain the San Francisco business, while J. T. Bill will remove to Los Angeles and take charge of the house there.

Benjamin Goes to Buffalo.

C. A. Benjamin, long sales manager for the H. H. Franklin Mfg. Co., has switched from gasolene cars to electrics. This is to say, he has resigned his position with the Franklin and engaged with the Babcock Electric Carriage Co., of Buffalo, N. Y.

TURNS ON $150,000 CLAIMANT

Goodyear Retaliates Quickly and Hard—Attaches Everything in Sight.

It is probable that the New York-Broadway Tire Co. now wishes it "hadn't." The Goodyear Tire and Rubber Co. has shown them that two can play at the game of litigation and as a direct result, keepers have been for several days in charge of the New York-Broadway establishments in New York and Brooklyn, while their bank accounts have also been tied fast in legal knots.

It will be recalled that about a month since the New York-Broadway Rubber Tire Co. caused to be instituted an action against the Goodyear Co. for $150,000 damages for alleged breach of contract and other things, and promptly attached the Goodyear assets to secure the claim. The Goodyear people quickly filed a bond and released the attachment. They pointed out that the "damage" complained of did not commence to be felt until they began pressing the New York-Broadway Co. for an overdue account.

If by filing their suit for $150,000, the latter hoped to relieve the pressure, they were sadly mistaken, for last week the Goodyear Co. retaliated by instituting proceedings to recover the amount of their bill, some $4,000. They went about it in no uncertain fashion, too. They attached practically everything belonging to the New York-Broadway Co. on which they could lay their hands. This included the bank accounts and the stock in the two stores. Keepers were duly placed in charge of the latter and there they were at last accounts, the New York-Broadway Co. apparently having found it difficult to obtain the necessary bonds to release the attachments.

Detroit Body Plant Destroyed.

Fire of an unknown origin last week almost completely destroyed the factory of the Michigan Automobile Body Co., at 1425-1441 Gratiot avenue, Detroit. The loss was $10,000 with $5,200 insurance.

Digitized by Google

The Week's Incorporations.

Lenover, Pa.—Chalfant Motor Car Co., under Pennsylvania laws, with $50,000 capital. Corporators not named.

Brooklyn, N. Y.—Trans-River Auto Co., under New York laws, with $15,000 capital. Corporators—A. T. Herd, O. R. Ferguson and C. W. Baker.

New York City, N. Y.—Eagle Tire Repair Co., under New York laws, with $1,000 capital. Corporators—J. G. Battle, Jr., E. J. Krimsky and L. J. Reynaud.

New York City, N. Y.—DeDietrich Import Co., under New York laws, with $250,000. Directors—W. C. Allen, Charles Raoul-Duval and C. H. May.

Milwaukee, Wis.—Krueger Automobile Co., under Wisconsin laws, with $10,000 capital. Corporators—Edward Krueger, W. H. Hathaway and George J. Besnal.

Hamilton, Ohio.—West Side Motor Co., under Ohio laws, with $10,000 capital. Corporators—John E., Clara A., Charles C. and Katie C. Schmitt and Clarence Murphy.

Denver, Col.—Denver Auto Goods Co., under Colorado laws, with $10,000 capital; to deal in accessories. Corpirators—H. O. Cartwright, Smith McKay and J. W. Foaster.

Toledo, Ohio.—Cooney Carriage Co., under Ohio laws, with $10,000 capital; to make Cooney, John McGettigan, Charles R. Bowman, Josephine S. Lindsay and John V. Todd.

New York City, N. Y.—Cryder & Co., under New York laws with $3,000 capital; to make automobiles. Corporators—H. C. Cryder, T. A. Havemeyer and Townsend Morgan.

Oklahoma City, Okla.—New Motor Roadway Co., under Oklahoma laws, with $150,000 capital. Corporators—Theodore A. Johnson, Richard G. Strobhard and A. E. Ashbrook.

Detroit, Mich.—B. Webster Co., under Michigan laws, with $10,500 capital; to deal in automobiles. Corporators—Benjamin Webster, R. H. Mockbridge and H. R. Mockbridge.

Brooklyn, N. Y.—Hugo Tollner & Sons, under New York laws, with $25,000; to deal in automobiles, vehicles, etc. Corporators—Hugo Tollner, Hugo Tollner, Jr., and Edwin Tollner.

New York City, N. Y.—Breese, Lawrence & Moulton Motor Car & Equipment Co., under New York laws, with $100,000 capital. Corporators—S. S. Breese, A. J. Moulton and H. C. Dickinson.

Bridgeton, N. J.—Standard Amusement and Manufacturing Co., under New Jersey laws with $50,000 cauital; to conduct garage.—Incorporators—Albert R. McAllister, Clarence Crane and Elmer H. Crane.

Jersey City, N. J.—The Automobile Wheel and Rim Co., under New Jersey laws with $200,000 capital; to make wheels, rims and appliances. Corporators—Isaac Hodge, E. C. Turner and Edgar J. Hodgson.

Toledo, Ohio.—Safety Storm Front Co., under Ohio laws, with $10,000 capital; to make plate glass storm fronts for automobiles. Corporators—A. H. Merrell, John M. Ormund, James York, N. O. Einter and J. N. Reid.

Lockport, N. Y.—American Motor Truck Co., under New York laws, with $10,000 capital, to make commercial vehicles. Corporators—H. J. Babcock, Robert Hall, Chas. R. Bishop, Burt W. Hall and Henry C. Eddy.

Knoxville, Tenn.—Scarborough-Schultz Co., under Tennessee laws, capital not named; to make automobile tire protectors. Corporators and officers—W. W. Scarborough, president; C. E. Schultz, general manager; C. W. Henderson, secretary-treasurer.

Kitto Coquettes with Des Moines.

Eastern inventors and promoters who fail to astonish the inhabitants of this section of the country or to revolutionize present day methods by their schemes, seem to take Horace Greeley's suggestion, "Go West, young man!" in all its literalness. E. J. Pennington, of "vibrationless motor" fame, whose methods have been revealed in the Motor World from time to time; Wm. F. Carter, of the unidentified "million dollar American Mfg. Co., Inc., of Washington, D. C.," who is still seeking some fruitful branch upon which to light; and others, all have gone West.

Wm. H. Kitto, an ex-employe of the Eisenhuth Horseless Vehicle Co., who organized the Simplicities Auto Co., of Middletown, Conn., which built one automobile during the one year of its interesting existence and whose affairs are now being wound up with the usual loss to its stockholders, is the latest emigrant. A Des Moines, Iowa, publication states that Kitto is in that city for the purpose of "promoting a factory to manufacture arctic radiators, supremus carburetters and eventually gasolene motors."

Mr. Kitto, who is "an Englishman, formerly having lived in London, where he has had a wide experience in the manufacture of automobiles," says the paper, "would prefer to locate in the West as he believes it offers more opportunities and that it is in the West that the automobile trade is to be heaviest during the coming years."

Extent of Lumber Used.

A Western manufacturer is authority for the statement that more lumber is used in the manufacture of bodies and tonneaux for automobiles than for carriage bodies; in fact, from three to four times as much. "There are about two automobiles built to every carriage," he says, "and when it is considered that a body for the ordinary four or five passenger automobile contains as much wood as two or three ordinary carriage bodies, it can be easily understood why every body factory in the country is taxed."

In the Retail World.

W. D. Grow, Marysville, Cal., has purchased a plot at Third and F streets, on which he will build a garage.

Another story is being added to the garage of E. C. Horton, at White Plains, N. Y. The alterations will be finished next month.

F. E. Lockwood, Norwalk, Conn., is erecting a brick garage to replace his old repair establishment. It will measure 40 x 85 feet and will be finished by May 1.

Luther W. Wright, South Norwalk, Conn., is preparing to erect a three-story brick garage, 61 x 63 feet, at that place. It will be completed by May 5.

George J. Dunham, the Boston agent for the Royal Tourist car, has been forced to enlarge his salesrooms. He has taken an adjoining store and is now occupying from No. 182 to 188 Columbus avenue.

To secure necessary elbow room, E. S. Hessels is enlarging his garage at White Plains, N. Y. When completed the establishment will measure 135 x 56 feet. A cement floor is one of the improvements.

William W. Pope & Sons, of Franklin Furnace, N. J., have purchased ground at Stanhope, N. J., on which they will erect a garage. The firm will deal in new and second-hand cars and do a general repair business.

The King Mfg. Co., Springfield, Ill., who make the King tops for automobiles, have leased the building in Main street between Centre and Factory streets. As soon as necessary alterations are made the top makers will move in.

The Morrison-Tyler Co., of Boston, Mass., is remodeling its showrooms on Massachusetts avenue. The company has taken an adjoining store and removed the partitions, thus throwing the whole place into one large establishment.

The Central Garage, 107 South Water street, Rockford, Ill., formerly owned by Seeburgh & Miller, has again been sold. F. I. Miller, who was a senior member of the firm that sold out about two months ago to Lundstrom & Peterson, has bought it again. A number of improvements are contemplated.

Stamford, Conn., will have one of the most complete garages in the State when that of William Clark, now building, is completed. It will be fire-proof throughout, of cut stone and cement construction and will be fitted with turntables and up-to-date machinery. Its dimensions are 40 x 90 feet.

A. A. O'Neill & Bro. have leased the large building at the corner of City Hall avenue and Randolph street, Norfolk, Va., and as soon as improvements are made will open the only garage in that city and which will be one of the largest in the South. The building measures 40x100 feet. The firm will feature the Rambler cars for 1906.

RAIDED BY THE POLICE

When Daimler was an Object of Suspicion —How the Motor was Evolved.

In an interesting interview with the two sons of Gottlieb Daimler, the founder of the motor industry, published in the Allgemeine Automobil Zeitung, several points concerning the very earliest days of his unceasing labor to popularize the automobile transpired, and they form a valuable addition to the history of the whole movement.

Gottlieb Daimler's great idea in life was to possess a vehicle driven by motor-power at a time when the gas engine industry was in its infancy and an internal combustion engine using gasolene as a fuel almost unheard of. The first steps taken were to improve the ignition of the gas engine, and Maybach, who has somehow or other since been lost to fame, and Daimler, carried on their experiments in a tiny shop at Cannstatt, on the very spot where the Daimler memorial stands to-day.

Cannstatt was then a small town, and these secret experiments, of which everybody had heard and nobody knew the raison d'etre, aroused the suspicion of the police. One night the two inventors were sitting plotting and planning, when admittance was desired in the name of the law, and a whole body of police officials entered to arrest the—coiners! After profuse excuses were made by the police, when they discovered their mistake, Daimler and Maybach were left in peace to continue their work on the engine.

With much experimenting the speed of the experimental motor was increased to 600 revolutions a minute, 200 being the utmost until then; and as soon as the ignition was improved, Daimler devoted his attention to the construction of a vertical in place of a horizontal motor.

The first automobile motor was built into a bicycle, to which little safety wheels on outriggers were added in both sides, as none of the Daimler family could ride a wheel. All the additional castors ever accomplished was to attempt to throw the rider at every turning. Nevertheless, Adolf Daimler, Jr., once managed to ride the mile and a half from Cannstatt to Unterkheim, without more than two accidents. It was hardly a pleasant ride, as the exhaust was immediately beneath the saddle, which became hotter and hotter, till young Daimler preferred to dismount.

This somewhat discouraged the builders, and they determined to fit the motor into a boat. A workman, sworn to secrecy, carried the motor, carefully wrapped up, to the Neckar in the small hours of the morning, and trial spins were undertaken until dawn, when the motor was again taken away with the same secrecy. These trials were successful from the start, but it is interesting to note that at this time there was such a fear of the unknown qualities of gasolene that electric wires strung on porcelain buttons, were fitted all around the sides of the boat, and the public was informed that it was driven by electricity.

After Gottlieb Daimler's success with the motor-boat he returned to his pet idea, the car. He ordered an ordinary horse-drawn phaeton, and upon this he fitted up the 1½ h. p. "standing clock" shaped motor. Soon after this motor phaeton came the steel quadricycle, and both these vehicles are now in the Munich museum. The steel cycle possessed all the principles of the latter-day type—vertical motor, speed changes by means of sliding gears, differential gear, the same as the present; in short it was absolutely a motor-car. Daimler, who was of the slow-going but very sure type, was only prevailed upon by much pressure to manufacture, as his motto was "either something good or not at all." He found his fullest and earliest appreciation in France, where Levassor introduced the Daimler productions, and by so doing laid the foundation of the firm of Panhard & Levassor.

Features of Matheson's New Factory.

The plant of the Matheson Motor Car Co., now building at Forty Fort, a suburb of Wilkesbarre, Pa., is rapidly nearing completion and the company will soon move from its present location in Holyoke, Mass.

The main buliding has a width of 80 feet and a length of about 600, about a city block. In addition to the main building there are three buildings on the lower side, which are connected with it. These buildings will be used for engine and boiler rooms.

The roof is of the style known as sawtooth. The length of each tooth is forty feet and the rise is ten feet. In the face of these teeth are set windows. These, with the large windows on each side of the building, will give plenty of light for the carrying on of the work.

On the side of the building a suite of offices is being constructed. It will consist of a general office, three private ofiices, drafting room, directors' room and lavatories, and will occupy a space 100x20 feet in size. In another corner of the building is a space twenty feet square, which will to be used for car washing.

The construction of the floor is novel and gives promise of great durability. The natural earth floor was first rolled well, and after this a 6-inch layer of tar concrete was laid upon it. This concrete is formed of cinders mixed with tar instead of cement and is absolutely waterproof. On top of this planks averaging 8 inches in width and 3 inches thick and tongued and grooved are laid together. These, too, are covered with tar. Tongued and grooved maple flooring is laid on this foundation, making a floor that is proof against dampness.

Due to transposition of cuts in last week's issue of the Motor World, the $5,000 Locomobile was made to appear priced $3,000. Both cars are good values, but there has been no reduction of $2,000 as the transposition might convey.

MITCHELL'S DARING MOVE

Decide to Meet the Horse on Common Ground—Ready to Assume Contracts.

Probably the most satisfactory and far-reaching evidence that the commercial motor car has seriously entered the industrial arena as an actual rival of the horse is contained in the move made this week by C. P. Skinner, manager of the Mitchell Motor Vehicle Co., of New York, which concern is unique in that it devotes itself wholly to the commercial car.

In his efforts to induce the big manufacturers and merchants to adopt the more modern means of transportation, Mr. Skinner has invariably been met by that succinct Missourism, "Show me." He met with it so often that he determined to show them in the most convincing fashion—that of meeting the horse on common ground.

As is fairly well-known, very many of the big establishments employing scores of horses and wagons are not the owners thereof. They are the property of contracting truckmen who supply and care for the animals, wagons and drivers and do the trucking for the firms for a stated sum per year. And, in brief, this is exactly the idea which the Mitchell Motor Vehicle Co. proposes to follow. They will furnish the motor vehicles and the drivers and take care of them.

It is a bold but convincing move that seems to leave absolutely no room for skepticism of any sort. The merchants who have been doubtful about the superiority of the motor, or who were disinclined to make a large investment in motor wagons, have had the way cleared for them.

Frayer-Miller Gets New York Garage.

The Frayer-Miller Motor Car Co., New York, has leased the Thomas salesroom and garage at Forty-ninth street and Seventh avenue, now occupied by H. S. Houpt. They will take possession early in the spring, when Houpt removes to the new Thomas building, now being erected at Sixty-second street and Broadway.

Changes in Cleveland.

The Cleveland branch of the Hartford Rubber Works Co. has been removed from 77 Bank street to 1831 Euclid avenue, nearer the automobile center of the city. The former manager, George Ostendorff, has been transferred to Buffalo, having been succeeded by H. R. Anderson, of Hartford.

Rose Will not Close Branch.

The Rose Mfg. Co., makers of the Never-out lamp, have decided to continue their branch at 107 Chambers street, New York. This means that the arrangements for giving the Eastern agency into other hands have been annulled.

THE MOTOR WORLD

Published Every Thursday by

THE MOTOR WORLD PUBLISHING COMPANY
154 Nassau Street,
NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum (Postage Paid) **$2.00**
Single Copies (Postage Paid) . . . **10 Cents**
Foreign Subscription **$4.00**

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

☞Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK JANUARY 11, 1906.

The Show of Independence.

Probably nothing more happily described the progress of the American industry at those periods of twelve months that were marked by the successive shows held in New York than the characterizations which the Motor World applied to them on the occasion of the last one, viz.:

1903—The Show of Promise.

1904—The Show of Progress.

1905—The Show of Achievement.

And no term will better describe the present state of the industry than—

1906—The Show of Independence.

The American industry is now full grown. It is not mere vainglory to say that it no longer looks to France or Germany or to any other country for hope, faith, charity, or inspiration. It has assimilated all that Europe was able to teach, it has thrown back its shoulders, and standing squarely on its own feet and relying on its ideas, and with exportations nearing the three million mark, America no longer asks odds of any nation. It is independent of all of them.

The long list of American cars that run just as smoothly, just as noiselessly and endure as well as any foreign car has lengthened greatly during the twelve months, and it is a fact that these cars are simpler, easier to operate, easier to care for and easier to repair than any foreign car and that they require less repair.

When price is considered, there is two and three times the value in the American car that there is in the imported car; indeed, it is fair to say that the domestic industry has reached that point when the purchase of a foreign car may be said to be merely an indulgence—the indulgence of wealth.

It gives the very wealthy a chance to have something that his neighbors cannot possess—that vicious spirit of rivalry which exists in the society of our big cities to a marked extent.

The show will emphasize what the exhibition of last year clearly indicated—that there is actually no sound reason why any American should purchase a foreign built car, unless he wants a special one, and then it may be added, if he would pay the American manufacturer as much as he pays the foreign one it could be obtained right here.

It would be odd indeed if the American designers and mechanics, who evolved and produced so much of the machinery that has made the foreign car possible, could not, when they applied themselves to the task, best produce the wares the machinery was designed to produce. They have done that very thing and the shows of 1906 will serve to convince the world of it.

Passing of "Automobile."

Although it may not strike the average person as being noteworthy, yet it is an indisputable fact that the passing of the automobile has become a present day reality. Not that the mechanically propelled vehicle has run its gamut of popular favor and has accomplished its need of usefulness, not that it is to cease to be an important factor in the history of the world, and a part of the essential equipment of the business universe, but that the automobile as such is ceasing to be, and in its place is coming the motor car.

The vehicle of mechanical auto-propulsion has been in the course of existence, by turns, a horseless carriage, a horseless vehicle, a motor vehicle, motor carriage, auto-vehicle, auto-car, and just plain "auto"—save the mark!—besides being an automobile. In addition to these, it has been graced with a host of purely general appelations relating to its motive power, its analogy to the locomotive, its imitation of some other type of machine, or the name of its maker. In England, they have dubbed it "motor" and say it with challenging emphasis. In France, they are more anxious for the thing and less for the name, and so automobile it remains.

In this country, on the other hand, they are profoundly disturbed lest they get behind the times, and so it is becoming a motor car. Of the comparatively few manufacturers who tell their occupation in the name of their firm, fully one-half subscribe themselves as being motor car makers, and qualify the noun according to taste. Among the users, talk of automobiles is in the wane, and talk of motor cars is on the increase. To be sure, there are still to be automobile shows in abundance, but it is a curious fact that their exhibits will be composed largely of motor cars.

Treading on Dangerous Ground.

While other statesmen have handled the subject with gloves, Governor Stokes, of New Jersey, in his annual message to the legislature, is frank in dealing with the so-called "automobile question" and in advocating the now popular trend toward revocation of licenses. He states in this exact language why he would have enacted a law imposing such a penalty:

"It would deprive the chauffeur of his means of livelihood and the pleasure driver of his means of recreation."

Although not usually so plainly stated, it is well-known that this is the underlying idea of all such enactments or suggested enactments. It is an idea that cannot be too soon put to the test of the highest court in the land. We have opposed it from the beginning and will continue to oppose it until that test is applied. It is a highly dangerous precedent in a republic in which "life, liberty and happiness" to all is a constitutional guarantee.

If it is possible legally to deprive the chauffeur of his means of livelihood and to

Digitized by Google

render useless a certain form of property that contributes to the owner's happiness, the step having been made easy, why will it not become legal to deprive other workers of their tools of trade and other owners of the use of other property?

Dodging that question should not be made easier than dodging the undoubted fact that every citizen is entitled to "life, liberty and the pursuit of happiness," which includes the inalienable right to use the public thoroughfares without let or hindrance, so long as he is free to enjoy it. There is a place for the malfactor. When he is not confined in that place his right to earn a living and his right to the free use of his personal property cannot, in our opinion, be abridged ever so slightly. That principle is worth fighting for.

Awkwardness to be Overcome.

Apart from the constant demand for improvements in minor detail and the specific needs of change which are peculiar to but one or two types of machine there always is one supreme problem which is very obviously "next" on the calendar of the motor car designer. One time it was the transmission, then, perhaps, it was something in relation to the distribution of the gases in the motor, then it was the delineation of the body. Now, the thoroughly rational type of side entrance body having for all time displaced the clumsy disposition of the rear entrance in all styles of cars, there remains for final settlement the troublesome matter of so arranging the mechanism of control that the driver's seat will be equally accessible from either side, and yet simple and easy of access under all circumstances.

The disadvantage of the present arrangement as found upon all cars, practically speaking, whether of the touring or runabout class is that in order to reach his seat the driver must enter the car from the opposite side. This is made necessary from the fact that the steering wheel lies rather close to the seat itself, and that the emergency and speed levers effectually block the entrance and egress of any but an accomplished acrobat from that side of the car. In many cases as well, the step on the driver's side is encumbered with tool or battery boxes, and thus is made useless for its basic purpose. In certain instances where the entrance of a normal individual from that side would be quite possible ordinarily, the emergency brake lever when applied, as indeed it always should be when the machine is left at rest, swings down into a diagonal position, forming a gate across the otherwise free passageway.

In the larger types of car, which are most frequently driven by the "hired man," who retains his seat so long as the machine is in service, this is of comparatively slight importance, save that in case of mishap, or the necessity of his dismounting to start the motor, the passenger in front must fain submit to having a person of "lower caste" crawl across his or her lap with clumsy grace. In the case of the runabout or light car, on the other hand, where the driver usually is the host as well, it becomes his duty to assist his passenger into the seat, and, having adjusted the robes, to climb over to his own position contorting himself with the best possible grace in order to dodge in behind the wheel. Another point which militates very distinctly against the present arrangement in nearly all machines, is that since the common custom of the day dictates the placing of the control upon the right side of the machine, and the rule of the road indicates, no less strongly than the traffic regulations of most large cities dictate, that the car when brought to rest shall have its right side to the curb, both passenger and driver must walk around to the outside of the car in order to clamber in.

It is comparatively easy to suggest some means for obviating the difficulty and awkwardness of the arrangement, but the actual burden of final eradication must rest with the makers, and, as a matter of fact, the problem is less easy of solution than it seems. Thus, the placing of the mechanism of control on the left side of the machine, which has frequently been tried, would do away with but a portion of the evil, while the other alternative of placing it in the centre is readily to be discarded as forming a barrier between the occupants of the driver's seat. The use of a tilting steering post is of distinct advantage, but has no effect upon the clearing of the entrance from the driver's side, as it fails to effect any change in the position of the outside levers. Probably the most obvious solution of the difficulty from the viewpoint of present standards of manufacture would be to use a tilting steering post in conjunction with side levers set well back, an emergency lever of the "pull up" type and a clear step.

The motor car of the day is a finished and elegant mechanism, capable of performing its requirements with credit to itself and its maker at all times. Yet it has its faults, both individually and as a class, and of these the most offensive and inclusive, the one most to be deprecated, is this matter of the entrance to the front seat. Most assuredly, it is the next problem to be taken up in the order of refinement.

Accident that Points to a Moral.

As an illustration of the profound extent of the knowledge possessed by even the most erudite scribe regarding the internals of the automobile, there may be cited the descriptions blazoned forth by two of New York's best dailies, of an accident that occurred early in the week. The "chef devver" of the two is the following:

"Mrs. Blank was run over by an automobile yesterday afternoon as she stepped off a surface car at Broadway and Seventieth street. The machine passed over her and a hot coal from the carburettor dropped on her dress setting it on fire. In a moment her entire clothing was aflame. The driver of the machine instantly stopped and, running back with rugs from the car, put out the blaze." The second account given to the public under an aegis that prides itself highly upon the accuracy of its news and never lets people forget that fact, stated that the "flames from the carburetter were responsible for the fire."

What actually happened, as a matter of fact, was that the woman's dress was set afire from the exhaust. It forms a striking commentary, not alone on the deep ignorance of the average scribe in this respect, but likewise that the position in which the end of the exhaust pipe is placed is capable of doing considerable damage under propitious circumstances. Those who have all along advocated a change in this respect to a horizontal position some distance from the ground may now add another and somewhat substantial support to their contention. Raising the exhaust so that it will not impinge either directly or indirectly against the road surface may be preventative of other things than dust raising.

Someone who evidently never tried it, tells the motorist that when he has had the misfortune to lose the starting crank, the best and only way for him to restart the motor is to put the gears in the low speed, switch on the spark, and then push the machine along the road until it starts. In most machines, the low gear gives the motor so great a leverage over the driving wheels that is is very nearly impossible to stir them when the clutch is in. The high gear should be used instead, but the motorist should be ready to pull out the clutch at the first "cough," or else he may be left standing all alone in the middle of the road.

FOR THE FLORIDA CARNIVAL

22 Nominations for the 27 Events—A. G. Vanderbilt Enters a Motor.

It is now definitely known who and what will constitute the magnets to attract winter boarders to the Florida cities at the forthcoming Ormond Beach carnival, January 22 to 27. As disclosed by the official entry list which closed Tuesday night, there are twenty-two cars in all, twelve of which are from abroad. Although the names of W. K. Vanderbilt, Jr., E. R. Thomas and other prominent American motorists were prominently linked with the affair in the advance press reports they are notably absent from the official list.

With 27 events and but 22 entrants it is plain that there will be no crowding on the sands. "Headliners" will predominate; stock cars have evidently been deemed of small importance. It is true that one stock car event, and one only, has been provided, but the entrants in this are the products of only two factories.

In the widely advertised "two miles a minute class" the speed qualities of the cars entered are unknown. The 250-horsepower special of A. G. Vanderbilt, of which nothing practically is known; the promised 200-horsepower Darracq, which has not yet arrived, the 110-horsepower Christie, a 100-horsepower Darracq, a 90-horsepower Thomas, a 110-horsepower F. I. A. T. and a new Stanley steam car make up the entrants. A Jacksonville publication has taken upon itself the task of conducting a voting contest to decide the most popular girl in Florida. Like a May queen in Central Park she will "crown" the victor in this class with a gold wreath, but as most of the probable winners are already married this banishes any thought of possible romance growing out of the result.

Following are the entries received up to the time of closing the list on Tuesday night:

Car.	H. P.	Cyl.	Nation.	Owner.	Driver	Events.
Special	250	8	United States	A. G. Vanderbilt	Sartori	11
Darracq	200	8	France	Darracq et Cie	Hemery	9

One Hundred Miles for Minneapolis $2,000 Trophy.—George W. Young, New York, 110 h. p. 4 cylinder car; C. A. Coey, Chicago, 90 h. p. 6 cylinder car; S. F. Edge, London, 80 h. p. 6 cylinder car; Hollander & Tangeman, New York, 110 h. p. 4 cylinder car; J. R. Harding, Boston, 90 h. p. 4-cylinder car; Alfred G. Vanderbilt, New York, 250 h. p. 8 cylinder car; Walter Christie, 110 h. p. 4 cylinder car; Napier Motor Co., Boston, 80 h. p. 4 cylinder car; English Daimler Co., New York, 45 h. p. 4 cylinder car; A. Darracq & Co., Paris, 200 h. p. 8cylinder car; A. L. Guiness, London, 100 h. p. 4 cylinder car; A. Darracq & Co., Paris, 80 h. p. 4 cylinder car.

One Mile for Dewar Trophy.—A. L. Guiness, Dublin; A. Darracq & Co., Paris; Alfred G. Vanderbilt; Ford Motor Co., 105 h. p. 6 cylinder car; Hollander & Tangeman; S. F. Edge, London, Hollander & Tangeman; Stanley Motor Car Co., Boston, Mass.; 20-30 h. p. 2 cylinder car, George W. Young.

Two Miles a Minute Race.—Alfred G. Vanderbilt, Walter Christie, A. Darracq & Co., A. L. Guiness, Ford Motor Co., Hollander & Tangeman, Stanley Motor Car Co., C. A. Coey and George W. Young.

Five Mile Open Championship.—Hollander & Tangeman, S. F. Edge, Stanley Motor Car Co., A. L. Guiness, A. Darracq & Co., Alfred G. Vanderbilt, George W. Young.

Ten Mile Open Championship.—Same as in five mile.

Fifteen Mile Open Championship.—S. F. Edge, Hollander & Tangeman, A. L. Guiness, A. Darracq & Co., Walter Christie, Alfred G. Vanderbilt, George W. Young.

One Mile Heavyweight Championship (gasolene).—Hollander & Tangeman, George W. Young, Alfred G. Vanderbilt, Walter Carlisle, A. Darracq & Co., A. L. Guiness, J. R. Harding, S. F. Edge.

Five Mile Heavyweight Championship (gasolene).—S. F. Edge, J. R. Harding, A. Darracq & Co., Walter Christie, A. G. Vanderbilt, George W. Young.

Ten Mile Heavyweight Championship (all powers)—George W. Young, Hollander & Tangeman, Alfred G. Vanderbilt, A. L. Guiness, J. R. Harding, Stanley Motor Car Company, S. F. Edge.

Mile Middleweight Championship (gasolene).—Hollander & Tangeman, 24-30 h. p., 4 cylinder; A. Darracq & Co., 80 h. p. 4 cylinder; Reo Motor Car Company, 32 h. p., 4 cylinder car; Wayne Automobile Company, 40-50 h. p., 4 cylinder car.

Five Mile Middleweight Championship (gasolene).—Same entries as above.

Ten Mile Middleweight Championship (all powers).—Hollander & Tangeman, Stanley Motor Car Company, A. Darracq & Co.

The Stanley steam car is the only entry for the one and five mile steam car championships.

The only entry in the ten mile Corinthian championship and the ten mile Corinthian handicap, for amateurs only, is A. L. Guiness.

Ten Mile Open Handicap.—George W. Young, Hollander & Tangeman, J. R. Harding, English Daimler Company, Wayne Automobile Company, Napier Motor Company, Reo Motor Car Company.

Fifteen Mile Price Handicap (for American touring cars, fully equipped).—Stanley Motor Car Company, Wayne Automobile Company, J. E. Bristol, Brooklyn, 30 h. p., 4 cylinder car; Stanley Motor Car Company.

Thirty Mile Free-for-All Championship (for American built cars).—Stanley Motor Car Company, Alfred G. Vanderbilt, Walter Christie.

Baltimorean Gives Three Cups.

J. H. Friedenwald, a wealthy Baltimorean, has given out that in order to create an interest in automobile racing in that locality he will give three valuable prizes to be competed for by stock touring cars. He proposes to give one cup for a race of touring cars from Baltimore to Washington and return; another for a race from Baltimore to Gettysburg and return, and a third for a race from Baltimore to Frederick and thence to Hagerstown and return. The time of holding the events he leaves with the club willing to take charge of arrangements. Mr. Friedenwald stipulates that the cars must each carry five passengers and there must be five or more cars in each event. The contests will be more in the nature of endurance tests than speed events, the trophies to be awarded to the car making the best allround showing. He will supply timers, etc., at the different points, and the autombilists will have no expense except the running of their machines.

Waco Cries for Licenses and Lamps.

The Waco (Texas) Automobile Club decided to ask the city authorities to adopt a license system; to compel each owner to number his machine plainly, with illuminated letters at night, and to regulate the speed at which cars may be driven on the streets. The officers elected are: President, W. W. Cameron; vice-presidents, W. B. Hays and Walter V. Fort; treasurer, W. W. Seley; secretaries, Frank Kirksey and M. T. Biel; captain, R. T. Dennis; lieuten-

Possibilities of Motor Development

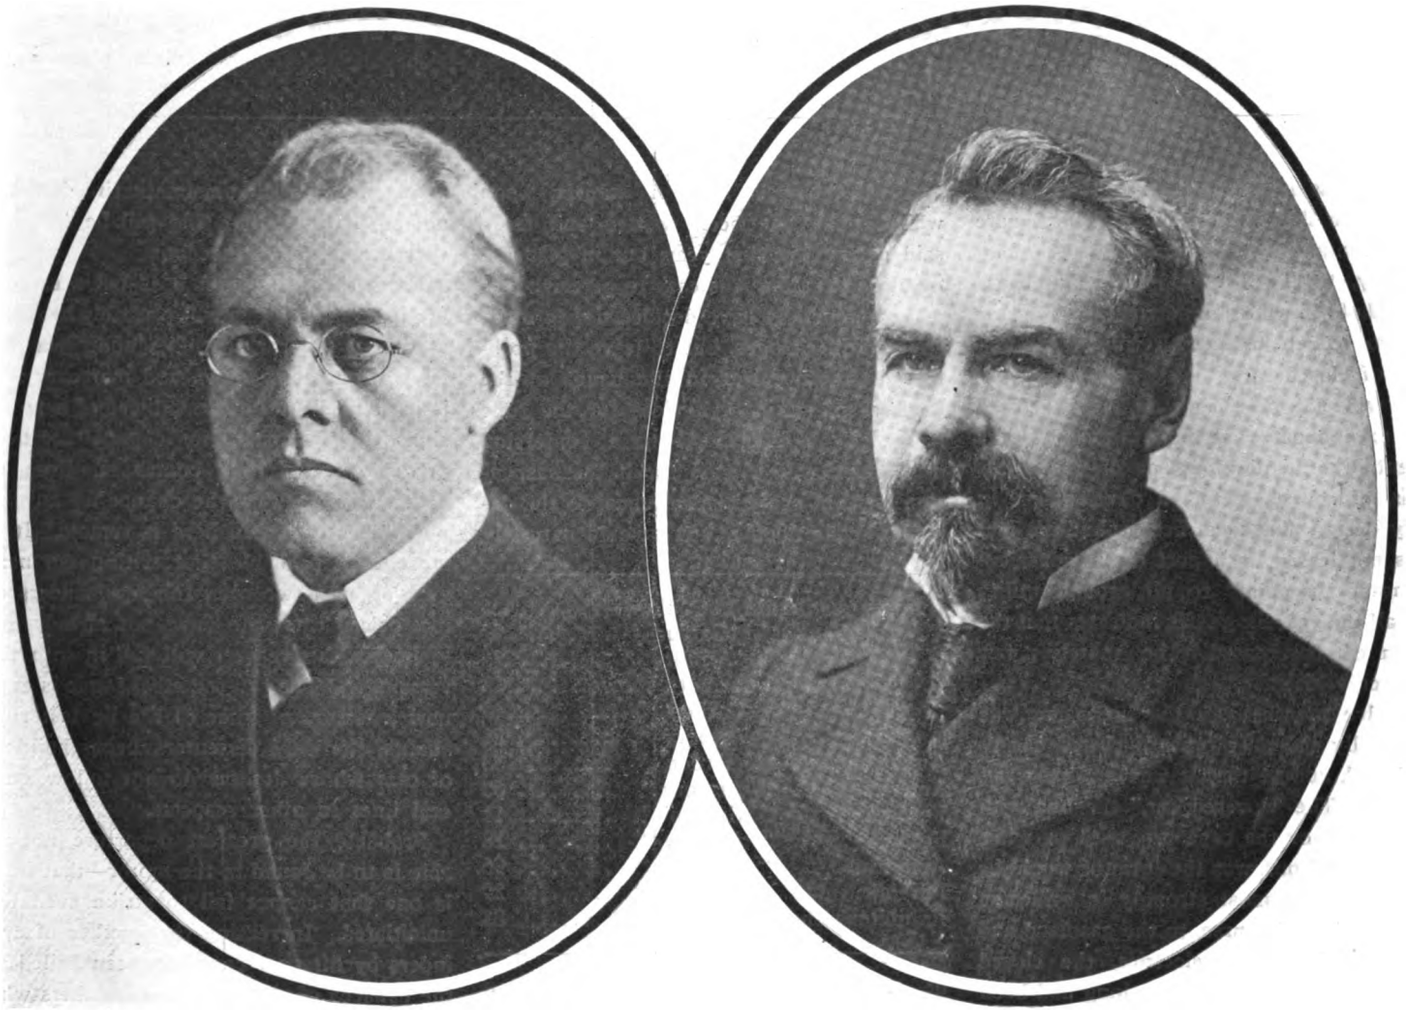
With the marked increase in favor which is being accorded the two-cycle principle at this time, a question naturally arises as to the relative practicability of the combined two and four cycle type, which was exploited at the Chicago Show nearly a year ago. The utility of the four-cycle engine is now beyond question, the advantages of the two-cycle engine are manifold and in many ways recommend it more strongly for motor car use than the more common type, and, moreover, it seems now to bid fair to gain that material advantage which can come only when it is given the attention of a number of different designers each approaching its problems from his own independent standpoint. Hence, the query as to the advantage and possible practicability of a combination of the two types in an effort to eradicate the ever troublesome difficulty of the transmission and change speed mechanism.

Basically, the characteristics which differentiate the two are, in the four-cycle type, an impulse every fourth stroke of the piston, a period of induction which lasts during an entire stroke, an equal period of compression and a ratio of expansion which takes its limitations only in accordance with such purely external considerations as govern the installation of the motor in its car. In the two-cycle type, on the other hand, there is an impulse every second stroke, an extremely brief period of induction during which the charge is admitted into the cylinder under pressure due to a previous compression, a period of final compression which is equal in duration to the period of expansion, and a ratio of expansion which is limited by the necessity of exhausting the contents of the cylinder to atmospheric pressure before the piston has reached the end of its out stroke. From the standpoint of efficiency, there is a similar contradiction of advantages, for while the four-cycle type has, in its best development, the highest thermodynamic efficiency of any heat engine, and the corresponding measure of the two-cycle type is considerably lower, on account of the limited ratio of expansion, the mechanical efficiency of the former is lower than that of the latter by a considerable amount because the internal absorption of power is continuous in both cases, while the number of impulses in the second is twice as great as that in the first. Thus the two-cycle motor, while in theory nearly twice as powerful per pound weight, or per cubic inch of cylinder capacity is more wasteful of fuel than the other type. And, finally, it is to be noticed that the two-cyle type, in its present state of development, is not susceptible of so great a variation in speed and power as is the other, and that in general it is not capable of being run at so high a speed, which is not, however, of great moment to the law-abiding citizen.

The scheme of the combined motor, is merely that of utilizing the two-cycle principle whenever the demand for power is in excess of the normal, as for instance, in starting, and in hill climbing, as well as for a more even driving effort at the rear wheels, while for all normal driving at medium and high speeds, the more economical four-cycle would be adhered to. In other words, supposing for the moment that the power per cycle were the same in both cases, then for the same total output, the motor would turn but half as fast when two-cycling as when running four-cycle. It is a matter of fact, of course, that the relative speeds would not vary quite in the ratio of two to one, but they would approach it, and would in some cases aproximate it pretty closely. In this way, by combining and overlapping the speed ranges of the two different cycles, a machine would be obtained in which the possible variation of speed would be in excess of any machine yet constructed. Also, the fact that in the lower ranges of speed, the power would not be diminished materially and the efficiency, though lower than that at high or normal speed, would still be greater than that which is obtained from the four-cycle type alone when running under throttle control, should militate in favor of the arrangement.

From the purely mechanical standpoint, there should be little hindrance to the carrying out of the scheme. Although the commonest form of the two-cycle motor is valveless and depends for the distribution of the gas upon the action of the piston in uncovering ports in the cylinder walls at the proper time, the same action could be obtained by the use of valves; in which case, all that would be necessary to effect the change in the cycle would be to cause an alternation in the actuation of the valves, either by the introduction of a different set of cams, or by any other convenient mechanical means at hand. In the one case, the supply of gas would be drawn directly into the cylinders from the carburetter, while in the other it would be taken first into the crank case where it would be compressed in the manner common to two-cycle machines, and then forced into the cylinders afterward. In manipulation, the control of the motor would not be unlike that of either type, the handling of the gas and ignition being unaltered by the change in cycle, and in all other respects, the motor would be quite similar to the prevalent types of machine except that it would have a duplicate set of valve gears, and that this would necessitate an additional lever to enable the driver to alter the distribution.

Other things being equal, this last clause would seem to constitute the chief disadvantage of the system, inasmuch as it would involve the encumbering of the motor with an amount of mechanism which is now entirely unnecessary. On the other hand, by this very means, the car itself would be rid of the necessity of a change speed gear, so that barring a single clutch, there would be no mechanism other than that of the direct transmission of the power from the motor to the driving wheels. This, then, might be taken as an advantage which would so offset the disadvantage of the increased mechanism of the motor, and in general increase the simplification of the type of car as a whole, that the drawback would be lost sight of.



Up to the present time, the motor car manufacturers, who comprise the only class of gas engine builders who are working for a variable speed unit, have contented themselves in the use of either one or the other of the two distinct types. Both are at present passing through the refining fire, and doubtless each will emerge with enough of argument in its favor to warrant its use to a large extent. Whether or not the combined motor will come into any sort of favor, is as yet, merely a matter of conjecture. It is possible that each of the two types will be developed to such a point of sufficiency that the merging of the two will not be a necessity. And yet, it is not at all unlikely that when the present tide which trends visibly toward a multiplication of cylinders shall have had its run, and the market shall have fixed upon some one type of cylinder construction as a standard, that there will be a still manifest need of flexibility and efficiency which can only be served in the manner herein indicated. It is one of the "problems of the future" that cannot wholly escape the attention of the thinking man.

PAUL PRY.

The start of the tire trials of the Automobile Club of Great Britain and Ireland has been postponed from February 1 to February 15, the last day of entry being fixed for January 31. The speedometer and lamp trials, the conditions governing which were published in the Motor World last week, will be held at the same time.

Marking a Twentieth Milestone

GEORGE W. BENNETT. THOMAS B. JEFFERY.

On January 19th, George W. Bennett, sales manager of Thomas B. Jeffery & Co., Kenosha, Wis., will round out an anniversary of uncommon interest, that of twenty years service in the Jeffery or Rambler interests.

It was in 1886 that Bennett first linked with the firm of Gormully & Jeffery, then and for many years engaged in the manufacture of bicycles. He traveled the Southern States for them until called to the Washington (D. C.) branch in 1889, of which he became assistant manager. Bennett saw the firm grow into one of the largest and most famous in the world. In 1895 he was transferred to Brooklyn, N. Y., where he managed the Rambler branch and made a reputation for himself. In 1899 Gormully & Jeffery disposed of their property to the American Bicycle Co.—the so-called "bicycle trust"—and Bennett, as one of the Rambler's valuable "assets," went with it, the following year becoming Eastern sales manager of the big institution, which comprised some 44 factories. When the "trust" was reorganized, Bennett was appointed Southern manager with control of all branch houses and travelers in the South. Mr. Gormully had died and Mr. Jeffery retired for a short spell, but the latter was too full of nervous energy to long remain in retirement, and in no time at all was again in the commercial arena building Rambler automobiles. In 1902 he called his old lieutenant to him and there he has been ever since, with duties and responsibilities greatly enlarged and in every sense Mr. Jeffery's right-hand man, his wide and ripe experience contributing in no minor degree to the impressiveness of Rambler success.

In whatever position he occupied, Bennett was never a negative quality. He is essentially a positive force who rather enjoys the sight of an obstacle and who believes in marching straight at it in preference to reaching it by devious detours. He is no "trimmer." He has the courage of his convictions and knows how to stand up for them. Bennett despises cant and bumptiousness, always keeps close to earth and does not try to force himself to believe that he cares a damn for the man who cares not a damn for him. He is indeed very much "on the level," is George Bennett, and true to those who are true to him.

Figures that tell a Story.

The city of Detroit, Mich., runs an "around the island" phaeton service at ten cents per passenger. An individual corporation has an automobile line over the same route charging twenty-five cents per passenger. For the year 1904 the phaetons carried 12,572, and the automobiles 11,903 passengers. For three months in 1905 the phaeton carried just eleven fares, while the other line had 12,853 passengers. The conclusion is obvious.

Where the Doctors Lead.

Newly-published statistics show that there are 21,524 cars in France, as compared with 17,107 in 1904, 12,983 in 1903, and 1,672 in 1899. Of these, 1,109 are used by doctors and pharmacists, 359 by manufacturers, 211 by distillers, brewers, etc., 254 by commercial travelers, 153 by agriculturists, a like number by tailors and the clothing industry, and 125 by metallurgists. In Paris itself there are 3,589 cars, and in Rhone 549,

Foreshadows of the Shows

If there is any one feature of the exhibits at the two shows, those in Madison Square Garden and in the Sixty-ninth Regiment Armory, that will "stand out" and cause the beholder, whose mind runs back a year or two, to rub his eyes, it will be the display of closed cars.

It will not be surprising if the closed car predominates at both shows. It is essentially the development of the year. It is, of course, merely a development in body design and construction, but the fact does not lessen its import or its conspicuousness. It points to all around utility and all the year usage. It indicates that the motor car has ceased to be merely a fair weather vehicle.

Twelve months ago the limousine was practically the only type of closed car to be found, and at that it was not very numerous. The "covered car," the one with the canopy or the cape top, with or without a glass front, was the form of would-be all-weather car most strongly in evidence. This applies, of course, to the gasolene and steam vehicles. In electrics, the closed car in a diversity of patterns long had been before the public; and what makers of electrics had done those who deal with the other two powers have now done. The brougham, the landaulet, the victoria and the coupe all may be said to have developed during the year, while the limousine is now the rule and not the exception.

The body-makers have done their work well, too. While some of the bodies do no great credit to the vehicles to which they are fitted, generally speaking, they are magnificent specimens of the art, both in design and finish. Again speaking generally and of the tonneau type more particularly, body designs now follow two distinct and well-defined models—the straight-line and the "sea-shell" or curved line patterns, the latter having received an unexpected amount of favor.

In dealing with tendencies as a whole it is naturally impossible to separate one show from another. There is so much in common between the cars exhibited at both that it would be a profitless task to attempt to differentiate.

Suspension has been a subject upon which much has been written and more said during the past year, but in glancing over the situation it is easy to perceive that makers generally have decided not to make any radical changes, but to leave the problem of improvement in the hands of the devisers of auxiliary devices for the time being. It is equivalent to a confession of inferiority in a way, for if the suspension were in every respect equal to the demands made upon it there would naturally be no necessity of doing anything to supplement it. Whether from generally accepted present lines, which are nothing more or less than an enlarged edition of the horse-drawn carriage and truck, a suspension can be evolved that will meet all the requirements of the vastly different motor car, must remain a question for some time to come. Suffice it to say, considerable difficulty has been found in overcoming the plunging action of either the semi or the full elliptical spring and as the various forms of shock absorbers accomplish this more or less satisfactorily, it is easy to see that they will be very generally used. The adoption of the platform type of rear spring was an evident attempt to overcome this drawback, but judging from the few adherents it has maintained—less now than ever, it would appear—this end does not seem to have been reached. There can be no doubt that the business of manufacturing spring damping and buffing devices has before it an era of unexampled growth and prosperity. In one instance, at least, the buffer is advanced as a substitute for the pneumatic tire, but it is not at all likely that this will be followed very largely as a precedent.

From the suspension it is but a step to the frame and in this will probably be found a part of the car that has undergone the least amount of change, and moreover that is least likely to be the subject of new designs in future. The channel section pressed steel frame, comes so close to being universal that the chance for any innovation creeping in here is remote. It is more than probable that within the next year or even two even the few builders of low priced cars who have not already got in line in this respect will fall in with the remainder. The pressed steel frame is even now a feature of some of the lightest runabouts, the only dissenters being builders of cars whose designs do not follow general lines in other respects.

Probably the greatest departure noticeable is to be found in the motor—that is, it is one that cannot fail to strike even the uninitiated. Increasing the number of cylinders by fifty per cent. has been hailed as the panacea of all ills by some makers who have hitherto pinned their faith to the four cylinder motor. Of all the cars shown, it is safe to say that something between 70 and 80 per cent. will be equipped with what has come to be regarded as the standard—the four-cylinder type. But there will be enough six-cylinder models in evidence and a sufficient number of them will find purchasers to place a coterie of six-cylinder enthusiasts on the road during the coming season to demonstrate once and for all whether the advantages outweigh the disvantages. This can never be conclusive, however, for there will always be those who will pay the increased expense in order to have something out of the ordinary run, and in such hands it would appear that six cylinders constitute a feature that has come to stay. But that this number will be so limited as to make it unprofitable for the several makers who have listed such a model, to continue to do so, or that they will find it expedient to discreetly drop further progress in this direction in favor of a return to four cylinders at the end of

the present year is a matter upon which it would be rash to prophesy.

Where the four-cylinder engine is concerned, it is noticeable that two distinct types have sprung up, varying with their power. Thus it will be readily noted that those rated 30 horse-power or under are still generally of the familiar twin cylinder type, but that over this there is a marked tendency toward the adoption of the independently cast cylinders. They are in evidence on such a number of cars that there is little doubt that this represents a feature of design upon which the majority are agreed. This may be explained by the greatly increased size of the castings brought about by the demand for more power. In some instances the present independent single cylinder castings are but slightly inferior in size and weight to former twin cylinders. None of the radical departures advocated here and there, such as the plan of offsetting the cylinders on the crank case, have apparently come in for any serious consideration, so that the motor as a whole will, with the exception of the differences just alluded to, enter upon 1906 in most respects the same as it was a year ago.

In the matter of valves there is little of novelty to record; the mechanically operated valve was already an established fixture a year ago and the automatic valve may now be definitely said to have passed beyond the ken of the automobile motor designer. There is still a divergence of opinion as to the proper location of the valves. A leaning toward placing them in the head is noticeable, possibly as a result of the effect that air-cooled designs have had upon the water-cooled engine. It has now become more or less general in the latter type to locate the valves on top of the cylinder, as in the Premier, and this has been adopted in numerous instances in the water-cooled type.

While the four cylinder motor predominates the field so largely the horizontal opposed type may be said to be holding its own, though it must be recorded that most of the makers of such machines have added four cylinder models to their line. Also somewhat of an increase in the use of the twin cylinder vertical type for runabouts and light cars, as evidenced by the Mitchell and Pope Tribune, is to be noticed. On the runabout the single cylinder is still adhered to in a few prominent instances, but there have defections rather than accessions to the ranks of its supporters.

Air cooling may be said to have found itself during the past year so that the leaning toward this factor of simplicity during the coming season will be represented by a much more extensive showing of cars of all types than has hitherto been thought possible. The present year really marks the advent in numbers of the modern touring car with an air cooled engine. The growth that the type has attained during the past year and particularly the conclusive demonstration of the fact that there appears to be no limit to the size of the successfully air-cooled motor, so far as the automobile is concerned, has once for all, put a quietus on those doubters who never expected to see the air-cooling win out, except in a very limited field sharply bounded by the restriction of low power. The building and successful running of an air-cooled engine rated at 100 horse-power—the Premier racer—as well as the marketing of the largest stock car of the type ever shown by a firm that has made a name for itself in this respect hardly calls for comment. This is the Frayer-Miller. There will certainly be more than a round half dozen of cars with air-cooled motors, but in every other respect the counterparts of the standard type of touring machine the world over, such as the Corbin and new Knox models. Upon these cars have been installed dummy radiators patterned after the water-cooled machines, which give them a most conventional appearance.

There is a marked tendency to take up the long neglected two-cycle engine which has hitherto had but one supporter, the Elmore, and develop it in the same manner that has brought success to other types, and its adoption by such a concern as the Olds Motor Works is an indication of great portent. Neither this nor the air-cooled type can be said to be sufficiently numerous to constitute a general trend—they are both comparatively new and both more or less novel by comparison, but they show such a marvellous growth, particularly in the case of the former, that they must be considered in the light of candidates for increasing favor.

In ignition, there is more and more inclination toward the use of the magneto, the high tension type now being very largely used on the more expensive machines. The construction of the magneto by a car manufacturer, as in the case of the Locomobile, is a noteworthy instance of the independence which is so widely manifest this year. Needless to say, the lower priced cars still adhere to the jump spark system.

What may be considered as portending the ultimate disappearance of the splash system of lubrication is to be found in the gradual, but none the less, certain increase in the adoption of the continuous feed pressure system for the lubrication of the moving parts of the motor. It is true, that so far this has been used in but a limited number of instances to the exclusion of the splash system, but it shows that there is a tendency in this direction.

Speed changing tendencies take the form of a desire to perfect the sliding gear type, and this has been carried out to such an extent that this form predominates. The planetary gear has neither lost nor gained ground; it is still used by those who have made a feature of it in the past, but its adoption for a heavy car with three speeds forward, as in the case of the Cadillac heavy touring car of last year, does not appear to have found any response in the designs of other builders. It will, of course, continue to hold its own where the runabout is concerned. The use of the selective system of gear changing has found new adherents and it is probable that it now largely exceeds in number the direct lever type.

The cardan shaft for final drive has come into pretty general use. It has now, with a limited number of exceptions, been extended to all types of car, from the very heaviest down to the light runabout. The exceptions to it take the form of runabouts or light cars that have been on the market for several years, using a single chain drive, and the highest powered cars with double

chain. In a measure it would even seem to be supplanting the single chain, as in the case of the Maxwell tourabout.

Of course, the general increase in the use of the anti-friction bearings, both of the ball and roller type, should not be overlooked. The adoption of one or the other of the two types has become general in all the more elaborate cars, and to a much greater extent than heretofore in those of less pretense.

Tentatively, and just stepping over the border by a small margin as if not to appear too radical, at least a few makers, among which may be cited the Lozier, the Rainier and the Cleveland, have paid heed to the plaint of the tire maker for larger wheels and these cars will accordingly be equipped, the first with 36-inch, the others with 34-inch size. But there is more in this than appears on the surface. The tire maker has placed himself on record as advocating the increased wheel diameter with a correspondingly larger tire as pointing the way to a large measure of relief from tire troubles and tire maintenance.

But it is a cure that comes high and in the opinion of the majority is a form of relief that may hold the promised ultimate lessening of the tire bill, though they are hardly willing to pay the price to obtain it.

In this connection, may be mentioned the most marked development that has been brought about—the general trend toward the mechanically fastened tire. While the clincher still retains its vogue and will doubtless constitute a very substantial percentage of all the tires turned out during the coming year, there are few makers who have not come to the conclusion that the time is ripe for the advent of a perfected mechanical fastening. Users generally have become reconciled to the fact that the non-puncturable, last-forever tire is an illusion that stands small chance indeed of ever assuming any more solid form and are content to put up with the weakness of the pneumatic tire in order to enjoy its advantages. But as long as the necessity for repairing is an ever present quantity, it may as well be robbed of as many of its terrors as possible. There is no chance of evading the issue; no choice but to make the repair or further damage the tire by riding it flat, so that the demand has been for means of facilitating the process as much as possible and bringing it more within the ability of one man to effect. Those makers who have had their ears to the ground have not been backward in detecting the approaching rumble and the result will be the presence of a greater number of mechanically fastened tires on the market during the coming year than ever before.

To revert to the mechanism temporarily, there is one very decided tendency connected with no part of the chassis in particular, but having a very important bearing upon all, and that is the importance of the role assumed by the study of the metallurgy of the car's motive power and support. The choice of the very best materials for every individual purpose—in no other way can maximum strength be combined with minimum weight, and it is something that henceforth will be made the subject of extensive study with a view to further refinement.

Functions During Show Week.

Saturday, January 13—8 p. m., opening of New York shows.

Monday, January 15—Meeting American Automobile Association racing board at Armory.

Tuesday, January 16—Meeting directors New York State Automobile Association at Armory; afternoon.

Meeting directors A. A. A. at Armory; afternoon.

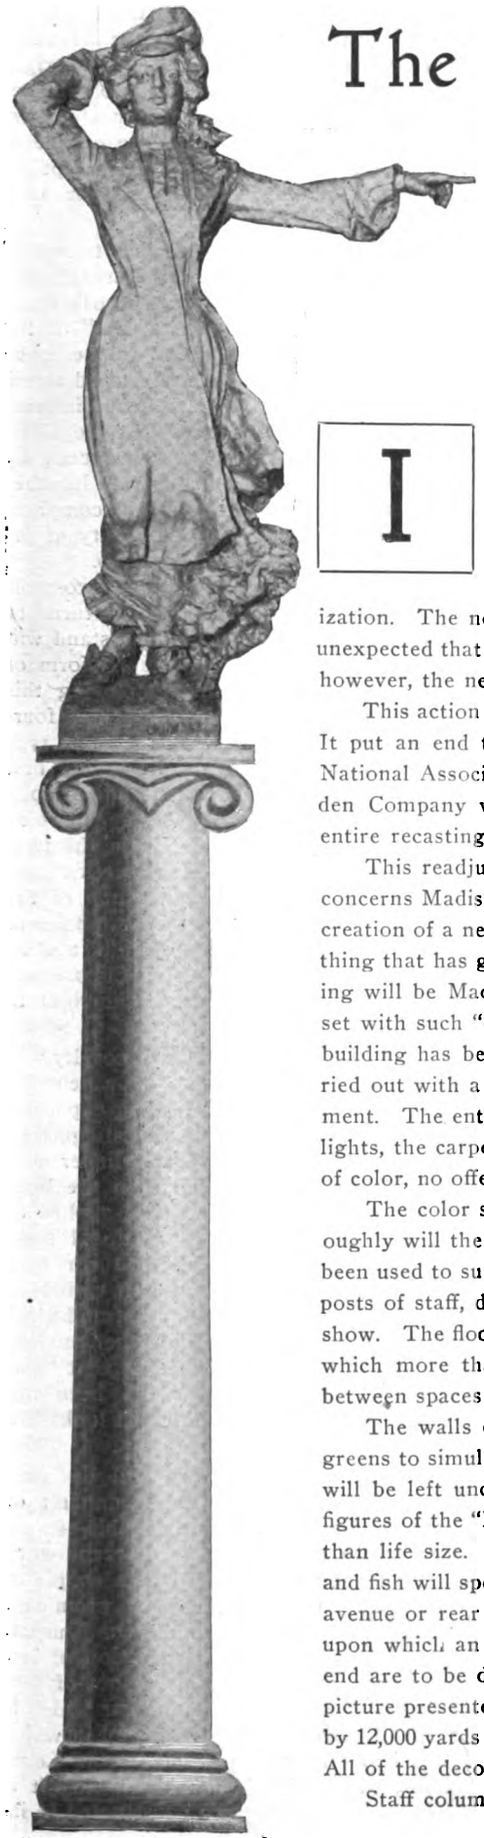
Meeting Society Automobile Engineers at Hotel Grand, 8 p. m.; informal dinner at 6 p. m.

Meeting and election, The Motor and Accessory M'f'r's, Inc., Hotel Astor, 8 p. m.

Annual Meeting National Association Automobile Dealers, Hotel Victoria.

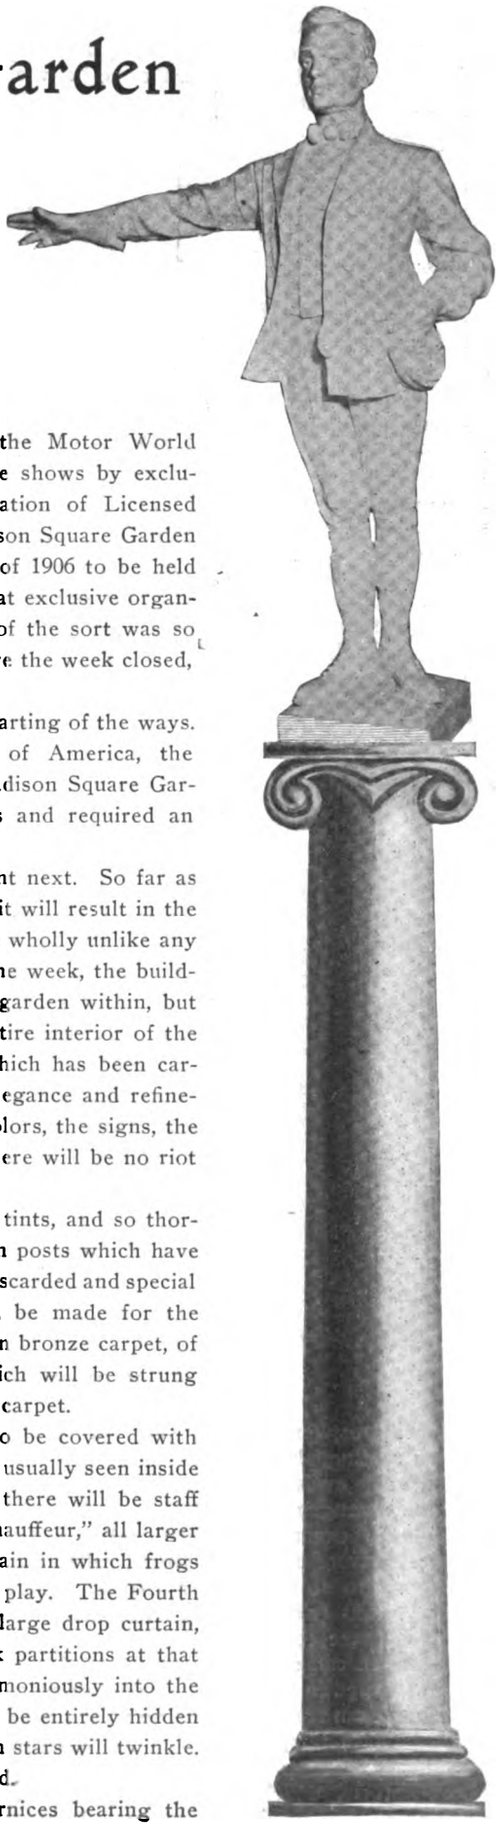
Wednesday, January 17—Open meeting for A. A. A. members at Armory, Wednesday afternoon.

Luncheon and entertainment Hyatt Roller Bearing Co., Harrison, N. J., at Waldorf-Astoria Hotel, 9 p. m.



Meeting National Association of Automobile Manufacturers at Hotel Victoria, Broadway and Twenty-seventh streets, 8 p. m.

Saturday, January 20—Annual banquet Automobile Club of America at Waldorf-Astoria Hotel, evening.



THOSE WHO WILL EXHIBIT AT BOTH SHOWS.

American Ball Bearing Co.
Anderson Spark Plug Co.
Aurora Automatic Machinery Co.
Auto Supply Co.
Badger Brass Co.
Baldwin Chain & Mfg Co.
Belden Automobile Transmission Co.
Bowser & Co., S. F.
Brown-Lipe Gear Co.
Briscoe Mfg. Co.
Byrne, Kingston & Co.
Charron, Girardot et Voigt.
Columbia Lubricants Co.

The Show in the Garden

TOTAL NUMBER EXHIBITORS, 197

CARS, 44; OTHER THAN CARS, 153

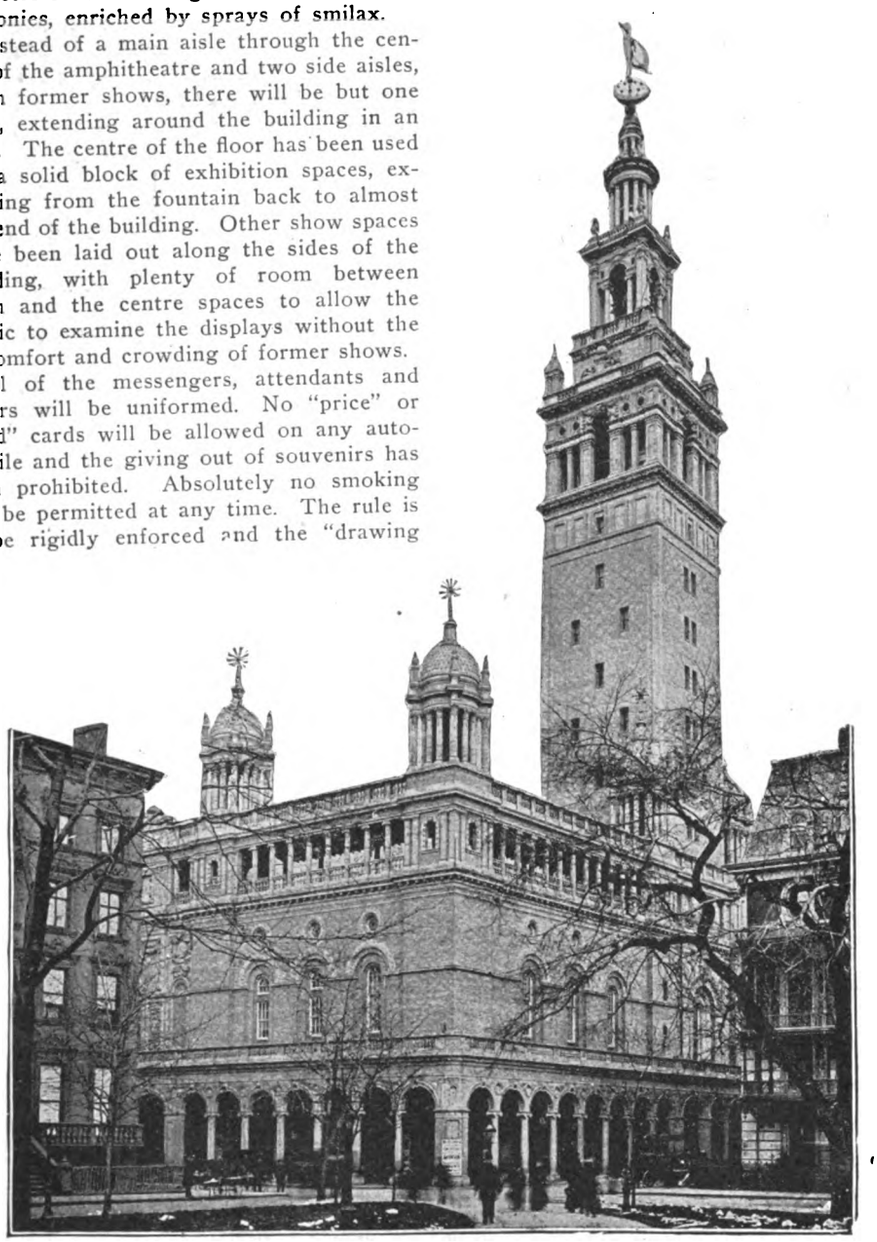
IT was at just this time one year ago that the Motor World electrified all who had to do with automobile shows by exclusively publishing the news that the Association of Licensed Automobile Manufacturers had secured Madison Square Garden for a term of years and that the exhibition of 1906 to be held under the auspices of what may be termed that exclusive organization. The news created a tremendous sensation. A move of the sort was so unexpected that it was not generally credited at the time. Before the week closed, however, the news was fully confirmed.

This action of th A. L. A. M. marked a distinct and visible parting of the ways. It put an end to the alliance between the Automobile Club of America, the National Association of Automobile Manufacturers and the Madison Square Garden Company who jointly had conducted the previous shows and required an entire recasting of lines and readjustment of affairs.

This readjustment will be made apparent on Saturday night next. So far as concerns Madison Square Garden enough is known to say that it will result in the creation of a new standard for industrial exhibitions. It will be wholly unlike any thing that has gone before, whether at home or abroad. For the week, the building will be Madison Square Garden on the outside, a Roman garden within, but set with such "chariots" as Roman never dreamed of. The entire interior of the building has been transformed to obtain this Roman effect, which has been carried out with a lavish hand, but always with an eye to quiet elegance and refinement. The entire scheme is one of harmonious blend. The colors, the signs, the lights, the carpets, the decorations, all will be in harmony. There will be no riot of color, no offense in contrast, no jarring, no discord of detail.

The color scheme will be white and gold with contrasting tints, and so thoroughly will the Roman effect be carried out that the round iron posts which have been used to support the chain barriers between spaces will be discarded and special posts of staff, designed in the prevailing style of architecture, be made for the show. The floors are to be covered by a specially woven golden bronze carpet, of which more than 6,000 yards will be used. The chains which will be strung between spaces will be bronzed to a tint almost like that of the carpet.

The walls of the short main entrance hall or lobby are to be covered with greens to simulate a forest effect, and no part of the buliding as usually seen inside will be left uncovered. Immediately inside the amphitheatre there will be staff figures of the "Poster Girl," the "Automobile Girl" and the "Chauffeur," all larger than life size. Under the "Poster Girl" there will be a fountain in which frogs and fish will spout water on which changing colored lights will play. The Fourth avenue or rear end of the amphitheatre will be covered by a large drop curtain, upon which an Italian garden scene will be painted. The box partitions at that end are to be draped to resemble columns, so as to blend harmoniously into the picture presented by that end of the building. The ceiling will be entirely hidden by 12,000 yards of torquoise blue bunting, in which 27,000 golden stars will twinkle. All of the decorations, including evergreens, will be fireproofed.



Staff columns placed ten feet apart will support classic cornices bearing the

Digitized by Google

signs of each exhibitor. Thousands of electric lights will be placed along the edges of the cornices and new electroliers have been specially designed to do their part in illuminating the building. Silkoline between pilasters of white and gold will decorate the balconies, enriched by sprays of smilax.

Instead of a main aisle through the centre of the amphitheatre and two side aisles, as in former shows, there will be but one aisle, extending around the building in an oval. The centre of the floor has been used for a solid block of exhibition spaces, extending from the fountain back to almost the end of the building. Other show spaces have been laid out along the sides of the building, with plenty of room between them and the centre spaces to allow the public to examine the displays without the discomfort and crowding of former shows.

All of the messengers, attendants and others will be uniformed. No "price" or "sold" cards will be allowed on any automobile and the giving out of souvenirs has been prohibited. Absolutely no smoking will be permitted at any time. The rule is to be rigidly enforced and the "drawing

MADISON SQUARE GARDEN.

room atmosphere" of the show preserved. Horn tooting also has been tabooed.

Striking evidences of the completeness of the arrangements will be found in the telephone exchange, which will be the largest private one in the world, called into existence to do its part for a week. There will be 150 telephones in operation with long distance connections, so that any exhibitor can call up his factory, even though it be situated in the West. Sixty-five trunk lines will run from the building to the Madison Square telephone exchange, a larger number even than can be found at the Waldorf-Astoria, which is the largest private exchange in regular operation. Twenty-three employees and hello girls will be required to operate the exchange, in addition to the attendants at the various stands.

The credit for this great work—for it is a great work—rests with the A. L. A. M. Show Committee, George Pope, chairman; M. I. Brock and C. R. Mabley.

Of all the cars staged the one which is the nearest approach to a sensation and which will attract all comers for at least a look at its "innards" will be the new Northern four-cylinder car with its air control. In itself, the use of compressed air on the car is not a novelty as one maker or another has applied it to some purpose, such as the application of the brakes or the governing of the motor, during the past two or three years, but heretofore it has not been called upon to operate the clutch, gear changing mechanism and brakes all on one and the same machine. It will be the leverless aspect of the car that cannot fail to attract the eye accustomed to seeing the inevitable hand levers, generally at the driver's right hand, which have in the past two or three years been reduced to a minimum of two, but which appear to stand little chance of further reduction in the future except by the use of some such flexible medium as is employed in this case.

In its way the two-cylinder two-cycle Oldsmobile also savors of the sensational. Its adoption by the pioneers whose name it bears was one of the "startlers" of the season, and the car that led to the move cannot well fail of wide interest and attention, though it may serve to lessen interest in the new four-cylinder, four-cycle Oldsmobile, the largest car ever produced by that old and experienced concern. In other respects, too, the Olds line will be complete, runabout, wagonette and a diversity of delivery types serving to make it so.

In every case where the name two-cycle is mentioned the mind naturally turns to the Elmore people, and at their stand will be found not simply a revamped form of their well-known machine employing this type of motor, but as well a brand new four-cylinder car still fitted with the same type motor, and noteworthy as being the first quadruple engine of its class to be put upon the market. Because of the way in which the limelight has been cast upon the two-cycle motor during the last few weeks, quite as much on account of the stamp of the makers who are giving it their attention at the present time, there is sure to be a week long radiance pervading the Elmore exhibit; its makers have earned the right to smile.

Probably next in the order of novelty will come the air-cooled cars, of which the Knox has been so long a leading exponent, and the Knox exhibit will be distinguished by the first air-cooled, four-cylinder machine to be built throughout on the lines laid down by current design as applied to machines of the more conventional type, and, too, the largest air-cooled car ever in a regular stock model of four cylinders. With its imposing proportions, straight line body, "dummy" radiator and other modern trappings it is totally devoid of that "gingerbread" appearance that has been too much of an air-cooled failing. It looks like a real motor car.

Some of the cars shown will be noteworthy because of the slight amount of alteration has been found possible—something which argues a very different story from what it would have done a couple of years ago. One of the most prominent among these will be the Stevens Duryea, which is practically a reproduction of last year's type, yet is by no means out of date or behind the times. Another car which is practically unaltered in design and in which refinement only was possible, is the Locomobile, which also is notable in that it is equipped with a magneto constructed in its

Digitized by Google

entirety by the makers of the car. Of the machines which have been altered to a greater degree, though not in a way which is readily appreciable to the layman, there will be the big four-cylinder Columbia, costing $5,000, the Pope-Toledo, the Pierce, the Thomas, the Packard, the Orient, the Peerless, the Apperson, have undergone considerable improvement in one detail or another, while the Royal and Haynes cars, counterparts of those which starred in the double elimination prior to the Vanderbilt Cup race last fall, are of new design, though each retaining its former characteristics,

GEORGE POPE,
Chairman Show Committee.

which substantially is true also of the Stearns.

Of the makers who have brought out large cars are the Autocar, the Cadillac and the Pope-Hartford, each of whom have added a four-cylinder model to its line.

The exhibit of electric vehicles will be very complete and will include, among others, a novelty in the way of an electric chemical fire engine, which is adapted to give smooth and reliable service under the rigorous conditions which such apparatus is expected to serve. The exhibit of the Columbia electrics will be, as usual, impressive not only in appearance but in variety. It will include practically every type of closed car to which the makers of gasolene vehicles have but just seriously turned their attention. The Pope-Waverly also has "come on" remarkably in this direction, as its exhibit will make plain.

No tire of repute, whether of foreign or domestic manufacture, will be found missing, and there is no lack of newness in the tires themselves in the means of attachment; in fact, the progress of the mechanical fastening will be made plain for the first time. The big house of Goodrich has been "won over" to that form of fastening and its "quick detachable" tire will at the show be demonstrated to the general public for the first time. The same is true of the Firestone pneumatic, the newest product of the Firestone whose solid tires long have been a byword. This Firestone mechanically fastened tire is so new, indeed, that many will see it at the show for the first time. The Perfected Dunlop fastening and the new ring or flange that permits the use of the Dunlop tire on any clincher

CHARLES CLIFTON,
President A. L. A. M.

rim is another recent and far-reaching development of no mean order. The Fisk and the Goodyear mechanically fastened tires were earlier or earliest in the field and require mention only in passing; their spurs are already won, so to speak. The Diamond, the G & J and the Morgan & Wright concerns still pin their faith to the clincher tire, though the Diamond holds a Fisk license and the other two are privileged to and actually are producing mechanical fastenings that are counterparts of that employed on the Perfected Dunlop. The Diamond Rubber Co. is, however, contributing four departures—a solid tire with a wire-mesh base, a wrapped thread Diamond with a flat thread, a double or diaphragm inner tube and a tire protector or removable tread which is made wholly of rubber and fabric and which, when applied, is held in place solely by inflation, without the use of beads or "shoe lacing." The Pennsylvania and Michelin adhere to the clincher type of tire, the former introducing a flat tread; the latter previously had a tire of this type.

In accessories there is nothing surprisingly new or startling. A birdseye survey of the list of accessory exhibits will quickly grasp the few real novelties, as, for instance, the Baldwin Chain & Mfg. Co.'s shock absorber, of the "House" spring recoil check, the principle of which is simple; it is enterely automatic, and, works by a spring contained in a steel cylinder attached to the axle and the body of the car. Besides the introduction of an eight-chime horn, the Gabriel Horn Co. also are presenting a shock absorber, the Foster, which is actuated by compression, a plunger in a cylinder containing oil furnishing the desired resistance. The Dayton Electrical Mfg. Co. have brought out the Apple automatic cut-out and voltmeter. Holley Bros. are presenting a new magneto in addition to its line of carburetters. Accessories like the cars, themselves, however, are rapidly settling into well defined standards, of which such as the Jones and Veeder speedometers and odometers, the Solar, Atwood and Gray & Davis lamps; Whitney, Diamond and Baldwin chains; Springfield, Sprague, Rands, King and London tops; B. & S. wrenches, Kingston carburetters, Timken, Standard and Hyatt roller bearings, Prest-O-Lite gas tanks, Midgley pressed

W. E. METZGER,
Vice-President A. L. A. M.

steel wheels, Briscoe and Whitlock coolers and radiators; Hill precision oilers, Truffault-Hartford shock absorbers; Hardy plugs and Splitdorf coils may be mentioned to better convey the meaning.

The Exhibitors and their Exhibits.

An alphabetical list of the exhibitors at the Garden Show, giving their location, and the nature of their wares:

M. F.—Main Floor.

Motor Wagon vs. Horse Costs.

Here is the itemized account, kept by a Chicago merchant in a long and thorough trial of various motor cars compared to two double-team horse wagons whose work was done by one twenty horse-power automobile averaging fifty miles a day:

	Per month.
Labor, driver	$75.00
Gasoline to run fifty miles per day	26.00
Oil, lubricating	4.00
Batteries	3.00
Painting, $30 per annum	2.50
Repairs, besides tires	20.00
Tire maintenance, solid tires cost per set, $150	25.00
	$155.50
Cost per year	$1,866.00

	Per month.
Cost to keep five horses, $20	$100.00
Shoeing five horses, $2.50	12.50
Wagon repairs and painting, $5	10.00
Harness repairs, $1.50	4.00
Labor, two drivers, $60	120.00
	$246.50
Cost per year	$2,958.00

Cost of operating and maintaining twelve horse-power, 1,500-pound delivery car, fifty miles per day:

	Per month.
Labor, driver	$65.00
Gasolene to run fifty miles per day	16.00
Lubricating oil	3.00
Batteries	2.00
Painting, $30 per annum	2.50
Repairs besides tires	20.00
Tire maintenance, solid tires	12.50
	$121.00
Cost per year	$1,452.00

Cost of maintaining two single horse wagons to do the work of one motor truck:

	Per month.
Cost to keep two and one-half horses	$50.00
Shoeing two and one-half horses, $2.50	6.25
Repairing and painting two wagons, $5	10.00
Repairs, two harnesses	2.00
Labor, two drivers, $60	120.00
	$188.25
Cost per year	$2,259.00

The Show in the Armory

TOTAL NUMBER EXHIBITORS, 236

TOTAL CARS, 81; OTHER THAN CARS, 155

"Removed.—The Sixth annual automobile show, held for five years in the old Garden, to the magnificent new armory, Sixty-ninth Regiment."

This is the way the Automobile Club of America states the situation. There's defiance in every line of it, and defiance fits well with armories, and also in those who will display motor cars in the Sixty-ninth's armory, from Saturday night to the Saturday following. They are making those cars and displaying them in defiance of the Selden patent, which is responsible for the show of "the firm across the street."

Just as that patent brought together those who comprise the Licensed Association, so it was responsible for the Armory show, which, though appearing a club affair, yet has as a "silent partner" the American Motor Car Manufacturers' Association, the roll of which holds the names of nearly all of those who rank high as "independent" manufacturers and who snap their fingers at Selden patents and the like; indeed, in the exhibit of one of them, the Ford Motor Co., will be found the original Ford car, now appearing archaic and toylike, but which is expected to bear strongly on the matter of patent independence.

In every respect will the armory show prove more democratic than the "other one." It will have a greater number and diversity of exhibitors and will be much richer in those cars that are more nearly within the means of the masses. There will be fewer heavy cars and more light touring cars and runabouts, and in whatever class the dominant question of price will be found answered more nearly as the popular demand would have it answered.

Also there will be those features that entertain as well as interest and that will serve to make the armory show the popular show. In the temporary theatre on the fourth floor each afternoon and evening the Vanderbilt Cup Race can be enjoyed, as well as other vitagraph presentations of the Bennett Cup Race, Mount Washington "Climb to the Clouds," the Ormond-Daytona Beach races and recent airship doings on the other side.

While the automobile in all its up-to-date advancement and all that is allied with it will be contained somewhere in the mammoth structure, space has been found in the gymnasium for the Aero Club of America exhibit. It is probable that the "Aero Club No. 1," the dirigible balloon which Leo Stevens, the famous aeronaut, designed, will be suspended from the top of the curved roof in the big drill hall. What should prove another attractive object in the airship department will be Prof. Alexander Graham Bell's kite, which, though of enormous size, is by its peculiar tetrahedral principle of construction, literally as light as a feather and is still so strong and substantial that it has recently supported in flight for a long time a man weighing 165 pounds and tackle weighing 62 pounds.

Then there will be Santos Dumont's "No. 99," the small airboat he used to call his runabout, and which, in many ways, has served him better than his larger machines. He found it to be the most reliable and handy of all, and tempted its master to use it in place of a cab when going about town in Paris. Next will come Captain Baldwin's clever imitation, the "California Arrow," that helped its designer to save the reputation of aerial flights at the St. Louis Exposition, and, guided by the intrepid Roy Knabeshue, was the first motor-driven craft to sail above the streets of New York.

In this section will be exhibited every important development in aerostation brought forth in this country, in addition to much from a foreign source. Besides the balloons and dirigible airships of all forms there will be parachutes, aeroplanes, tetrahedral, box and other kites; lifting machines, both with propellors and wings; lightweight motors, metrological instruments; a complete collection of the literature of mechanical flight; pictures of various famous flying machines, both in flight and at rest, and an exhibit of materials and accessories. In short, this exhibit will constitute a complete exposition of all that has been achieved in the solution of the greatest unsolved mechanical problem that today confronts mankind.

Something out of the ordinary in the show and indicating another direction of motor departure, will be a motor battery

Digitized by Google

SIXTY-NINTH REGIMENT ARMORY.

wagon, loaned by the Ordnance Department of the United States Army. This wagon is provided with a lathe, forge and necessary equipment for almost any kind of emergency on the battlefield.

As the building has just been completed, there will be no attempt made at elaborate decoration, the show committee believing that the public will be much better pleased to realize the architectural beauties of the fine big drill hall than to have it hidden by colored bunting. The committee, however, has planned an effective and artistic scheme of stand decoration that is expected to blend into the industrial picture harmoniously and invitingly without detracting from the character of the exhibition, all decorations, signs and lights having been provided by an official decorator. The members of the show committee decided against elaborate decoration, as it was their opinion that such a plan would have a tendency to absorb some of the attention which otherwise would be fully centred on the exhibits.

Despite the prominence of the Selden interests the ranks of the independents have expanded amazingly during the last twelvemonth, and it is significant that many of the newcomers, far from being mere "fly-by-nights," have come with good financial backing, are promoting thoroughly legitimate goods and promise to prove important additions to the industry.

As the season of 1906 opened so very early and many of the makers have had their new cars on the road for a number of weeks or even months, many of the exhibits, while new in one sense, will be unveiled for the first time on Saturday night. Therefore the show will be one of comparison quite as much as a mere exhibition of the new and curious, and all the more valuable to the observer because the announcements already made public will have prepared him for what is to be found there, and, by the same token, will have sharpened his appetite for what is to come. The West is unusually well represented any may be said to have come East in force. The number of Western cars is, indeed, surprising and well shows the expansion of the industry and typical of that portion of the country there is a deal of independence of inventive thought displayed.

Among the distinct innovations probably none has been given more in the way of publicity, and none will attract more attention that the Ford four-cylinder runabout. The idea of a light four-cylinder car at less than $500 has been a sort of poor man's dream for years. Many have said that it never could be realized, others that it would come in time. But none except Henry Ford has had the temerity to attempt so radical a departure from current practice, no matter what his opinion may have been as to the possibility of the idea. Consequently, this first little quadruple engined machine will be regarded with curiosity by all and with an equal degree of interest. In addition, the Ford line will include a sensational six-cylinder car which, like its little brother, will be the lowest priced thing of its class ever offered to the public.

Among the makers who are making their debut this year, and consequently will attract a good measure of attention, is the Aerocar Company, which presents an air-cooled machine, thoroughly up-to-date, judging from its general specifications, and backed by interests that lack nothing. Then there is the American Berliet and the American Mors and the American replicas of standard foreign products manufactured, the one by the American Locomotive Co. and the other by the St. Louis Car Co., names in themselves sufficient guarantees. Also there is the American Napier of similar derivation. In addition there will be the Viqueot, the Crawford, the York, the Iroquois, the Moon, the Dorris and the Windsor, all entirely new so far as New York shows are concerned.

Of the notable new models of makes which already are well placed in the market will be the new four-cylinder Ramblers, the Ranier, the Cleveland, the Mitchell, the Lozier, the Maxwell, the National, which has made such an impressive mark during the year, the well-heralded Reo, the air-cooled Corbin, the Wayne, the Welch, the St. Louis, the Queen, the Austin, the

Digitized by Google

Glide, the Premier, the Berkshire, the Marmon, the Marion, the Pungs-Finch—all cars with reputations. The Austin, embodying among other new and exclusive features an improved system of double ignition, and a patent spring controller which absorbs the recoil is a new Western production of some interest, while another car which will prove considerable of an attraction will be the six-cylinder Frayer-Miller, rated at 40 horsepower, and equipped with the unique system of air cooling which caused so much comment at the shows a year ago, and which has accredited itself so well during the past season. Among the cars of long established makers which will be seen for the first time at any show will be the new Grout gasolene, whose maker plumped for the internal combustion motor early in the season, with apparently very successful results.

J. B. BARTHOLOMEW,
Treasurer A. M. C. M. A.

Nor will the commercial type of vehicle be neglected several newcomers being noticeable among others. Of these the Autocar Equipment Company will present one of the most attractive from the standpoint of general utility and stability. It will be gasolene driven, and embodies several features worth nothing. Among the electric vehicles will be seen the Lansden, with its unique arrangement for drawing power from a trolley wire, shown for the first time, and, also, there will be the Rauch & Lang, the Atlas, the Rapid, the Champion, the Iroquois, the Commercial and the Logan.

The steam-driven contingent, which makes a brave showing, despite its paucity in numbers, will be entirely confined to the Armory Show. It will consist of the White —an exhibit which always proves a strong attraction— the Lane and the Johnson Auto-Carriage, which last, though by no means new, in the sense of being untried, yet embodies many distinctive features, and is placed on exhibition in New York for the first time.

There will be no less than five different exhibits of motor cycles, including the Indian, the Curtiss, the Wagner, the Reading Standard and the Marsh. Each will have its quota of new features.

The diversity of accessories also is greatest in the armory show. The Foster and House shock absorbers will be there, likewise

JAMES COUZENS,
Chairman American Motor Car Manufacturers Association.

the Diezeman and Sheddan, each of them a recent development; the Gabriel horn, the Hutchinson electrical horn and other horns will be shown, Charles E. Miller having several novel ones that never have been ex-

ROGER B. McMULLEN,
Manager A. M. C. M. A.

hibited before; indeed, and as usual, Miller's display will be practically an accessory show in itself. There is little of importance that it will not contain, and the delver after novelties and good things will find "rich picking" at Miller's big space. The Apple storage battery charger and the Edison battery, too, will be found in the armory, not to mention Splitdorf's ignition outfits and the other electrical apparatus which will be found in unusual abundance. The thousand and one knicknacks, most of them of real use and some of them curious to behold, will abide for the week in the armory.

In tires, too, the armory show will be more prolific, thanks to the annual outcropping of non-puncturable "wonders," most of them previously unheard of and which once the show is over go their way unobserved and unsung. No show is complete without them. But the standard tires, those of proud repute, are not lacking. The Firestone mechanically fastened air tire will be shown for the first time, likewise the new Diamond diaphragm inner tube and flat thread tire; the Pennsylvania flat thread tire also will be displayed for the first time.

BENJAMIN BRISCOE,
Auditor A. M. C. M. A.

The G. & J., the Morgan & Wright, the Goodrich, the Hartford Dunlop, the Goodyear, the last named three not only in clincher form but also with their new mechanical fastenings comprising removable rings or flanges, and the Fisk, first in the field seriously with a mechanical means of securement—each and all of them will be in evidence, as a matter of course, it may well be added.

Exhibitors and Spaces.

The exhibitors at the armory show—alphabetically arranged, and the wares they will display, are as follows:

MF.—Main Floor.
B.—Basement.
G.—Gallery.
GA.—Gallery Annex.
Gym.—Gymnasium.

A

Acme Motor Car Co., Reading, Pa., MF, Sec. B2.—Acme 4-cylinder touring cars.

Aerocar Co., Detroit, Mich., MF, Sec. B2.—New 4-cylinder 24 h. p. air-cooled Aerocar.

American Ball Bearing Co., Cleveland, O., G, Space 27.—Ball bearing axles, wheels, etc.

The Man with "No Time to Read."

Think of a man in these days of strenuous competition, when, in order to succeed, one needs to know every wrinkle connected with his business, declining to subscribe for a journal published in his interest on the curious pretext that he has "no time to read," sagely remarks a contemporary.

One might, with almost as much reason, swear off eating on the ground that he has "no time to eat." Starving the brain is just as bad policy as starving the body, and that is what a man does when he refuses to subscribe to a paper published in his interests. Of course, everybody recognizes the necessity for feeding the body, but very few comparatively feel the same necessity for feeding the brain, and yet these same people will complain that they are not getting along satisfactorily; that they should have a show to make a good living as perhaps somebody else does.

The reason the other fellow does better is because he knows more, and the only way he can know more is by feeding his mind with practical information such as can be obtained from the columns of the up-to-date paper published for his benefit.

"Motor Mania," Australian Style.

"Motor Mania" has taken a new form in New South Wales, according to a report from Geelong. A man, while walking in the road, was seized suddenly with the idea that he was a motor car. He began to run about wildly, and, under the impression that he was traveling at the rate of sixty miles an hour, dashed blindly into trees, fences, and walls. Before he could be restrained he was black and blue from head to foot.

LAMPS FOR ALL VEHICLES.

Big Fees and Revokable Licenses for Motor Cars, Only, Urges Governor.

In his annual message to the New Jersey Legislature this week Governor Stokes paid considerable attention to the question of automobile legislation. As the Governor has taken the initiative in broaching the subject dearest to the hearts of his colleagues in South Jersey, there will no doubt be an influx of automobile bills before the session of 1906 adjourns. Public safety, said Governor Stokes, is still menaced by the use of motor vehicles, and for this he ascribed two reasons—failure to execute the law and reckless driving. The message advocated a graduated license fee for cars and revocable license fee for drivers.

The full text of that part of the message bearing on the subject of automobiles is as follows:

"No little attention was given by the Legislature last year to the regulation of automobiles on the highways. The representatives of the various interests agreed upon a measure which the Legislature adopted. Public safety, however, is still menaced by these motor vehicles. For this two reasons may be assigned—failure to execute the law and reckless driving. In a discussion of this matter, it is well to know just what the law is. Under its provisions automobiles are not authorized to run at any set rate of speed. Their speed must at all times be regulated so as not to endanger the life or limb or injure the property of any person." Judge Swayze so charged in the case of Kutz vs. Patten. The law, therefore, would seem to be stringent so far as the speed limit is concerned. Attempts to enforce this provision of the act have not been successful and the violators have suffered severe penalties. No law will enforce itself, however, and inaction on the part of municipal authorities encourages wilful and continued violations.

"Every legislative provision, however, should be made to remedy any just ground of complaint in connection with the use of automobiles upon our highways. The damage done through the use of these machines to the surface of our macadam and gravel roads should be compensated for and means to prevent reckless driving provided. A graduated license fee for cars might be charged and devoted to the repair of our damaged roadways.

"Locomotive engineers, who run upon a defined track, are required to serve several years of apprenticeship before they are permitted to take charge of an engine. An automobile capable of running from fifty to seventy-five miles an hour is granted the right of way upon our streets and highways and is driven in some cases by amateurs who have had little or no experience in the handling and management of such powerful machines, whose eyesight may be defective or who for other reasons may be entirely incapable of appreciating the responsibility they have assumed. It would seem that drivers of automobiles or chauffeurs should be required to have a license, and this license should be revoked upon the violation of its provisions, under proper rules and regulations. The revocation of a license will go far toward halting reckless driving, as it would deprive the chauffeur of his means of livelihood and the pleasure driver of his means of recreation. It might be provided that deliberate reckless driving, whether of automobiles or horses, resulting in injury to person or property, should be punished by imprisonment.

"Vehicles of all kinds using the public highways should be required to carry lights at night for the protection of themselves and the public."

The Dangers of the Road.

A French automobilist gives the following interesting statistics of dangers in the road gathered in the course of 1,000 miles' travel on the public roads:

Vehivles abandoned by their drivers.....75
Drivers who refused to move out of the way 51
Drivers asleep on their vehicles..... 8
Drivers on the wrong side of the road...35
Drivers not holding the reins.....12
Vehicles without lanterns.....31
Drivers resting their horses in the middle of the road and at dangerous turnings 2
Drivers walking behind their vehicles....18
Several vehicles fastened together, and having only one lantern.....10
Saddle horses left standing.....13
Wandering dogs which had to be avoided.85

In the above list, of course, the word "vehicles" applies only to horse-drawn vehicles.

Want Busses for Ladies Only.

Motor-buses for "Ladies Only" is the latest plea in London. It is said by feminine workers and others employed daily in the world's metropolis that the struggles involved in boarding motor-buses result in ruffled hair, hats askew, and general personal dishevelment. Men, it is stated, "catch women by the shoulders, swing them to one side, board the buses, and commandeer all the vacant seats." When remonstrated with, they remark, "I have to go to work. You're only going to do silly shopping." As a matter of fact in the early morning hours most feminine motor-bus passengers are also going to business.

Hotelman Will Build his own Speedway.

From San Diego, Cal. comes the news that John H. Gay, a hotel proprietor, will build a circular-mile track at that place, to be used exclusively for automobile racing. The oval will be constructed on the Lakeside Hotel property, and, it is said, work will commence immediately.

Chicago to Reproduce Cheshire Cheese.

Cheshire Cheese, the famous old London inn, will have a counterpart in Chicago when the new home of the Chicago Automobile club is built. The architects are at work on the plans and have decided to copy the quaint hostelry. It is estimated that the cost of the building alone will be about $75,000. When it is completed the autoists of Chicago will have one of the finest club houses and garages in the country, it is announced.

Although a site has not yet been selected it is expected a location will be decided upon in a few days.

The new clubhouse will be built of cement and rough timbers. To preserve the appearance of an old English inn it will be only three stories high. A broad porch will run across the front and a picket fence will inclose the yard. There will be forty sleeping rooms for the accommodation of the members, and a ladies' cafe in addition to the dining room. But the principal attractive place to eat will be in the old grill-room, which will be in the front of the building. Under the same room of the club house and in the rear will be the garage.

Where the Thieves are Busy.

A few years ago the safety of a car left in a busy thoroughfare was never in question, for persons of precarious honesty regarded the automobile as a dangerous weapon to the uninitiated. But now automobile knowledge is by no means unknown to the man in the street, and the feeling of awe and respect towards the automobile is passing away. That is clear by the attention that inventors have paid to the devices intended to prevent the starting of the car by anyone but the owner or his driver.

But the only danger of theft is by no means confined to the car. In some places so serious have been the depredations suffered by motorists in the pilfering of portable articles from cars left unattended for a few minutes in public thoroughfares, that local organizations in England have taken up the matter and, in one case, an automobile club has decided to employ an attorney to prosecute on behalf of any of its members who trace such thieves.

Shakespeare With a Gasolene Flavor.

Shakespeare up to date, appears in various guises according to the spirit of the times. Naturally enough, his paraphrasers of the present day devote themselves to motoring matters, but seldom with as much success as is seen in the following quotation from the Sporting Times:

"Who would hotels bear,
To sweat and grunt under a garage fee,
But that the dread croppers after dark,
The unexpected contour from whose slopes
No motorist returns, incurs their bills,
And makes us rather funk those hills we have
Than fly down others that we know not of?"

Quakers Travel 1000 Miles Non-stop.

Bespattered with mud, but otherwise in as good condition as when it left the garage, a 1906 model 30-horsepower Peerless touring car, was driven into the garage of the Eastern Automobile Co., at 324 North Broad street, Philadelphia, Wednesday night of last week, having completed a noteworthy non-stop run of 1,062 miles.

The car, which previously had been used for demonstrating purposes by the Philadelphia agents, set out on Monday, 1st inst., to make a 1,000 mile non-stop run, with W. H. Savage at the wheel and carrying four passengers. The course was from 324 North Broad street to the old York road to Ogontz, thence to Fox Chase, Rhawn street, to Castor road, over the Bustleton pike to Grant avenue; thence to Torresdale, Holmesburg, via Church road, to Ashbourne, returning by York road and Broad street to the garage, a distance of about 36 miles. The trip was made in twenty-eight relays. The route was particularly trying, for there are more than a score of stiff hills to climb, a dozen bridges, numerous stretches of cobblestone and three railroad crossings. The weather conditions for the first two days were all that could be desired, but on Wednesday the men had to drive through a steady downpour of rain and over ice covered roads.

During all this time the motor was not stopped once, and at no time was the car without its full capacity of five passengers. During the run of 1,062 miles 91 gallons of gasolene and two gallons of cylinder oil were consumed. The cost per mile, therefore, was 1⅛ cents, or $.0036 per passenger.

Diamond tires were used and not a puncture or blowout occurred. The car finished with the same set of tires as was put on at the start.

The official relays, giving the number of miles and driver, follows:

1, 72.3 miles, H. W. Savage; 2, 108.3 miles, J. R. Maynes; 3, 144.2 miles, H. W. Savage; 4, 180.2 miles, J. R. Maynes; 5, 216.2 miles, H. W. Savage; 6, 252.1 miles, J. R. Maynes; 7, 288.1 miles, H. W. Savage; 8, 324.1 miles, H. W. Savage; 9, 360.1 miles, J. R. Maynes; 10, 396.1 miles, J. R. Maynes; 11, 432.1 miles, H. W. Savage; 12, 463.2 miles, H. W. Savage; 13, 468.2 miles, H. W. Savage; 14, 540.2 miles, J. R. Maynes; 15, 576.2 miles, H. W. Savage; 16, 612.2 miles, H. W. Savage; 17, 648.4 miles, J. R. Maynes; 18, 684.5 miles, J. R. Maynes; 19, 720.6 miles, H. W. Savage; 20, 756.7 miles, H. W. Savage; 21, 792.7 miles, J. R. Maynes; 22, 828.7 miles, J. R. Maynes; 23, 864.8 miles, H. W. Savage; 24, 900.9 miles, H. W. Savage; 25, 937 miles, J. R. Maynes; 26, 973 miles, J. R. Maynes; 27, 1,009.1 miles, H. W. Savage; 28, 1,062 miles, H. W. Savage.

When Russel Sage was in a hurry to get to his office in answer to the demand for call money the other day he used an automobile. With its assistance he succeeded in clearing $70,000.

Where Oiled Roads are General.

California has nearly 3,000 miles of roads which have been transformed from dusty, and often almost impassible highways, into excellent avenues by the use of crude petroleum as a road dressing.

Out of the fifty-seven counties of the State, at least forty now have oiled roads; the use of oil on roads is as much adapted to cities as to the country, and there are over 500 miles of city streets treated in this manner. There are also nearly 1,100 miles of oiled railway roadbed in the State.

The first experiment in oiling roads began in 1898 and it was found that when oil was applied it immediately began to bind together all the loose particles and formed a stratum resembling asphalt.

California now occupies a foremost position as regards mileage of good roads, as a result of this successful method of treating highways.

As an Aid to Church Fairs.

Now the automobile has entered the precincts of the time-honored church fair. At this season of the year these functions are many, and the innovations that have been introduced have been innumerable, but it remained for the Baptist Church of Brookline, Mass., to introduce the automobile. One of the parishioners loaned his machine and chauffeur to the fair management, and nightly sight-seeing tours of Brookline are being made. The fee charged is 50 cents a person, and the income of the fair has been materially increased by the use of the horseless vehicle.

How the Kidnapper was Caught.

Enoch Coffey, a Kansas man, kidnapped his brother's boy at Kenesaw, Neb., and boarded a train with him. He was observed by the boy's father just as the train was pulling out. The father immediately secured the assistance of an expert motorist and together they climbed into a substantial touring car, which belonged to a friend, and which happened to be standing nearby. For thirty miles the race between the train and auto continued—and the automobile won, with the result that the father secured his son and the arrest of the kidnapper.

Shirts will Hold the Money.

Although it does not conduct a haberdashery, the Hamilton County Automobile Association of Noblesville, Ind., has about it something that savours of gentlemen's wearing apparel, Brown Shirts being included in its officiary. At the last meeting Horace Brown was elected president, Elbert Shirts, treasurer, and Dr. H. S. Harrell, secretary.

Pine Bluff Motorists Organize.

Pine Bluff, Ark., motorists have organized as the Pine Bluff Automobile Club, with the following officers: President, Dr. R. G. Thompson; vice-president, J. M. Parker; secretary-treasurer, L. O. Knox.

Factors that Affect Power

Well may it be said that there is no consideration of greater importance to the motorist than that of the disposition of the power of his car, yet it is safe to say that not one in fifty of the men who are intimately familiar with the action of the motor car are able to account for the output of energy from the motor, telling in so many words just what becomes of it. It is indeed an important consideration, for it involves, when taken up in detail on an analytical basis, a thorough comprehension of all that transpires in the mechanism under all sorts of conditions, and also a thorough understanding of the purely mechanical principles which are involved in the transformation of the dormant energy which is stored up in the limpid fuel to the snappy propulsive effort which acts at the driving wheels, in dragging the machine along over the road, and, indeed, a knowledge of just how that effort is to be accounted for in pounds and ounces, and what becomes of it ultimately.

Naturally enough, a complete analysis of the many different forces which are brought into action in the propulsion of the motor car is an extremely difficult thing to accomplish, because of the infinite number of extraneous conditions which are to be taken into account. But it is possible by making liberal allowances for some of them, and by making one or two rather sweeping and inclusive assumptions, to arrive at a demonstration which shows pretty clearly what becomes of the power, and shows it with sufficient accuracy for all practical purposes. In doing this, it is better to consider merely the transformation of the potential energy which is served up by the motor, and to show the method of its absorption by the various parts of the mechanism and finally by the forces outside of the machine, and to consider the motor itself as delivering a certain known amount of actual or brake horse power, rather than to go back to the fuel itself and follow its combustion and the resulting impulsive effort through the mechanism of the motor itself. So that any reference to efficiency in the following paragraphs may be taken as indicating a purely mechanical quantity, and totally apart from the consideration of the heat transfer within the motor, or to its own ratio of mechanical transformation.

The disposition of the power of the motor may then be accounted for in five different ways, since there are five distinct and different groups of factors which combine to absorb the effort delivered at the crank shaft. They are (1), the losses due to internal resistances in the machine, (2) the losses due to rolling friction, or, roughly speaking, the resistance which is offered by the road to the passage of the wheels, (3) the losses due to the gradient or inclination of the road, which are sometimes positive and sometimes negative, (4) those losses which are caused by curves in the road, and (5) the losses due to wind resistance. Each of these groups is very comprehensive, and involves numerous considerations which do not appear at the outset, the entire quintet combining to form in the aggregate a problem which in novelty and complexity is probably without equal anywhere in the entire field of mechanical engineering. To reduce each to an entirely accurate quantitative value for any general or specific case is well nigh impossible at the present time, and, indeed, certain of the factors involved are of such a nature that they can only be got at by methods of approximation, and that by experiment rather than close calculation. Fortunately, however, these are such as have but a slightly important bearing upon the really significant matters connected with the design and construction of the machine, and hence are more useful in the discussion of theories than in the real life of the motorist.

Those losses in power which are due solely to the internal resistances of the machine are accounted for in the friction of the various bearings and the power taken up by the gearing. These, of course, vary exceedingly with the type of machine, the sort of care which is normally given to it and the sort of lubrication which is accorded it. Without going too deeply into the detail of the matter, suffice it to say that, according to tests made at different times and under various conditions, the efficiency of the transmission varies from 50 to 75 per cent. ordinarily. That is to say, the power which is available at the rear wheels of the car is from 50 to 75 per cent. of that which is actually delivered by the motor at the crankshaft. This quantity varies not simply with the age and condition of the parts, but also with the arrangement of the speed changing gear, since, for different speeds, different numbers of gears are used thus offering resistance to the effort of the motor. Some difference also is occasioned by the nature of the final drive, the efficiency of the double chain method of transmission being probably very high when the chains are new and free from dirt, and falling to a considerable lower figure when they become fouled, as they soon do on the road. With the cardan shaft drive, on the other hand, the efficiency which may be very high when the machine is standing upon jacks, or running on perfectly level roads under normal load, is considerably affected by the oscillation of the springs, and may fall considerably under such circumstances.

The question of the resistance of the road which has to be overcome by the wheels involves not simply the condition of the road, whether it be wet or dry, rough or smooth, and soft or hard, but as well the condition of the tires and their size, and the diameter of the wheels. Moreover, the question is not a little affected by the resilient quality of the tires and the fact that under the driving action of the transmission they tend to surge or drag upon the rim, at times working backward and forward under the action of the driving force, all the time bulging at the tread and receding as the springs oscillate, thereby constantly altering their cross section and materially affecting the friction of the road. Without going into the considerations which are involved in this way, suffice it to refer to the recently quoted experiments of Churchward which were published in these columns, in which all these minor tributaries to the rolling friction were grouped under the single head of "drawbar pull"—a quantity which is well known in railroad work, and represents simply the amount of effort which must be exerted upon the car from any source whatever in order to drag it at the speed indicated under the known governing conditions. These results, though purely empirical, are fully as accurate as could be arrived at in any other way, and cover all ordinary cases with sufficient precision for all practical purposes.

The effect of the gradient upon the propulsive effort of the motor is precisely the same as though the work were done in raising it vertically to a height equal to that of the hill or grade, and then driving it along a perfectly level stretch of road equivalent in length to that of the incline. That is to say, the hillclimbing effort may be divided into two parts, and the total effort will be that which would be necessary to drive it along the level for a distance equal to that of the incline, plus the number of foot-pounds necessary to raise it to an equal height. Similarly, in descending a grade, the power consumed is equal to that necessary to propel the machine on the level, minus that which would be consumed in raising it. Hence, when the grade is of

Digitized by Google

sufficient pitch to make the vertical components of the actual propulsive force, or the force which would be necessary to lift the car vertically, equal to or greater than that which is required simply to move it on the level, the machine will run of its own accord and the service of the brakes must be called into requisition in order to stop it.

To the average driver of a motor car it would hardly seem possible that the curvature of the road could have any possible effect upon the force used in driving the car, the idea of a resistance due to curvature being an entirely novel one, and one which is not self suggestive. The actual value of this quantity is, however, comparatively slight, as the provision of a balance gear or differential in the driving axle allows for the rotation of the outer and inner wheels at different speeds consequent upon the varying lengths of their respective paths on the curve and the chief factors to be encountered are those due to the added internal resistance of the differential mechanism, which is normally out of action, and the increased rolling friction of the tires due to the change in their direction of motion. Added to these, in the case of any close calculations, would be the gyroscopic effect due to altering the planes of rotation of the various wheels of the machine, an effect which is far too complicated to be understood in the net effort of its resultant, and one which is of rather doubtful magnitude under ordinary conditions.

In a recent article in the Motor World the question of wind resistance was taken up in a general way, and the great variation in its effect illustrated, as well as the fact of its tremendously increased importance when high speeds are to be taken into account. In this connection, then, it is enough to recall the fact that the windage is proportional to the square of the velocity of the car, and that its actual value for any given case is equal to .005 of the square of the velocity expressed in miles per hour, the result being expressed in pounds resistance per square foot of effective surface presented to the wind. Needless to say, this quantity is vastly affected by the direction and intensity of the external wind, which in this way sometimes acts as a help and at others as a hindrance to the progress of the car. When there is a following wind, its effect upon the total amount of surface presented by the car should be subtracted from that which is due to the velocity of the car itself, or, in other words, the wind which the car itself is creating due to its motion. In the case of a head wind, on the other hand, this factor should be added to the resistance due to the motion of the car. From which it will appear that the effect of the windage may have a much more important bearing upon the performance of the machine than at once would be indicated by the simple law of the square of the velocity.

By way of illustration of the foregoing, the example may be taken of a hypothetical car which may be supposed to move on a windless day along a perfectly level asphalt road of uniform surface. This car is of the typical order, is rated at 20 horsepower, weighs 1,900 pounds, and may be supposed to present a total area of 16 square ft. when carrying four passengers. The combined weight of this load, at an average of 150 pounds per passenger, is 600 pounds, thus making the weight on the tires 2,500 pounds. When running on the high speed this machine has a direct drive through the counter shaft, and a final transmission by double chains to the rear wheels. By this arrangement, the driving effort of the motor is carried to the wheels through the medium of one pair of bevel gears and one pair of chains, no other possible sources of internal resistance being present except the bearings of the transmission. Then, supposing that the efficiency of the bevel gears be taken as 85 per cent., and that of the chains, when running in the best of condition, as 90 per cent., the total efficiency of the transmission would be .85x.90 — .765, or 76½ per cent. These allowances may be fairly liberal, or according to the opinions of some engineers, they may be rather low, but they represent the average of several results, and may be taken as accurate enough for purposes of illustration. Then, selecting the resistance of the bearings, which in this car, are supposed to be of the latest ball-bearing type, and consequently "frictionless," the power available of the rear wheels, will be 76½ per cent. of 20, or 15.30 horse-power. Thus, about one-quarter of the power has been used up before the serious business of propelling the car has been even attempted, and indeed, some authorities place it is high as one-third on the average.

Now, suppose that this little car is traveling along the ideal road at the rate of 3,000 feet per minute, or about 34.09 miles an hour, the drawbar pull, according to Churchward, is something like 60 pounds per ton, which, since the car and its load weighs a ton and a quarter, amounts to 75 pounds. The windage, that is to say, the resistance due to the motion of the car through a body of stationary air at this speed, is equal to 5.75 pounds per square foot, or expressed in its total as applying to the entire surface presented by the machine and its occupants, is equal to 92 pounds. These two amounts, the drawbar pull, and the windage, being added, give a total of 167 pounds which represents the amount of effort which must be applied at the imaginary drawbar, in order to secure the desired effect. This force must be applied through a distance of 3,000 feet per minute, in order to attain the desired speed, and the product of these two is the number of foot pounds of work, which must be exerted at the drawbar per minute in order to propel the machine. Now the value of the horse-power is defined as being equal to 33,000 pounds per minute, and hence, to find the horse-power necessary to propel the machine under these ideal conditions, it is necessary to multiply force necessary to move the car, by the distance in feet per minute through which it acts, and to divide this by 33,000, or;

$$\frac{167 \times 3{,}000}{33{,}000} = 15.18 \text{ h. p.}$$

That is to say, 15.18 horse-power will be necessary to propel the car at the rate of 34 miles per hour under these conditions, and as the amount of power available at the rear wheels is 15.30, it is evident that the difference of .12 horse-power represents the amount of extra power or possible accleration available when the motor is doing its full rated work.

By comparing the five sources of loss or absorption of power, especially considering those conditions which relate solely to factors of resistance external to the car, namely, the rolling friction, the factors of curvature and gradient, and the wind resistance and taking into account the fact that no road, no matter how good it may be when judged according to the criterions of highway construction, is absolutely uniform in its conditions, absolutely straight and uniformly curved in its course, or of absolutely uniform grade for any considerable distance, it will be seen that these factors must be constantly varying throughout a wide range, and that they must be as hard to determine with even a fair degree of accuracy, as they are to provide against in the construction of the machine.

Moreover, when it is considered that in addition to this extremely variable load which is thrust upon the motor and all its subjoined mechanism, thereby creating in it a multiplicity of stresses which are not all germane to its primal function, but rather serve as a very important hindrance to its action, the machine as a whole, is being thrust ahead and jolted over a surface of constantly altering quality, and is being forced to adapt itself to the conformation of the road without in the least disturbing the proper relation of any of its parts or interfering with their action, the greatest wonder of all is that the machine can be made to go at all. The greatest wonder is that it does not come to grief at the first mole-hill and fall in a heap. And then there comes a wave of the profoundest respect, almost of awe, for the man who has been able to contrive and achieve albeit through the assistance of hundreds of other men to be sure, but none the less by means of his own grey matter, a really successful motor car.

H. P.

Thomas Higginbotham, a repairman, of Waukegan, Mich., has learned that "there's many a way to turn an honest penny," and at the same time learned some of the utilities of the gasolene motor. Now that the condition of the roads prevent his driving his car with comfort, Higginbotham has jacked up his car and attached a chain from the sprocket to an emery wheel. He claims he is able to sharpen skates more rapidly and with less muscular energy than formerly.

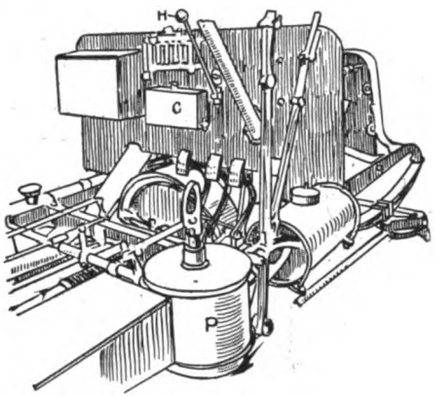
PRIZES FOR SELF-STARTERS

Paris Contest Results in a Tie—Many of the Devices Fail Utterly.

In explanation of the number of self-starting appliances which made their appearance at the Paris salon, and to which detailed reference was made in these columns last week, it is said that they were the result of the offer of a prize for the most efficient device of this kind put up by M. Deutsch. No less than 17 different devices were entered for the contest, but only 11 put in appearance



In the opinion of the judges "Le Cinogene" and the Mors self-starters were tied for first place and accordingly divided the grand prize between them. The first named, has been on the market for some time and probably has been more widely tested than any of the others. It consists of a drum in which liquid carbonic acid gas is stored under pressure, in connection with a small motor which is attached to the crank shaft at the place usually occupied by the hand crank. The expansion of the gas in the cylinder moves the piston and this in turn actuates the shaft through the medium of a rack and pinion. The piston is automatically returned to the end of the cylinder by a spring upon the escape of the spent gas.

The Mors consists of a special carburetter and pump connected with the cylinders by means of which the driver may put a charge under compression in any of them. The operation is completed by switching on the current.

The Saurer, which is designed only for four-cylinder motors, consists of a device for injecting compressed air into the particular cylinder of the engine that is about to commence its downward stroke. The Renault also uses compressed air, but in conjunction with a small independent motor.

The Battault is a sort of motor gun. A percussion cartridge produces a powerful impulse which causes a flywheel in the "gun" to revolve and the latter imparts its motion to the crank shaft of the motor. This is by no means a new idea as both the "match" and "gun" ideas have been employed on large motors which could not be started by hand under any circumstances. But it has always been in direct connection with the engine and not as an independent device that they have figured.

The Sjilsky enables the driver to turn the crank shaft from over the seat by means of levers, as in the Richard Braisier and the Genevrier. In the Guerrard, pressure from the exhaust is stored and re-expended to give the start. The same idea is taken advantage of in the Pellorce, except that it takes the form of a dynamo and set of accumulators to store the energy. The dynamo gives the engine its initial impulse. In the Buisson et Renardy, a pedal arrangement connected with the shaft through a ratchet and lever is employed. The Lemale is the only one of the spring type and was granted the third prize. It consists of powerful helical spring automatically wound by the motor, a ratchet and pawl preventing overwinding, and is of a type that has been shown in this country some time ago. The Phillipe consisted of a small turbine motor adapted to be moved by carbonic

MORS SELF-STARTER.

acid, compressed air or water under pressure.

In the tests, the Guerrard and Genevrier failed to start the engine at all while the remainder functioned with more or less success. "Prizes of encouragement" were also awarded the Saurer and Pellorce by the jury.

Contest for Town Cars.

The contest for automobiles for town use was conducted by the Automobile Club of France, in Paris, was decided on the 21st. and steam cars, the other for electric vehi- There were two classes, one for gasolene cles, each being subdivided into four classes on a price basis. The cars were required to cover a circuitous course of 100 kilos (62½ miles) in turns, the awards being based on regularity of running, fuel consumption, comfort and elegance and finish of the body work. The competition started at 6 a. m., with 27 starters. Of these 21 finished before 1 p. m. The first prize was awarded to an Aries car in the first class, the running time of which was 3 hours 56 minutes 42 seconds. A Vedome took honors in the electric class. Its time was 4:33:12.

Wherein American Makers are Ahead.

With the steam hammers of three and four thousand pounds that are being put in some of the leading automobile factories it is claimed that no small fractures or flaws are possible in forgings, which is a big advantage over the methods pursued in some foreign factories, where the forgings are made almost by hand, the workmen using small hammers. Visitors to Europe say there are many ways in which American manufacturers lead the foreigners now, especially in the making of parts by machinery, which is much more accurate than that done on the other side by hand.

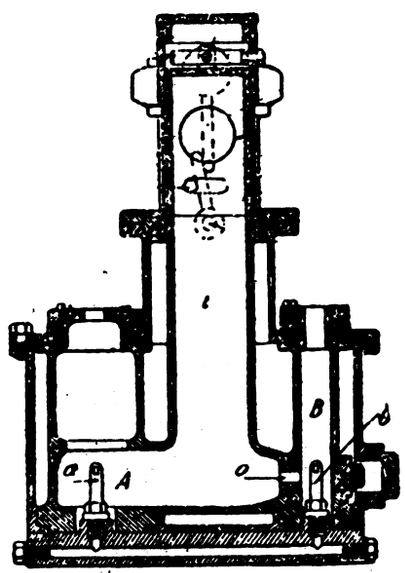
IMPROVEMENT IN IGNITION

How it Evolved from the Hot Tube and the Tendencies of To-day.

Discarded by makers with one accord but a few years ago as only being suited to the requirements of the slow speed engine, the low tension, make and break system of ignition is again in the ascendant and its prevalence on this year's models exhibited at Paris may well be put down as one of the most noticeable developments of general acceptance. When the internal combustion motor was first settled upon as the power of the motor car of the future, the designers of the latter found it in a rudimentary state, particularly with regard to the system of ignition employed.

Probably the pioneer method of exploding the charge was the Otto slide valve used in connection with an open gas flame —obviously one totally unsuited to the needs of the motor car. There appears to be some uncertainty as to the chronology of the invention of the various systems of ignition, but in all probability the hot tube method followed the use of the pocketed flame, of which it was a consistent development. Whether the discovery of the catalytic method preceded or was approximately coincident with that of the use of an electric current for the purpose is unimportant, but these, supplemented by spontaneous combustion through high combustion comprise the catalogue of known methods.

No attempt was ever made to employ Otto's invention on the automobile motor, the hot tube used on the first Diamler and Panhard motors marking the pioneer application of any system in this role. It is hardly necessary to state that its use was open to numerous objections, not the least of which was the necessity of heating the tubes prior to starting and the cooling effect of the wind upon them, frequently reducing the temperature to a degree that prevented the occurrence of the explosion. A few missed explosions allowed the tube to cool so much that reheating was necessary. In the light of present day advances this all reads like ancient history, but it is surprising to recall that the hot tube was retained on the Panhard car as recently as 1902.



So far as known this method was not experimented with for automobile use in this country. It was prevalent on stationary engines at the time the investigators first took up the problem of applying the gas engine to the motor car, but even in that field, it then had a competitor in the shape of the electric current. Credit for the development of the latter in this connection must really be accorded the marine engine designer. Being the only practical method that lent itself readily to his needs, the use of a spark caused by suddenly separating

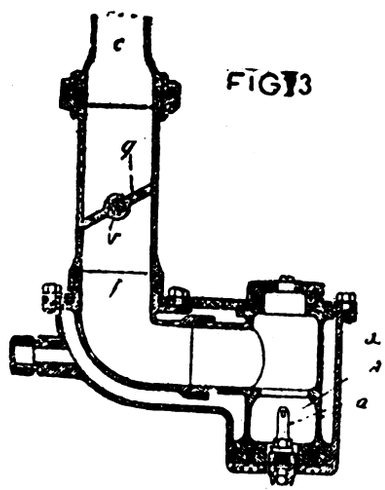
Digitized by Google

or wiping two contacts, was for a number of years standard on small boat motors.

Some automobile engine builders followed the lead thus set, while others started right at the outset with what has come to be known as the jump spark, and it was not long before the latter had the field entirely to itself. Crudity of design brought about the downfall of the make and break system at that time and it is not to be wondered at that methods and apparatus suited to the requirements of low powered and low speed motors should have proved inedaquate when transferred to a sphere imposing so much greater demands upon them. Lack of suitable means for advancing and retarding the time of ignition was a further drawback and burdened with these disadvantages the system fell into disuse. But the jump spark system has fallen short of fulfilling the bright promise held out by it and while marking the greatest advance yet made, it appears that its erstwhile predecessor is capable of development to a degree greatly surpassing it in simplicity and reliability. Hence its recrudescence which bids fair in the course of time to put it at the head of the list.

FIG 1

C. G. V. CARBURETTER.

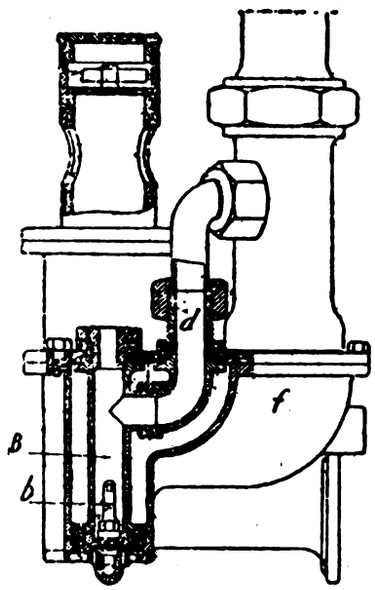


Rather a novel variation of the principle of providing as great an amount of radiating surface exposed directly to the air in a muffler is embodied in what is termed the "radio" silencer, of British origin. It consists of six tubes a foot or more in length with their open ends terminating in aluminum exhaust chambers, the whole being bound together by a bolt passing longitudinally through the center. In appearance it resembles a miniature steam radiator more than anything else. The exhaust enters at one end and traverses the length of all six tubes in rotation before issuing. It is claimed to give a perfect scavenging action.

SPRAYING THE GASOLENE

Multiple Nozzles now Coming into Use—One of the More Recent Creations.

Following the lead of other Continental designers, the builders of the C. G. V. cars have adopted a multiple spray nozzle type of carburetter, though it is interesting to note that while such makers as Renault and Diamler have adopted no less than four independent outlets for the fuel into the mixing chamber, in this instance but two are relied upon.



One of these is naturally the normal outlet which is at all times open and is sufficient to supply the needs of the motor while running light. This jet is likewise always open to the air on one side and to the suction of the motor on the other. To augment the speed the usual accelerator pedal is employed and in this instance controls the air-outlet and suction passage of the larger jet simultaneously, which immediately puts the latter into play. A hand regulator is further provided in reach of the driver by means of which the suction of the motor may be placed in communication with the chamber of the larger jet by a single movement. The speed may be varied to any point within the range provided merely by depressing the accelerator pedal more or less.

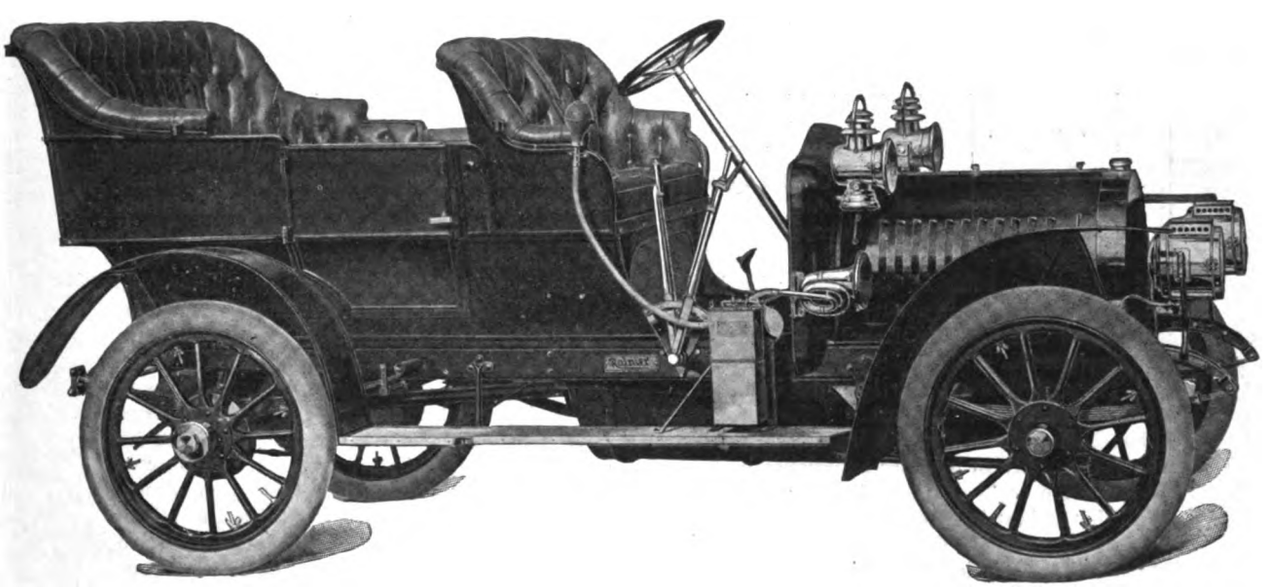
C. G. V. CARBURETTER.

Both nozzles are connected to a common float feed chamber maintaining a constant level, this part of the apparatus not being shown in the accompanying drawings. The relative positions of the two jets as well as their connections are made plain in the sectional elevation, Fig. 1. A and B represent the respective mixing chambers and ab the jets proper. A better idea of the general arrangement of the various parts may be had by reference to Fig. 2. In this partial section it will be noted that the tube D connects the mixing chamber of the smaller nozzle to the common intake f, to which it is attached as a branch. The larger tube f opens in direct communication with the cylinders through a manifold attached at c. In order that the small spray may be worked independently, a flap valve g is provided in the main inlet f below the point where d enters it. This arrangement is made clear in the sectional elevation Fig. 3. By closing this flap valve the suction of the engine can only reach the small nozzle, thus cutting off the other one. As the small chamber is always in direct communication with the outer air it may thus be readily isolated. But in case the air inlet of the large jet has not been closed entirely the two mixing chambers A and B communicate with one another through the small opening o, fig 1,

FIG 2

C. G. V. CARBURETTER.

and a sufficient quantity of air thus reaches B without in any way diminishing the pressure in chamber A. The air inlet of the large chamber consists of a tube rising above it and which is pierced with a number of holes. A cylindrical cover pierced with holes to correspond is so arranged as to be revolved. This cover is held in place by the tension of a spring bringing it against a stop in which position it closes the air inlets to a great extent. The flap valve g in the fuel outlet proper and the air inlet k are controlled simultaneously in the following manner.



On the axle of the flap valve g, is fixed on the outside, on one side, a regulating lever s connected with a regulating pedal, and on the other side is a second lever t. On the other part and on a protruding point on the outside of the cover k a curved finger v has been fixed, which can place itself in theway of the circular movement of the lever, as can be seen in the illustration (Fig. 1.) As soon as the automobile driver moves therefore the lever s by means of the intermediation of the pedal, a simultaneous opening of the flap g and the rotation of the cover k takes place, and this allows the air to enter. The more the pedal action ceases to work on the lever, the more it closes the flap, and at the same time the spring turns the cover in the reverse direction and places it at rest.

Rainier

The Pullman of Motor Cars

1906 Catalogue and Cars Now Ready.

1906 MODEL B, 30-35 H. P. PRICE, $4,000.

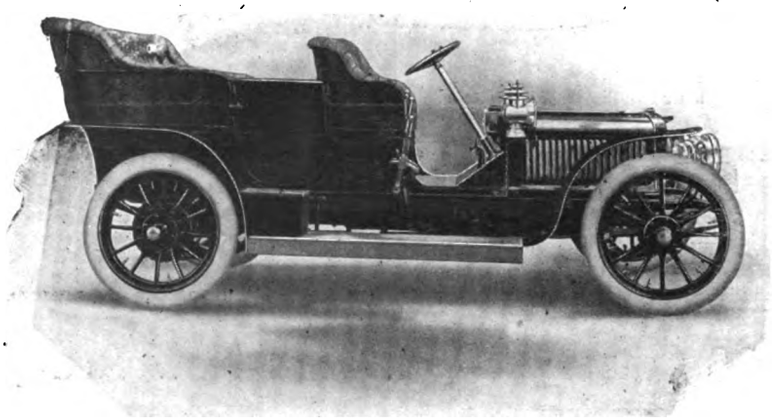
GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

During 1905 the Rainier was the hit of the season in New York, the most critical of markets. Not a single dissatisfied customer, only favorable comments everywhere, and orders galore for the new model from former users. Before you decide, investigate the Rainier, carrying the world's broadest automobile guarantee.

Make and break spark. Simms-Bosch Magneto. Bevel gear-drive.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Chicago Branch: 1253-1255 Michigan Ave. (after January 15th).



Boston Agents: MORRISON-TYLER MOTOR CO., 121 Massachusetts Ave.

Good Agents wanted in unassigned territory.

We exhibit in the Armory Shows in New York and Chicago.

LOZIER 1906 MODEL, TYPE D, 40 H. P. CAR

IF THE SATISFIED customer is the best advertisement, the LOZIER MOTOR CAR enjoys a most unique position. Every customer is a satisfied customer, and the fact that each is, in addition an owner with large Automobile experience, makes his expression of satisfaction with THE LOZIER MOTOR CAR an advertisement of the VERY BEST—Ask one of them—and then see our line of Limousines, Landaulets and Touring Cars.

The Lozier Motor Car is a high-grade product with years of Motor building experience back of it—the name of "LOZIER" being a guarantee of all that is best in high-class construction.

Our new 1906 MODEL TYPE D, 40-H. P. TOURING CAR, is shown above, and it is a most beautiful car. The price is $5,500, and among its features of construction may be mentioned the long wheel-base, 117"— 36" wheels —4"-4½" tires —55" tread —10" clearance. Platform-spring suspension. Weldless I-beam nickel-steel forged axles. Dust-proof irreversible steering column. Ball-bearing steering knuckles—nickel-steel forgings. Large ball-bearing wheel hubs. Noiseless sliding gear transmission gear slides of nickel-steel—gears ground to gauge. Self-contained annular ball-bearings in thrust, transmission and differentials. Speeds—selective type—four forward and reverse —one lever for all. Dog-and-ratchet back-stop on differential shaft. Noiseless exhaust. Dust-proof internal expanding emergency hand brakes. Powerful foot brake on differential shape. High power motor. Annealed pistons. Interchangeable valves and parts. Webbed crank-shafts. Crank-shaft bearings hardened and ground on own centers. Combination bronze and babbitt crank and crank-shaft bearing boxes. High tension magneto. Positive force-feed lubricator. Large radiator. Automatic carburetor with balanced throttle controlled by governor. Speed controls on stationary quadrant at top of steering-wheel. Automatic disengaging cam on starting crank. Self-contained, large face, cone clutch—simple adjustments. Dust-proof aluminum case under motor and entire transmission. Noiseless fiber cam-shaft driving gears. Cottered nuts throughout. Small oilers for chassis springs. Camshafts of crucible steel—cams integral. Nickel-steel clutch shaft—double universal joints. Cylinders bored and ground. Chain adjustments. DESCRIPTIVE CATALOGUE NOW READY. Send for it.

THE LOZIER MOTOR COMPANY

FIFTY-FIFTH STREET AND BROADWAY, NEW YORK CITY

See our Exhibit at the Automobile Show, Jan. 13 to 20, at 69th Regiment Armory. "The OLD Show in the NEW Armory." We are in Section B, on the Main Floor.

The Week's Patents.

808,622. Friction-clutch. Frank H. Ball, Plainfield, N. J. Filed June 29, 1903. Serial No. 163,608.

Claim.—1. In a friction clutch the combination of an annular friction-surface a split friction-ring adapted to act on said surface; a carrier for said split ring, the ends of said ring having a limited circumferential movement on said carrier; and mechanism for actuating the free end of the ring to set the clutch, each end of the ring being adapted to become either the driving or free end according to the direction of movement of the clutch the ring being driven with a clutch moving in one direction from its end.

808,625. Construction of Wheels. Thomas R. Beaumont, Park Place, London, England. Filed November 29, 1904. Serial No. 234,775.

Claim.—1. In a wheel in which a segmental wooden felly is surmounted by a metal tire, a wedge-shaped plug between adjacent segments of the felly; removable adjustment-liners between the outer end of the plug and the tire, a bolt countersunk in the tire and threading the said liners and plug, and a nut on said bolt engaging over said plug; substantially as described.

808,732. Change-Gearing. Castor H. A. Dissinger, Wrightsville, Pa. Filed October 1, 1903. Serial No. 175,293.

Claim.1. In a change-gearing wheel provided with a series of eccentric pins, an engine-shaft, a clutch-drum and a clutch member on said shaft, said clutch-drum having connections with the pin-provided wheel, a pinion adapted to engage the pins, a lever for shifting the pinion, and springs to automatically throw the device out of operation when the lever is released.

808,765. Wheel Structure. Joseph Ledwinka, Detroit, Mich., assignor of one-half to Charles Berg, Cleveland, Ohio. Filed September 10, 1904. Serial No. 223,956.

Claim.—1. In a wheel structure, the combination with a suitable rim, of a tire secured thereto and consisting of fibrous material divided into two sections in a plans traverse relatively to the wheel-axis, the fibers of one portion being inclined, with reference to said plane, in one direction and the fibers of the other portion being inclined in the other direction, said two sections forming the complete tire.

808,769. Power-Transmission Device. George W. Marble, Chicago, Ill. Filed December 15, 1904. Serial No. 237,011.

Claim.—1. The combination with a motor-shaft, of a plurality of pairs of shafts driven therefrom, the shafts of each pair being driven oppositely, a plurality of driving friction members on said shafts, a driven friction member adapted to be engaged by either of the driving friction members of one pair of shafts in driving and of another pair in reversing, a driven shaft, and an operative connection between the same and the driven friction member.

808,779. Electric Generator. Benjamin P. Remy and Frank I. Remy, Anderson, Ind., assignors to Remy Electric Company, Anderson, Ind., a Corporation of Indiana. Filed May 27, 1905. Serial No. 262,668.

Claim.—In an electric generator, the combination, with stationary poles, of a pair of annular segmental poles journaled within said stationary poles and provided at the ends with journal-bearings, an armature mounted within said annular poles and having shaft-sections journaled and supported in the journal-bearings of the annular poles, means by which the armature may be angularly moved within the annular poles, and means by which the annular poles may be shifted within the stationary poles.

808,828. Cover for Vehicles. William Findlay, Edinburgh, Scotland. Filed December 6, 1904. Serial No. 235,685.

Claim.—In a device of the character described, the combination of a plurality of stationary tubular pillars, tubes telescoping in said pillars and adapted to be raised and lowered therein, a casing connecting a pair of said tubes and permanently secured thereto, a pair of supplementary casings hinged to opposite ends of said first-named casing and adapted to be swung out from said casing, spring-actuated rollers in each of said casings, and covers wound on said rollers and adapted to be unwound therefrom.

808,902. Gas-Engine. Newton Crane, Boston, Mass., assignor to Newton Crane Gas Engine Co., Boston, Mass., a corporation of Maine. Filed May 23, 1903. Serial No. 158,420.

Claim.—1. An engine comprising communicating cylinders forming the sides of a polygon, and double-acting pistons in said cylinders.

808,915. Carbureter and Igniter for Hydrocarbon Engines. Arthur B. Goodspeed, East Orange, N. J., assignor to Industrial Development Co., New York, N. Y., a corporation of New York. Filed March 10, 1904. Renewed June 9, 1905. Serial No. 264,531.

Claim.—1. An igniter for internal combustion engines, etc., comprising a shell for external contact with the charge to be ignited and communicating internally with the external air and a carbureter and burner placed within said shell and comprising alined tubular members connected respectively with a hydrocarbon-supply and an air-supply and terminating centrally within said shell and means for spreading radially the burning gases, substantially as described.

808,958. Spark-Ignition System for Explosive Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed March 28, 1905. Serial No. 252,458.

Claim.—1. In an ignition system for explosion-engines, the combination of an induction-coil, an igniting device, and means whereby according to the speed of the engine a single spark or a series of sparks will be created at the igniting device.

808,965. Clutch. Roy L. Woodard, Richburg, N. Y. Filed January 31, 1905. Serial No. 243,523.

Claim.—1. The combination of a clutch, of a shaft, a loose pulley mounted thereon and having a perforated rib, a collar rigidly secured to the shaft, a plurality of arms projecting from the collar and provided with laterally-extended brackets, radially-moveable pins guided by the arms and provided at their outer ends with tool-engaging surfaces accessible through the perforations of the pulley-rim, said pins being provided with peripheral threads, clutching-shoes having threaded openings for the reception of the threaded portions of the pins and provided with lugs engaging said brackets to prevent independent turning movement of the shoes, said pins being independently adjustable with relation to the shoes to which they are attached, clamping-nuts mounted on the pins for holding the shoes in adjusted position, friction-blocks carried by the shoes, and means for operating the pins.

808,974. Protector for Pneumatic Tires. Henri David, Paris, France. Filed January 20, 1904. Serial No. 189,856.

Claim.—An antislipping, removable protector for pneumatic tires, comprising a series of independent narrow metallic strips secured upon and extending traversely of the tire, each of said strips being bent at two points to form a central tread portion and diagonally-arranged substantially straight sides having eyes at their extremities and fastening means passed through said eyes to hold the strips upon the tire.

808,975. Friction-Clutch. Hermann G. Dittbenner, Minneapolis, Minn., assignor to Diamond Iron Works, a Corporation of Minnesota. Filed August 29, 1904. Serial No. 222,500.

Claim.—1. The combination, with a shaft, of a loose pulley thereon, a member fixed on said shaft and having a surface to be gripped, arms pivoted on said pulley and provided with gripping-blocks to engage said member, a sliding sleeve, plates pivotally connecting the ends on said arms, and links pivotally connecting the ends of said plates with said pulley and said sleeve, the links between said plates and sleeve being substantially at right angles to the latter when the clutch is locked.

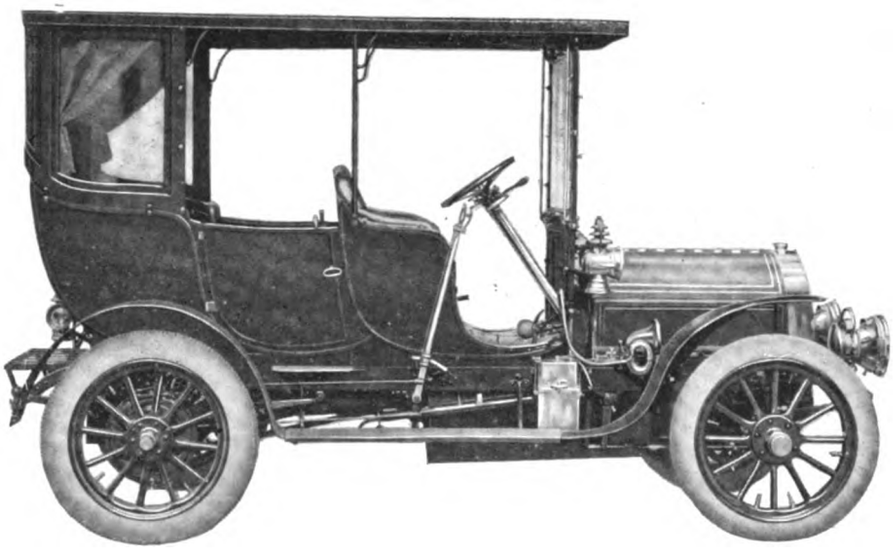
809,019. Device for Calculating Horse-Power. Eugene M. Scoville, Wipahu, Hawaii. Filed January 31, 1905. Serial No. 243,497.

Claim.—1. A calculating device comprising a pair of scales, one being provided with a stationary gage-point, and a slide having a scale adapted to register with one of the first-mentioned scales and provided with a rider slidably mounted thereon and adapted to register with the other stationary scale and with the gage-point.

809,040. Vehicle-Wheel. Manuel G. Babio. New York, N. Y.. Filed March 6, 1905. Serial No. 248,479.

Claim.—1. In vehicle-wheels, an inner and an outer hub, one mounted loosely around the other, said outer hub being provided with gearing on the peripheral surface of the inner rib of the hub, a circular pneumatic tube fitted in the outer hub and having constant bearings upon the main hub by means of an endless band intervening between the two, a hollow bolt in connection with said pneumatic tube, and chains connecting the two hubs, which chains are in independent series, acting in opposite directions.

809,081. Internal-Combustion Engine. Sydney S. Williams, Chicago, Ill. Filed September 2, 1902. Serial No. 121,746.



Claim.—1. In an internal-combustion engine, the combination of a cylinder having a piston, a plurality of ignition-chambers each communicating with both ends of the cylinder, and valves controlling the communications of the chambers with the cylinders.

809,082. Internal-Combustion Engine. Thos. Wright, Jersey City, N. J. Filed February 17, 1904. Serial No. 193,961.

Claim.—1. In an internal-combustion engine, the combination of a plurality of working cylinders, a plurality of pump-cylinders arranged alternately with respect to the working cylinders, a crank-shaft common to all of the cylinders, means for supporting all of the cylinders to turn around the center of said shaft, pistons operating in the cylinders, connections between the pistons and the crank, means controlling fluid movement between the various cylin-

Digitized by Google

PIERCE

This is the Great Arrow Victoria Tonneau, 40-45 H. P. with semi-enclosed top. Price without top, $5,000. Semi-enclosed top, $350 extra. Cape top, $200 extra. Folding glass front, $50 extra.

One convincing proof of the excellence of Pierce cars is the fa[c] that they appeal most to the most mechanical minds. An automobile is a machine. The more a man understands about the principles of mechanics, the better he appreciates the way in which the Pierce Arrow is made.

The initial cost of a Pierce Arrow is greater than that of any automobile made in this country, but the price seems low when compared, not only with the small cost of maintaining, but with the long time of service given.

Pierce Arrows are never out of date as far as effective service is concerned.

Catalogue and descriptions mailed on request.

ders, said means comprising connections between the pump-cylinders and the two working cylinders adjacent thereto, and valves controlling said connections and seating against pressure in the working-cylinders.

809,171. Steering Device. Alexander T. Brown, Syracuse, N. Y., assignor to Brown-Lipe Gear Companv, Syracuse, N. Y., a co-partnership. Filed May 11, 1904. Serial No. 207,463.

Claim.—1. A steering device for vehicles comprising a driving member having internal substantially helical teeth, and a driven member arrangcd eccentrically relatively to the driving member and provided with teeth engaging the internal teeth at one side of the driving member and separated from said internal teeth at the diametrically opposite side of the driving member, substantially as and for the purpose specified.

809,185. Explosive-Engine. John F. Johnson, Chester, Pa. Filed October 19, 1904. Serial No. 229,133.

Claim.—1. In an engine, the combination with a cylinder, of a reciprocatory piston mounted thereon, a tubular extension carried by the piston and reciprocating therewith, said extension having a port, means for introducing motive-fluid-supply charges into the extension, a cut-off located within the extension and arranged to close the port thereof, and means for holding the cut-off against reciprocation.

809,205. Vehicle-Wheel. George D. Munsing, New York, N. Y. Filed March 20, 1905. Serial No. 251,103.

Claim.—1. In a vehicle-wheel, an inner rim, a hub, spring-spokes having their outer ends bent, a two-part clamp to adjustablv hold the hub end of each spoke and having bearing in the hub. and a channel-shaped over which the outer bent ends of said spokes take and around which said bent ends are capable of rotation, substantially as and for the purpose set forth.

809,211. Starting Means for Gas or Similar Engines. Francis L. Orr, Thurman, Iowa, assignor of one-half to Mark Morrow, Percival, Iowa. Filed February 21. 1905. Serial No. 246,753.

Claim.—1. An explosive-engine starter, employing an air-storage tank, a carbureter, an air-passage way leading from the storage-tank, through the carbureter and into the combustion chamber of the engine, means for re-storing the air-tank, means operating to arrest action of the storing means by pressure in the storage-tank, a spark-plug with battery and suitable electric circuit, ,for ignition of the explosive mixture in the engine combustion-chamber, a communicator device driven by the engine, a valve in the air-passage way leading from the storage-tank, a solenoid or similar device having electric supply and a cut-out, adapted for operating the said valve, brushes adapted for adjustment into circuit-closing contact with the commutator bv operation of the solenoid, a normally open circuit-closer adapted for closure through operation of the solenoid, the spark-coil and battery being in electrical circuit with the commutator-brushes. the engine spark-plug, and the poles of the normally open circuit-closer, substantially as described.

809,235. Induction-Coil Vibrator. Richard Varley, Englewood, N. J., sasignor to The Autocoil Sompany, a Corporation of New Jersey. Filed February 25, 1905. Serial No. 247,215.

Claim.—1. An induction-coil comprising a vibratile element fixed at one end and carrying an armature at the other, in combination with a tension screw adapted to positively increase the tension of said element when working outward.

809,262. Contact Device for Induction Apparatus. Ralph O. Hood, Danvers, Mass., assignor of one-half to Warren D. King, Peabody, Mass. Filed April 11, 1905. Serial No. 254,921.

Claim.—1. In a contact device for induction apparatus, the combination of a casing, a flexible closure therefor forming therewith a substantially air-tight chamber and contact-points, one of which passes through the said flexible closure.

809,268. Sparking Ignition System. Leon J. Le Pontois, New Rochelle, N. Y., assignot to Poly-Phase Ignition System Company, a Corporation of New York. Filed November 17, 1904. Serial No. 233,165.

Claim.—1. A sparking ignition system comprising an alternating-current generator of the inductor type, said generator consisting of a stator having a field-magnet in the form of a permanently magnetized ring wound from a continuous steel ribbon, symmetrically-located polar projections secured to said ring, coils wound on said polar projections, an inductor mounted on a revoluble shaft whose axis is coincident with the axis of said stator and constituting a rotor, a circuit-breaker rigidly secured to said stator, a cam mounted on the rotor-shaft and adapted to actuate said breaker at the period of maximum current generation, a transformer, and means for shifting said stator and breaker relative to said rotor and cam respectively so as to modify at will the time of sparking.

Lubricating the Shaft Drive.

A point in connection with the lubrication of the cardan joints of shaft driven machines is that although there is little or no danger of their receiving injury from dust or mud while the machine is running, owing to the effect of the centrifugal force of the rotating parts, when it is brought to rest, if there is a coating of either on the outside of the joints, it is very likely to work into the bearings. Consequently, when such parts are not properly protected by leather or metallic covers, they should be washed off with care as soon as the car is brought in from the road, and then lubricated plentifully.

In Case of Radiator Troubles.

In nearly every case of failure on the part of a radiator, the cause may be directly attributed to the vibration of the machine, and the distortion of the frame when running over rough roads. As a matter of precaution, it is well to place under the supporting arms bits of sheet rubber which will serve to absorb the majority of the strains. Pieces cut from a discarded inner tube will be found to answer very well for this purpose.

To Preserve the Accumulator.

To preserve accumulators during the winter, a motorist advises that if the car be not used during the winter the ignition cells will keep in good condition if all the electrolyte and dilute sulphuric acid is emptied, and preferably distilled water substituted. A disused battery put by without taking this precaution is apt to become badly sulphated, and is practically incurable.

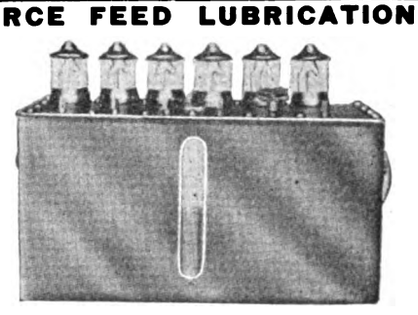
WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals. 25 cents per line.

A TEN PASSENGER wagonette; sample car, 1905-1906 model steam; price and description on application. THOMPSON AUTO CO., Olneyville Sq., Providence, R. I.

WANTED—Trained men as instructors in progressive automobile school. Fitness proved by examination. Address, INSTRUCTOR, care of Motor World, Box 649, N. Y.

FOR SALE—Established Automobile business, stock and machinery. For particulars address STANDARD WHEEL CO., Terre Haute, Indiana.



MUST be sold at oncc for the account of purchasers of 1905 Royal Tourists: 1904 Peerless, fine condition, canopy top, gas tank, price $1,500; 1905 Royal Tourist, fine order; 1905 Pope-Toledo, type 8, perfect condition, canopy top. Ohio Sales Agency, THE ROYAL MOTOR CAR CO., 330 Euclid Ave., Cleveland. O.

FOR SALE—One Model D. Cadillac Automobile in first class condition full lamp equipment and cape top. Also one Model F. Cadillac, in first class condition. THE COOK & STODDARD CO., 22nd and P St., N, W. Washington, D. C.

FOR SALE—Very cheap, Searchmont four cylinder; Ford two cylinder; Winton two cylinder; Rambler two cylinder; improved Rambler E, one cylinder; Orient Buckboard; mostly 1905 cars; prices and descriptions extremely interesting. A card will bring the information. E. S. YOUSE, Reading, Pa.

AUTOMOBILE users, drivers, repairmen, chauffeurs and others wanted all over the country; 50,000 machines built this year in United States, affording great opportunities for men trained in this coming business; six cents a day will qualify you for good wages in this field; in which the demand is such that ability counts ahead of pull and length of service. For full particulars, address THE CORRESPONDENCE SCHOOL OF AUTOMOBILE ENGINEERING, Suite 1357, Flatiron Building, New York City.

THE MARMON

"A MECHANICAL MASTERPIECE"

THE ONLY CAR WITH DOUBLE THREE POINT SUSPENSION.

DOUBLE THREE POINT SUSPENSION must not be confused with fixed THREE POINT SUSPENSION; it is the ONLY CAR which has a PIVOTAL THREE POINT SUSPENSION for both frames.

Solid cast aluminum body on one frame, power plant on another, each suspended on THREE PIVOTAL POINTS.

This eliminates the binding and twisting strains inevitable in rigid suspension of all other cars.

Also permits the use of a rigid shaft drive without the use of cardan joints.

Every part is manufactured under one roof excepting tires and lamps.

Automatic force lubrication in engine, with constant and uniform flow through a hollow crank shaft directly into engine bearings, crank and piston pin bearings. Allows a distance of 500 to 1000 miles on less than on gallon of oil for the engine.

We will exhibit at the Armory Show.

Model C, 24 H. P., $2,500. Model D, 32 H. P., $3,000.

ALSO chassis and solid cast aluminum body parts. All patented features will be thoroughly explained and demonstrated at any time during the show by

New Jones Combination

SPEEDOMETER - ODOMETER

For the dashboard of your automobile. Indicates the speed with positive accuracy. Registers the Season mileage traveled in miles and tenths to 10,000 miles. Registers the Trip mileage in miles and tenths to 100 miles. The mile figures are black; fractional miles, red. The Trip register has a stop-watch instantaneous resetting stem. Speed is indicated and mileage cumulatively recorded whether the car go forward or backward.

THE DASH BRACKET is adjustable to permit the instrument being set at any desired angle.

THE SHAFT CONNECTION is adjustable and permits the passing of the shaft through the floor; through or around either end of the car.

The principle and general construction of our new instruments remain essentially the same as in previous models—for the reason that the feature of compactness and durability are made possible in their highest form.

Complete catalog upon request.

New York exhibit Madison Square Garden only—January 13-20.

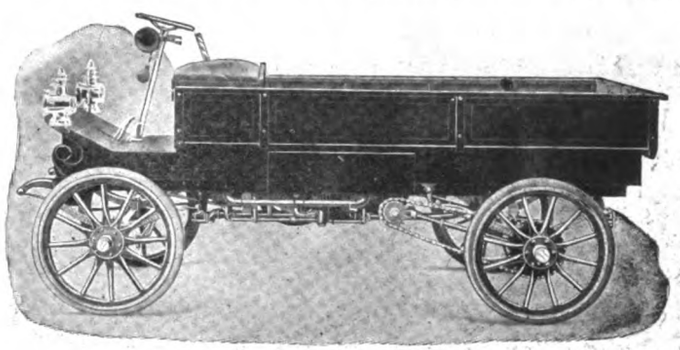
JONES SPEEDOMETER,
132 West 32d Street, New York.

The Rapid Motor Commercial Vehicles

Our entire organization has from the very first been devoted exclusively to the building of Commercial Vehicles.

The success of "Rapid" motor wagons is due to the fact that they are built with the idea of giving heavy continuous service, and carrying heavy loads.

The wagon illustrated weighs 2230 lbs. and carries 3000 lbs. easily. Rear Wheel measures 34 inches; front wheel 32 inches; solid tires. The double side chain drive insures a maximum of power delivered to the 2-inch solid steel axles. The cut illustrates only one of our many bodies. Size and style of body furnished to meet your requirements.



One Ton, $1,400; 1 1-2 Ton, $1,800.

GUARANTEED FOR ONE YEAR.

Agents can secure territory by writing me now, before all choice allotments are gone. Our new factory is a guarantee of prompt delivery.

THE SIMPLEST ENGINE IN THE WORLD.

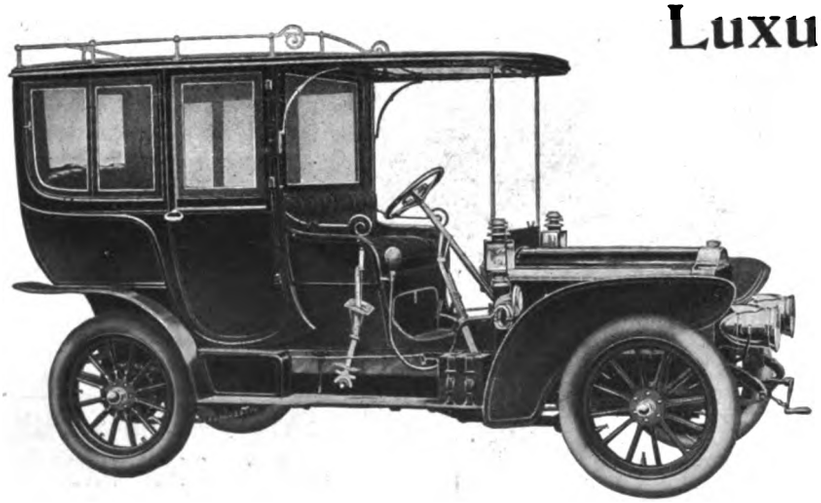
THE TWO-CYCLE ELMORE

When you understand that the two cycle Elmore engine does away with 18 to 20 parts on each of the four cylinders, and absolutely eliminates all inlet and exhaust valves with their attendant mechanism, you'll agree with us, won't you, that this is the simplest engine in the world?

Do we need to point out that this also reduces the cost of operation and upkeep to the minimum and makes the Elmore the most economical as well as the simplest of engines in the world?

From whatever standpoint you examine the two-cycle Elmore, equally impressive and sensational features present themselves. The four cylinder car produces approximately as much power as would eight cylinders of the four-cycle type—produces it in a continuous and unbroken application that will carry the car indefinitely on the high speed under any and all road conditions.

Again, it is the most successful self-starting engine in the world. Again, you can cut out one, two or three cylinders at will, both spark and gasoline. With one cylinder cut out the difference is imperceptible except in speed; with two out, barely noticeable. Do you see the economy of this?



Again, you can throttle the Elmore engine on the high speed down to two miles an hour. Again, the Elmore will take a 16 per cent. grade on the high speed with approximately as much ease as it travels on the level road.

It starts with a smooth gliding motion that is delightful, and dips down and over uneven spots with a minimum of jolt or jar.

The four cylinder Elmore at $2500 and the two cylinder Elmore at $1500 are two cars whose manifold exclusive features demand your most serious consideration. Learn all the wonders of the two-cycle type by getting in touch with the nearest Elmore agent or by writing for our new descriptive catalogue and books of information.

THE GROUT 4 CYLINDER

30-35 H. P. PRICE, $2,500

Read the following specifications and then think it over:

30-35 H. P., 4 cylinder, balanced motor, high tension ignition, using one coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse, actuated by single lever.
Wheels, 32-inch, wood artillery, ball bearings, 4-inch tires.
Armored frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication: Mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.
Top and headlight, with generator.

GROUT BROS. AUTOMOBILE CO., Orange, Mass.

NEW YORK AGENCY: MUNSING & CHAPMAN, 1855 BROADWAY

The Model F 30-35 Horse Power

Cleveland

THE CAR WITHOUT A WEAK SPOT

SHOWING THE CLEVELAND MODEL F, EQUIPPED WITH THE TULIP BODY.

THE buyer of a Model F. Cleveland can safely eliminate the cost of repairs as a factor. Its economy is a tangible asset, due to harmony of strength, design and construction.
The repairs on 50 1905 cars in constant use averaged $4.00, including time.
One Boston car ran 6,000 miles at a repair expense of $3.90. One New York car ran 9,000 miles at a repair expense of $6.00—$4.00 of which was for spark plugs.
The CLEVELAND has real, solid, tested, standing-up ability. The complete chassis is made by the Garford Company, the largest manufacturers of exclusively high grade automobile parts and chassis in America. It has no weak spots; we guarantee you against them. Price, $3,500 to $5,000, depending upon body equipment.
The ignition is by the imported Simms-Bosch low tension Magneto, with which all important foreign cars are equipped. The spark is make and break and controlled by the speed of the engine—doing away with spark plug, coils, intricate wiring and batteries. This ignition was used on the first seven cars in the last Gordon Bennet Cup Race.
The carburetter is automatic and requires no adjustment. It will not flood. The exhaust on the muffler prevents dust from coming in the rear of the car. Weight, 2,400 lbs., equipped for the road.

SPECIFICATIONS.

4-cylinder 30-35 H. P.
Imported Simms-Bosch Magneto—automatic make and break spark.
Direct drive. Nickel steel I-beam front axle.
34x4-inch wheels. Ball bearings. Wheel base, 104 inches.
Simplest control, 5 to 55 miles on high gear.
Absolutely noiseless.
Body option Victoria or Tulip, as illustrated.

Price, $3,500.00 to $5,000.00, depending upon Body Equipment. The 20-H. P. Model D will be continued without change. Price, $2,800.00. Both models guaranteed for one year. Catalogue and full information on request.

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocket-book and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

Fig. 1

And the chances are ten to one that if you are forced to ride around the block on a deflated ordinary tire with ordinary rims your tire will be rim cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough.

Fig. 2

Fig. 3

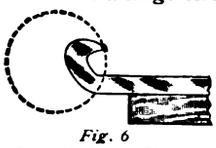

Fig. 4

But if you take the strap like Fig. 2, with a little sawing you can cut it. That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire. But just as soon as it gets partly deflated or flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

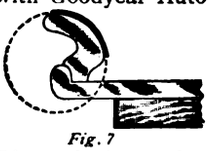

Fig. 5

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

Fig. 6

Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

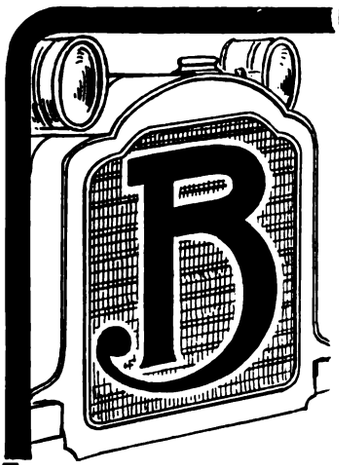

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without serious injury to the tire. We have the evidence if you would like to see it.

This is only one reason why wise riders are specifying Gooodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manufacturers, Dealers and Riders seeking relief from tire troubles.

THE GOODYEAR TIRE & RUBBER COMPANY, Grove Street, Akron, Ohio.

Branches in following cities: Boston, 6 Merrimac St.; New York, 253 W. 47th St.; Chicago, 110 Lake St.; Cincinnati, 242 E. RISCOE RADIATORS

ALWAYS IN FRONT

We are in the midst of our most prosperous season and are proud of the popularity of our product as evidenced by its general adoption.

Briscoe construction has won out through its merits both of design and construction. Both of our plants are busy with orders from the most representative car builders. We have shown our ability to provide the best results for those wishing either tubular or honeycomb radiators. We have also enlarged our line of products to embrace all the sheet metal parts required on both water and air cooled automobiles.

Our exhibits at all the shows will be well worth visiting by automobile manufacturers and assemblers. We will have on exhibition the latest designs in which we have made up our several styles of trustworthy radiators as well of samples of new methods of water circulation developed by us in our experimental department. We may be found at the Garden in Section 72, Elevated Platform, at the Armory in Section 15 Gallery, at the Coliseum in Section 134, and at the Detroit Armory in Section 27 Gallery.

Our two plants bring BRISCOE PARTS within reach of all automobile builders and our workmanship remains—THE VERY BEST.

WE ARE MAKERS OF

Both Honeycomb and Tubular RADIATORS.
Iron and Aluminum HOODS AND FENDERS.
Sheet metal DECK BOXES, SEATS AND MUFFLERS.
Ornamental HOOD FRONTS for air cooled cars.
Galvanized iron and copper Gasoline and Water TANKS.
Plain and ball bearing DISC FANS.
Concave Sheet Metal DASHES.

Write to our nearest office for estimate.

To Try An Acme Is To Buy An Acme

Acme Motor Cars

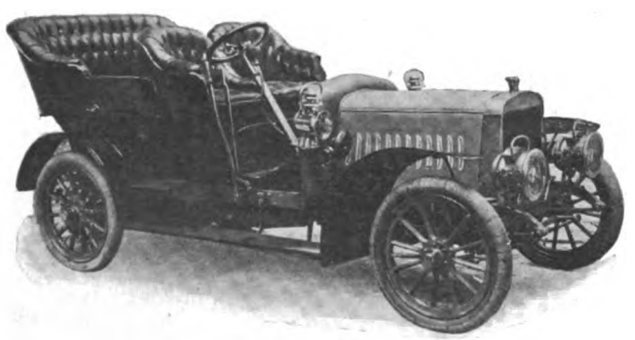
prove on actual, practical road demonstration every essential feature of advanced and perfected automobile engineering to-day.

The Acme claims of superiority are based on these cardinal points:

Highest Power in Proportion to Weight
Highest Efficiency Ease of Control Beauty of Design
Strength and Compactness Smooth, Quiet Running

GUARANTEED FOR 365 DAYS

Acme Motor Cars are built entirely and wholly by the Acme Motor Car Company, which means there are no bought parts for assembling—**no unknown quantities.**



TYPE XIV—$2750. Of the same practical construction as type XV. Greatly improved in arrangement and larger body than last year. Three Speed Sliding Gear Transmission, 30 Horse Power, 4 Cylinder Vertical Engine. Speeds up to 50 miles an hour. Demonstration by appointment.

Specifications, Type XV

Price	$3500. Complete with two side Oil Lights, two Acetylene Head Lights and Generator, Tail Light and Horn.
Type	Touring Car.
Seating Capacity	7 persons.
Weight	2600 lbs.
Wheel Base	114 inches.
Tread	56 inches.
Clearance	10 inches.
Body	Double Side Entrance Tonneau, divided Front Seats, made of best seasoned Ash, Poplar and Basswood.
Seats	Soft Edged, Spring Cushioned Seats and Backs, width, front, 19 in., depth, 18 in., width, rear, 52 in., depth, 18 in.
Leather	Best Quality, Hand Buffed, Pebble Grained, French Finished.
Frame	Cold Rolled Nickel Steel, 180,000 lbs. tensile strength.
Axles	Front Nickel Steel, drop forged "I" Beam Spring Seats integral with Axle; rear 1½ in. square, Nickel Steel forged.
Engine	40 H. P. Vertical, 4 cylinder, mechanical valves.
Clutch	Multiple Disc, running in oil, self-contained, no end thrust on bearings.
Transmission	Practically Indestructible, Selective Sliding Gear, direct drive on 3rd speed.
Speeds	4 speeds forward and one reverse on one lever.
Gears	Chrome Nickel Steel, oil tempered, 212,000 lbs. tensile strength.
Bearings	Annular Ball, full type non-adjusting, Lemoine pattern.
Sprag	Internal Rachet in Sprocket of each Wheel.
Bolts and Nuts	All Bolts and Nuts throughout car, case hardened, and locked with Spring Lock Washers and Cotter Pins.
Gearing	Speed up to 60 miles an hour.

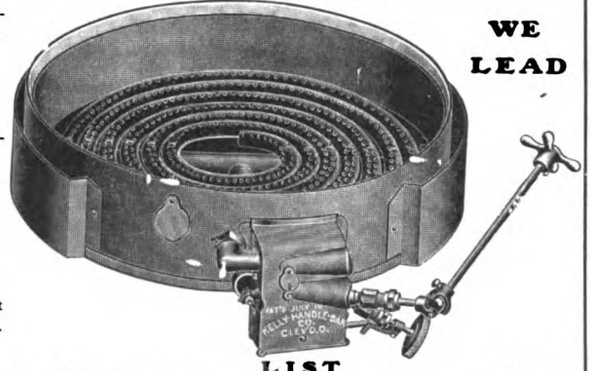
IMPROVED KELLY GENERATOR



Tubular Burners and Casing for Steam Boilers

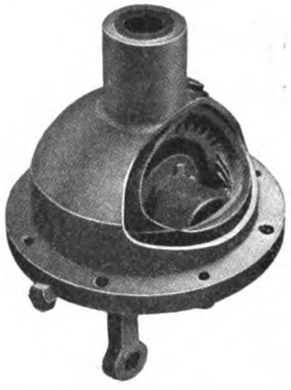
ARE UNEXCELLED

OUR new and Improved Burner is made of one continuous steel tube with cross tube below which is connected with each coil, giving an even distribution of gas over the entire surface of the burner.

The walls of the burner being of uniform size give a perfect and powerful fire.

No inconvenience or damage should the burner become red-hot, no back-firing as there are no air tubes swaged in the coils as is the case with a double sheet steel burner.

WE LEAD



LIST

Generators alone,	$25.00

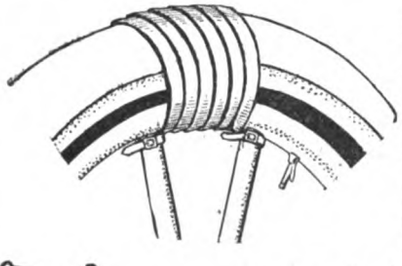
Woodworth Detachable Tread

FOR 1906

Is perfect in every detail. Our new construction making a partially flat tread, has the effect of increasing the wearing surface, and making the studded strip maintain its position exactly on the middle of the tire, even when the tire is flat. Our new wire side-ropes can be very quickly and easily adjusted, making it possible to apply the tread in less than 15 minutes, and with very little effort. The tread prevents punctures, skidding and wear. Suitable for any make of pneumatic tire, old, or new. Does not rot the fabric like a vulcanized tread. Adds to the appearance of the machine.



Compare our prices with others which do not give one-half the value.

The Automobile Tire Emergency Strap

DOES for the automobile tire what tape does for the bicycle tire. ¶ Made of special chrome leather absolutely unaffected by water. ¶ Is applied by buckling one end to a spoke, winding tightly around the partly inflated tire and buckling the other end. ¶ Will enable a person to run a hundred miles with a bursted, rim-worn or badly cut tire-shoe. ¶ Makes it safe to take long trips without an extra casing.

One size fits all tires.

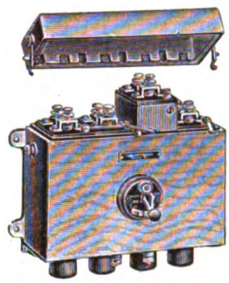
PITTSFIELD IGNITION SPECIALTIES



For 1906

Single Cylinder Dash Coil

Two Cylinder Dash Coil

Four Cylinder Dash Coil

Pittsfield Spark Coils

are as nearly perfect as it is possible to make them. The insulation is of the best and we guarantee that it cannot be punctured or ruptured. It has an extremely fast vibrator, and all adjustments are by lock nuts. Made for one, two, three four and six cylinders, dash type; and one, two, three and four cylinder box type. Smallest and most efficient American Coil made.

The 1906 Jewel Spark Plug

is of the same excellency of manufacture that has made this plug so popular throughout the country, the difference being that it is much shorter, the core being ground on a taper into the shell, which makes it easy to remove and clean, and it is also made with a novel connection which does away with the binding nut and also obviates the trouble of twisting the core by a person using a wrench or plyers for fastening the nut. The advantage of a plug of this kind can readily be seen. We are daily receiving large orders for them.

The 1906 Pittsfield Timer and Switch are now ready

MONEY makes the mare go. PETROLEUM makes the motor go

But the OIL that makes the car go best, is known as

LUBROLEINE

LUBROLEINE Non-Carbonizing Cylinder Oil for Gasolene Motors.

LUBROLEINE CYLINDER OIL
For Steam Motors

This oil is especially manufactured for lubricating the Cylinders of Gasoline Motors It has a high fire test, will not carbonize or gum, and is perfectly safe.

LUBROLEINE ENGINE OIL
For Bearings

Packed in 1, 5, 10 gal. cans, barrels and half bbls.

CLYMAX-SYNOVIA

Solidified Oil or Cup Grease

FOR AUTOMOBILES AND MOTOR BOATS

This high grade lubricant is a combination of the finest grades of mineral lubricating oils. It is impervious to heat, cold, water or steam. Will not gum, and contains no acid, alkali, or any ingredient injurious to finest metal surfaces.

It is not affected by climatic changes, and retains its consistency under all ordinary degrees of temperature.

CENTAUR GRAPHITE GREASE

For Automobiles and Motor Boats, Axles Bearings, Chains and Gears

This preparation is a perfect combination of the finest American graphite and a high grade lubricating grease. While it is of a pasty consistency, it is not affected by climatic changes. It is impervious to heat, cold, water or steam, will not gum, and contains no acid or any ingredient injurious to the finest metal surfaces.

Its anti-friction qualities are unexcelled.

Packed in 1, 2, 5, 10, 25, 50 lb. cans. barrels and half bbls.

The CELEBRATED BRAMPTON CHAINS Made from Self-Hardening Steel

SCIENTIFIC AMERICAN
ESTABLISHED 1845.
INCORPORATED 1906.
MUNN & CO.
361 Broadway, New York.
CABLE ADDRESS: ETNAN NEW YORK.
PATENTS, TRADE MARKS, COPYRIGHTS, UNITED STATES PATENT OFFICE.

May 22, 1905.

Chas. E. Miller,
97 Reade St.,
New York City.

Dear Sir:-

I wish to express my appreciation of the Brampton chain, one of which I have recently given a severe test on a single cylinder touneau, the chain for which is small for the power it has to transmit. Last season I tried three kinds of the best domestic chains with the result, that each one was worn out at the end of about 500 miles. Owing to a quick-gripping clutch, I was constantly experiencing a broken chain.

As soon as I was able to procure a Brampton chain of the proper size, I equipped my machine with it. I recently made a 250 mile trip through the Berkshire region of Massachusetts, cutting directly across country from Northampton to Adams, over some very hilly and rough roads. During this trip the chain was submitted many times to terrific jerks when pulling the car out of mud holes and starting it on hills, these jerks being much greater than would ordinarily be experienced; owing to a fiercely-gripping clutch; throughout all this severe test the chain never failed me. At the end of the trip, and after running it altogether something over 500 miles, an examination showed only a slight wear on the inside of the rollers, causing a very little play of these on their bushings. The chain otherwise is as good as new. Best of all however, is the fact that I can now go motoring without the constant dread of a broken chain, the repair of which is the dirtiest of all jobs that the automobilist has to encounter.

Yours very truly,
Auto. Editor of the Scientific American.

Note Heavy Chamferred Side Plates. All Parts of this Chain Polished. Fits Sprockets Without Friction

TWO PAIRS OF CHAINS IN 75,000 MILES

BRAMPTON BROS., Ltd.

EALING, LONDON, February 13, 1905.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, running daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

CAN BE AND WILL BE FITTED WITH THE CELEBRATED BRAMPTON CHAIN IF YOU ORDER IT THAT WAY, AND IT WON'T COST YOU OR THE MANUFACTURER ANY MORE THAN AN INFERIOR CHAIN. ALL STANDARD SIZES IN STOCK TO FIT AMERICAN AND FOREIGN CARS.

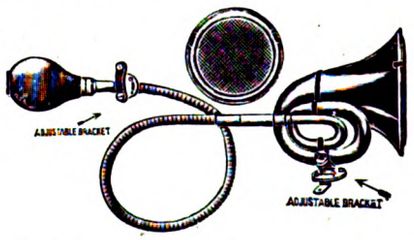
Miller's Combination Siren Horn

This is a combination of the ordinary horn and the Siren Horn, and the only one of the kind on the market. Special Catalog mailed on request. Price of this combination horn is **$50.00.**

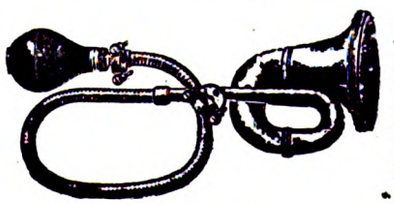
"La Bassoon" Horns

This is one of the latest ideas in a horn and is distinctly new. You will notice from the cut that this horn is made with an extra coil in the body of the horn similar to "La Tuba." This extra coil has the result of producing a very deep and musical tone. All our horns are spun from heavy brass and are highly polished. The illustration shows the adjustable bracket fitted to both horn and tube so that they may be attached to any kind of a car and in any position desired. The reeds and bulbs are guaranteed for one year.



No. 15 L. B. Diameter of bell, 7 inches. Polished brass only. Complete with 40 inch flexible tube and screen, **$9.50.**

No. 14 L. B. Same as No. 15, except diameter of bell is 6½ inches. Price, complete, **$8.00.**



"La Tuba" Horn

This is another one of the latest (double bend) style of horns, similar to "La Bassoon." Fitted with adjustable brackets and produces a deep and lasting tone. Three sizes, complete with tube. Price each,

$7.00, $8.50, $9.50

No. 8, Our Leader

This horn is fitted with 40-inch tube, screen and adjustable brackets. Diameter of bell, 5¼ inches. Furnished in polished brass and nickel plated. Price, complete, as above, **$4.50.**

DIAMOND CHAINS

The structural variations in automobile chains are much more striking and important than is commonly supposed. The indispensable elements in the manufacture of a high-class chain are first-class materials and workmanship. It is easier to pretend that these elements have been combined than it is to prove it.

No chain factory uses as good stock as ours. "Diamond" rivets are made from nickel steel—that's their distinguishing characteristic. Their tensile and shearing strength is from 50 to 100 per cent. higher than in the case of rivets made from inferior stock. "Diamond" side links are also made from special analysis carbon stock, and all holes are reamed to size and pitch—exclusive advantages we boast for our product. We test every pound of stock before it passes from our warehouse to our factory.

Good workmanship is not associated with poor factory equipment. The physical condition of our plant is unrivaled—in fact, it is not even approached. Making nothing but chains, we are necessarily specialists in every branch of such manufacture. The degree of attention we pay to our business is shown in the many little refinements of practice which are to be observed only in our establishment. This attention to details may not serve to explain the superiority of "Diamond" chains, but it is certainly very suggestive of it.

"Diamond" chains fit any standard sprocket. They are unrivalled for accuracy of manufacture, strength and durability.

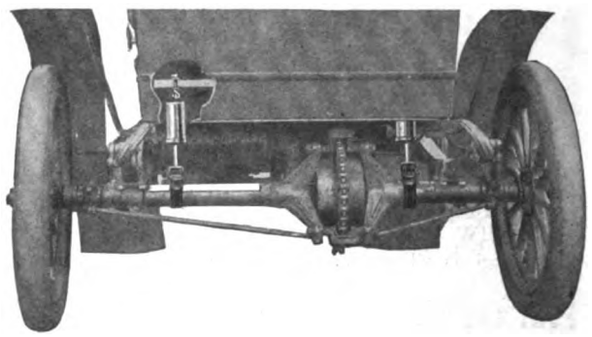
A Spring Recoil Check

(HOUSE PATENT)

An automatic, frictional device perfectly controlling the recoil of the springs

Its attachment to the body and axle of the car is easily made and so arranged that it is flexible, so that any oscillating or lateral movement of the car or running gear cannot strain or break its parts, and no oiling or adjusting is required.



A protection against broken springs.

Prevents the quick recoil over rough places which lifts the rider from the seat and makes travel fatiguing.

Permits the free action of the springs over smooth roads, but steadies the movement of the car over rough places and to a large degree relieves the weight from the tires when striking severe obstructions in the road.

Makes fast riding, with comfort and safety, possible.

Kilgore Automobile Air Cushion

"SHOCK ELIMINATOR."

(PATENT ALLOWED)

ON GOOD ROADS—They Allow you to use and enjoy the full elasticity of EASY FLEXIBLE SPRINGS, OBSERVE we say "full elasticity."

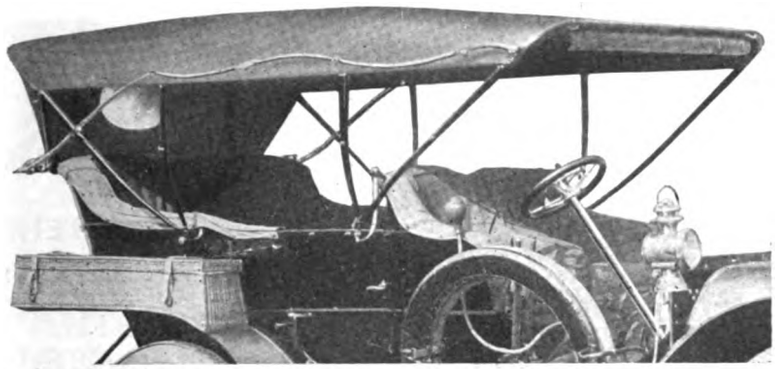
ON BAD, DANGEROUS ROADS—They control the too violent spring play BOTH UP AND DOWN, OBSERVE we say "both up and down."

THEY TRANSFER THE LOAD and strain from the springs to the axles.

THEY PREVENT spring istortion and breakage.

THEY LESSEN THE WEAR and tear on tires.

THERE ARE NO ADJUSTMENTS.



This should interest you because:—
It adds to your comfort and safety,
It effects a direct saving in "up keep."

Write for full particulars.

KNOX Waterless Commercial Cars.

PULLED FREIGHT CARS—BIG KNOX TRUCK MOVES 73,450 POUNDS OF FREIGHT UP GRADE.—To satisfy their curiosity, employes of the Knox Automobile Company made a test yesterday morning of the pulling capacity of one of the new Knox trucks, with rather remarkable results. In spite of the bad weather conditions, the truck was able to draw easily two freight cars, one of them heavily loaded, the total weight hauled amounting to 36 tons. The truck has just been completed for Marshall Field & Co., the great Chicago dry goods firm. It was known that it was a powerful machine, and to test it permission was obtained from the railroad officials to try it on cars on the New England track at Wilbraham Avenue. The truck was then connected with two freight cars, one weighing 41,245 pounds loaded, and one 21,200 empty. The truck itself was loaded and weighed altogether 11,000 pounds, making a total of 73,450 pounds. As there was snow on the ground, a little sand was sprinkled to give the wheels a grip, but no chains or any attachments were put on the wheels. Without any difficulty the truck started up the cars, the tracks being slightly up grade at this point. It was afterwards discovered that the brakes were partially set on one of the cars.—(Springfield Union, Dec. 12, 1905.)

We have recently received orders from Marshall Field & Company, Carson, Pirie & Scott, Chicago; Sterns Brothers and National Lead Company of New York, for these trucks. Firms of this kind do not spend thousands of dollars for a thing until they are thoroughly convinced that it is the best on the market.

Why No Car Should Satisfy You

BUT

The Thomas Flyer

It is impossible in these announcements to convey a complete and comprehensive idea of the manifold mechanical superiorities of the Thomas-Flyer. But it is possible to point out a few dominant features peculiar to this magnificent car which have won for it the high honor of representing America against the world in automobile manufacture.

From time to time we shall try to describe for you special features which are essential to your comfort and satisfaction and which you should insist upon having. In this announcement we group a few of the special Thomas advantages, calling special attention to the invaluable Thomas Safety Device.

THE CAR YOU BUY SHOULD PROVIDE:—A speed of from six to sixty miles per hour on the high gear, quietly, smoothly, without rock or jar; fifty horse power; mechanically operated valves; and separate cylinders—great flexibility, enabling you to take the steepest grades or the most crowded streets without change of gear. The car you buy should be able to take a 14 per cent. grade, etc.

THE CAR YOU BUY should have a dust-proof body. The Thomas body is patented. There is not a straight line in its design. Dust suction is entirely eliminated. The dust does not rise until it is fifty feet behind the car. Ladies can travel an indefinite distance without fear of dusting their traveling costumes.

THE CAR YOU BUY should seat seven, as does the Thomas—two in front and five in the rear. It should have two revolving chairs which are removable and may be placed under the cushion. It should be luxuriously upholstered in the best hand buffed leather, curled gray hair and springs. Shawl and coat racks; luggage box for two large suit cases, straps, tire and tool box.

THE CAR YOU BUY should have a clutch equal to the Thomas clutch, on which patents are pending. Three metallic discs—a perfect clutch, not susceptible of any improvements. After the most rigid and exhaustive tests of thousands of miles under adverse conditions, with extra heavy loads, the Thomas clutch has the reputation of never having shattered the car in starting; slipped or given the least trouble.

THE CAR YOU BUY should have a transmission equal to the patented Thomas transmission. A point of most vital importance. Selective type. Four speeds forward and reverse. Noiseless. Possesses the exclusive features of roller bearing on forward end of main transmission shaft and five Hess Bright bearings and large ball-thrust bearing with drive direct on the high speed without a gear or mesh. Very large spur gear differential. Wide faced gears and anti-stripping device which renders it absolutely impossible to strip the gears. Gears may be changed between high and low without passing through intermediate gears. The strongest and most efficient and most costly transmission in use.

THE CAR YOU BUY should have the commutator on the dash board. Various attempts have been made at home and abroad to locate the commutator on the dash board. The Thomas method has proven successful. The others have not.

THE CAR YOU BUY should have a single coil. With one exception all attempts to accomplish this have been unsuccessful save in the case of the Thomas. Only one adjustment of vibrator required for all cylinders.

The Celebrated Thomas Safety Device

You do not need to be told how many lives have been lost by cars backing down hill. Are you not entitled to be guaranteed against the danger of any such accident? Is not the Thomas Safety Device absolutely essential to your safety? Every Thomas automobile turned out is equipped with the Thomas Safety Device, a peculiar ratchet cast integral with the brake and sprocket drum on the rear hubs, the co-acting pawl being pivoted to the brake spider. It is operated by hand lever on the right side of the dash board, to which the pawl is connected by a wire cable. This safety device positively prevents the car from backing down hill should the engine stop. It can be used in place of the brake when stopping on a hill. This makes the Thomas car particularly adapted for use in hilly sections, and renders accidents from backing an impossibility. It is one of the distinctive and exclusive features of the Thomas.

Get in touch with the nearest Thomas representative and place your order at the earliest possible moment. Write for ilustrated catalogue.

Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA."

15-20 H. P., $3,000. **30-35 H. P., $5,000.**

Both with complete touring equipment.

TYPE H. LOCOMOBILE 30-35 H. P. $5,000.
Top and Luggage Carrier extra.

"It was hardly to be expected that the 1906 product of the Locomobile Company of America, manufacturing in Bridgeport, Conn., would incorporate any very marked departures from previous practice. To have done so would have been somewhat in the nature of gilding refined gold. By the early adoption and subsequent perfection of such advanced constructional features as four cylinder vertical motors, enclosed timing gears, automatic carburation, sliding gear transmission, yielding a direct drive on the highest speed, and solidly forged axles, it produced a car that was a credit to the makers and to those who used it. This being the case, the designers have been at liberty to confine their attention to the improvement of the minor details from year to year, the absence of distinctly radical changes in the make-up of the machine allowing opportunity for a process of evolution and elimination in the lesser parts which has worked out a most excellent result."

(From a recent issue of THE MOTOR WORLD.)

For 12c in stamps we will mail 12 souvenir postal cards showing various views ot the LOCOMOBILE in the Vanderbilt Cup Race, making the best showing of any American car in any international contest. For 10c in stamps we will mail a five-color poster showing the LOCOMOBILE finishing the race. Printed matter of 1906 cars on application.

C. H. BLOMSTROM MOTOR CO

DETROIT, MICH.

Digitized by Google

We will Exhibit in Madison Square Garden Automobile Show January 13-20. Space No. 39.

The "Matheson" touring car is designed to compete principally with the very finest and highest priced cars of foreign make. Its exceptional qualities and superior operation can only be fully appreciated by ***actual comparison*** with others, ***part for part,*** and by ***actual long-distance road demonstration.*** It is, without any exception, far and away the most thoroughly mechanical, the strongest built, the most powerful, the fastest, the handsomest and the most completely equipped car on the market to-day.

CHARACTERISTIC FEATURES:

Self-starting from the seat.
Make-and-break ignition with magneto.
Four-cylinder vertical engine.
All valves in the head mechanically operated.
Valves never require regrinding.
All valve-actuating mechanism, on top of engine quickly accessible.
Absence of Vibration.
Noiseless in operation.
Automatic, wide-range, multiple-spray carburetor; will stay adjusted and vaporize any grade of gasolene.
Automatic speed control by governor.
Automatic lubrication, multiple, positive, force feed.
Clutch, multiple-disc, metal to metal. Will run thousands of miles without adjusting.
Sliding-gear transmission, chrome nickel steel.
Roller bearings on all wheels.
Double Chain drive.
Extra large bearings throughout, insuring long life.
Hess-Bright (imported) ball bearings on transmission shafts, differential shafts, steering knuckles, and in clutch actuating mechanism.

Four especially powerful brakes; two are water-cooled.
Hill-pawl prevents car backing down grade.
Irreversible steering gear.
Axles, special nickel-steel forgings; I-beam pattern.
Nickel-steel frame, cold rolled pressed.
Flexible reciprocating rotary spring suspension, eliminating all torsional strains on front and rear springs.
Long half-elliptic springs front and rear.
Radiator, honeycomb type.
Gasolene tank, capacity 20 gallons.
Metal pan underneath car.
Tires, 36 x 4 inches front; 36 x 4½ inches rear.
Wheel base, 40-45 H. P., 112 inches. 60-65 H. P., 118 inches.
Side-entrance aluminum bodies, superbly finished; the unparalleled production of J. M. Quinby & Co. and Moore-Munger Co., luxuriously upholstered.

"America's Finest Motor Car."

"Matheson"

40-45 H. P. $6 000. 60-65 H. P. $7,500.
With Complete Equipment Below.

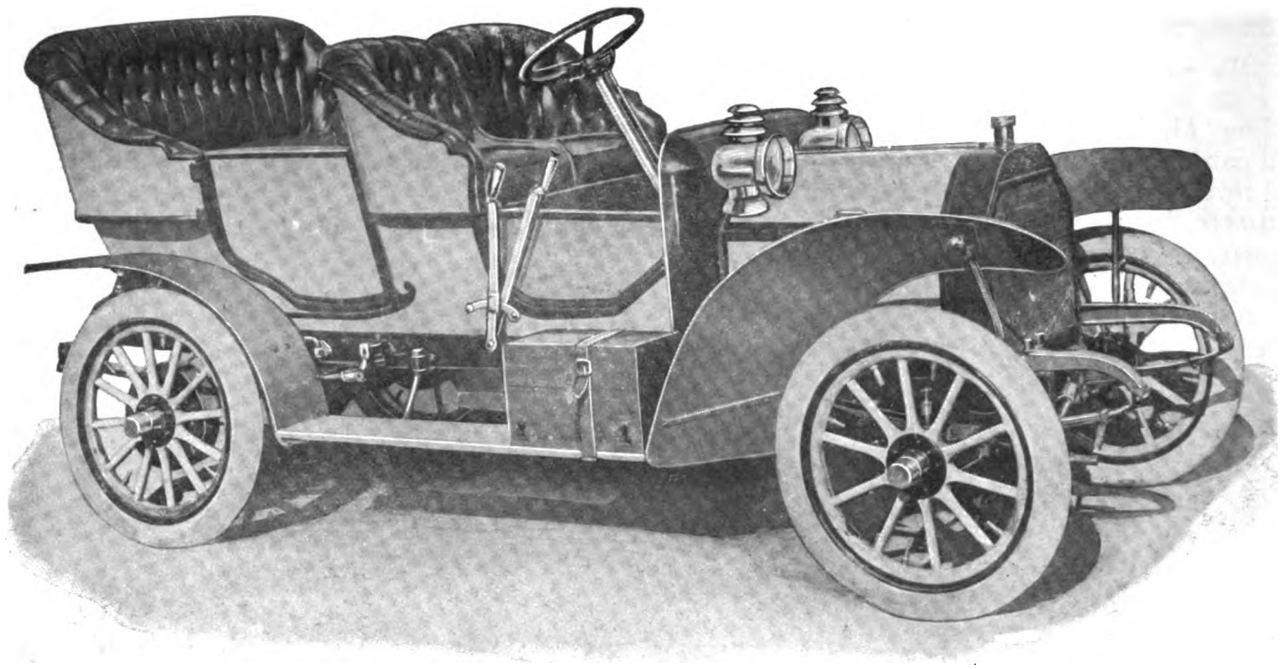
Weight, 40-45 H. P., 2,960 lbs.; 60-65 H. P., 3,160 lbs.
Speed guaranteed: 40-45 H. P., 60 miles per hour. 60-65 H. P., 70 miles per hour. Geared for greater speed, if desired.

Our Complete Equipment Consists of

Cape-Carte top.
Storm curtains,
Standing glass front,
Detachable folding seats, with lazy backs,
Foot cushions,
Mats front and rear,
Large leather wallet,

Toilet set of comb, brush, mirror, whisk broom and soap case,
Tool and accessory lock drawers,
Folding baggage rack,
Tire irons for carrying extra tires at side of car,
Tire covers, waterproof,
Coat rail,

Truffault-Hartford shock absorbers,
Acetylene generator or gas tank,
Acetylene headlights, oil side lamps, tail lamp,
Large dragon horn,
Chime horn,
Gasolene gauge,
Grademeter,



Reserve tank lubricating oil,
Jones Odometer-Speedometer,
Water-gauge,
Dashboard 8-day clock
Monogram on doors,
Complete set tools and tire repair outfit,
Extra parts, etc.

Complete catalogue giving full details mailed on request.

THE DOUBLE-ACTION OLDS,

Model L, Price $1250.

The Double-Action Olds is the most talked of car in America.

Here's why:

FIRST—Its motor has only three working parts: piston, connecting rod and crank shaft. It has no valves, no push rods, no bushing, no cam gears, no valve-stems—**IT'S SIMPLER THAN A HORSE.**

SECOND—It has an explosion to every fly wheel revolution, instead of one explosion to every other revolution. There is no idle stroke. Every stroke is a working stroke—**TWICE THE POWER WITH HALF THE WEAR.**

THIRD—It also means that you have a **CONSTANT CONTINUOUS POWER** instead of intermittent. It means the use of the high speed (direct drive) where any other car on hills or heavy going is forced into the second, or hill climbing, gears.

Write to-day for Double-Action Booklet.

The Waltham-Orient is an Air-Cooled Car.

And the advantages of air-cooling in cars of certain power-rating are manifold, each advantage being a conclusive argument in itself.

1. There is a great reduction in weight, owing to the absence of radiator, water-jackets, pumps and plumbing, and of the water supply itself.
2. This permits lighter proportionate construction throughout, and does not require such large tires, which are more expensive to renew.
3. It reduces wear on the motor and all bearings, cuts down the expense of repairs, replacements and tire bills.
4. It eliminates completely the complicated mechanism of water radiation with its constant tendency to leak.
5. It increases power and speed of the same comparative horse-power proportionate to the decrease in weight.
6. The weight reduction increases the elasticity and responsiveness of the car.
7. Its extreme simplicity and accessibility make it possible for each owner to adjust and tune his own car without assistance from an expert but expensive repairer.
8. A woman can drive it with ease because of the absence of confusing complications of control.
9. It will run 365 days in the year. It matters not if the thermometer registers 40 degrees below zero; there is nothing to freeze.
10. It is equally immaterial if the temperature is one hundred in the shade—the Waltham-Orient system of radiation, assisted by a powerful fan, keeps a uniformly cool engine, entirely free from overheating or pre-ignition. When it is considered that the explosion in the cylinders equals 1600 degrees Fahrenheit, it is apparent that the ordinary range of external temperature is not an important factor.

Our catalogue will be sent free upon request, and will tell the entire Waltham-Orient story. We are always ready for good live agents in unassigned territory. Write for proposition.

HAYNES

The Car of Many Exclusive Features

The Haynes has many exclusive features that assure for it a wonderfully low maintenance and up-keep expense.

In a 6,000 mile trip, made in early winter, from Kokomo, Ind., to New York and Boston via Albany, returning over the Allegheny Mountains by the National Road, the repair expense was but $1.50.

Roller-bearings throughout, make the loss of power between the motors and rear tires less than 10 per cent, and account for the ease with which the car went up the longest and steepest grades in crossing the mountains.

The Haynes exclusively has roller-bearing engines; a Master Clutch with no wearable surfaces, which takes hold without jerking; a transmission that positively prevents burring and stripping of gears; and a roller pinion and rear axle that overcome every objection to shaft driven cars.

Other exclusive Haynes features are given in our new catalogue. For prompt attention address Desk 7 .

Model "R" Four-Cylinder Touring Car.

Vertical roller-bearing engines. Cylinders cast separately, 5⅛x6 inches, 50 H. P. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master Clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller bearings throughout. 108-inch wheel base, 54-inch tonneau, seating five people. Four to 60 miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f. o. b. Kokomo. Full equipment.

Model "O" Four-Cylinder Touring Car.

Cylinders cast in pairs 4¼x5 in., 28 to 30 H. P. Transmission, cooling system, lubrication, master clutch, shaft drive, universal joints, sprocket, roller pinion and roller-bearings and body same as on Model "R." 97-inch wheel base. 4-inch tires. Tonneau seating three persons. Four to 40 miles an hour on high speed. Price, $2,250, f. o. b. Kokomo. Full equipment.

"The Car The Repairman Seldom Sees"

The 1906 Haynes Models will be shown at the New York Madison Square Garden Show, Space C-7, and at the Chicago Show, Coliseum, Spaces 7 and 8.

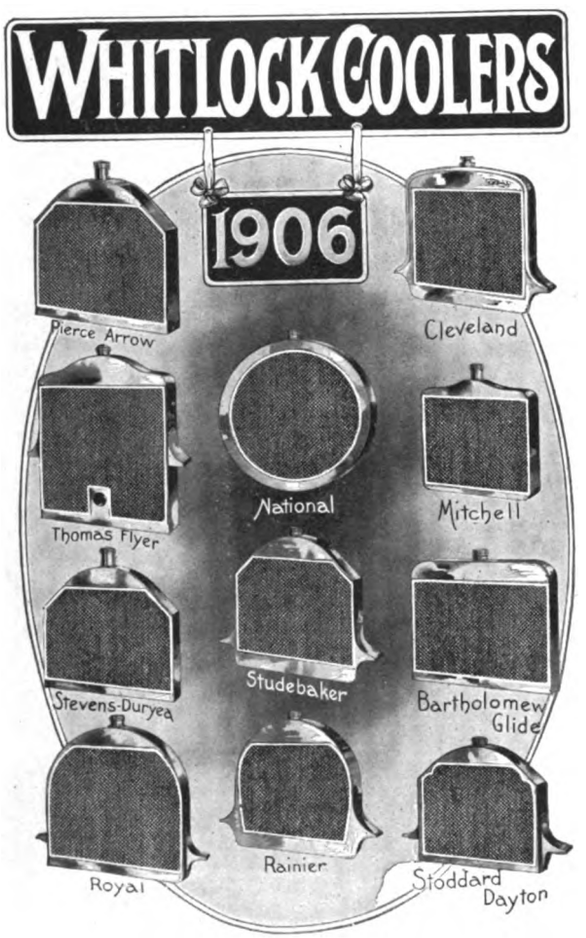
New Electric Carriages

COLUMBIA ELECTRIC BROUGHAM, MARK LXVIII.

IN New York, London, Paris and other large cities Columbia Electric Broughams, Landaulets and Hansoms are the favorite vehicles of people who demand and have the best of everything.

These carriages are made for private use only and no others compare with them for motive efficiency, exclusiveness of design, perfection of detail and finish, and luxury of furnishing. For town use they provide the ideal motor service.

At the AUTOMOBILE SHOW, MADISON SQUARE GARDEN, we are exhibiting a complete line of these superb carriages—also the lighter COLUMBIA ELECTRICS, VICTORIA-PHAETON and RUNABOUTS which, in their class, are no less distinctive in point of exclusive design, and equal superiority.



Catalogues of all Columbias, Electric and Gasolene, on request.

THE "Maxwell"

Perfectly Simple Simply Perfect

The Evolution of the Maxwell Doctrine–Maxwell Cars

The Doctrine:

1st. A cylinder of 5 inch bore with 5 inch stroke is ideal for a double opposed gasoline motor.

2nd. A double opposed motor, 5 inches by 5 inches, when properly made, develops, about 20 ACTUAL horsepower.

3rd. To use four cylinders for motors of 20 or less horsepower is unnecessary because thereby the number of wearing parts is unnecessarily increased.

4th. 20 ACTUAL horsepower, not momentum or fly-wheel horsepower, is enough for every requirement except excessive speed or extreme fashion. Therefore, a two cylinder, 5"x5" double opposed motor is the best, and IT IS AS EVENLY BALANCED AS FOUR CYLINDER CONSTRUCTION, is very much less complicated and much more reliable. It would take four 4"x4" cylinders to develop the same power as two 5"x5" cylinders, properly made.

5th. Four cylinder cars appeal largely to "Fad and Fancy" only; TWO CYLINDER CARS PRODUCE RELIABLE SERVICE.

The unprecedented successful record of the Maxwell cars during the season of 1905 prove the WISDOM of the above written DOCTRINE.

Reasons for the SUCCESS of the MAXWELL.

Common sense was the motive of its construction, not the impulse of "fad and fancy."

A 5"x5" horizontal double opposed motor for a touring car and a 4"x4" for a tourabout have been proved the *ideal* types for *service and reliability.*

MAXWELL HORSEPOWER is demonstrated by the ACTUAL CONTINUAL TEST, not by the flash system of testing which includes that resulting from the inertia of the fly-wheel. Therefore, MAXWELL HORSEPOWER is ACTUAL HORSEPOWER.

MAXWELL CARS ARE SPLENDIDLY MADE AS WELL AS PERFECTLY DESIGNED.

MAXWELL FEATURES in the PERFECT MAXWELL CAR.

MULTIPLE DISC CLUTCH, encased and running in oil, self-adjusting.

BEVEL GEAR DRIVE, combined with double universal joint avoiding filthy stretching chains.

THREE POINT SUSPENSION, resulting in the adaptability of the car to the unevenness of the road without straining the mechanism.

NATURAL CIRCULATION OF WATER, automatic in action, and eliminating all pump troubles.

METAL BODIES, eliminating the opening up of seams and the checking of bodies.

GREATEST SIMPLICITY, RELIABILITY AND ECONOMY, resulting in the lowest cost of upkeep, maintenance and operation.

Model H. 16-20 H. P. Touring Car,
Price, $1450.00.

It doesn't take a mechanic to adjust, to maintain and to run a MAXWELL car. MAXWELL CARS are sold under the *positive* guarantee that AS GOOD A CAR cannot be sold at a lower price.

Model L. 10 H. P. Tourabout.
Price, $780.00.

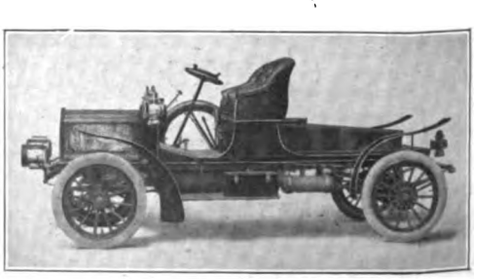
WHITE LIMOUSINE

WHITE TOURING CAR

To Those Who Did Not See Our Exhibit at the Armory Show:

As was quite appropriate, White cars were exhibited in the largest space alloted to any company at either Show. No less than six types of the Model "F" White car were on view and received the admiration of thousands of visitors.

If you missed this exhibit, the best consolation for you is to read our new catalog. All of our new models are completely described and illustrated therein. There is also included a short historical sketch, tracing the gradual development and perfection of steam machinery from Newcomen's engine of 1705, to the invention of the White generator. Brief references are made to some of the more notable triumphs of White cars in each year, commencing with 1901.



If you will write to us we will be very glad to send copy of the catalog and also to put you in touch with our nearest agent.

The Two-Cycle Principle Made Plain

1906 Four-Cylinder Two-Cycle Elmore.

Everybody should understand the two-cycle principle, which has given the Elmore Car its motor prominence.

A two-cycle engine means a constant, steady application of power, with no interval between the impulses. The expansive force of one explosion is only half way through when another begins.

Two-Cycle Elmore Engine.

Look at Cylinder No. 1. The piston of this cylinder is only half way down, the force of the explosion is still acting upon it, at the same time that the piston of cylinder No. 2 is just starting down from another explosion and before the force of the explosion of this piston is exhausted the third cylinder will come into action, then the fourth, and so on as long as gas is fed into the cylinder and there is a spark to fire it.

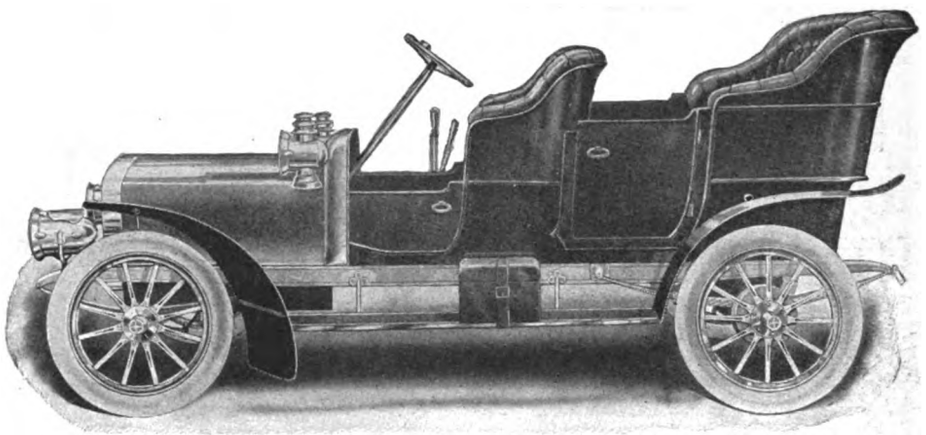
Simple, isn't it? But listen to this:

All the inlet and exhaust valves have been eliminated and actually from 18 to 20 parts on each cylinder have been done away with.

When actually fifty per cent. of the moving parts have been eliminated it is only natural that the cost of operation and up-keep is reduced fully fifty per cent.

The constant, unbroken application of power, only to be equaled in the four cycle by the use of eight cylinders and 16 valves; and the small cost of up-keep has made the **TWO-CYCLE ELMORE** the sensation of the moment.

You cannot fully understand the broad meaning of these points of superiority until you have seen the car.



Send for catalog describing the Four-Cylinder Two-Cycle Elmore at $2,500.00 and the Three-Cylinder Two-Cycle Elmore at $1,500.00.

Will Exhibit in New York at Madison Square Garden Only. Chicago, at Coliseum.

The Car for today, tomorrow and the years to come.

—Built by practical men.—

Aerocar

The **Aerocar** is a magnificent, handsome automobile in every detail of design, workmanship, equipment and finish. It is so thoroughly high-grade that it compares most favorably with the highest-priced cars of foreign as well as American make. It is built by practical men who know from intimate connection with the automobile trade just what the motorist most desires. The **Aerocar** embodies to the fullest extent every essential requirement, and the more minutely its mechanical construction is investigated the more conclusively will this fact be demonstrated. Hence, the severest investigation and the sharpest comparison are courteously requested.

We again direct attention to the following:

AEROCAR SPECIFICATIONS.

MODEL—A.
PRICE—$2800, f. o. b. Detroit.
BODY—"Side Entrance" Tonneau. Front doors (easily detached and complete without them.)
COLOR—Royal Blue.
SEATING CAPACITY—Five persons.
TOTAL WEIGHT—2000 pounds.
WHEEL BASE—104 inches.
WHEEL TREAD—56 inches.
TIRE DIMENSIONS—Front, 4x34.
TIRE DIMENSIONS—Rear, 4x34.
STEERING—Worm and nut.
BRAKES—Two (rear hub) and transmission.
GASOLINE CAPACITY—20 gallons.
FRAME—Pressed steel.
MOTOR POWER—24 h. p.
NUMBER OF CYLINDERS—Four.
CYLINDERS ARRANGED—Vertical in line.
COOLING—Air.
IGNITION—Jump spark with storage battery.
DRIVE—Shaft, bevel gear.
TRANSMISSION—Sliding gear.
SPEEDS—Three speeds forward and reverse.
CLUTCH—Leather-faced cone clutch.
ROAD CLEARANCE—9 inches.
STYLE OF TOP—Extension.

DETAIL INFORMATION.

The frame is of pressed steel, and sufficiently strong so that there is no possibility of its sagging or becoming distorted from the hardest possible use to which the car may be put.

The four cylinders of the motor are cast separately and are of a peculiar, symmetrical, flanged construction. The bore is 4 inches by 4 inches stroke. Both cylinders and pistons are made of a special gray iron mixture, very hard, fine grained, and close, and without speck or blow hole. The construction of piston and rings is such that it prevents an excess of lubrication accumulating on top of piston, obviating the usual deposit of carbon, generally found on either air or water cooled motors.

The crank case is in two pieces, and are fine specimens of aluminum castings, with handhole plates, making bearings and connecting rods easily accessible to inspection.

The mechanically operated valves, located in the cylinder head, are interchangeable and made of nickel alloy.

The crank shaft is of generous proportions, made from high carbon steel, hammered, forged, rough-turned and ground to size. Phosphor bronze and nickel Babbitt bearings, of ample wearing surface, are found throughout the motor.

The commutator is placed in a vertical position, which is very accessible. Both primary and secondary wiring are incased in fibre tube.

Carburetor is thoroughly automatic, making starting almost instantaneous and fuel consumption very economical.

Lubrication is of the splash system, through the agency of a Hill Precision Oiler.

(In addition to the peculiar construction of the cylinders to facilitate air cooling, a 15-inch fan is used the six blades of which are made of sheet brass. It is carried on Hess-Bright ball bearings. The construction of this fan is theoretically and practically correct, the blast being concentrated directly on the cylinders. Running on a still day, the fan is unnecessary, the motor cooling entirely by the movement of the car. Some of these motors have been run 3500 miles, without an adjustment to the connecting rod or bearings being necessary.)

See the **Aerocar** at the Automobile Shows if possible, and let us give you a practical demonstration of its running merit.

Illustrated literature promptly supplied on request.

For 10 cents in stamps we will mail a beautiful gold-plated scarf pin.

The agent who will have the selling agency for the **Aerocar** will have a profitable business. If interested write us promptly.

ST. LOUIS
1906
"RIGS THAT RUN"

TYPE XVI
32-36 ACTUAL H. P.—$2500.

Every AUTOMOBILE, no matter what the PRICE, STYLE or CONSTRUCTION, contains some individuality which, in its builders' estimation places it above its competitors. Every manufacturer strives to have the best, and undoubtedly some one HAS THE BEST, but a fair verdict cannot be rendered by any one man. ONE exclusive feature does not constitute an entire MOTOR CAR no more than one individual constitutes a MILLION DOLLAR ORGANIZATION. An engine may be absolutely perfect, but if the power is not transmitted correctly to the rear wheels the car is a FAILURE, and vice-versa. To build a successful car, the manufacturer must give as much attention to the smallest details as the largest. THE ST. LOUIS MOTOR CAR COMPANY are the Pioneer Automobile Manufacturers of the UNITED STATES. FOURTEEN YEARS of BUILDING EXPERIENCE has taught us CONSIDERABLE. We know the material and style of construction best adapted for AMERICAN roads and CONDITIONS. We know how to manufacture intelligently and economically. WE KNOW that TYPE XVI is equal to any AUTOMOBILE built in America. Our claim is not based upon any ONE exclusive feature. It's "RIGHT" all the way. Compare our specifications with cars listing from $3000.00 up, then make arrangements for demonstration at any of the coming shows. We still have some valuable territory at our disposal and our AGENCY PROPOSITION is just as thorough as our car.

AGENTS who have already contracted for over two-thirds of our '06 product tell us that "TYPE XVI" will be the car of the year. We KNEW this four months back. If you are INTERESTED, it will be a pleasure to tell you WHY.

ENGINE. 32-36 ACTUAL H. P. 4 cylinder water cooled.
IGNITION. Jump spark. Spiltdorf coil. Pitsfield timer. Storage battery and dry cells.
TRANSMISSION. Sliding train. Three forward and reverse.
REAR AXLE. Floating type, bevel, Timkem roller bearings throughout.
FRONT AXLE. I section, drop forged, roller bearings.
FRAME. Cold rolled pressed steel, special stock, channel section, full pan in under hood covering entire engine.
WHEEL BASE. 110 inches.
WHEELS. Superior ouality; second growth hickory.
TIRES. 32 by 4 inches; optional.
VALVES. Mechanically operated; all interchangeable.
CARBURETTER. Float feed; automatic governor requiring no adjustment.
BRAKES. Transmission, foot and emergency lever, 5 in number.
BODY. Exceptionally roomy; will carry seven people; upholstering, general appearance and workmanship unsurpassed.
EQUIPMENT. Two brass side lights, one tail light, two head lights, full tool equipment, baggage haul, etc.

The Stearns

The Best Automobile

One Model 45 Horse Power

"The best automobile." Somehow it seems presumptuous to even think of claiming that; but we honestly believe that we make that car—and with good reason, as you shall see—so why not say it?

Furthermore, we can make **you** believe that very thing too, if you get close enough to our product and our ways of producing it.

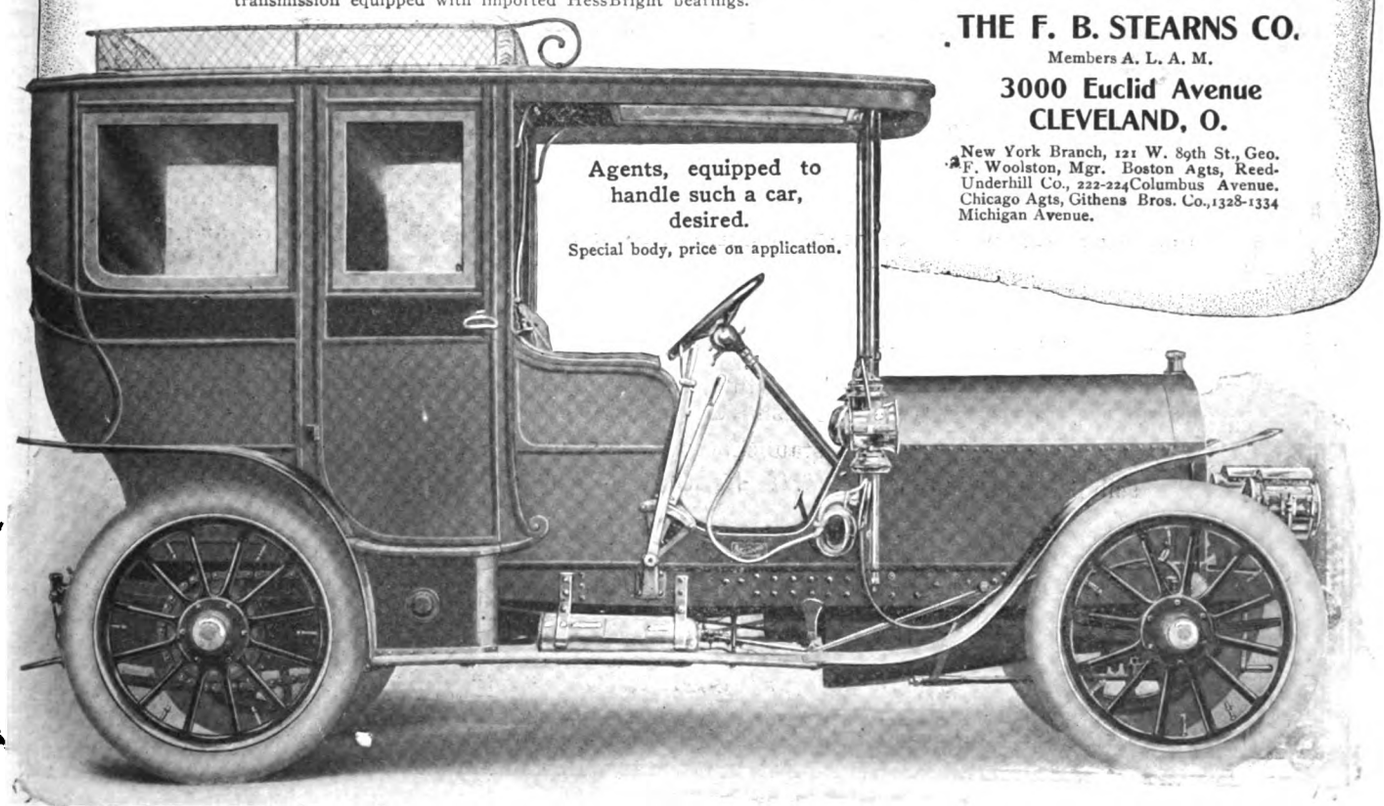
We use the best materials from all parts of the world. We put 2100 hours' labor in finishing alone—10 months of working days—by American machinists, not "cheap labor."

We follow accepted practice in form, the design refined to the utmost of simplicity—not one bolt an "afterthought."

By what process could any maker anywhere produce a better car? Where is another so made?

After producing this car we figured the cost and selling price. We were pleased to find that the duties and excessive commissions on our only competitors, make our charge—$4,250—barely half the cost of any foreign car that makes a comparison possible.

We seek communication with those who will appreciate this car. For such it will give a service greater than any other mechanism the world has produced. Shall we send our book of details?



SPECIFICATIONS—40-45 h. p.; 4-cylinder motor, forward under hood; transmission, 4 speeds forward, one reverse, selective type; ignition, jump spark with magneto, batteries and coil; carburettor, double automatic; gears and shafts, special chrome nickel steel; crank shaft machined from solid billet; I-section axles, forged in one piece; frame, pressed steel; wheel base, 118 inches; double chain drive; transmission equipped with imported HessBright bearings.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, January 18, 1906. No. 17

SHAKE-UP IN MICHELIN.

Sudden Change Effected in American Representation—How it was Brought About.

Internal friction in the Michelin Tire American Agency has brought about an unexpected change in the Michelin representation in this country. Henceforth that famous French tire is to be handled by the Michelin Products Selling Company, New York, which was incorporated this week, under the laws of the State of New York, with a capital of $100,000.

Of this new company, E. D. Winans, who occupied a like position with the American agency, will be the manager. It is not definitely known who are his colleagues. It is known, however, that the change was effected with startling suddenness. Both G. M. MacWilliam, representing the financial interests in the American Agency, and Winans journeyed to Paris to effect a renewal of the Michelin contract. Word first came that MacWilliam had been successful, and that Winans was down and out.

This report had scarcely grown lukewarm when cabled advices stated that Winans, who had remained in Paris after MasWilliam sailed for home, had secured the plum. Then quickly followed the incorporation of the Michelin Products Selling Company, and Winans arrived this week with evidence in his possession that it was he and the interests he represented that had acquired the prize sought.

Andrews Gets the Bliss.

Douglas Andrews, the New Yorker, who in three short months has made himself and the Berkshire car uncommonly well known to the trade and public, and who contracted for the entire output of Berkshire cars, made an even more surprising move late last week when he personally obtained control of the entire production of Bliss cars. For two years the E. W. Bliss Co., Brooklyn, N. Y., the big machinery and projectile manufacturers, have been working on the car, the "debut" of which was awaited with no small interest, due to the great size and importance of its manufacturers. It was known to be about ready for the market when Mr. Andrews unexpectedly stepped in and contracted for all of the cars that are in sight and thereby became their selling agent. The Bliss is a big, impressive four-cylinder machine resembling the best foreign creations, and its source leaves no doubt of its quality and workmanship.

May Make Continentals Here.

It is not improbable that arrangements shortly will be consummated for the manufacture of the Continental tire in this country. Willy Tishbein, representing the parent German company, is now in this country, and it is understood is negotiating to that end with a Massachusetts rubber company not at present identified with the tire industry. On the occasion of his last visit it is known that Mr. Tishbein endeavored to perfect arrangements of the sort with one of the largest tire manufacturers in Akron, Ohio, but they were too busy to undertake the work. If the present negotiations result favorably, it is stated that some marked changes will be effected in the personnel of the Continental Co.'s present American staff.

Buys the Matheson Output.

Hereafter the Matheson cars, and all matters pertaining to the sales and agencies thereof, will be handled by the Matheson Company of New York, which was incorporated this week with a capital of $100,000. This new company, in which the principals are Charles A. Singer of Manhattan and Henry U. Palmer of Brooklyn, N. Y., has purchased the entire output of the Matheson factory, and for the time being will locate at 1619 Broadway, New York City. It is the intention of this new selling company, however, to erect a commodious salesroom and garage in the upper part of the city which will involve an expenditure of approximately $50,000. Several sites are now under consideration and a definite selection will be made within the next week or two.

Mercedes Agency Changes Hands.

Smith & Mabley have lost the American agency for the Mercedes car. It has been taken over by the recently organized Mercedes Import Company, of New York.

WILL ISSUE SANCTIONS, TOO

Accessory Association Takes a Hand in Show Game—Post Again Made President.

H. Winfield Chapin, refusing re-election to the presidency of the Motor and Accessory Manufacturers, Inc., strong pressure was brought to bear on H. S. White, but he resisted it, and then, by a rightabout movement, the pressure was applied to D. J. Post, first president of the organization, and, as a result, he is again in the executive chair.

These presidential by-plays, and a strong declaration of show independence were the chief developments of the annual meeting of the Motor and Accessory Manufacturers, Inc., which occurred in Hotel Astor, New York, on Tuesday evening, 16th inst. It was a largely attended session fully one-half of the entire membership of 136 being present.

After the reports had been read and the election of officers consummated, the "declaration of independence," which had been hinted at in President Chapin's report, was promulgated. It took the form of the following resolution:

Resolved, That any member of the association exhibiting at any automobile or automobile parts or accessory show not sanctioned by directors of this association may be debarred from occupancy of space from any or all of these shows. This motion to become effective May 1st, 1906.

There was no disagreement as to the sense of the resolution. It made plain that the accessory manufacturers purpose being well and properly represented at all shows, or not being represented at all, whether the exhibitions be national or local in character, and whether they be organized by those in the trade or by those professional promoters who, seeing a "good thing," attempt to realize on it. The resolution strikes a hard blow at the show of the latter sort which certain Chicago men had incorporated as the Manufacturers and Automobile Parts Appliances and Accessory Exhibition, and which had been definitely set for September 27th to 29th next, at the First Regiment Armory in the Windy City.

Digitized by Google

Several members of the Motor and Accessory Manufacturers had already engaged space at this projected exhibition and paid deposits to bind their engagements. How thoroughly the members of the organization are in accord, and how well they are pulling together, was shown by the disposition of these intending exhibitors. They let it be known that they would respect the resolution adopted to the extent of forfeiting their deposits.

The resolution is also in the nature of a warning to a couple of local show promoters who had proceeded on the belief that the exhibitors of accessories must be content with any locations that may be parceled out to them. It is the intention of the M. & A. M. to henceforth be a vital factor in all affairs dealing with shows of whatever nature.

Following the adoption of the resolution, sanctions were granted for the shows to be held in Buafflo, Detroit and Cleveland.

After Mr. Post, who is of the Veeder Manufacturing Company, Hartford, Conn., had been impressed as president, the other officers and directors were elected as follows:

First Vice-President, Howard E. Raymond, B. F. Goodrich Co., Akron, O.; Second Vice-President, H. S. White, Shelby Steel Tube Co., Pittsburg, Pa.; Third Vice-President, E. S. Fretz, Light Cycle & Mfg. Co., Pottstown, Pa.; Secretary, J. W. Gilson, Hartford Rubber Works Co., Hartford, Conn.; Treasurer, W. S. Gorton, Standard Welding Co., Cleveland, Ohio; and as Directors: H. Winfield Chapin, Brown-Lipe Gear Co., Syracuse, N. Y.; Clarence E. Whitney, Whitney Mfg. Co., Hartford, Conn.; P. S. Steenstrup, Hyatt Roller Bearing Co., Harrison, N. J.; C. S. Mott, Weston-Mott Co., Utica, N. Y.; F. E. Castle, Gray & Davis, Amesbury, Mass.; M. H. Moffitt, National Carbon Company, Cleveland, Ohio.

Two new applicants were elected to membership, viz.: The Hayes Manufacturing Company, of Detroit, Mich., and the Madison Lubricating Company, of Madison, Wis.

The report of Treasurer Gorton showed the organization to be in a strong financial condition. It has a balance on hand of more than $3,000, with all bills paid.

In his report, the retiring president, H. Winfield Chapin, outlined the work of the year. In the course of it Mr. Chapin said:

"The most important business of the Motor and Accessory Manufacturers during the past year that has required the attention of the Board of Directors has, of course, been the shows. We had hoped that during the present year we would be a partner in at least the New York show, to receive our share of the profits as an organization and to have a hand in the management; but the unfortunate conditions which resulted in rival New York shows upset our plans and we had to make the best of the situation.

"We contracted and called for approximately 11,600 square feet of show space at Madison Square Garden, 8,060 square feet at the 69th Regiment Armory, and 10,550 square feet at the Coliseum for our members, which would not have been possible without our organization. While this was assuming considerable financial responsibility, our members have taken all of the space contracted for, and the organization is now relieved of liability.

"In the conducting of future shows, whether they be for automobile manufacturers and partsmakers combined, or for parts makers only, I recommend that our Board of Directors continue to do so on the lines pursued heretofore, namely, to become proprietors of the shows, not merely exhibitors. We think all will agree that we are entitled to all the benefits arising from the part that we take in making the shows successful.

"The past year has been a most prosperous one. We have grown in number and in strength, very nearly doubling our membership, which is now 136, and have accomplished much of what we set out to do."

In the Retail World.

Frank A. Sanford is to re-enter the business in New York. He has taken the agency for the Austin car and will locate at 1843 Broadway.

J. H. Frenier & Son, Rutland, Vt., have broken ground for the erection of a garage and repair shop; the former will be 80 by 60 feet and the latter 40 by 60 feet.

L. R. Parker, of Aurora, has been made trustee of the bankrupt Monarch Automobile Co., Aurora, Ill. He has given bond in the sum of $40,000.

John Charter and Russell George, of Sterling, Ill., have formed a partnership under the firm name of Charter & George, and will conduct a garage and repair stop at that place.

The Atwood Garage Co., Toledo, Ohio, has leased a plot of ground at Collingwood and Bancroft streets, on which will be erected a one-story brick garage 100 to 200 feet. Building operations will not, however, be commenced until spring.

The Sidney B. Bowman Automobile Co. has leased the new building at 225-231 west Forty-ninth street, New York, but will not take possession until May 1st. Until then Bowman will occupy his present place on Forty-third street.

Grant Bros. Automobile Co. and W. F. V. Neuman will occupy two of three new stores comprising the new automobile building now being erected at Woodward and Alexandrine avenues, in Detroit. It is expected that the structure will be completed February 1st.

Curtiss & Tomlinson, Derby, Conn., carriage and automobile dealers, will separate their business on March 1st, when the automobile end of it will be operated as the Derby Automobile Co. They already have leased a new garage, 100 x 45 feet, recently erected on Seymour avenue, to which it will be removed.

The B. Webster Co. has incorporated in Detroit, Mich., to represent the Northern cars in that State. The company will be located at 251 Jefferson avenue.

The Ford is "taking" in South Jersey. Last week the Philadelphia branch placed two agencies, one with E. L. Lacy of Pitman, and the other with Hahn & Hahn, Bridgeton, N. J.

The Quaker City Automobile Co., of Philadelphia,, is making extensive improvements at its Broad street garage. To secure increased room for exhibition purposes the waiting rooms and lockers have been torn out and light wells are being installed to better illuminate the building.

The Elston Automobile Co., Indianapolis, Ind., has been dissolved, the head of it, S. W. Elston, having acquired an interest in the Indiana Automobile Co., and his partner, E. C. Vajen, having retired from the automobile business. The Indiana concern will have the State agency for the Oldsmobile and will also handle the Pope-Toledo, Cadillac, Knox, Autocar, Packard, Peerless, Winton and Franklin. The Fisher Automobile Co., which formerly had the Olds agency, is now representing the National and the Maxwell.

The Week's Incorporations.

Flint, Mich.—Auto Brass and Aluminum Co., certified to increase of capital from $25,000 to $75,000.

New York, N. Y.—Darracq Motor Car Co., under New York laws, with $100,000 capital. Directors—L. B. Chase, C. W. McCandless, Judson Hyatt, New York City.

Denver, Col.—Reo Automobile Co., under Colorado laws, with $10,000 capital. Corporators—Harrison B. Robinson, Lansford F. Butler, Milton J. Stair.

Glen Cove, N. Y.—The Hol-Tan Company, under New Yark laws; capital, $100,000. Directors—G. P. Tangeman, Brooklyn; E. R. Hollander, C. H. Tangeman, New York.

New York, N. Y.—Michelin Products Selling Company, under New York laws; capital, $100,000. Directors—W. F. Donovan, Brooklyn; P. W. Logan, F. P. Reilly, New York.

Huntington, N. Y.—The Matheson Company, of New York, under New York laws; capital, $100,000. Directors—H. U. Palmer, A. P. Palmer, Brooklyn; C. O. Singer, Larchmont.

New York, N. Y.—Universal Motor Car Company, under New York laws, with $500,000 capital. Directors—M. E. Hutchinson, F. E. Gunnison and Walter Moffatt, New York.

Monticello, N. Y.—American-European Automobile Touring Company, under New York laws; capital, $150,000. Directors—C. E. Wemple, New York; G. Y. MacTaggart, H. A. Taylor, Brooklyn.

Lenover, Pa.—Chalfant Motor Car Co., under Pennsylvania laws, with $50,000 capital. Directors—Harry Chalfant, Horace S. Boyd, M. F. Chalfant, W. C. Minchener, W. Howard Chalfant.

DUTCH PANELING AT CHICAGO

This Form of Decoration to Make Western Show Handsome—Other Details.

All is to be harmonious at Chicago, too. While it is not known whether a negro lady or a "boy wonder" will warble in the same old way, it is known that the beautifying touch is to be laid on with generous hand and that no longer will the big Coliseum look like a crazy quilt of bunting. It was announced long ago that a uniform plan of decoration would be followed, but it was not until late last week that it was made known just what manner of decoration would be employed. It was then given out that hardly a square foot of the falls or ceiling of either the Coliseum of the First Regiment Armory, where the overflow will be housed, will be visible. The walls are to be covered, upstairs and down, to a height of ten feet, with a scheme of Dutch paneling, the woodwork being of Flemish oak and the background of green and old gold. At the top of this there will be a cornice of staff work representing various automobile designs and bearing groups of opal incandescent globes. The decoration which covers the roof will extend under the galleries and along the walls to meet the top of this paneling.

A great deal of staff work is to be used in the signs and the pillars which support them. The latter will vary from eight to twelve inches in diameter and will run to a height of eleven feet, there supporting the sign proper, which will be fifteen inches wide, of black and gold. Suspended from this sign will be a shirred satin drapery three feet in depth, and in front of this, suspended by chains of old English design, will be a row of shields, each shield bearing a letter, the combination of shields forming the name of the car exhibited in that particular space. The drapery will be of old gold and the shields will be deep blue with gold trimmings. The letters will be of enamel and raised one-half inch. At the top of the sign there will be staff work of suitable design fifteen inches wide and above this again groups of three and five electrically lighted globes, twelve and sixteen inches in diameter, supported by arms which will also be of staff. This work, over all, will be nearly eight feet in width and "is expected to eclipse anything of the kind ever attempted at a show of this character."

Not a pillar or obstruction will be visible in eight of the buildings. The pillars of the Coliseum spring directly from the floor and have long been a source of worry to exhibitors. This year they will be included in the panelling and lighting scheme, as described, so that exhibitors under the Coliseum gallery will be practically enclosed in their private rooms, the front side only being open.

"Extraordinary lighting effects have also been arranged for in those particular spaces, the Chicago Edison Company having provided a set of magnificent fixtures of extraordinary brilliancy which have never before been shown to the public," is the way the official announcement reads. In addition, a powerful searchlight will be mounted on the Coliseum which will sweep Michigan avenue "for miles"—presumably for Manager Miles—and permit of demonstrations at night.

The American Automobile Association has secured a rate of a fare and a third on the certificate plan from the Central, Trunk and New England associations, and Secretary Batchelder reports that the same concession is expected from the Western, Southeastern and Southwestern associations. The railroad agents, with the secretaries of the two automobile associations, will have offices on the first balcony of the First Regiment Armory.

Ford Fixes Price and Selects Tires.

The Ford Motor Co. finally has set at rest all doubts as to the price of their new four-cylinder runabout. It has been definitely listed at $500.

What is almost as interesting, and in its way as sensational, as the car itself is the fact that the new Firestone mechanically fastened tire is to be the standard equipment. The deal with the Firestone people was consummated this week.

Winton to Build in New York.

The Winton Motor Carriage Co. is the most recent of the New York branches to prepare to cross the circle—Columbus Circle, that dividing line between upper and lower Broadway. They have leased for a period of sixty-nine years a site at Broadway and Seventieth street, on which a palatial fire-proof four-story salesroom and garage, having 84,000 square feet of floor space, will be erected.

Goodyear Moves in Chicago.

The Goodyear Tire and Rubber Company, which has just taken possession of a large, new brownstone Broadway building in New York, has also "blossomed out" in Chicago. There the Goodyear branch has been removed from Lake street to 80-82 Michigan avenue, a big, six-story structure, a part of which will be occupied by the Beckley-Ralston Company, jobbers.

Birdsall out of Decauville.

E. T. Birdsall, manager of the Decauville Automobile Co., New York, has severed connection with that concern and has practically completed arrangements to go into business on his own account. He has invented a six-cylinder motor which he purposes placing on the market.

Ludington to Superintend G & J.

George Ludington, an old and experienced rubber man, has been appointed superintendent of the G. & J. tire factory at Indianapolis.

NO NEW OFFICERS FOR N.A.A.M.

Old Ones all Reelected and Thomas only New Director—Treasury Bulging.

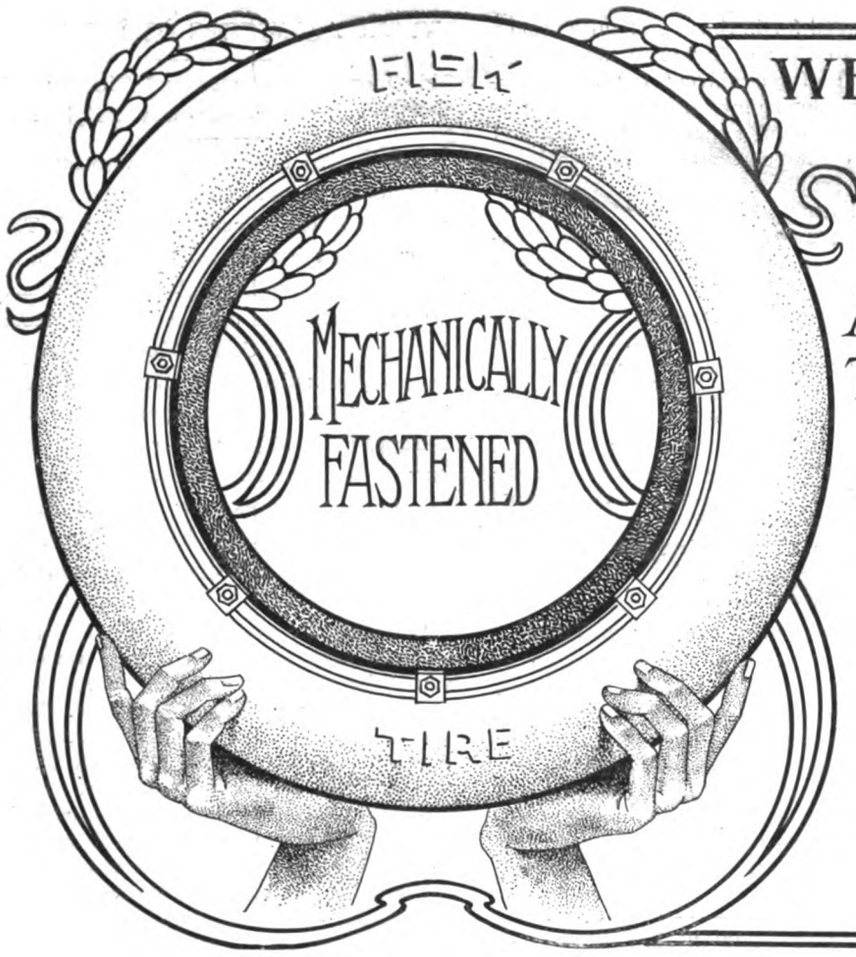
During 1906 the National Association of Automobile Manufacturers will be officered exactly as it was officered during 1905. That is to say, at the annual meeting, held in the Victoria Hotel in New York on the 17th inst., all of the old officers were re-elected as follows: E. R. Cutler, Knox Automobile Co., president; George W. Bennett, Thomas B. Jeffery & Co., first vice-president; Albert L. Pope, Pope Mfg. Co., second vice-president; S. D. Waldon, Packard Motor Car Co., third vice-president; W. R. Innes, Studebaker Bros. Mfg. Co., treasurer, and Percy Owen of the Winton Motor Carriage Co., secretary.

Preceding the election of officers all the directors save Marcus I. Brock, were re-elected for the term of three years. They are as follows: Windsor T. White, White Sewing machine Co.; C. C. Hildebrand, J. Stevens Arms and Tool Co., and R. D. Chapin, Olds Motor Works. Mr. Brock, who leaves the service of the Autocar Co. this week, to take up the assistant management of the Association of Licensed Automobile Manufacturers, was succeeded by E. R. Thomas, of Buffalo.

Aside from the transaction of routine business, which included the reading of the treasurer's annual report showing a snug nest egg of more than $30,000 on hand, the election of officers was the only thing of moment before the meeting.

First American Annunciator.

Joseph W. Jones, the New York manufacturer of the well known speedometer that bears his name, has added the Jones Auto-Annunciator to his list of inventions and productions—the first American instrument of the sort. It is designed for communicating instructions to the driver of a car by the push-button method. The plate, which is fixed on the dashboard in plain sight of the driver, is lettered: Start, Stop, Fast, Slow, Left, Right, Home, Club. Pressure of a button inside the car rings a bell and also illuminates a particular signal.



Minich out, Fanning in.

V. E. Minich, sales manager of the Haynes Automobile Company, Kokomo, Ind., has resigned that office to engage with the National Cash Register Company. He will be succeeded by Frank J. Fanning, formerly manager of the Electric Vehicle Company's Chicago branch.

Conwell Joins Marion Staff.

J. S. Conwell has been appointed general manager of the Marion factory at Indianapolis, Ind. Conwell "knows his book," having served for several years as manager of the Waverly plant.

WE HOLD UP THE

FISK

AS A MODEL OF TIRE PERFECTION.

DESIGNED
VERY DIFFERENTLY from OTHER TIRES
(FOR SAFETY AND COMFORT),
and constructed a little more carefully (for DURABILITY), they have survived the attacks of many erstwhile competitors, continuing to prove their real worth, and pleasing those who used them, until to-day they are universally acclaimed

THE IDEAL TIRES FOR PLEASURE, and THE MOST PRACTICAL FOR ENDURANCE AND ECONOMY.

It is perhaps possible to make as good tires as the FISK, but we do not know of any who is doing so at present.

Let us send you some Tire Literature,

THE FISK RUBBER CO., Chicopee Falls, Mass.

1906

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK JANUARY 18, 1906.

Extent of the Independence.

If the forecasts of the shows left any doubt that the best American manufacturers have drawn fully abreast of the best foreign manufacturers, the shows themselves have thoroughly dispelled it. They amply prove that the year 1906 is exactly what the Motor World of last week styled it, i. e., "The Year of American Independence."

Freely granting that car designs the world over follow the same general lines and that those lines first were cast abroad and then taken up here, is to say all that fairly may be said. If Europe sets a good fashion America is not usually slow to follow it and improve on it, and this is exactly the case with motor cars. The Americans—the best American makers have learned their lesson thoroughly and well and no longer have reason to fear the rod or the once superior knowledge of their teachers. They now "know their book" and are adding a few pages of their own authorship. If they have assimilated many European ideas, the American manufacturers are not producing slavish copies. Their cars contain a deal of their own ingenuity, much of which in due course Europe will duly "assimilate." It is so in nearly all other lines of mechanical manufacture. It would be odd, indeed, if it did not prove the case in this instance.

It is a striking and significant fact that that good old libel, "America is just about five years behind France," has not been heard once on the occassion of the present shows. Two years ago it was rampant and last year it was not entirely absent. To-day not a lip gives utterance to it. It is stilled forevermore. America is no longer behind any other nation. The cars on exhibition prove it, and have put the old libel to rout.

The best American cars will "hold their own" with any in the world.

The Most Impressive Development.

If there be any one striking development revealed by the annual staging of America's automobile productions it must be considered that this one has to do rather with the supports of the car—the wheels and tires more than to any one feature of the mechanism. This may come somewhat in the nature of a surprise to many, for there are doubtless those who have not given the subject a thought, nor proved keen enough observers to see it for themselves.

But a few years since, 30-inch wheels and three-inch tires were considered standards on the great majority of medium weight cars built in this country with thirty-two inches and a half inch larger tire as a maximum that was not thought necessary by many. At the opening of last year this former maximum had come into general use; it had, in fact, been transformed into a minimum, with thirty-four inches as the top notch. With the latter came the more general use of the four-inch tire and nothing so strikingly illustrates the progress made during the past twelvemonth as the prevalence of this size on cars of the same weight that formerly employed the thirty and thirty-two by three inch standards. More significant than this is the number that have blossomed forth with thirty-six inch wheels and four and a half inch tires, of which more than a baker's dozen can be found at the shows.

This item of bigger wheels and bigger tires may appear on the face of it to mean but little; to be of comparatively insignificant import as compared, for instance, with an improvement in the motor or other part of the mechanism. But its importance is far reaching; it is but a step that makes for the routing of the pessimist and for silencing, or at least greatly reducing, the wail that more than any other thing has served to injure or confine the industry to too-restricted bounds—the wail about tire trouble and the cost of tire maintenance.

The tire makers have dinned this into the ears of the tire user first, last and all the time, and without wishing to claim an undue amount of credit for the result that is beginning to appear, the Motor World has dwelt upon it both persistently and consistently. It is not difficult to understand why this should be so. It is a matter of common knowledge that the smaller the wheel the more difficult and uncomfortable must be the travel over an uneven surface. The small diameter necessarily causes a sharp rise in its circumference from the point of contact on the ground, which is very small, and it must, accordingly, rise more abruptly at obstructions that would be rolled over easily by a larger wheel and drop into every depression no matter how small, that would be bridged by the latter. Increasing the diameter of the wheel naturally enlarges the amount of surface in contact with the road and in the same proportion reduces the amount of wear to which any given part of the wheel rim, or in this case the pneumatic tire, will be subject.

In the case of the pneumatic tire there are other equally strong reasons, chief among which is the greatly increased volume of air permissible which in turn conduces to a proportionately increased degree of resilience in the tire as a whole. It is yielding that saves the tire; resting that wears it out. The more it yields to the obstructions placed in its path the longer will be its life. provided that resilience is not obtained at the expense of something else.

This use of thirty-four and thirty-six inch wheels where formerly thirty and thirty-two were standard, and four or four and a half inch tires instead of three and three and a half, places the American maker of pneumatic tires on a par with his foreign competitor for the first time. Larger wheels and larger tires have been a feature of Continental practice from the first; the tire manufacturer has never seen fit to skimp the diameter of either the car's wheels or its tires, and the result has been manifest in the great advantage obtained. It is a step in the right direction which in the next few years is bound to sweep away a very large part of the everlasting complaint that is now so general regarding the

Digitized by Google

pneumatic and result in vastly greater satisfaction to both maker and user. It has been a long time coming and its advent has been unheralded and unnoticed, but it is here none the less, here and here to stay, and with the impressive strengthening and improvement of brakes and increase of safety devices that the shows have brought to the surface, the prospective purchaser, who is timid of purse or person, will no longer have cause to hold aloof.

Lengthening of Wheel Bases.

Multitudinous and dire were the predictions made but twelve months ago as to what was bound to happen when the cars of then unprecedented wheel base were put to a practical test under touring conditions. Sagged, twisted and utterly disrupted frames constitute but a few of the unpleasant results that the wise ones foresaw as coming to the man who had the temerity to drive one of these monsters of 106 or 108 inch wheel base over the average American road. The metal that would endure the violent twisting and surging strains and at the same time bear the weight of a heavy body and passengers had not been created, they said, and what was more, there was little prospect of ever obtaining such steel.

How great the advance has been in this direction may be appreciated most fully by quoting from a commentary in the Motor World on the then approaching show published in the first week of January, 1905. It is there said that "in looking over the leading 1905 models the observer will notice a number of cars having wheel bases of 100 inches or more. When it is recalled that only a year or two ago such bases as 60 and 70 inches were considered fairly long, and that only a short time before the dummy runabouts of unlamented memory were the vogue, the tremendous change that has been made will be apparent.

"It is easy to see that these long wheel bases increase the car's liability to give trouble. This is, of course, well known to designers and builders and they take what they deem to be sufficient precaution against sagging, twisting and buckling frames. It can be determined only by actual use whether they have done enough. They have to build well and provide against the severest strains and stresses, and each time the frame is lengthened the problem of giving it strength to support the engine and transmission becomes increasingly difficult. Whether it has been solved in all cases only the future can disclose.

And this reflected the generally prevailing opinion of the time; the great lengthening of wheel bases was regarded with many head shakings and doubts. What has come to pass in the interim is so much a matter of common knowledge as not to call for comment. The past year's experience has fully disclosed that while there is always room for improvement no error was committed in lengthening the wheel base. It has shown this so conclusively that now wheel bases of 120 inches or over call forth no remark. While the drawing out process has not reached its limit by any means, it is, however, noticeable that now increased wheel base does not mean a longer frame owing to the expedients resorted to of placing the springs off center. Now, nothing but the light runabout falls below the 100-inch mark, and even these small, low-priced cars are approaching it.

Wherein Some Testers Fail.

What is life without a hobby? Whether it be chickens or postage stamps, old paintings or cigar bands, it would seem that human nature runs more or less to hobbies. The automobile owner naturally could not in reason be expected to enjoy any immunity from the ubiquitous germ that takes such endlessly varying propensities to itself according to the temperament of the individual in which it finds lodgement, but the man who is employed to test cars should certainly not be subject to the malady, and therein lies a plaint of the manufacturers.

That considerable time is required on the part of a new entrant to gain the experience necessary to become of value to the maker of a car hardly need be referred to and this regardless of his qualifications, for the tester must know his car from the ground up. General knowledge of the automobile and the theories of its motor are, of course, the best foundation upon which to build, but without actual experience with the car upon which he is to work the tester would be of small value to his employer and this experience he must get at the latter's expense.

Once having attained that degree of proficiency that establishes his value, the tester should be in a position to take up his task with a mind entirely free from prejudice. Unfortunately this does not happen to be the case and the manufacturer who has carefully schooled and watched over the welfare and progress of some promising candidate for the testing crew feels aggrieved when the latter, once in that coveted position, develops a new hobby that renders him blind to all other possible sources of trouble. As an example of this, a complaining manufacturer cites the instance of several of the members of his testing crew who have only been elevated to that post after long experience, but once there have developed tendencies that greatly impair their value. In other words, they cannot be impartial and look over the car with an eye single to the location of any defect, whatever it may prove to be. One of them would never attribute the cause of a breakdown to any other source than the carburetter. Regardless of what might have happened to bring about the involuntary stop, this individual could conceive of no other cause than the carburetter and was wont to take that essential to pieces upon very slight provocation.

In another instance, the hobby took the form of valves and the victim of its wiles is credited with having ground in valves oftener on one car than has ever been recorded previously since such things came into existence. Anything from the loss of power occasioned by absent mindedly leaving the brake on lightly to an absolute stop was by him attributed to the valves, and so it goes. Others became afflicted with a leaning toward the ignition or some of its component parts and could see nothing but the fault of a battery or coil as the root of the trouble. Unfortunately the disease does not fully develop until too late.

Regardless of whatever conflicts or consideration, it was a fortunate circumstanc that the shows were this year housed in two separate buildings. In the light of to-day it is plain that neither building would have held much more than half of the cars it was desired to exhibit, and that great embarrassment must have resulted.

Enclosed please find $2 to renew my subscription to the Motor World, from the issue of December 28th. I do not feel that I can spare a single copy of the paper, as I derive a great deal of information necessary to the successful operation of my car; so please see that there is no break in my file."
—A. G. Seaman.

Some farmers at least are growing wise. The National Grange of the Patrons of Husbandry has duly resolved that the motor car is "an innovation in modes of travel which must be accepted."

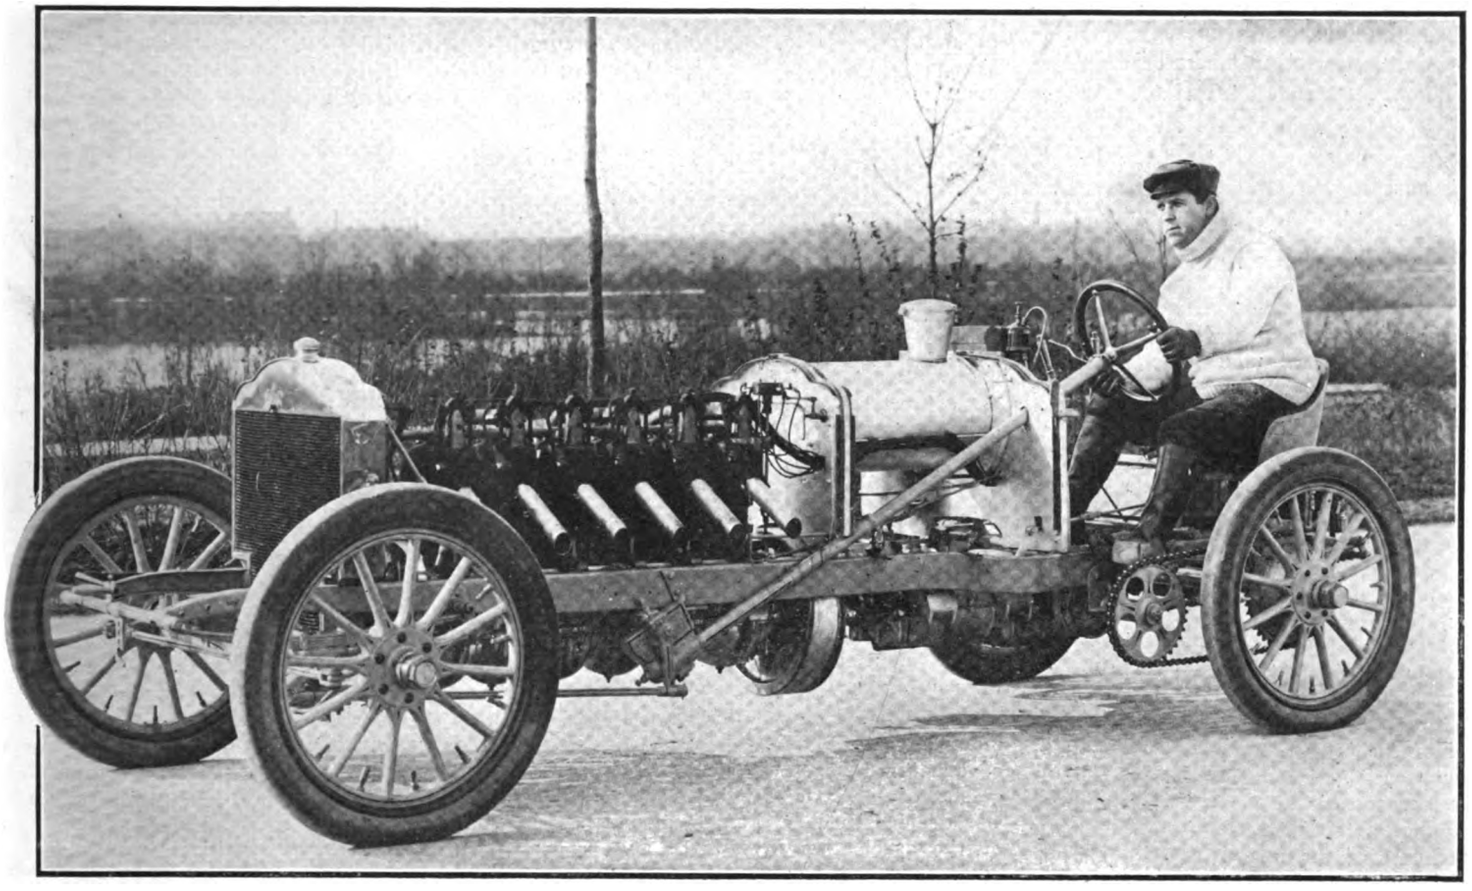
GATHERING ON THE BEACH



Eight Racers Already in Florida—Wreck Comes Ashore but will be Dynamited.

Daytona, Fla., Jan. 15.—Only seven or eight of the important racers have thus far put in an appearance for tuning up on the Ormond-Daytona beach, owing to various delays, but the prospects for a successful carnival of speed never have been so bright a week ahead of the gathering. The beach is in tiptop shape, if one does not venture north of the turn to the Ormond station, where treacherous quicksand has always prevailed. Joe Downey, chauffeur for J. R. Harding, of Boston, H. W. Fletcher and others within two or three days have located this quicksand to their sorrow, Downey being obliged to work a good share of one night to extricate the 70 h. p. Panhard in which he was caught. But for a low tide that lessened the suction he might be laboring there still. A big piece of wreckage that came ashore a few weeks ago is to be blown up by dynamite tomorrow, which will leave the course free from obstructions.

A small stand is about finished close to the elevated platform extending from the Florida East Coast Automobile Club's house near the South Bridge road. At the front of this stand will be about twenty private boxes, and at the rear six or eight rows of ascending seats—bleachers, in fact. The capacity of the stand is about 500 persons. The Ormond and Daytona contingents have wisely concluded that their salvation lies in pulling together, and so great care is being taken to balance the power between the two places. The preliminaries have been running far smoother than last year, and with favorable winds and tides any upset seems remote. The Clarendon Hotel, a mile and a half north of Daytona, has a garage this year, making three large establishments of that sort accessible here, but there is business enough for all, with several minor shelters brought into requisition.

The racers on the ground to date are F. E. Stanley's steamer, the successor to the teakettle that Louis S. Ross piloted so well last season; Stanley's Model H; Clifford Earp's 90 h. p. Napier; Emanuel Cedrino, with the 120 h. p. Fiat; H. W. Fletcher, with a racer of the same make and power; J. R. Harding's 90 h. p. Mercedes and Walter Christie's racer. None of the cars have been here a week yet, and no determined tilts against time have been made. There has been greater privacy than ever over performances, but it is widely understood that Fletcher and Cedrino, who were the earliest comers, have been going "great guns." Fletcher's friends are afraid, however, that he will not let well enough alone, and so seek to readjust his Fiat that his "going" at the proper moment may not be so impressive. Earp's Napier, too, has been hitting a fast clip, but Alexander McDonald's absence is noticeable. Harding's Mercedes has not yet given an account of itself.

Of Stanley's Model H, although wonderful speed is claimed for it, little need be said, as it was brought here mainly to test its relative power against the teakettle's successor. The latter, judging from its first spin to-day, seems to have almost no speed limit, running with surprising ease and being handled with exceptional quickness. Only an accident can keep it from cutting a big figure in next week's contest. Stanley, who is a hard headed, practical man of scientific bent, has unbounded confidence in his latest production, which has previously been tried only on a couple of steep hills near Boston. Empty it weighs 1,650 pounds, against 1,750 for Ross's teakettle. Filled, the difference is about the same, the new car tipping the beam at 2,100 pounds. It has only one engine, while the teakettle had two, but this one can develop almost twice as much power, and, further, can make 50 miles without replenishing the tanks. The shell is of cedar, covered with canvas and painted dark red, so that spectators will not be dazzled as by the tin teakettle. Lift the cover off and reverse it and it makes the two perfect halves of a canoe. The thin boilers are reinforced by being wound with piano wire, which, while only one-twentieth of an inch in diameter, enable a pressure of 800 pounds to the square inch to be safely sustained.

C. A. COEY, OF CHICAGO, IN THE SIX-CYLINDER THOMAS, WHICH HE WILL DRIVE IN THE FLORIDA SPEED CARNIVAL.

A. A. A. BUSY ALL WEEK.

Four Meetings in Three Days—Resolutions Passed Favoring Private Speedways.

The "big-wigs" of the American Automobile Association had a busy week during show time. At the armory, where the "removal" show of the Automobile Club of America is holding forth, various committee meetings were held, starting on Monday afternoon with a meeting of the racing board and ending on Wednesday, when an open meeting for all members occurred.

William K. Vanderbilt presided at the meeting of the racing board Monday afternoon, the chairman, Robert Lee Morrell, being absent. No business of importance was transacted. The racing board voted to recommend to the A. A. A. board of directors that recognition be given to the International Automobile Racing Association of Havana, Cuba, which will hold its second annual carnival next month. E. R. Thomas, George Isham Scott, R. L. Lippitt, A. L. Riker, J. L. Breese, A. G. Batchelder and A. R. Pardington were in attendance.

Discussion of the good roads question was, in the main, the subject of discussion at the meeting of the directors of the New York State Automobile Association Tuesday afternoon. A sentiment was shown in favor of co-operating with other users of the highways in contributing an annual tax for maintenance of highways built by State aid. The following resolution was unanimously adopted: "Resolved, That it is the sense of the New York State Automobile Association that such association should favor a reasonable provision of law looking to the motorists of the State paying a share of the cost of the maintenance of all improved highways built by State aid, provided such maintenance is made by the State." The reports of officers and chairmen of committees showed the association to be in a porsperous condition. The total membership of the State division is about 2,500 and comprises fifteen clubs. The New York Motor Club of New York City was admitted to membership.

At the conclusion of the meeting of the board of directors Tuesday afternoon, they were entertained at luncheon by Emerson P. Brooks. This was because the board put itself on record as opposing road racing except upon specially constructed tracks. Emerson Brooks and his associates are and have been for a twelvemonth projecting a speedway in New Jersey. This resolution bearing upon the subject was passed: "Resolved, That it is the sense of the board of directors of the American Automobile Association that a special speedway for automobile racing and the testing of cars has become a necessity, and that this board encourages the construction of such speedways throughout the country." A nominating committee, consisting of Elliott C. Lee, Walter T. White and A. R. Pardington was named to nominate a ticket for the annual election to take place in Chicago next month. The affairs of the association are in a prosperous condition, the treasurer's report showing a balance of $4,520. There are 62 affiliated clubs, with a total membership of over

Winthrop E. Scarritt, former president of the American Automobile Association, was the principal speaker at the open meeting of that association, held in the armory Wednesday afternoon. After touching at length upon his pet subject—legislation—Mr. Scarritt spoke of the decreasing supply of gasolene. "There are in use in America," he said, approximately 70,000 motor cars. These do not consume as much as the 800,000 gasolene stoves which are in use all over the Middle West, where fuel is always high, and it is due to the use of gasolene for such purposes that has been the chief cause during the past five years in doubling the price of gasolene. The California and Texas oils are practically barren of gasolene distillates, and while the supply of gasolene is not growing, its consumption is rapidly increasing. What is our remedy for this threatening situation. It lies in the direction of vegetable alcohol. At present the United States Government taxes all alcohol $2 per gallon. There is no reason why this tax should not be removed on denatured alcohol, that is, alcohol rendered unfit for beverage. Experiments with this fuel made in France, also in America, by Prof. Elihu Thompson, show that it may be utilized as a motor fuel successfully. Germany last year used over 70,000,000 gallons of denatured vegetable alcohol." The necessity of signboards was discussed and it was decided to have a technical committee of the association investigate and report upon means of alleviating the dust nuisance. Among the other speakers were President Elliott C. Lee, Judge William H. Hotchkiss, president of the New York State Association; Sidney S. Gorham, president of the Illinois State Association; A. R. Pardington, Augustus Post, John P. Coughlin, president of the Worcester Automobile Club; Windsor T. White and Emerson Brooks.

"Fourth Frictionless Feast" Was Fine.

About the best attended function of show week was the "Fourth Frictionless Feast" of the Hyatt Roller Bearing Co., which occurred in the ballroom of the Waldorf-Astoria on Wednesday night. At midnight, when the festivities were at their height, fully 300 men were in attendance, all apparently enjoying themselves to the full. "Collation" was a mild term for the things that refreshed the "inner man," and that Peter Streenstrup, the sales manager of the Hyatt Co., who was the moving spirit and master of ceremonies of the occasion, is "wise," was proven by the programme of entertainment. There was but one male performer on the card. Mr. Streenstrup introduced all of them, not excepting a Spanish senorita.

Motor Cars get Mail Contract.

According to advices from Santa Fe, N. M., the post office department has just given the contract for carrying the mail to the longest automobile mail line in the world—from Torrence, the terminus of the Santa Fe Central Railway, to Roswell, Chaves County, N. M., over 100 miles, across a practically unsettled land. At present mail from Roswell and the lower Pecos Valley must be sent around by way of El Paso or Trinidad, a detour of several hundred miles. The automobile line has been in operation ten months and is giving good satisfaction.

Weston Succeeds Dr. Brandow.

At the annual meeting of the Berkshire Automobile Club, Pittsfield, Mass., Franklin Weston was elected president to succeed Dr. Frank W. Brandow, who could no longer attend to the duties of the office because of ill health. The other officers were as follows: First vice-president, S. G. Colt; second vice-president, Courtland F. Bishop; corresponding secretary, Robert T. Parker; recording secretary, E. H. Kennedy; treasurer, L. A. Merchant.

Merion Prepares to Mulct Motorists.

In accordance with the power granted townships of the first class by the Pennsylvania Legislature, the commissioners of lower Merion have passed an ordinance limiting the speed of automobiles to one mile in six minutes. Penalties of $10 for the first offence, $25 for the second and $50 for the third are provided for. Signs to that effect will be posted.

Odd Accident While Cranking.

Fred T. Sholes, president of the Cleveland Automobile Club, is confined to his home because of a rather peculiar accident. He was cranking his car when his left foot slipped on the ice and the weight of his body was thrown sharply on his right ankle. It was twisted to so great a degree that the larger bone snapped.

Pierce to Enter Foreign Tests.

America, in the form of a Pierce-Arrow car, is this year to be represented in the Herkomer Cup contest and other foreign touring trials, the George N. Pierce Company having already decided on this move. Percy Pierce, who won the Glidden trophy, will pilot the car in the foreign contests.

The Noise Fully Described.

"The loud, whirring, wheezing, puffing, coughing, chugging, buzzing, clanking, rattling, popping machine" is the way a plaintiff in a damage suit in Ohio describes an automobile.

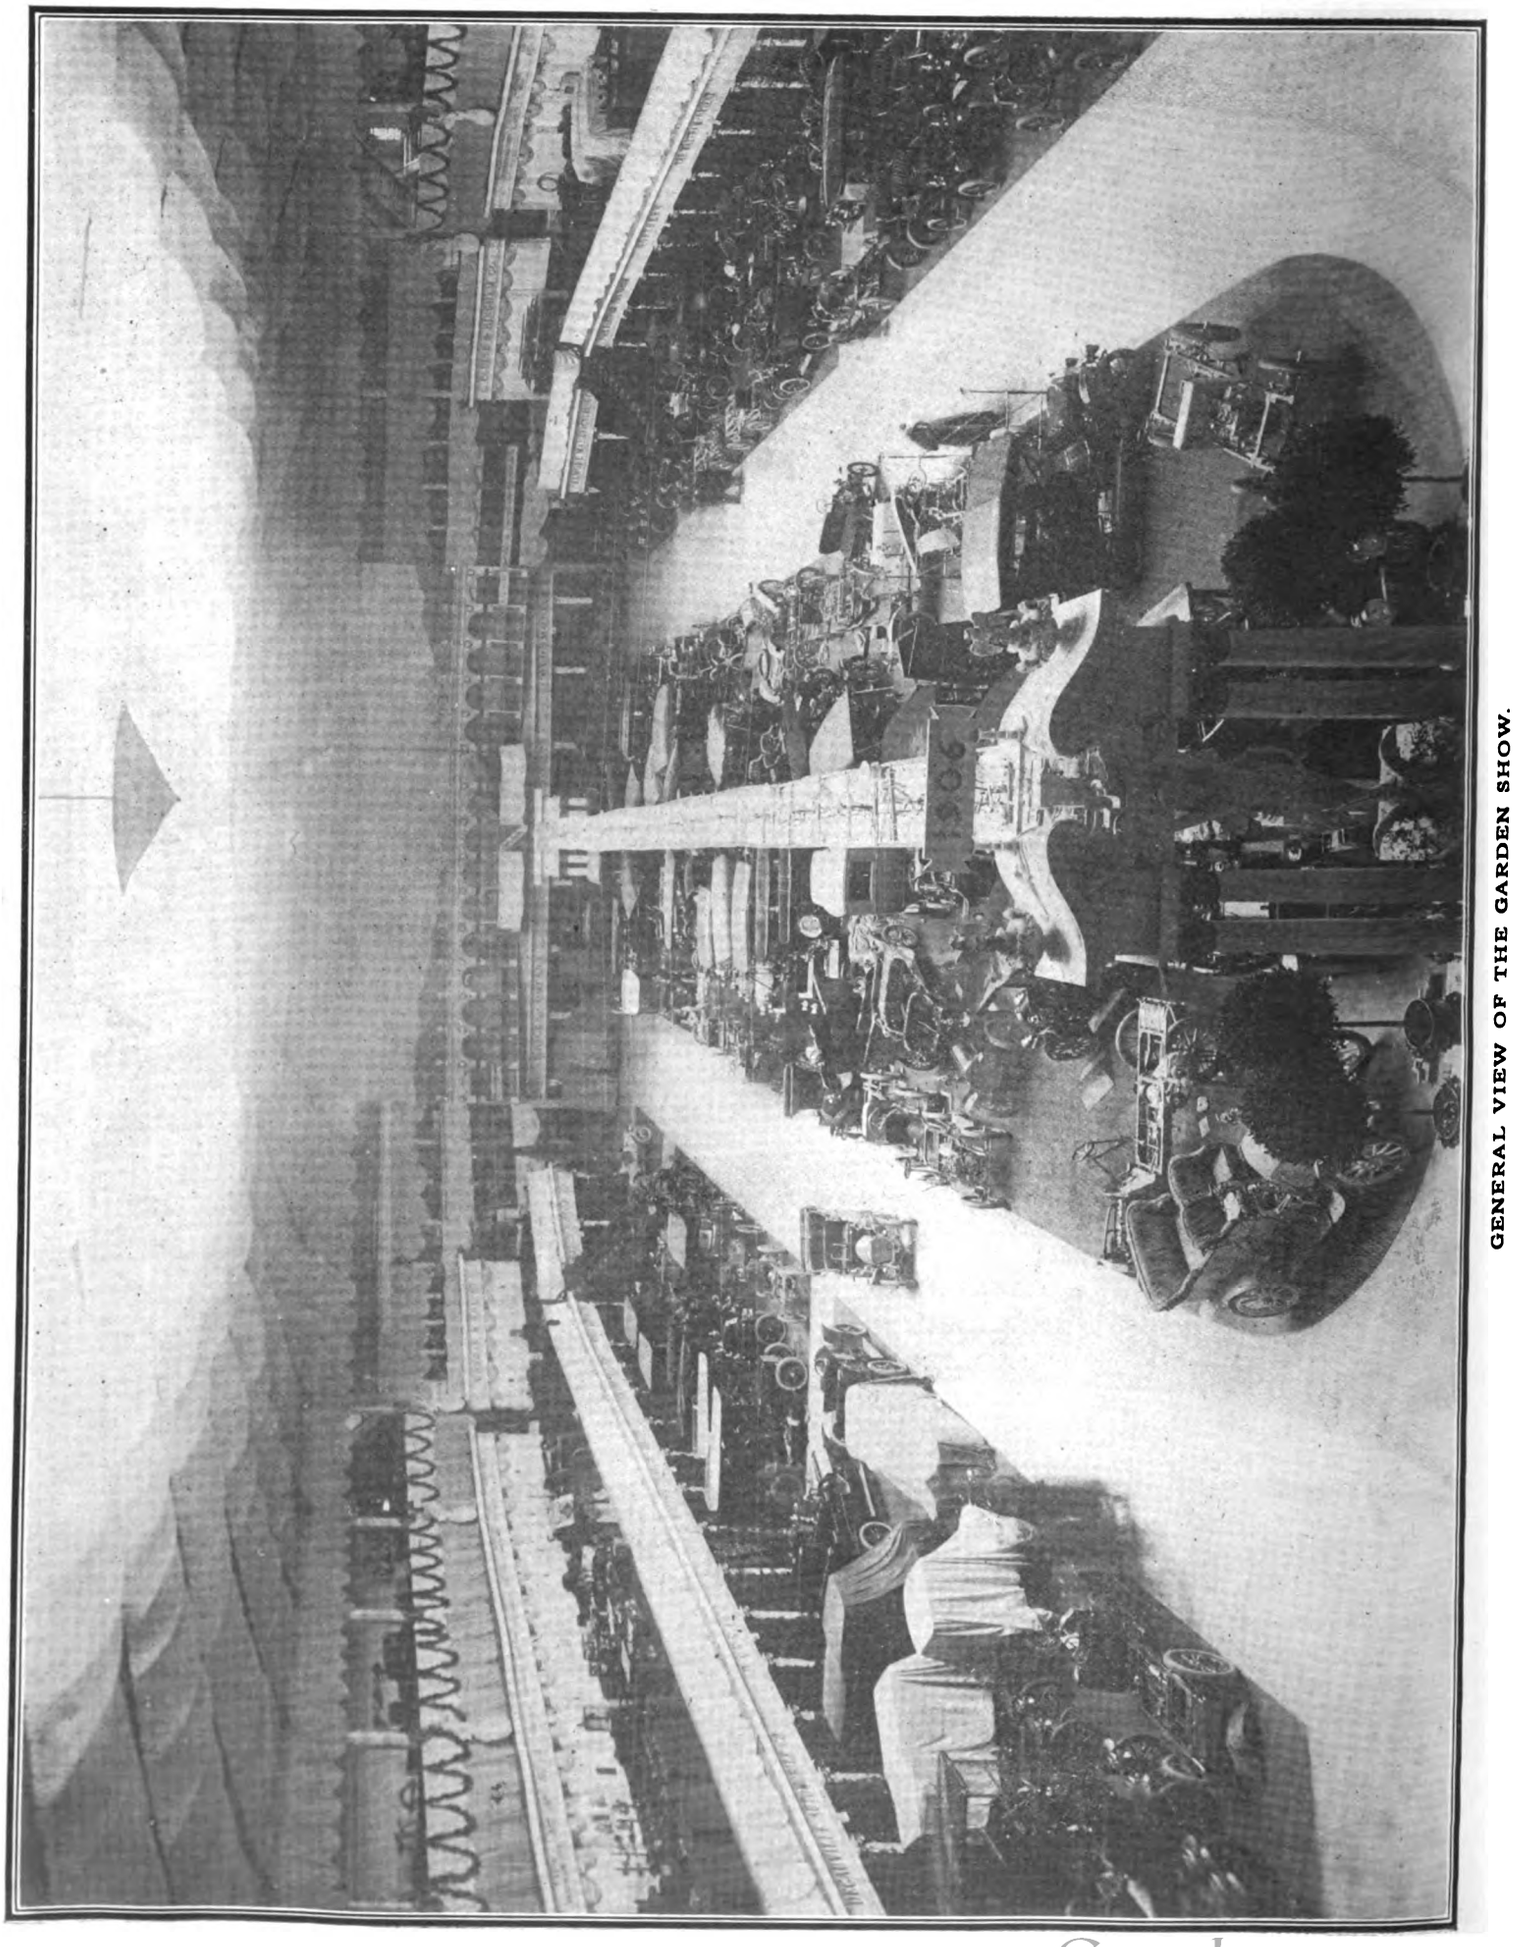
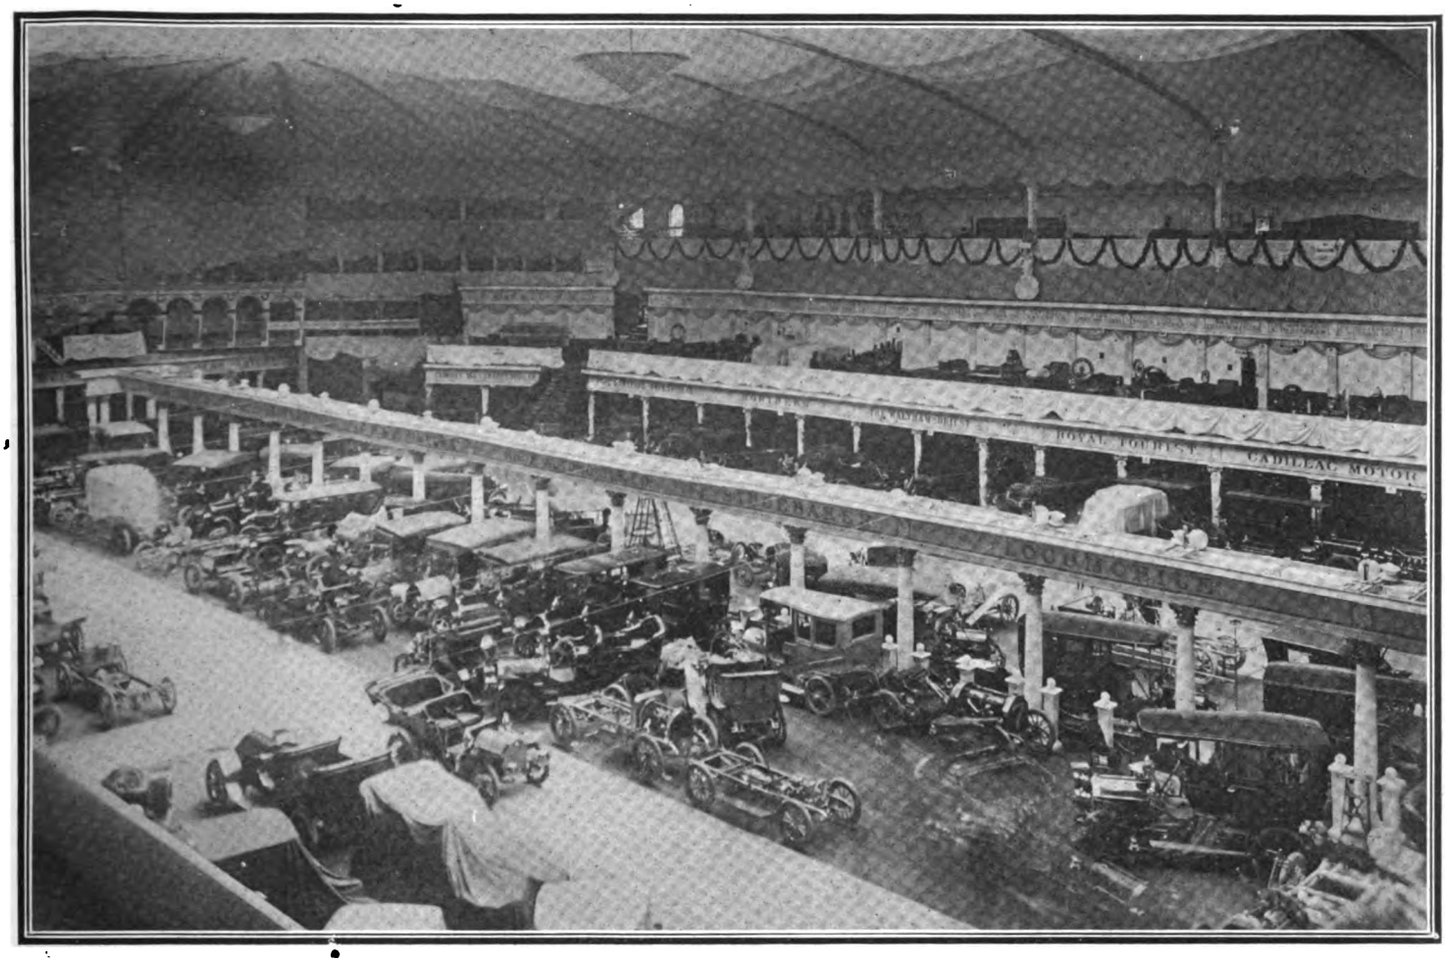
The Show Beautiful, also Instructive



When one views a glorious landscape, if he has but half an eye, he is bound to be impressed. But unless he has the soul of an artist it is all landscape that he sees. The pictures within the picture are apt to escape him or to pass with scant appreciation.

So it is with the Association of Licensed Automobile Manufacturers' Show at Madison Square Garden. Speaking solely from the viewpoint it is easily the most beautiful picture which ever supplied the setting for an industrial display. Advance reports of the beauty were not too fulsome. But it is all one picture. Its very harmony—its entire lack of contrasts in adjoining exhibits, however jarring and offensive to the eye, makes the task of the word painter no easy one. There are not many colors into which he may dip his pen.

The setting of one exhibit is the setting of all exhibits. Particularization is impossible. If, from the professional standpoint, the word juggler would have it otherwise, he would not have it so, if he consulted his sense of sight.



As it was on Saturday night last, when the doors were thrown open and as it will remain until Saturday night next, Madison Square Garden is almost dreamlike. Remove the modern motor cars and it would be easy to imagine that a playwright had created a masterpiece of the Roman era and that all was in readiness for the players

GENERAL VIEW OF THE GARDEN SHOW.

Digitized by Google

VIEW FROM THE NORTHWEST CORNER OF THE GARDEN.

and the populace. The great amphitheatre bears no resemblance to its usual self. The heroic white figure of Speed, poised 'tween the columns of the Roman arch and at whose feet a fountain plays and golden frogs look upward, charms the eye at the entryway. The "Automobile Girl" and the "Chauffeur," each with outstretched arm, and each of gleaming white, one on either side of the main entrance to the area, stand as if bidding welcome. Above is the blue canopy studded with gilt stars; the rails of the successive tiers of balcony look not at all like balconies. They are hid by graceful trappings of white and sea green, here and there pinned by white figures of nymphs arising from a scolloped shell. The centre of the Garden is bisected by a row of Roman columns topped by connected cornices studded with electric bulbs so shaded that there is obtainable that art-gallery effect; the light illuminates the names of each successive exhibitor, which are fashioned in letters of gold. Nowhere is there a discord. Looking upward from the arena floor one would not suspect that exhibits were housed in the upper galleries. They are not to be seen from below.

The whole effect is as of one beautiful picture, quiet, refined and restful. The one slight marring effect is obtained when it is viewed from aloft. The line of demarcation between the exhibits on the main floor is a slight one—a mere line in the carpeting of golden bronze. It is not easy to distinguish one from the other and there are those exhibitors who have so crowded the spaces which they occupy that some confusion is the result. Their cars are fairly packed into place. There is not even elbow room between them. There is no regard for artistic or even eye-pleasing angles or positioning. It constitutes a blur on the picture and if the picture effect is to obtain another year this detail simply must be considered.

Save the cars themselves, a highly polished chassis or a crankshaft on other part, or some parts, in the rough, is all that is to be seen on the main floor. Carpeting, chairs, desks all are alike. Of the chassis and parts, it is to be said that their workmanship and polish are such that the foreign exhibitor no longer enjoys a monopoly of an exhibit that in former years used to tremendously impress the beholder and serve to "convince" him of the alleged superiority of the imported product. The American display of chassis and part is in every detail the equal of those that come from across the sea and every whit as handsome to look upon and as impressive.

Although the weather Saturday night was not exactly propitious and comparatively few free tickets were in circulation, and though the aisles are much wider than in previous years, the Garden was packed as on all former occasions of the sort. The crowds were much like the crowds of yore, and strange to remark, there was not so much comment regarding the beauty of the scene as of right was to have been expected. Although it was evident that many of them were curiosity seekers, all seemed to have eyes for the cars—or costumes—women's costumes. Some of the women, in some of the most stunning costumes, as usual, became weary and found rest in the cushioned seats of the cars most comforting and convenient. That position also enabled them to see and be seen to much better advantage! There were many, very many, however, who made the circuit of the show and then betook themselves to the other show "across the way." This was going from one show to the other is distinctly the "proper caper." Attempts have been made to make it appear that one or the other is the "society function," but the result is feeble. There are as many well dressed, well fed, well bred people at the Garden as there are at the armory, and as many at the armory as there are at the Garden.

So far as the cars themselves are concerned, there are few of them that have not been already seen or described in at least general terms. It takes painstaking delving to discover anything of particular interest that is not already known.

The Show from the Engineering Viewpoint

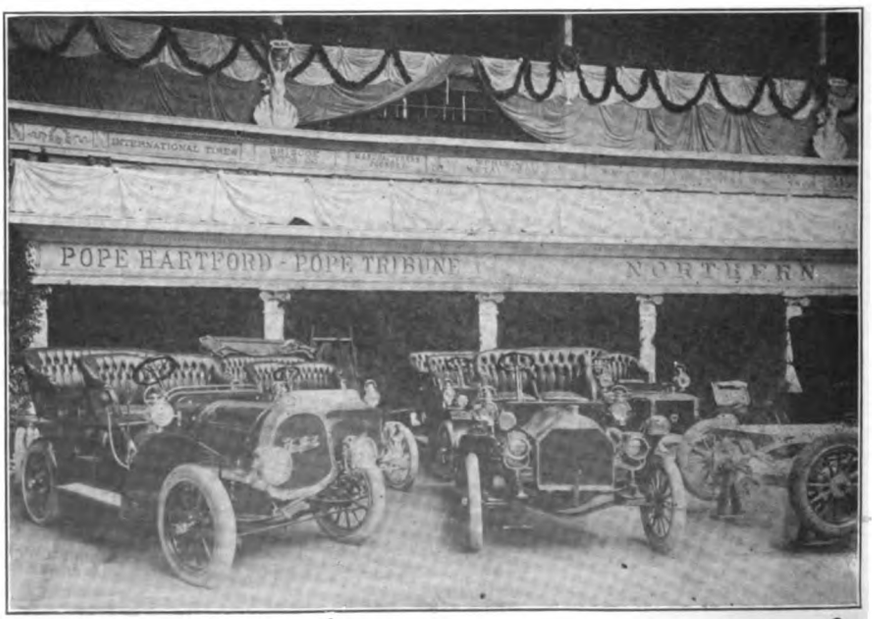
By Henry Souther

Features are looked for in the Show by the casual observer, but perhaps the most important one in the Show will be overlooked by most observers, and that is the presence of the large steelmakers of the country. They are in evidence for the first time with exhibits of samples of their work; samples of their steel; broken test specimens, showing the toughness, ductility and strength of the steels they have to offer. It is a very important thing that these exhibitors are on hand, because it shows that they are now ready to meet the wants of the automobile manufacturer and give him the steel he asks for.

The great Krupp Steel Company, of Essen, Germany, has a fine exhibit, showing the products of their concern especially adapted to automobile work. No foreign concern, however good, ought to have found a foothold in this country among the automobile people, and would not if the American steel manufacturers had been willing to believe that the demand for fine steels would have become so strong as it is at this moment. The large American steel maker has been made to sit up and listen by the foreigner; another illustration of the fact that competition is the life of trade and results in what is best. Exactly the same materials are offered by home and foreign producers, notwithstanding the glamour and mystery that the steel agent endeavors to throw around his particular steel. Notwithstanding the fact that each one of these manufacturers claim that he is the only one who can produce automobile steel, steels of equal quality are produced by all of them, analyzing the same, testing the same and behaving the same under the equally skilled treatment in the hands of the user, the treatment being quite as important as the composition and method of manufacture.

In the past the large steelmakers have been too busy with customers demanding a greater tonnage and uses going into large structures. Now the automobile industry steps into the ranks of first importance and, as usual, the manufacturer meets the demand.

All the talk about the wonderful steels used abroad will sink into insignificance because of the immense quantity of just the same steels that are offered by such companies as the Carpenter Steel Co., the Bethlehem Steel Company and the Midvale Steel Company, all home concerns of established reputation; makers who have known for years how to make good steels, but who have not offered them in the machine makers market because there was no demand. Their best steels went to the government for the high-class demands of the torpedo boats, battleships, guns and projectiles.



Steel for tools demands as much, if not more care than the steel they are now producing for automobile construction. No one imagined a few years ago that the automobile manufacturers would be willing to pay the same price for structural steels as for tool steels, but such is the fact, and steel of this character is to be seen distributed all over the Garden among the high priced high-speed cars.

The spring maker, one who contributes so much to the easy riding and pleasure of a car, has also awakened to the fact that high-class steels will be paid for and he is ready to put good steel into springs. The result is that the cars are more easy riding than formerly, the springs more flexible and the liability of rupture greatly diminished. Good steel spring in plenty has always been available at a price.

Lightness is, of course, a necessity; the lighter the car for a given strength the better. The makers of alloys of aluminum have been making a most careful study and research for the best alloys possible. Large concerns who paid no attention to the automobiles a few years ago have now started departments devoted especially to the manufacture of castings of great strength for automobile purposes. Alloys of aluminum possess now after this careful study, nearly double the strength available a few years ago, and with a considerable degree of ductility as well, formerly not obtainable. Manganese bronze and aluminum bronze have come to the front and the casting of them has reached a high degree of perfection, bringing about splendid combinations of strength and ductility. Such concerns as Cramp Ship and Engine Building Company and the Light Foundry and Manufacturing Co. are in evidence at the show with these wares.

So great has the trust become in alloys of this kind that prominent automobile manufacturers like Knox and Winton have introduced them into so vital a part as the front axle, although Knox has always used an alloy of this description for its front axle with absolute success.

The casting of automobile cylinders, perhaps the most intricate and delicate bit of cast iron in the market, has led to specialists in this line, as indicated in the exhibits of the Manufacturers' Foundry Company. Such castings as these have been habitually avoided by the foundryman. The accuracy necessary in the manufacture of cores and the setting of them, and then, finally, the pouring of the iron into these shapes has discouraged almost all foundrymen. They could not do it for the price ordinarily paid for castings and did not think that the demand would be so strong as to force the production of castings at almost any price. Such a demand has arisen, and, as usual, has been met by the enterprising foundryman. At least one of the automobile makers, the Olds Motor Works, have their own

Digitized by Google

foundry and pour special irons for the purpose.

Construction and Design.

In the construction of the cars there is variety in plenty, but few freak ideas. Thoroughly digested sound construction is the rule. The evolution of the last few years has told all along the line—well designed engines, well designed frames, transmissions, brakes, steering mechanisms, axles and wheels. The vitals of the car have reached a stage of perfection comparable with older constructions, such as railway locomotives and coaches. Structures reaching the high state of efficiency demanded by high speeds and bad roads are here. The danger of rupture has been reduced to a minumum and long life in motor cars is insured. A glance at the axles, steering mechanism, frames and springs by the layman is enough to convince him of the determination to make machines that will last. The increase in dimension of the vital parts coupled with the use of steels two and three times as strong as in the past is bound to make itself felt.

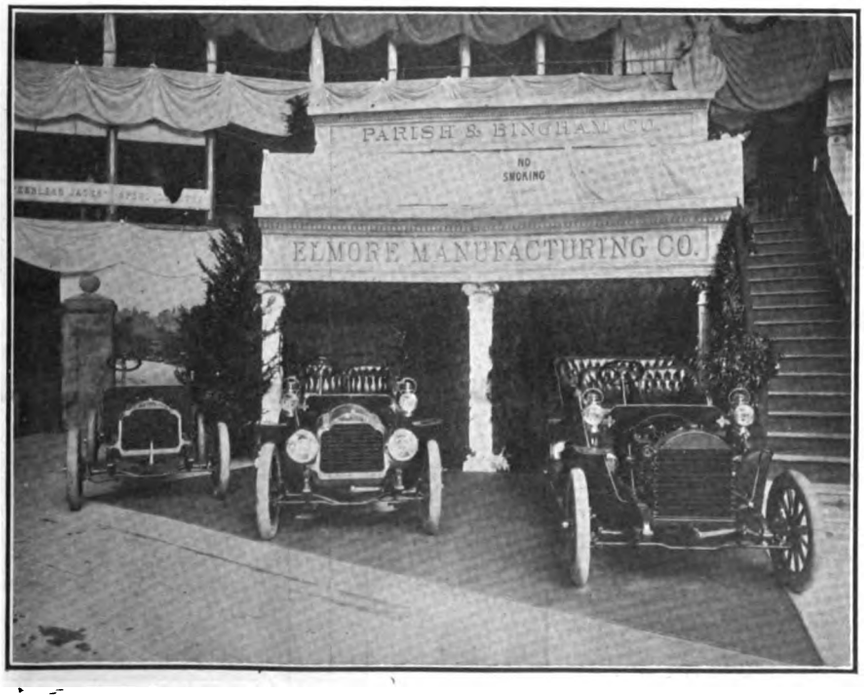
Long wheel bases, much longer than last year, are in evidence; even cars of small power have lengthened wheel bases. Last year it was the usual thing to find the front axle pretty well under the middle of a four-cylinder engine; now it is as often under the radiator, or as nearly there as elsewhere—all this with an idea of getting longer wheel bases and not longer bodies, and therefore without increase of weight.

Every type of motor is to be seen, single and double cylinders horizontal, double cylinders vertical and, of course, the four and six vertical.

Chain and bevel gear drive for all powers vie with each other for supremacy. There are strong advocates of both to be found if you are looking for a discussion as to the relative value of the two systems. A fact overlooked by general observers, however, is that in every double chain drive car there is a pair of bevel gears in the transmission box instead of on the rear axle, as with the so-called bevel drives. This disposes of the extremists' argument—that bevel gears will not do because they consume power. They are there in some shape or other in nearly every car, the only bone of contention being as to whether they can be suitably held in place on the rear axle, it being admitted by all that they are the right thing if they can be as well held in place as they are in the transmission gear case.

The same air-cooled cars are present as were present last year. There were no additions and no desertions, so it is fair to assume that the air-cooled engine has satisfied enough people to make them a perfectly successful mechanical and commercial venture for the manufacturers. This is the best proof that the air-cooled engine is a success and is practical. The water-cooled motor is, of course, in the majority.

The two-cycle motor has made a step ahead. The movement started by the Elmore and continued by them for so many years, now has been taken up by the Olds people. It is a most interesting proposition from a mechanical standpoint and will bear watching. This is important when it is realized that a two-cylinder, two-cycle motor gives just as many explosions for a given number of revolutions of the fly wheel as a four-cylinder, four-cycle motor gives; and that a four-cylinder, two-cycle motor is the equivalent of an eight-cylinder, four-cycle motor. The two-cycle motor requires no valves, either automatically or mechanically operated, thus reducing immensely the number of parts in an engine. The piston of the engine performs all the functions of the valves of a four-cycle motor, coupled with the device for precompressing the charge before it enters the explosion chamber.



It has some drawbacks, perhaps, in the fact that a reasonable speed of motor must be maintained at this time to get the highest efficiency, but that is something that will be taken care of with experience, just as it has been done with the four-cycle motor, following increase of knowledge and experience.

A year ago the gasolene commercial wagon was not an important factor in the exhibit. This year in the basement is to be found a very large number of a variety of trucks propelled by gas engines. They are to be seen in large and small sizes, four cylinder and two-cylinder, some vertical and some horizontal, air-cooled and water-cooled.

During the past year the public has become familiar with the appearance of many of the various vehicles exhibited, as they are in common use in the streets of the large cities, and particularly in the cities where they are made. The manufacturers have had them in use for their own purposes so as to thoroughly test them out before offering them to the public. They are now before the public as a product well tested, well digested and ready for business. This year some of them make their first appearance in a show, but by no means their first appearance as a practical vehicle.

All of them show evidences of careful study to make these commercial trucks practical for the ordinary teamster to handle. Engines of the simplest type and transmissions of the simplest and most fool-proof construction.

A most ingenious application of the magnetic clutch is found in the Pope-Hartford motor truck. A control has been devised that is as simple as that of an electric wagon, with no possibility of stripping gears through ignorant handling and with no clashing of gears and consequent wear. The description of the clutch sounds complicated, but its manipulation is simple, indeed.

Motors.

The four cylinder motor predominates, that is sure, and most of them are cast with their cylinders in pairs. But there are exceptions. In the Pope-Toledo, for instance, is found a composite casting scheme with the straight portion of the cylinder cast separate and all tied together by cylinder heads containing the valves, cast in pairs. Also the Northern shows a four cylinder motor in one casting, neat in the extreme as to its exterior appearance.

Of course the air cooled adherents necessarily cast their cylinders separately. Some of the motors, in fact, quite a number, are supported at three points only, so that no weaving or bending of the frame is transmitted to the engine base construction, thereby setting up strains in it that should not be there.

Motors hung upon the main frame or upon the subframe are both to be seen, and without accurate count it would be difficult

Digitized by Google

to say which has the superiority in numbers. Suffice it to say that in all cases the means of support is very thoroughly and efficiently worked out, combining simplicity, strength and neatness of appearance.

Beautifully finished motors are on the increase, extremely neat arrangements of intake and exhaust pipes and, in general, a finish that equals anything of a similar nature known to the engineering industries of the time—just as much refinement, if not more, than the electric motor or high class torpedo boat engine.

The Buick people are showing a new four-cylinder car and it is apparent that they have followed the daring example set by the Stevens-Duryea people in combining motor, clutch and transmission in one continuous structure, supported at the front on two points, at the rear on one, with the fly-wheel at the front end of the motor.

Stevens-Duryea have carried this same construction into their big 50 horse-power six-cylinder motor, and apparently with perfect success. A demonstration of this car revealed its smooth running, perfect control and enormous power. Speed as low as five miles per hour on high gear was easily possible, the engine responding immediately to the opening of the throttle. The length of this motor as seen from the driver's seat is impressive; the front of the motor is a long way off. There is a feeling of confidence as to its ability to get there not inspired by the shorter motors of four cylinders only.

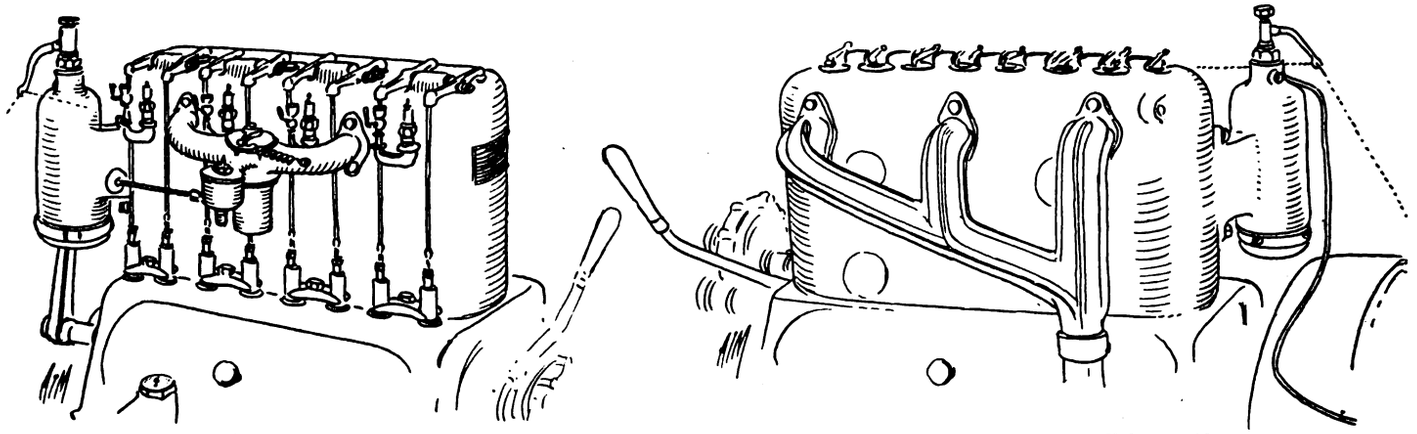
Perhaps the most unique, daring and beautiful piece of engineering in the crankshaft line is to be seen at the Stevens-Duryea stand. An exhibit of the crankshaft actually used by these manufacturers in their six cylinder car is mounted for examination. The feature of it is the large Hess-Bright bearing in which it rotates; four bearings containing balls 1 1-16 inches in diameter, about 5 inches in diameter from center to center—generous in the extreme and because of this generosity sure to perform their functions well under any kind of punishment. It is a beautiful piece of work and sure to attract the admiration of the automobile engineers even if all of them do not support and endorse the idea of a crankshaft run on ball bearings.

Lubricating Systems.

The variety in lubrication is greater than ever, and, strangely enough, a new feature has come to the front; that of neatness connected with the filling of the lubricating tanks. All who have had any experience with cars know how bad a mess has been made by careless spilling of oil about the footboard and dashboard of automobiles. Trying to fill the tank hurriedly on a long run, or in the dark garage, oil is spilled.

Now a small tank is carried outside the frame, so that in case any oil is spilled it is spilled on the ground. The oil is forced from this low tank to one on the dash holding just the supply that is now ordinarily available. Furthermore, the oil tank has a capacity so large as to make it unnecessary to carry inconvenient and dirty oil cans under the seat of the car on long tours. One tank of oil will last from three to five hundred miles, depending only upon the tightness of the bearings and the leakage from the engine. This is more of a change than appears at first glance. The pressure in the large tank is supplied by various means, some machines by a shunt from the exhaust, some by air pressure furnished by a little hand pump; but whatever the means the additional complication is well worth while.

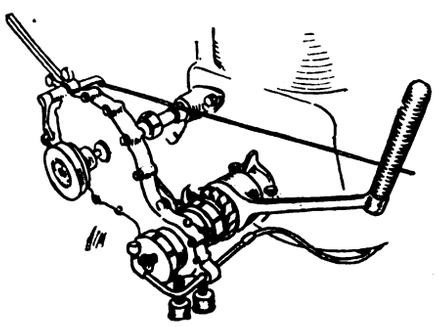
Just about the same number of pressure feeds are found with their sight feed glasses, some of them on the lubricating tanks themselves and some of them on the dash entirely separate from the tank containing the oil; all of them very much neater than in the past, and all of them so devised as to prevent badly arranged dripping devices so that the rapidity of feed is very hard to see, especially in the dark.



The standard lubrication used on the Pierce has been followed with modifications by several others. In connection with this there are no sight feeds, no oil boxes on the dash at all and very short lengths of lubricating pipes and all these of generous bore. The principle of flooding the bearings and allowing the surplus oil to find its way back into the tank either by means of a pump or gravity is gaining adherents.

The lubrication in the Cadillac is rendered extremely positive by a ratchet pump working under high pressure, some 60 pounds per square inch more or less, forcing oil to the main bearings of the engine. This oil after leaving the main bearings finds its way by centrifugal force to the bearing surfaces on the crank pins. Other oil splashed by the gears finds its way into channels around the crank case, and by splash to all working parts of the motor. This renders the lubrication certain.

In the new four-cylinder Oldsmobile, copious lubrication by means of a pump from a reservoir underneath the engine base and a large supply tank at that point has been adopted, channels about the crank case conducting it to all the bearings. The same shaft that drives the pump in this case also drives the commutator, and should, by any means the oil pump cease to work, the commutator would also stop and give due warning of improper lubrication.



Certain it is that proper lubrication insures long life in the engine bearings as no other thing will do. There is no use putting the best of babbitt, the best of bearing bronze or anything else into the bearings of an engine if they are not copiously and thoroughly lubricated. No combination of metals will run dry if indifferently lubricated.

Right here in the matter of lubrication is

Inlet side — Exhaust side

THE NORTHERN MOTOR, SHOWING AIR PUMP AND STARTING LEVER.

NORTHERN MOTOR.
Showing Commutator, Water Pump and Air Connections to Clutch.

Digitized by Google

to be seen one of the greatest steps in advance in the automobile industry.

In the Northern car there is to be seen no evidence of lubrication. No tank is in sight even to contain the lubricant, but careful investigation reveals a four gallon tank as a part of the pan under the engine, this being connected like other lubrication systems with the crank case, and results in a splendid system of splash lubrication.

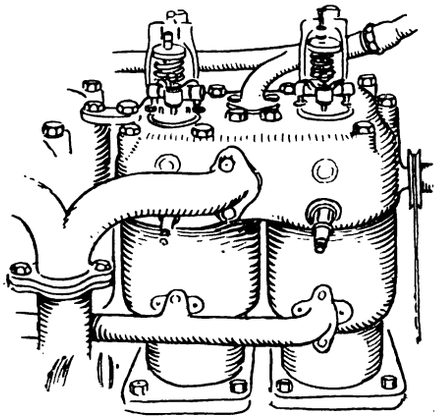
Objections will be raised by some to the fact that lubricating systems without sight feeds do not indicate when the lubricating ceases if anything goes wrong, but such cars have been equipped with try-cocks which can be opened a little, and if the oil is circulating as it should be a flow of oil will be instantly in evidence.

Valves.

Changes in minor details are found on every hand as to the operation of the valves. All are of the poppet type, as in the past. That seems to be essential up to the present time for gas engine purposes. Automatic inlets are few and far between, and yet they are found on such a splendid machine as the Pope-Toledo.

The location of the valves, as in the past, is very equally divided between two on one side of the cylinder and one on each side, and all in the heads directly over the top of the cylinder. Both of the Pope-Toledo valves are found in the top, one the inlet suction and the exhaust operated by walking-beam mechanism. This is a radical departure and is made a part of their new motor cylinder construction. The Packard engine has changed its valves from both on one side to one on each side of the cylinder, operated by two cam shafts, both the Locomobile and Packard being supplied with two cam shafts.

A departure from the accepted means of operating valves is found on the Matheson car, the secondary shafting being near the top of the cylinders, the motion transmitted to it by bevel gears from crank shaft. They use the valves in the top of the cylinders, operated by cams and cam mechanism that is exposed.



The Pope-Hartford, four-cylinder valve motion, is all produced by walking beams from the secondary shaft and the valves are located on the tops of the cylinders, all eight of them being operated mechanically. This system has been splendidly carried out and can not help giving good service.

It looks as though the location of the valves was being determined in many instances entirely with a view to obtaining neatness and symmetry in the general appearance of the motor. This being true, thermodynamic efficiency is suffering in many cases; not too much, to be sure, but to some extent.

As time goes on, if automobile engine development follows the line of steam engine development, such things as style and symmetry will have to take a back seat and yield to efficiency. When this comes about, then the valves will all be found in the tops of the cylinders just as in the many cars referred to as having them there.

The Apperson car is supplied with valves on opposite sides of the cylinders, and, in addition, two sets of spark plugs, one over the inlet side and one over the exhaust side, one set being fired by magneto and the other set held in reserve to be used in connection with the battery, thus giving two complete ignition outfits. This system has a fine advantage in being able to find out in all probability whether any skips or misses are due to ignition troubles or to something else.

The new four cylinder Knox has most carefully arranged valves in the top of its cylinders, operated by long walking beams set at an angle of 45 degrees with the axis

POPE-TOLEDO MOTOR.
Showing Automatic Inlet Valves.

of the car, the idea being to give a long walking beam and as little angular motion as possible.

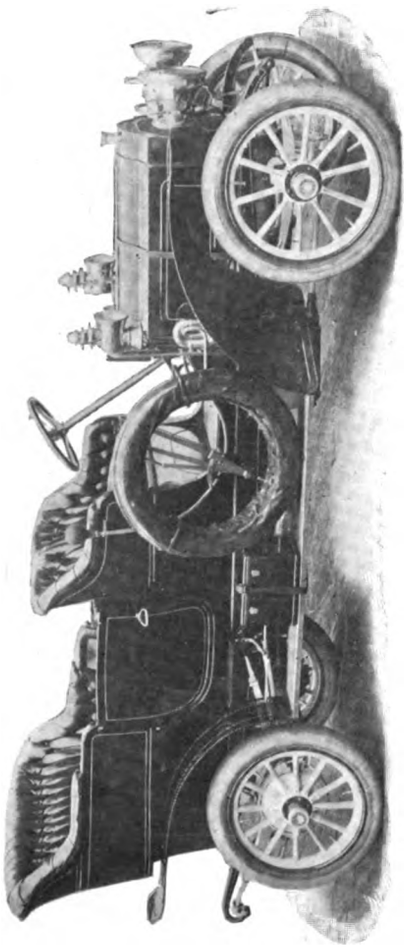
The Franklin's valves are all in the heads of the cylinders as they have been in the past few years. This arrangement is most important in the air-cooled car, allowing, as it does, the diminution of heated area in the explosion chamber and contributing to the ease of cooling. The Franklin also adheres to its exhaust port at the lower end of the stroke, having found by experience much assistance in getting the heat out of the motor as quickly as possible after the charge is fired. A separate valve is supplied at this point mechanically operated.

Carefulness of the workmanship of the valve operating mechanism and quietness has been studied, in fact some of the motors operate almost without a sound.

Brakes.

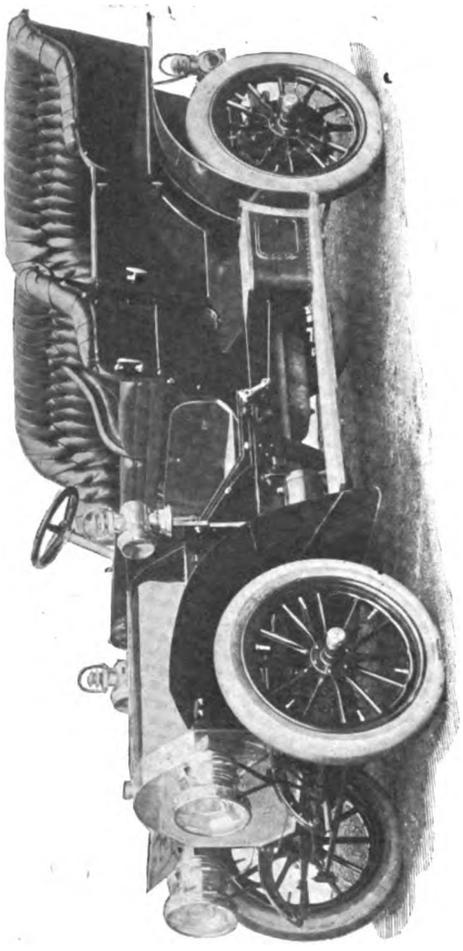
That most important adjunct of the automobile, that which contributes so much to its safety and efficiency—the brake—has received most painstaking study. Increased dimensions all around are universal. Braking surfaces four and five times as generous as those of the past are to be seen in dozens of cars. The wire cable replacing steel rod connections has made decided gains as connections between levers and the brake bands proper. Prejudice against this has existed in the past but has become fully overcome by actual use and experience. Increased knowledge as to the proper materials to be used in the cables and the proper attachment of them to the rest of the mechanism has solved the problem, and the brake cable has arrived and is likely to stay, because of a great many reliable features. It is so constructed that both bands on the rear wheels, for example, take hold with equal force without necessitating the minute adjustment that has been required in the past. It has been no uncommon thing to find a car with all the force applied to the brake band operating on one wheel, instead of being equally divided between two. This improvement is as it should be.

The hand brake that pulls toward you instead of pushing from you is found in a great many new places. It represents a step in the right direction; for, is it not easier when a brake is to be applied with a foot on the clutch pushing, to pull with the arm rather than to push with both arm and foot?



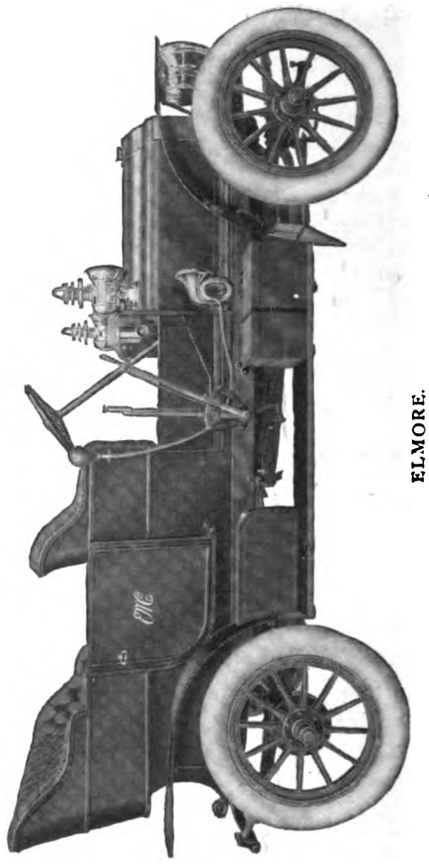
The greatest novelty in brakes is undoubtedly to be found at the Northern exhibit, where a brake is seen applied by air pressure, just as are the brakes in a train of railroad cars. The air pressure is supplied by an air pump driven by a crank on the end of the cam shaft giving air pressure at 75 pounds per square inch. This brake is applied by a little lever on the steering wheel moved by thumb and finger, and yet with the air to help furnishing power enough to lock the wheels where the pressure is applied.

Internal and external brakes on a drum on the rear hubs appear on many cars. Perhaps the number is about equally divided with those retaining one pair of brakes on the rear hub and one on the transmission shaft or propeller shaft, as the case may be, but in every case increased dimensions are noteworthy and to be greatly applauded. It means a brake that will last longer and be more efficient and to require less strength in application. A child can bring to a stop a heavy car with such brakes as are now in common use.

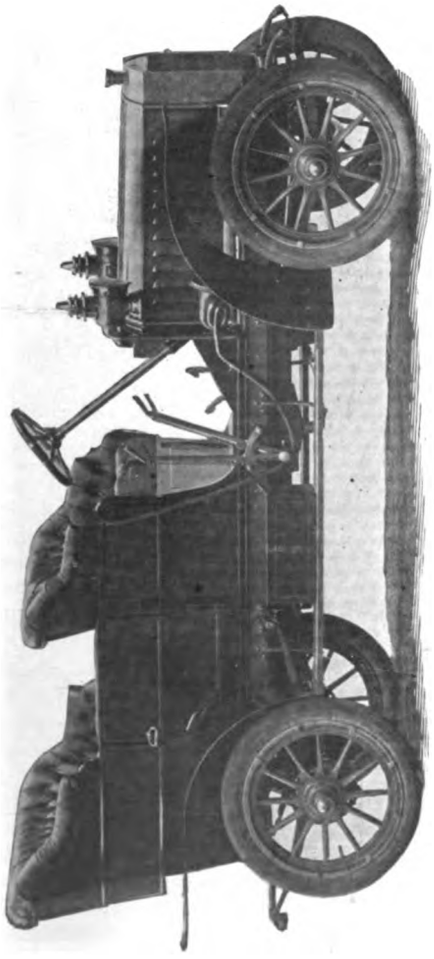


On the new Peerless models are found a pair of brake beams that have not their duplicate in the show. They necessarily give a perfectly balanced pressure on the rear hubs, dividing it equally as no other device can, and all this with absolutely no adjustment. They are simple in construction, consisting of pressed steel girders light and stiff. Skidding is minimized by this means.

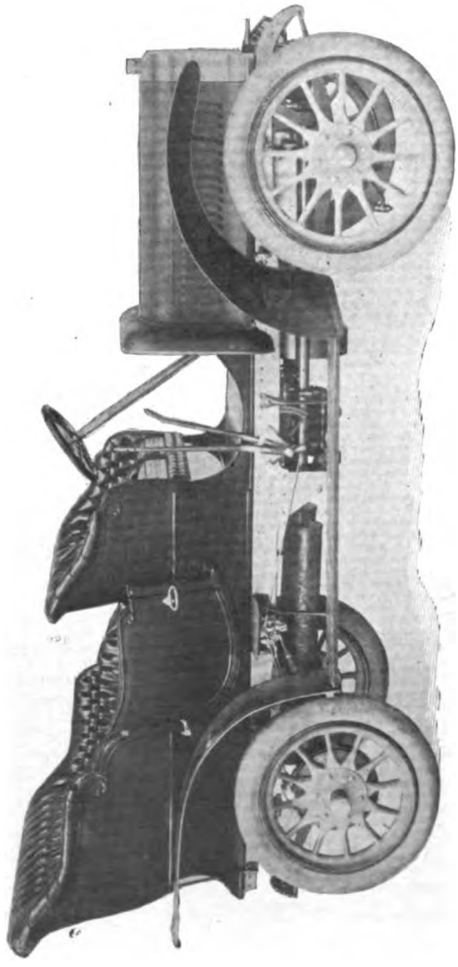
The Thomas engineers have adhered to their ratchet safety brake on the rear hubs, in the old form except that they have removed the ratchet and pawl to the outside of the brake drum instead of on the inside where it has been. This is rendered necessary on account of an internal brake on the rear hubs. This ratchet may be thrown into action at the bottom of a hill. Take for example a new driver being taught with a man at his side. There may be some



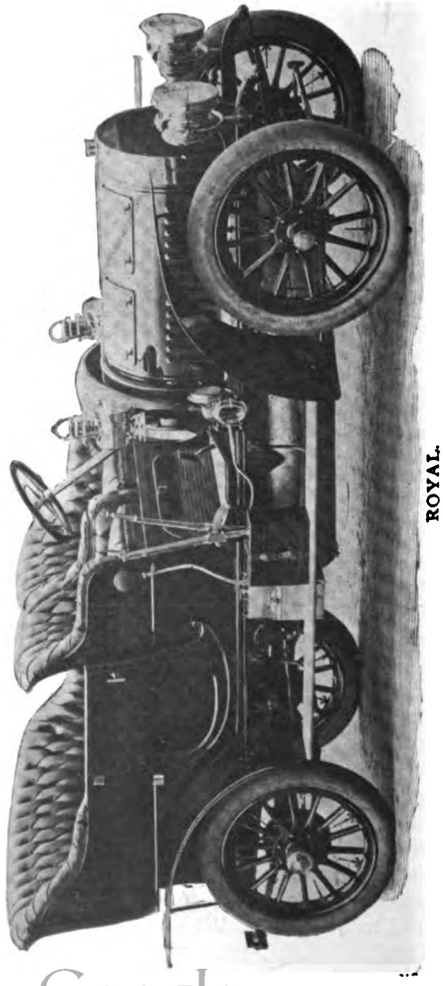
Digitized by Google



PACKARD.

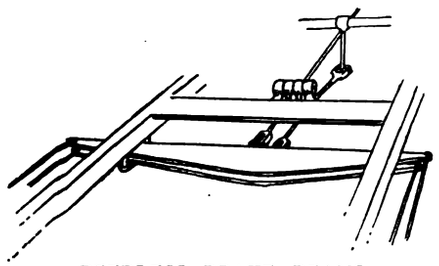


LOCOMOBILE.



ELMORE.

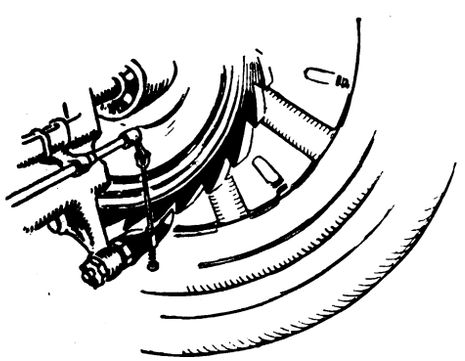
AUTOCAR.



CADILLAC.

ROYAL.

Digitized by Google



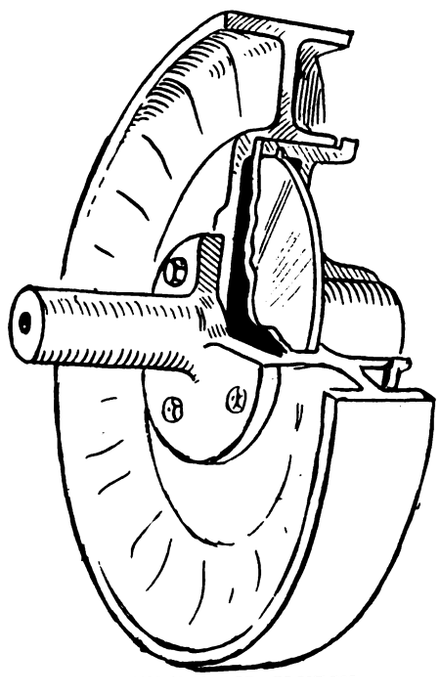
possibility of his missing his gears on the hill. The car, of course, starts back, the pawl comes into action on the ratchet and stops the car instantly. The beauty of this device is that it is under the control of the man doing the teaching, being between him and the driver. Constant use is not expected in connection with this ratchet, but when it is wanted it is wanted very badly, and may very easily prevent a very bad accident.

PEERLESS BRAKE BEAMS.

The Renault brake on the transmission shaft is of very generous dimensions, both as to diameter and width; furthermore, the exterior surface of the metal band is sharply corrugated, with the idea of dissipating heat.

Both Pope-Hartford machines, two and four-cylinder, have no hand brakes, being supplied with a full equipment of two sets of brakes operated by the foot. The material used for the brakes coupled with the generous dimensions of the brake, gives a most excellent feel to them under the foot

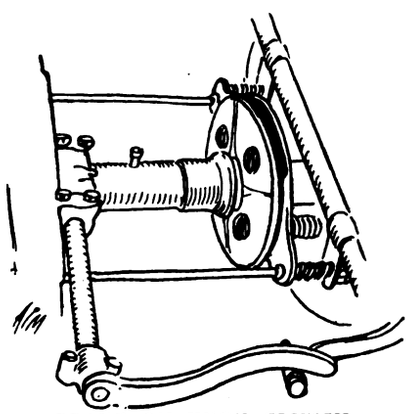
THOMAS SAFETY RATCHET.



and powerful action. It is the use of what is commonly called camel's hair belting, resembling a canvas material of heavy mesh.

On the Fiat car the application of water to the brakes is a feature, the brake drum being supplied with an internal rim into which a small supply of water can be released at will from the seat, a small tank ing carried at the side of the chassis under the dash. The water is caused to flow by pressure from the exhaust.

It seems to be the general impression among the engineers that the brake that should be in use constantly ought to be an external one, wear being less rapid as a rule and renewal less difficult, the internal and second set of brakes being held in reserve as emergency propositions.



Clutches.

The all-important clutch has not been neglected, and it is apparent that no end of study, ingenuity and time has been centered on this feature. All kinds are in evidence—the good old leather faced cone of accepted type, with or without or springs

NORTHERN AIR CLUTCH.
Showing Air Passage through Shaft and Flexible Diaphragm.

underneath the leather to modify the gripping force and make them take hold gently; the metal cone running in oil, shown on the new four cylinder Knox; the multiple disc, the expanding internal band, and finally, and most novel, the air pressure clutch of the Northern car.

BRAKE ON KNOX CLUTCH.
Shaft to Prevent Spinning when Released.

The type of friction clutch, consisting of two discs, the edge of one bearing on the face of the other, is found only in one little car, and that is the Orient buckboard. It necessarily conduces tremendously to the efficiency of this little car, and is particularly adapted for use with a small high speed motor like the Orient buckboard. Infinite variation of gear is possible and desirable with a motive power of this kind. It ought to solve their problem to the queen's taste.

The Northern people have taken the same air at 75 pounds pressure that they use to operate their airbrake and applied it to their clutch. It is transmitted from the air compressor to the front end of the crankshaft, through the crankshaft, which is hollow, to a diaphragm disc 10 inches more or less in diameter, which is flexible and has a leather face. This being pushed outward by the air pressure amounting to some two or three tons, presses against the steel disc attached to the transmission shaft, the result being both flexible and positive.

This clutch can be made to slip by using only a little of the air pressure or can be made to hold tight with the air pressure full on. There is no trouble about the alignment of parts in this clutch, no care is needed to make it center exactly in the flywheel, and it allows of the very unusual construction of driving with the shaft directly from the clutch to the transmission and bevel gears on the rear axle. Alignment is not necessary, in fact the power can be transmitted around a corner as far as the clutch is concerned. It all depends, to be sure, upon the air system and its certainty, but when we stop to consider that we ride daily in trains supplied with this same air system and feel safe because the train has air brakes and air devices, we realize that if the Northern people use the same care in the construction of their air system as they have in the past with the remainder of their work that nothing is to be feared from this source.

The importance of aligning the cone clutch has caused the introduction of flexible connections in the way of cardan and universal joints between the clutch to the transmission case almost universally. Experience has taught that a cone clutch not in line absolutely does all sorts of queer things and that lack of alignment has been the cause of bad behaving clutches more than any other mechanical point.

On the new four cylinder Knox a device has been provided that ought to be of much benefit—a small auxiliary braking device on the clutch itself which operates automatically, so that when the clutch is released from the flywheel it does not continue to spin and render the changing of gears a noisy operation. The clutch and its shaft are brought instantly to a standstill. The gears may be changed without clashing; when the clutch again engages this little braking device is released, all without the knowledge or attention of the operator of the car. It is a complication that simplifies and is well worth while.

The Rochet-Schneider clutch is radically different from others shown, consisting of a small diameter split steel internal band, expanding against steel and running in oil. The "feel" under the foot is extremely delicate, due to a long powerful spring. The Thomas car departs from the cone type clutch decidedly and uses a larger diameter, some 20 inches, with the shorter arm of a lever pressing against a floating ring and

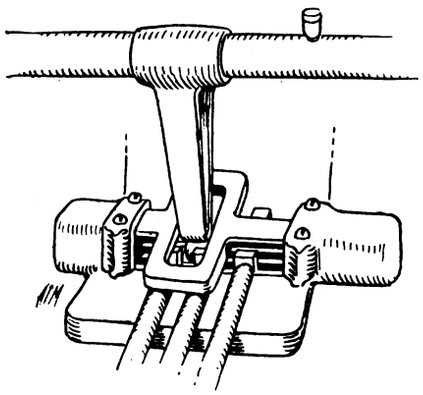
Digitized by Google

binding the fly wheel to it. The Autocar clutch, although not the same as the Thomas, is not unlike it in some of its features and consists of pinching a ring lugged to the fly wheel between two floating members. The Haynes clutch is one of the gripping band type, further modified by springs interposed between it and the fly wheel, so that it cannot take hold too sharply.

It is apparent that the clutch problem has not been finally settled. Had it been settled there would be no such attempts as are seen throughout the well constructed and well considered cars to find something different. All are familiar with the cone clutch—all have not adhered to it, but it is probable that most of them have tried it more or less. There is as much variety in the design of clutches as exists in any one feature of the accepted car of high grade. Each one has a strong impression that his is the best. They are all doing pretty good work, as is shown by the behavior of the cars. Further developments in clutches may be looked for.

Transmission.

Those who anticipated a radical change in transmissions will not find it; the same sliding gears are in evidence; they vary only in detail of operation and their arrangement. This form seems to have come to stay and the difficulties formerly existing have been so thoroughly worked out that there really is now very little that is objectionable. Like much else about the motor car in its infancy, problems that seemed insurmountable then have been overcome, and the sliding gear transmission is a success. Three and four speeds ahead with a reverse are furnished, most cars have three speeds ahead only. The transmission box is found mostly under the body between the rear axle and the fly wheel. The Packard has its on the rear axle in the same box with the bevel gears, also the new four cylinder Northern.



With one exception the bevel gears on the chain driven machines are found in the same gear box with the driving gears. That exception is in a foreign car, the Clement-Bayard, where the bevel gears and the differentials are grouped in a separate box on the sprocket shaft, leaving the sliding gears to themselves.

There are two means of operation nearly equally divided as to numbers, one called the selective system, where the lever works in an "H" casting, allowing the engagement of any gear at will without the necessity of passing through another gear, as is necessary in connection with the progressive system. Both systems have the strongest kinds of adherents, and it is safe to say that an operator becomes easily accustomed to either one or the other, it all becoming a matter of habit.

A nice detail of the Stevens-Duryea control is the arrangement of the notches in such a way that change from the intermediate gear to the high speed is made by simply pushing the lever ahead without thought of a notch and without the necessity of raising the latch; and in coming back simply pulling back the lever with the assurance that the latch will catch in the middle notch without any thought being given to it. This wonderfully simplifies the change from middle to high and back again.

The Apperson people furnish two forms of transmission, a four-speed ahead with the selective and a three-speed ahead with the progressive system.

The Pierce-Arrow keeps its gear changing lever under the wheel as formerly, but a change in their transmission has been made so that the car is on the direct drive through to the bevel gears from the engine when on high speed gear. Formerly they have driven through gears even to the highest.

KNOX GEAR INTERLOCKING DEVICE.

The Pope-Toledo transmission is quite different from any of the others in the fact that the main shaft and lay shaft are at right angles to the axis of the car instead of parallel with it, which, of course, necessitates the sliding motion of the gears across the car instead of endwise with it. Direct drive on the high gear is furnished however just as with the other arrangement, their system of change being of the progressive type.

The Winton Co. adhere to their old type of two speeds ahead and a reverse with independent friction clutches to the gears, all enclosed within the transmission gear box.

The planetary system is found of the three speed ahead and reverse type in the large four-cylinder Cadillac car. This company has had one year with this type of transmission and are satisfied with it; it has given them good satisfaction even with the large amount of horse-power developed in their large motors. The dimensions of this planetary system are most generous and herein undoubtedly lies the success.

There are no freaks in the way of transmission in evidence as there always has been in the past; the systems are all pretty thoroughly worked out.

In the new four-cylinder Knox car is found an innovation in what may be called a double-faced bevel gear, one face doing the driving on all speeds but the high, and the other face of the bevel gear doing the work on the high gear. This makes the transmission of power a little more direct when on the lower range of gears. It is simple and well worked out.

Safety locking devices controlled by the movement of the clutch are on the increase. When the clutch is engaged a bolt or pin of some kind locks the gear shifting mechanism absolutely. Pressure on the clutch pedal unlocks it. This makes the attempt to shift the gears while the clutch is in out of the question. Of course, experienced drivers never do this, but all drivers are not experienced and the device being a simple one serves a good purpose.

The means of moving the gears are various and most ingenious, that is the details of the mechanism between the hand lever and the point of application on the gear.

Ball bearings of the Hess-Bright type and large ones at that, are found in a great many cars in the transmission and it is fair to say that the use of ball bearings in transmission is becoming rapidly into favor.

Yet take such a splendid car as the Locomobile and no ball bearings are found, the perfectly successful arrangement for some years being shafts of hardened steel revolving in well lubricated bronze bearings, no trouble of any kind having been experienced and long life in the bearings being the outcome of the practice.

In connection with the transmission it may be well to mention that several of the cars have been provided with flanged couplings in the shafts between the transmission and the clutch, so as to allow of removal of the transmission without disturbing the clutch and vice versa.

Haynes adopted for his car last year a roller bevel gear drive and continues it this year, having had such good success with it. He exhibits a gear which has been driven 5,000 miles and no wear is noticeable. In addition to this a form of torsion rod is used on the Haynes car that is the only one of its kind in the Show, consisting of a rigid rod screwed into the bevel gear box nearly vertical and engaging with rollers on a cross bar on the frame, free to move up and down, but absolutely preventing all torsional movement of the rear axle. The rollers are large and the torsion rod is ample in area, the result being that this arrangement is giving perfect satisfaction. On the Peerless car is found an eccentric on the fan pulley, as a means of taking up any looseness of the fan belt. The Peerless car is also supplied with full pan protection under its engine and transmission.

Control.

The variety of engine controls exhibited covers the whole possible range. The simplest form is that illustrated by the two cylinder Knox car where one lever opens the throttle simultaneously with the advance of spark, there being but one lever that controls the engine, with no governor on the engine to assist or any other means of control.

The next in point of simplicity is the

Digitized by Google

separation of the spark from the throttle and the use of two levers. one throttle and one spark control. These are found on top of the wheel and at the side of the steering post, then again with the throttle only on the wheel and the spark elsewhere, all without any governor. Then, in addition to this control, comes an additional foot pedal to be be used in emergencies, where the hands are not free because of difficult steering, to control the engine entirely independent of the hand lever.

Finally, there is the motor with a governor having a variable spring tension, so that the speed of the engine may be set at any given number of revolutions per minute within its range, such as is found on the Locomobile, the Columbia and the Pierce. Both of these are accompanied by foot pedals for accelerating purposes, and for use about town where the traffic is congested and the hands are busy with the steering wheel.

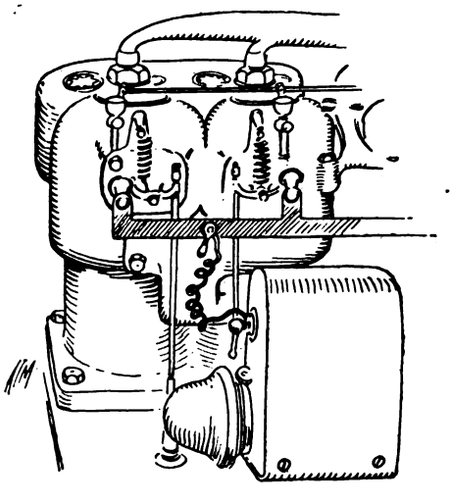
Many of the cars have adopted the plan of placing their control levers on top of the steering post, and not moving with the wheel, but always remaining stationary with the idea that the hand instinctively finds them regardless of the position of the steering wheel.

The small Columbia car has a new control consisting of the governor operating a separate throttle in the carburetter of its own, and the foot accelerator, another throttle entirely independent of the governor throttle. This avoids all complicated interlocking devices between the foot accelerator and the governor. The governor holds the car at any speed, and even though the accelerator may be used temporarily, as soon as it is released the speed of the car returns to where the governor was left last.

Thoroughness in the construction, accuracy and positive behavior of these controls are found in the accurate machine work used and replacing the former means of wires and carelessly constructed rods. Take the Haynes car, for example, which has at the bottom of the steering post nicely cut bevel gears transmitting the motion to the throttle and to the spark advance without a chance for lost motion in any way.

The Pierce-Arrow and the Thomas car are equipped with very painstaking devices to insure accuracy of movement; in fact there has been an improvement all along the line in these nice little details which contribute so much to the certainty of control.

The use of governors is certainly not on the increase, but those advocating the governor last year have adhered to it this year, only improving the details of the mechanism.



The governor spring of the Mark 46 Columbia car is most ingenious being entirely independent of the governor itself and yet controlling it to a nicety. It consists of a number of flat leaf springs which build up one on the other as required when higher speed is desired.

In connection with the Elmore control and their two cycle motors will be found as a part of it a device for cutting out one or more cylinders at a time, both as to spark and gas. For example, running about town where little power is wanted, any number of the four cylinders may be entirely cut out and the remainder used without any loss of gasolene. This is not possible without serious complication with the four cycle motor.

The increase of electric cutouts is noticeable, a button being supplied on the wheel which stops ignition for the time being, the cylinders continuing, however, to pump gas through them without exploding.

Ignition.

Compared with last season the ignition problem has undergone considerable change. Up to this year the magneto has

COLUMBIA ONE-PIECE IGNITION CONNECTION.

been very little in evidence. This year it has come to the front very fast in its various forms. The Electric Vehicle Company have adopted the simplest form, doing away at once with the complicated wiring, spark coils, commutator boxes, high tension currents and ill-behaving spark plugs. This is true also of the Locomobile Company, who used the same thing last year.

Another variety is the low tension magneto coupled with spark coil and therefore secondary current and spark plugs, then comes the high tension magneto, and finally the old standby, as far as the United States in concerned, of batteries working through spark coils.

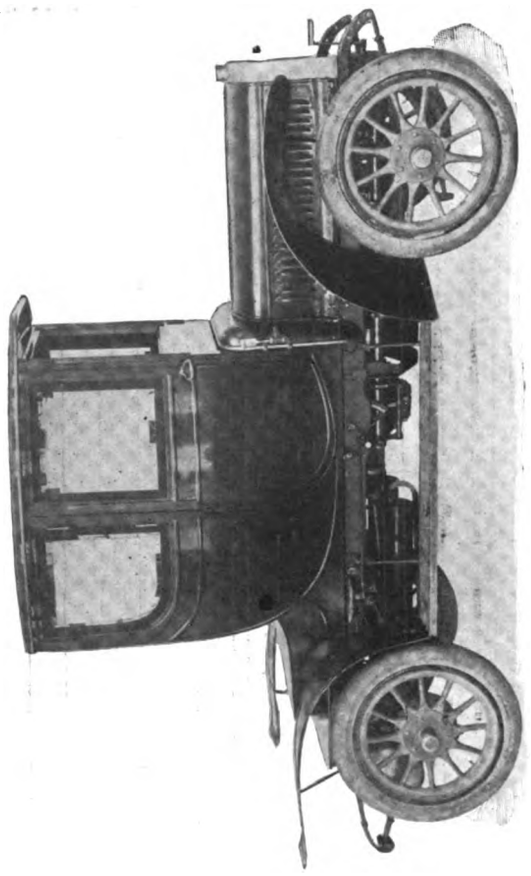
All these systems are pretty evenly distributed in their various combinations, but there is no use talking; the simplest looking thing is, after all, the low tension current with the simple make and brake mechanism adopted by the two concerns mentioned.

The question will naturally occur—How about the certainty of this low tension current? The best reply possible to make is that it has worked for a year on the Locomobile product and that it has worked for longer than that on foreign machines, and the thorough testing out given it by the companies using it demonstrates that it is working out for them successfully. A hot large spark results which means instantaneous firing of the charge that otherwise might not ignite with a small spark.

One form of supply of electricity is badly overlooked, or rather the application of one form. It is well known that most cars using the dry battery are supplied with two sets of four or two sets of five, with a switch to throw from one to the other when one set is exhausted—they have the voltage and amperage of four or five cells, and the length of life permissible by such a volume.

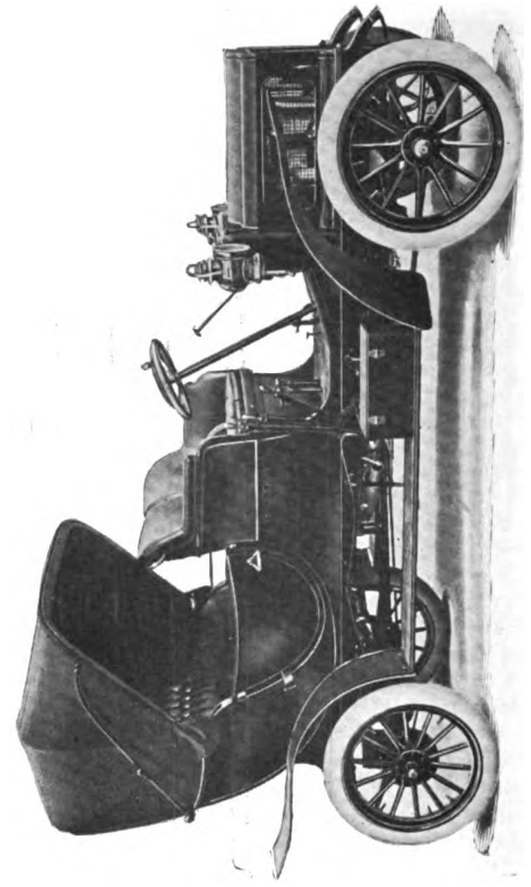
Years ago the Columbia cars were supplied with twenty-five dry batteries in multiples of five connected in series, giving a voltage of five cells and the amperage of twenty-five. This means that each individual cell was drawn on at any given amount to an exceedingly small degree, so small that its life was lengthened up to a point where it would last as long as though it were not in use at all; in fact, the dry cell under this system dies of old age and not of use. Moreover, at the end of a two hundred mile run, with this system of using batteries, they are just as strong as for a one mile run, not being in the least drawn down or exhausted. It may be asked, "What will be done if they do run down? "You have no extra one on which to switch over." . But such questioners forget that the life of such a series of batteries is measured in months and not miles, and that with ordinary good luck a set of batteries such as described will last the season without thought or attention. The increased cost at first is a little greater ($2 or $3), but the decrease of annoyance is infinitely great and people who try this system find that ignition troubles almost cease in connection with them.

Exhaust System.



Greater care and substantiality in the construction of exhaust systems is the general rule, larger diameter of exhaust pipes and manifolds are numerous. Tubes leading to expansion chambers with long straight runs, free from elbows, are noticeable and numerous. All this kind of improvement leads to more rapid cooling of exhaust gases and consequent gain in power and lessening of noise.

The mufflers this year are generally simpler, and this problem has been so thoroughly worked out that little or no noise from the engines is heard. It is gratifying to learn, too, that all this has been accomplished without increase of back pressure and consequently diminishing of power.



Cutouts are furnished by some makers solely for the purpose of being able to note the sound of explosions and to detect any irregularity in the explosions, and these cutouts are more carefully located and better constructed, some of them so arranged that even with the cutout open the exhaust finds its exit from the same opening as when the entire muffler is in service. No flame is visible, which is a distinct improvement. The former practice existing in

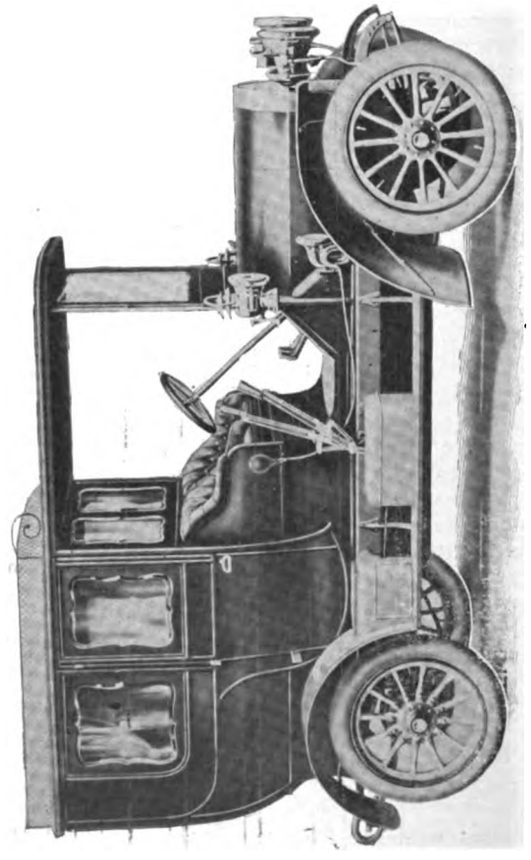
Types of Closed Cars



CADILLAC COUPE.

WHITE IMPERIAL VICTORIA.

WHITE LANDAULET.

KNOX LIMOUSINE.

Digitized by Google

many cars of pointing the exhaust toward the ground and stirring up the dust has been gradually eliminated. As a rule, the outlet of the pipe being horizontal, or nearly so, so as to shoot the gas directly backward.

Shunts from the exhaust are found leading to gasolene tank to furnish pressure to force the gasolene to the carburetters situated above them, to the jackets around carburetters and to the tops of oil feed tanks.

In the Knox car the exhaust gases are filtered before they are allowed to pass toward the gasolene tank to furnish pressure. The filter is easily accessible and easily cleaned, which does away with some of the troubles found with the clogging of passages and the loss of gasolene and consequent stopping of the motor because of it.

Pressure regulators are introduced to so regulate it as to blow off when the pressure exceeds the required amount of a pound or two per square inch.

Axles.

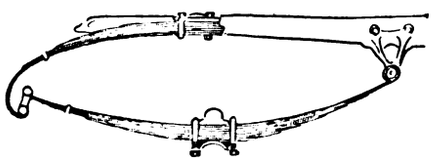
No more radical departure is met in anything than in the character of the axles. I beam sections have been adopted almost universally in one shape or another for the expensive cars and for some of the cheaper cars, too. A most gratifying increase in the solidity of this important part has been brought about. Nearly all front axles are dropped either by a gradual curve from end to end or between spring perches.

Generous steering knuckles and correspondingly generous wheel pivots in front and steering arms are to be seen everywhere. Many such axles are forged in one piece in most extensive drop dies, something that would not have been dreamed of because of the expense a few years ago. Rear axles are of I beam construction, too, and just as strong and substantial in appearance.

It is safe to say that there will be nothing more gratifying to the prospective purchaser than this splendid advance and generosity of dimensions at this point.

With the improvement in design has come a corresponding improvement in material and it is common and usual to find in these axles material from 100,000 to 200,000 pounds per square inch tensile strength, whereas last year and years previous 60,000, 70,000 and 80,000 pounds per square inch tensile strength was the limit.

In connection with the rear axle of bevel gear cars there is the same variety of construction as last year, some carrying the weight of the car on the driving axle, others carrying the weight of the car on the exterior tube and driving the outer end of the hub by a positive clutch.



Better materials have been brought into use here, too, and although the size of some of the driving shafts is smaller the strength is greater.

In connection with this axle problem it must not be forgotten that the gain in strength is fourfold because of the double gain of increase in size and increase in strength of the material used. The makers may have gone to the extreme in this matter, but it is well that they should.

Springs.

Every possible variety of spring is found among the different exhibits, but of course the prevailing one is the semi-elliptic front and rear, some with the cross spring behind and some not. Nearly all have adopted in connection with such springs fixed attachments with the frame at the front end and swinging shackle at the rear. This, of course, is dead right, the idea being that the axle should be drawn ahead rather than pushed ahead. Next in popularity is the semi-elliptical spring in front with the full behind, coupled with strut rods.

Adherents are found to four full elliptical springs, but they are in the minority. Then comes the modification found on two or three cars, of the three-quarter spring, the lower half being arranged like the semi-elliptical but engaging either at the rear or front with aquarter elliptical spring. It might be better and more clearly explained by saying that the forging attached to the frame and engaging with the spring has been supplanted by part of a spring.

CADILLAC DEMI-PINCÉTTE SPRING.

In years past the Packard car has always used a cross spring on the front axle, it being held in line by two generous strut rods. This year that has disappeared and give place to the usual type of semi-elliptic spring.

On one of the foreign cars exhibited the makers have raised the rear end of their frame to accommodate a cross platform spring. This is a noteworthy point, inasmuch as it affects the shape of the frame and the body as well.

As to design, however, distinctly longer springs are found. No one can say that as generous proportions are not found now among the high-priced American cars as among any cars in the world.

Shock absorbers are gaining ground without a doubt. Rubber bumpers as a part of the regular equipment of the cars are on the increase, as a tribute probably to the awful conditions of some of our American roads, and the fact that no spring can fully compensate for the bumps found by the ordinary tourist, and of course it is much better that the blows should fall on rubber than on metal.

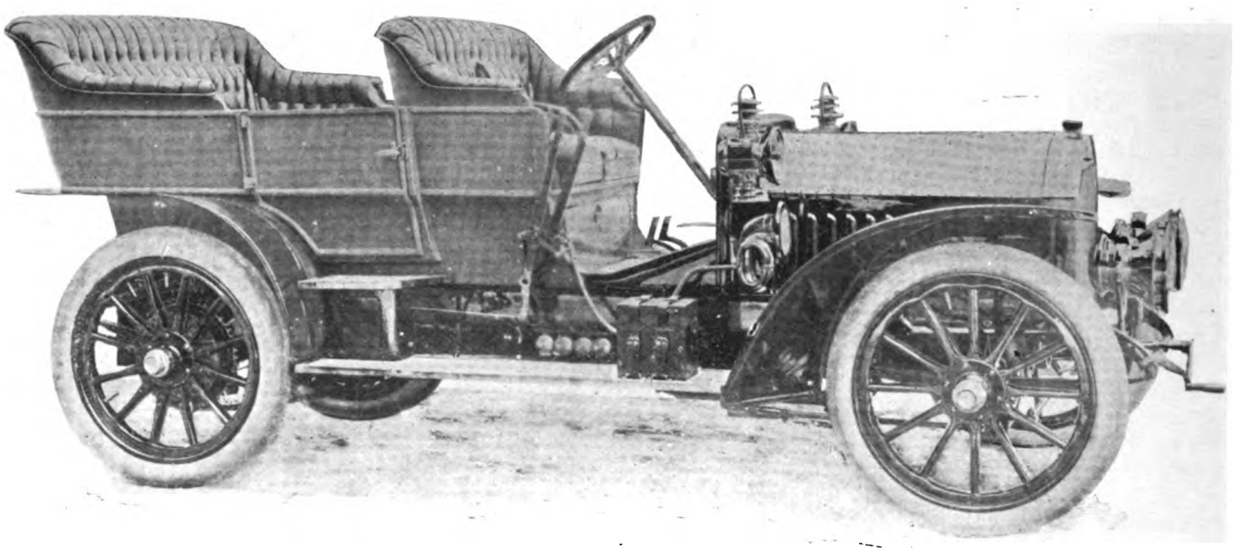
Bearings.

Bearings are an important feature in an automobile and have received no end of study. The result shows a variety of opinion as to the right bearings. It is safe to say, however, that anti-friction bearings are increasing in favor in one form or another. Just now the Hess-Bright bearing is in high favor. Many makers show it as part of their regular equipment, using it in the transmission and wheels. The Timken roller bearing is another extremely popular one for use about bevel gear housings and on wheel bearings. The older forms of ball bearings are found in many of the cars, consisting of the well rounded cone and cup used in connection with a generous diameter ball. Whatever bearing is found shows a decided tendency toward larger dimensions, which is by all means desirable. Engineers do not fear appearances in the matter of bearings as much as they did and do not hesitate to make a large hub or other container for ample sized bearings whenever it is found necessary or wherever it is mechanically possible.

Frames.

It is safe to say that the pressed steel frame has the call. There are exceptions, and worthy ones, but, as a rule, the regulation channel shape with the smooth exterior and the two flanges extending inward is used, cross members being of a similar shape. Good, generous gusset plates at the corners of the frames, and, better yet, with the Packard the side member is enlarged in the neighborhood of the gusset, giving generous rivetting surfaces and increased stiffness.

Lightening the frames by resorting to cutting out circles of metal is noticeable in several cars. The frames are of splendid shape and design, some having straight side members from extreme front to rear, many brought in under the dash with several inches of inset.



The depth and dimensions of the frame are not very different although it is seen that one or two makers are using rather thinner metal, and rather narrower flanges and must be approaching the limit of safety as far as strength is concerned with the material now available for frames that can be struck up cold, as these frames are.

Reinforces of various kinds are seen; for example, the Haynes people have filled the channel iron inside with a hickory elm at a point extending from opposite the transmission to the front end of the side members.

The Stearns, Apperson and Thomas truss their frames from a point about opposite the rear end of the transmission to a point about the middle of the engine or thereabouts. This truss consists of two rods tied at the ends and suported by a strut at or near the middle of the rod. This is a step in the right direction inasmuch as frames of deeper section are practically out of the question.

In the new four cylinder Olds is found a frame which may be called a double frame in its forward half; that is, there are two side members extending from the rear of the transmission to the front of the engine, the interior side members being practically the same in size and depth as the outside members. Moreover, these dupli-

Digitized by Google

COLUMBIA, MARK LXVII, 40-45 HORSEPOWER, $4500.

cate side members are tied together at the bottom with a thin sheet steel plate, giving an exceedingly rigid frame throughout this forward and critical part of the frame. The swaying of the car on rough roads at high speed will certainly not cause serious distortion at this point.

The Pope-Toledo still adhere to their inverted "U" frame, which has given them so much satisfaction, there being in it only a little change of design to accommodate the change in other features about the car.

The Autocar adheres to their composite structure, consisting of a very narrow and light channel iron pressed steel frame on the inside bolted to an exterior frame of wood. This makes an exceedingly rigid and serviceable structure, carrying out the ideas used in composite light built racing yachts and some of the high speed steam launches. This composite structure possesses features of stiffness and resilience practically out of the question with simple steel.

Angle iron frames are found on some of the first-rate smaller cars. Some of these frames are reinforced with wood and some are not.

In the frame forgings for attaching the springs, however, is found a decided change in the way of increased strength and lengthening out of the forgings made necessary by lengthened springs. Moreover, these forgings are neater, better in design and with considerable thought given to graceful appearance and form.

The Cadillac on their large car adhere to the tubular sub-frame supporting the engine, having found it a most rigid and light means of support.

Several of the frames show large steel pans underneath the engine and fly-wheel firmly riveted to the frame and really supporting it to some degree against side strains, combining this function with that of keeping the delicate motor and mechanism free from dirt as far as possible.

In the Franklin exhibit is seen a frame almost entirely of wood and one that has given satisfaction now for several seasons.

The Pope-Hartford two-cylinder frame is entirely of wood and the Pope-Hartford four-cylinder frame is of composite construction, being reinforced wood with flat steel plates. This last construction is bound to give most excellent results.

Details.

There are a number of little details not possible to classify that are well worthy of mention; features not absolutely essentian to the existence and proper operation of a car, but contributing to a greater or less extent to the convenience of or possibly accomplishing some function in a clever way.

Take for example the Northern new four-cylinder car. Here the gears at the front end of the engine driving the secondary shaft that operates the valves are encased in a manner to make them watertight and are made to pump the water of circulation for the engine—a double function, consisting of a good set of gears and a good gear pump in one.

In this same exhibit is the combination of a lamp bracket and fender iron that is worthy of mention and extended use. The front fender iron is made of a substantial character and supports the fender and at the same time the large gas lamps. This takes the lamps out of the way of the cranking mechanism of the car which has been seriously narrowed in some instances by big lamps. It puts the big gas lamps directly over the wheel so that the light is in front of the wheel track that is to be, and it is also out of the mud, advantages every one of them worth having. This scores another double function for the Northern exhibit.

In the Knox four-cylinder, the gasolene tank is under the body and a large pipe is brought forward so that its opening for filling is under the front foot-board. A magnetic indicator is used in the gasolene tank, which shows at a glance whether or not the tank is full.

On the Fiat car the gasolene tank opening is of a very substantial character and is so formed as to be its own funnel; not a very large one, to be sure, but one that could be nicely used in the absence of a better one. And also on the Fiat car is a most excellent scheme—that of supporting the radiator on trunnions, so that no weaving action in the frame of the car can possibly strain the radiator and cause leaks.

The materials entering into the cars are variously distributed as to quality, each maker according to his own fancy. Many use aluminum alloys for their engine base and engine supports; perhaps it is safe to say that most of the engines have aluminum bases and transmission cases. Others, like the Locomobile, prefer manganese bronze, with its greater strength, also greater weight for these parts, others malleable iron.

The quality of steel used has been greatly improved during the last season, no effort being spared to get what is good. Tensile strength per square inch have risen as high as 150,000 pounds and 200,000 pounds, as compared with the strength of ordinary steels not exceeding 100,000 pounds in common use during previous years. This means greatly increased expense about the machine shop, necessitates the use of the highest priced tool steel to cut such materials and, also, necessitates expensive methods of heat treatment and annealing and tempering operations, but the results obtained are worth it all.

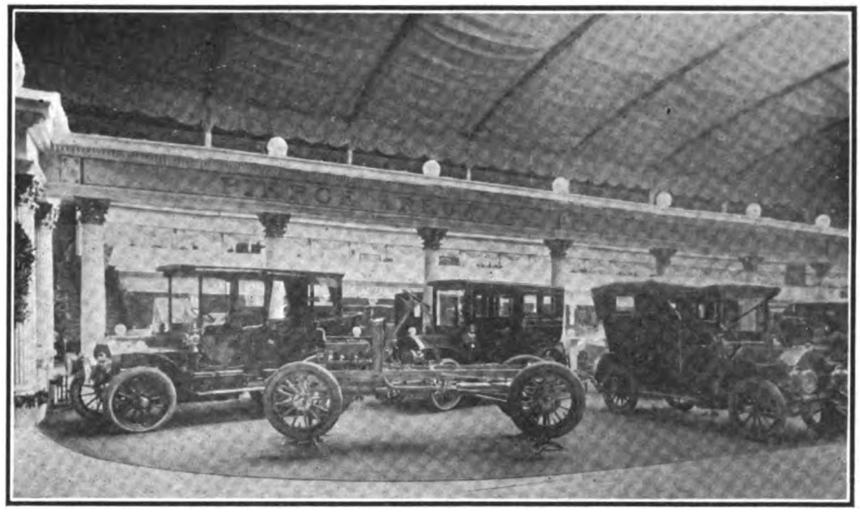
The use of castings is on the decrease, either steel or malleable iron and the use of forgings on the increase. Take for example the little Pope-Tribune, two-cylinder, selling for $900. It has within its makeup dozens of drop forgings. Examine the exhibit of the Packard, showing the wrought forgings used by them, and it is immedi-

Digitized by Google

ately seen what an extensive part they play in the construction of the Packard car.

When it is considered that the forgings are made of steel having at least a tensile strength of 60,000 or 70,000 pounds per square inch, and may be made of such good materials as to have a strength of three times that, as compared with the maximum strength of the strongest steel casting at 70,000 or 80,000 pounds, coupled with the uncertainties of blow-holes and undiscoverable defects that may exist in castings, the policy of using forgings is most wise.

In the old days of the bicycle, every possible device was resorted to in order to bring the chain pull over between the ball bearings. In the Thomas car this principle is found carried out to a nicety, the ball bearings being directly under the front sprocket and the chain pull on the axle being between the ball bearings.



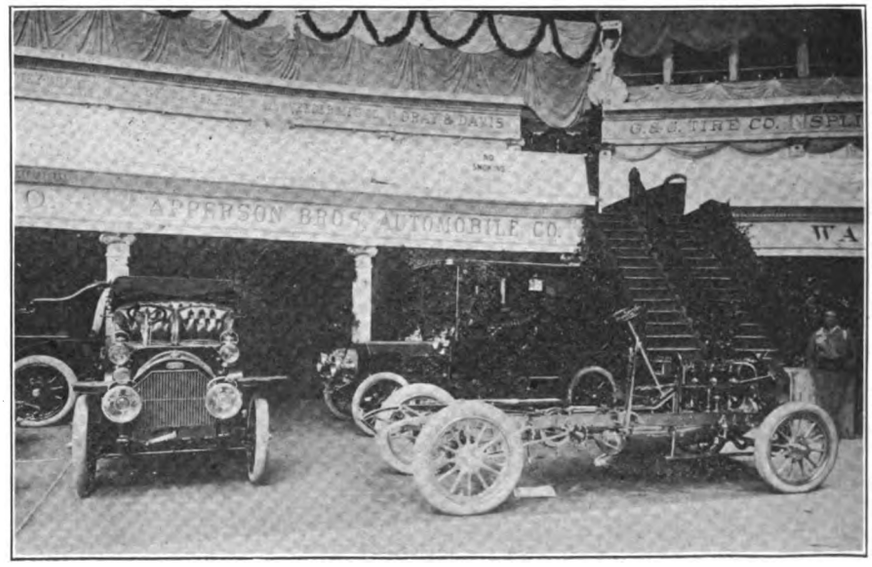
To show the thoroughness of the Thomas construction throughout it is found in their exhibit that there are 222 drop forgings entering into the construction of their car. Another clever little detail of the Thomas car is found in the easy removal of the commutator in case it needs cleaning or wiping out, which is a desirable thing to do once in a while. It is on the dash in plain sight and within easy reach. Removing two screws allow it to be taken off and put back. It goes back as it came off because it can only be put on in just one way, because of a little detail in construction.

On the Locomobile car is found something which exists nowhere else apparently, and that is that the thrust collar and the clutch operating mechanism is within the gear box and therefore copiously lubricated by the flood of oil always present in gear boxes. This makes the gear box a little longer, but insures everlasting moving parts as far as the clutch is concerned.

On several of the cars, notably the Columbia and Stearns, are found an aluminum tread for the running boards and footboards. It is light and strong and always clean and has every appearance of being rubber and probably the majority of observers think that it is rubber.

The Pope-Hartford four-cylinder car has adopted a most efficient means of water circulation, the water being forced into the top of the cylinder around the valves by pump and also being taken out of the top, thus insuring the coldest water in the neighborhood of the valves and around the explosion chamber and at the same time keeping the body of the cylinder warm, in all probability at the boiling point, which certainly contributes very largely to the efficiency of the motor.

The two-cylinder Buick motor remains just about as it was. Some refinement has been introduced in the oiling system and in carrying a tremendous gasolene supply under the bonnet to the amount of 16 gallons. The radiator is much larger and has been given the outward appearance of those used by regular four-cylinder cars, very much



to the improvement of the car and adding much to the cooling capacity.

About the only exception to the general rule of the accepted crank as a starting device is that shown by the Northern, which is a lever and ratchet, so arranged that the engine is pulled over easily by a lever located just in front of the radiator. Incidentally, a safety device is added, whose function it is to retard the spark to zero point, that is, so that the explosion does not come before the piston has reached the top of the stroke, in case the spark has been left advanced. This is very cleverly worked out.

Out in the street, however, there is a car being demonstrated that has the same starting device brought out last year and shown in the basement, consisting of a heavy spring wound up by the action of the engine and left locked always ready for use, all that was necessary to operate it being to trip the spring, which had length enough to spin the engine for a fraction of a minute, thus starting it and then immediately winding it up again. This seems to work very nicely and takes up about as much room as a good-sized straw hat on the end of the crank shaft, the latter protruding so that in case of accident the starting crank might be used.

A little detail noticeable on French cars, notably the Clement-Bayard and Rochet-Schneider, is the way the fans on the rear of the radiator are placed. It is extremely noticeable that the amount of clearance between the cutting edge of the fan and the back of the radiator is extremely small, that the fans have a peculiar curve on a straight blade. This disposition of the fan is so radically different as to indicate an extremely good reason for so placing it. It certainly must do away with all eddies between the fan and the radiator, and must pull the wind through the radiator most efficiently. This is a marked contrast with the careless location of many of the other fans in the Show which seem to have been placed by chance or accident and very little thought given to any real efficiency.

Several of the machines are supplied with a convenient little device in the shape of a pointer on the back of the rear cylinder against which marks on the fly wheel are

Digitized by Google

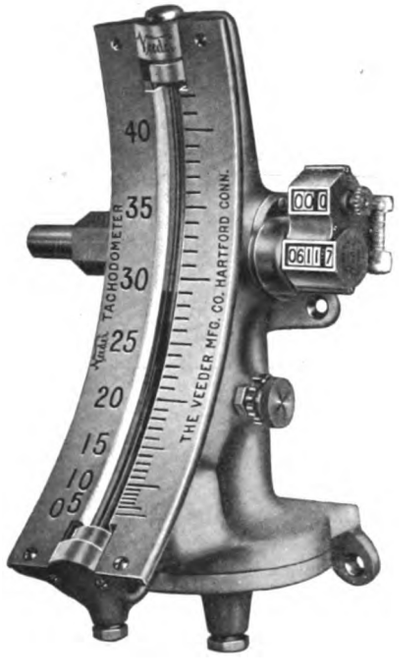
placed to indicate the opening of the inlet or the closing of the exhaust and all necessary details in regard to valve timing; all this in case during repair the valve timing is upset, that it may be accurately returned to the predetermined and correct timing.

One of the talking points dwelt upon heavily by the Northern people is the fact that they are galvanizing their cylinders to accomplish several things. In the first place the cylinders are being heated before galvanizing, and during galvanizing they are annealed and all internal strains drawn before machining, then in case all sand and grit has not been removed from the water jacket inside and out even with the utmost care, or in case there may exist a pin hole in the casting at some point, the galvanizing flows into it, covers and fills the pin holes and holds the sand. In this way all sand troubles about the crank case or in the pumps is avoided, and defective cylinders are rendered practically impossible. Any defect too large to be cured by this process is liable to be detected by superficial inspection.

One detail adopted on the larger Pope cars, however, and the only one seen in the show, at least among the American cars, is the auxiliary five-gallon gasolene tank located at the top of the dash and within it, thus giving gravity feed to the carburetter at all times, no matter how steep may be the hill or low the gasolene supply. The bulk of the gasolene is carried, however, in a large tank at the rear of the chassis, the gasolene being forced from the large tank into the smaller one by air pressure. This is a very happy solution of the gasolene supply problem and one which is pretty sure to find favor because of the simplicity following gravity feed and the practical manner by which it is obtained. Ball bearings were used last year on the Pope-Toledo and are used this year somewhat larger in dimensions, however, and therefore extremely efficient. The double chain drive is retained as a special taking point of the Toledo factory.

The wiring of the high-tension devices on the Royal is worthy of remark. The commutator is of suitable design permitting of no ground wiring completes the circuit, thus controlling the flow of electricity to the highest degree.

On the Studebaker the muffler has two exhaust ports pointed backward and a little outward at an angle of 45 degrees with all the area of breaking the vacuum that ordinarily follows a rapidly moving car. The idea is nicely worked out and makes a very attractive exhaust arrangement. The exhaust from each cylinder is carried down the engine base before it joins the manifold.



In the Studebaker are probably the only bearings of the kind in the Show. They are of the plain journal type, but the marked characteristic is the fact that both turning and standing member are hardened and ground, oil being furnished by ring oilers.

HENRY SOUTHER.

Accessories

Speed Indicators.

Marked improvements are apparent in the numerous speed indicators which are exhibited. The Warner Auto-Meter, made and marketed by the Warner Instrument Co., Beloit, Wis., is one that has undergone several changes, though not of the character to make the instrument undistinguishable from last year's model. The size of the speed dial and also of the trip and total mileage dials has been increased, the enlargement naturally making the register easier to read from the seat. The casing at the base of the meter around the flexible shaft has been lengthened, giving greater strength. A flexible shaft connects the worm gear in the instrument to the bevel gear on the wheel. Its principle remains unchanged. A magnet revolving freely on sapphire bearings is its power. The indicating dial is suspended in front of the magnet and a partition separates them, precluding the possibility of affectation by air. The dial is mounted on a pivot. A hair spring holds the dial to zero point and the magnet, when revolving, has a tendency to draw the dial in the direction of its revolution, while the hair spring opposes its tendency. The greater rapidity of the magnet's revolution, the greater the displacement of the dial, and when the speed of the magnet doubles, the displacement is doubled.

VEEDER TACHODOMETER.

In principle and general construction this year's Jones speedometer-odometer is not essentially different from last year's models, although several minor improvements have been made to record the total mileage, irrespective of the direction of motion. Thus a car which in the course of a day covers 100 miles forward and five backward, will record 105 miles. The advantage is that the entire mileage adds up and also makes it is impossible for a chauffeur to jack up the wheel and industriously unwind the result if his night's clandestine performance. The addition of a trip mileage dial, similar to that employed on the Jones odometer, is an innovation on the 1906 speedometer-odometer. In this regard a noteworthy point is that the setback mechanism, instead of being actuated by a thumb screw and a motion analagous to that of winding a clock, is now instantly operated by a push button, which resets the indicator at zero, as in a stop watch. A new instrument which is being exploited by Jones is the Jones tachometer, for indicating the revolutions per minute of engines and machinery. It is based upon the same principle—centrifugal force—and containing the same movement as the Jones speedometer. The tachometer has a four-inch dial, a heavy standard and small pulley wheel one and one-half inches in diameter. The instrument is adjustable and will face at any angle. The belt driven instruments, operated from the engine shaft, are made in two models—Model A, indicating up to 1,200 revolutions per minute, to be geared 2 to 1; Model B, indicating up to 600 revolutions per minute, to be geared 4 to 1. The gear tachometers are also furnished in two models, C and D, indicating respectively up to 1,200 and 600 revolutions per minute.

Quite a notable feature of the 1906 Webb indicator is the addition of a total mileage and a trip mileage recorder and dial. The principle involved in the Webb speed indicator is not new, being that of holding a feather in the air with your breath. It is constructed with a taper bore and an aluminum wire or index weighing five grains which rises or falls in proportion to the air created by the air pump, which is driven by a flexible shaft over the knuckle of the front wheel. The indicator on the right represents the total mileage to 10,000 and repeats; the trip registers to 100 miles and repeats or it can be set to any mileage by pressing the button and turning.

On the new Veeder tachodometer this year the speed register is curved, the claim being put forth that the scale is easier to read from the driver's seat and its value has increased by adding a total and trip mileage odometer. There is, theoretically, only one moving part in the Veeder tachodometer, i. e. the small paddle wheel in the centrifugal pump which is geared direct to a front wheel of the car. It works some-

Digitized by Google

what on the order of the thermometer, the revolutions of the paddle wheel forcing the colored alcohol up the indicator tube. The various Veeder odometers are, of course, displayed.

Post & Lester, of Hartford, exhibit the Bullard speed recorder, a combined clock odometer and speed recording instrument, the latter marking on a round card every mile traveled, the speed per hour and stops. A flexible shaft connects the instrument to the wheel of the car. Something very similar is being exploited by the Baldwin Chain and Mfg. Co., or, at least, will be shown by them as soon as it is ready to be marketed, which is promised for the Boston show. It is the Monitor speed recorder, which has been adopted by the United States Government for warships and other steam ships. In addition to being an electrical speed recorder it indicates the speed per hour, gives total mileage and trip mileage or counts revolutions of the engine per minute. An electrically regulated arm, the end of which contains a marking fluid, records on a graduated cardboard disk the speed at a certain mile and to the minute; also recording the time of stops. While the device shown by the Baldwin people is the type designed for nautical use, they state that a smaller instrument designed for automobiles is now completing six months of hard test and will be shown for the first time at the Boston show in March. It will be marketed for about the same price as the various speed indicators now in use.

Sibley & Pitman, New York City, have a new speedometer and odometer which they claim will fit any car by the substitution of the small gear on the end of the flexible shaft which is fastened by a cotter pin. A dealer may therefore carry a stock with a few extra gears and fit any car on the market. The Motor Car Specialty Co., of Trenton, N. J., through its agent, Wm. S. Jones, of Philadelphia, in addition to the Lea tire pump are showing a new instrument which they have named the Lea Speedistometer. It has no new features. The McGiehan line of speedometers and odometers remain practically unchanged. The Weed Chain Tire Grip Co. display the Lashar electrical speed indicator, an ingenious device which works entirely by electricity.

Lamps.

There are practically no radically new features apparent in the exhibits of lamps. All the well-known makers have improved old or added new models to their lines and have seemingly designed upon the principle that simplicity is beauty in itself. Generators have come in for their share of attention, the idea being to make them as simple of operation as possible and to minimize the waste of carbide, at the same time increasing the efficiency and power of the produced gas. One of the newest generators is that produced by the Rose Mfg. Company—the Neverout patent invertible gas producer. It is entirely automatic in action and swings on an axial bracket, a half revolution of the device starting the generation of gas and vice versa. It is constructed on a different principle from that of the ordinary gas generator. The carbide container is a metallic cylinder with plain surfaces. When the gas is turned off the water is at the some time automatically turned off. Conversely when the gas is turned on the water and carbide are brought into contact. It is made in two types, with single and double cylinders, respectively. It goes without saying that the Neverout lamps also bear evidence of the touch of the refining hand.

Simplicity and effectiveness also are apparent in the generators of the Atwood Mfg. Co. and the Badger Brass Co. On the theory that water cooling will eliminate the dirty residue of decomposed carbide, thus reducing the burned carbon to dry ash or dust, instead of the dirty ill-smelling refuse, so common in most ordinary generators, have these been constructed. Both the Solar and the Atwood generators are made in two sizes, the shape of the two makes differing, the former being cylindrical. Although the Solar parabola projectors, a combination of ground and polished plano convex lenses in front of short focus, surrounded by a German silver reflector, which is a section of parabola and a spherical rear silver reflector, were first introduced last season, several new types are this year exhibited. The Solar square oil and the Duplex oil side lamps are new styles. The Atwood Company also presents several new lamps, conspicuous among which are the No. 21 swivel gas searchlight, Nos. 9 and 12 diamond-back shaped gas headlights, with parabola lenses and a new diamond backed oil lamp.

New Dietz models include an oil lamp in two sizes with corrugated ruby backs and side oil lamps with small side lights, to throw light on the running board of the car or on the curb. The famous Bullet lamps of Gray & Davis call forth favorable comment, as they usually do. The C. T. Ham Mfg. Co., Rochester, N. Y., have an interesting exhibit of their "cold blast oil lamps," and are featuring the Tourist, a side lamp with a semaphoric optical flint lens. The well-known Twentieth Century and Rushmore lines remain practically the same, excepting, of course, refinement in minor details.

In connection with lamps, one of the brand new things, although the embodiment of an old idea, is the Imperial-Lyon automatic lamp adjuster, made and shown by the Imperial Brass Mfg. Co., of Chicago. This lamp adjustor bracket is operated by the steering knuckle rod to which it is attached. It causes the lamp to move with the wheels, so that before the body of the car swings around the driver is able to determine the lay of the land around the bend. It can be adjusted to automatically turn as fast or faster than the wheels. Charles E. Miller is also showing the Rand adjustable bracket.

Horns.

While last year's Gabriel two-chime horn somewhat suggested a pipe organ, the new eight chime horn certainly approaches nearer to that instrument than anything heretofore attempted. Like its predecessors it is the invention of C. H. Foster, and is manufactured by the Gabriel Horn and Mfg. Co., of Cleveland, Ohio. The eight chime horn consists of eight tubes, each giving a clear musical note. Like all other Gabriel horns it is operated by the exhaust and it is claimed for the new eight note instrument that any tune within the scope of one octave can be played upon it by simply placing the foot on the exhaust pedal and working the keyboard like a piano. A. H. Funke, New York, has a line of new bulb horns, but they are very similar to the accepted type of reed instruments, with the exception of the eight toned bugle horn. The Motor Car Equipment Co., New York, is howing a new French siren horn operated by means of a flexible steel shaft keyed to a leather pulley which comes in contact with the engine fly-wheel by pressing a small pedal. The same firm also has a triple tube chime horn which connects with the engine exhaust. Charles E. Miller's line of horns on exhibition are so numerous that to particularize would be difficult. Two of his features in this line, however, are the Miller imported combination siren horn, operated by a roller on the fly-wheel connected by a flexible shaft to the horn, and the Miller electric horn.

Shock Absorbers.

In shock absorbers there is an imposing array of all kinds, actuated by all principles. The best known perhaps, the Truffault-Hartford Suspension, made by the Hartford Suspension Co., of New York City, has been materially strengthened by making the centre arm double instead of single as heretofore. The center stud and steel washers are hardened—the latter provided with five prongs to take up lost motion caused by wear. This improved locking facility provides for easy adjustment and entirely eliminates the former check nut and binder screws. One of the new shock absorbers is the Baldwin spring recoil check, manufactured by the Baldwin Chain and Mfg. Co., under the House patents. Its construction is of the most simple form of automatic grip. A steel shell or case with a supporting eye on the top is hooked to the floor or frame of the car body. Inside this cylinder is a divided piston covered with oil-treated leather which contacts with the sides of the hollow case, a set of toggle arms butt against each side of the piston segments and a yoke over the top drawing thew down is attached to the axle by a strap. Thus when the jerk upon the yoke bolt is increased in velocity the friction upon the sides is multiplied by the square of the velocity springs in the cylinder returning the piston to its normal position after every action of the checks. The Gab-

Digitized by Google

riel Company not only makes horns, but have turned their attention to the matter of reducing shock which has resulted in the appearance of the Foster shock absorber, a neat and effective looking device. The Foster consists of a hollow steel cylinder which contains the piston, oil furnishing the force of resistance. The plunger head contains a circle of valves and when a shock sends the plunger down the oil flows through these holes into the upper chamber. When the recoil comes the force of the oil presses against a washer around the piston rod which partly covers the valves, thus allowing the oil to flow back into the lower chamber, a small portion at a time, causing it to act as a cushion. The old equalizing spring idea to reduce jars has been brought out by J. H. Sager in the Sager equalizing springs, which are simple coil springs of the barrel pattern with an eye at each end. One end is fastened to the axle or the other part of the running gear, while the other end is fastened to the body or upper frame work.

Although there has been an amazing multiplication of accessories, there seems to be little that can be classed as brand new, that is, involving new ideas. Many new firms have entered the field with sundries, some of them firms who are taking up automobile specialties as a side line, and that it is proving a profitable venture there is small room for doubt. The exhibit of the well known exporter and importer, Charles E. Miller, is a sundry show in itself, his large stock embracing almost everything that has been devised for the needs of the automobile or its user. One of Miller's latest good things—and he is always presenting something of the sort—is a complete tool shop on wheels, designed for the man who would do his own repairing, or for the small garage keeper who finds it beyond his means to equip his shop with a large and expensive outfit on the strength of a few possible odd jobs. The "Automo" tool cabinet, as it is styled, has been designed to meet these exigencies, and that it will "take on" goes without saying. It consists of a substantial hardwood cabinet with a full complement of tool drawers, mounted on wheels so that it may be rolled through any doorway. It contains an electric drill with a motor that can be connected to an incandescent lamp socket, a combination anvil and surface block, a swivel machinist's vise, offset jaws and pipe vise, dies and taps for threading bolts, and nuts, chisels, saws, files, calipers, levellers, squares, hammers, nut and pipe wrenches, oil stone, metal saws, belt lacing outfit, wood and iron clamps, drills, files and all the other necessary tools which go to make a complete repair shop. Miller is also the American agent for the celebrated Brampton chains, and flattering letters of commendation from their users show how they are regarded. One of his novelties is an eight-day clock, which can be attached to the dashboard. The Miller mica spark plug does not differ in construction from the 1905 article, but he has added several foreign patents to his stock. Realizing that there would be an enormous demand for jewelry typical of the automobile and its component parts, Miller is showing an extensive line of watch fobs, buttons, pins, etc. His line of clocks is large, and the style of caps, gloves and gauntlets which he is showing are so varied as to make choosing difficult. In ignition apparatus, Miller's line embraces the types of all the leading makers, among which might be mentioned the Splitdorf plugs, timers, coils and distributors; the Witherbee storage battery igniter; the new Apple battery charger and automatic cutoff; the Herz timers, distributors and other ignition apparatus and the Kingston coils and plugs. He has also taken on the Janney-Steinmetz tanks, the Barrett jacks and the Wray pressure register and compound pumps, beside a varied assortment of lubricants and cleaning compounds.

E. J. Willis, another well known New York jobber, is showing the new Hopkins autolog, which gives the speed, both in miles and kilometres, speed and mileage for each separate mile, speed from 1 to 60 miles an hour and kilometre speed from 1 to 100 kilometres per hour, and the total mileage and kilometres per trip. His 1906 Yankee grade meter, which gives the grade going up or down at 40 per cent., has been perfected. Owing to a chemical used in its construction last year the dials became discolored, which defect, as well as other minor imperfections, have been overcome.

The New York Sporting Goods Co. has on display a large assortment of domestic and imported sundries.

Charles E. Splitdorf, the New York man who makes coils—and has been making them for years—has introduced a new ball bearing commutator, the spindle carrying the hardened steel plunger contact revolving upon steel balls in steel cones, which reduces the wear to a minimum, produces a perfect ground and absolutely prevents freezing in case of neglect in oiling, it is claimed. Another addition is a low tension magneto. The armature is of the Siemens shuttle type, which gives two sparks for each revolution. He also has a high tension magneto in the course of construction.

R. E. Hardy's 1906 line of Sta-Rite ignition plugs consists of six distinct types and forty-seven sizes. Although the Atwater-Kent new spark generator is given this name, it is rather misleading, as it is simply a mechanical vibrator and distributor. The mechanical vibrator has done away entirely with the timer, all magnetic vibrators and reduced to a small percentage battery consumption. The vibrator, being mechanical, is worked by the power of the engine and consumes no battery wear to move it as does an electrical vibrator. The new mechanical vibrator is designed to take the place of both the commutator and magnetic vibrator. In the distributor, or what they term the generator, the four secondary wires are led from the binding posts through the bottom of the box to the spark plugs. The two primary wires come from the bottom, one leading to the battery and the other to the ground. Contact is made directly from the secondary of the high tension coil to the longitudinal distributor. A shaft connected with the "two to one" shaft of the engine drives the distributor and also the mechanical vibrator, which is placed under cover on top of the box. An advancing lever moves the mechanical vibrator for advancing the spark. The current is led into and out of the mechanical vibrator by sliding contracts, which allows the advance and retard without the use of moving wires. A two-point switch allows the use of two sets of batteries if desired.

An automatic starter is displayed by the Auto Improvement Co. of New York City. It is simply a spring which is thrown into operation by a small release pedal and after starting the engine it is automatically rewound as soon as the engine has attained sufficient speed, and when fully wound is automatically disengaged, when it is ready for the next release. The same firm also shows a trip detector which is designed to protect the owner from the unauthorized use of his car. This instrument is a little case which can be attached to the dashboard, the pulsations of the engine setting in motion a balanced vibrator which registers a mark on a paper dial calibrated in miles. As this detector can be set in motion even though the car is not moving it is hardly likely that it will become popular.

Byrne, Kingston & Co., Kokomo, Ind., have created new carburetters, but in these the essential features do not differ materially from the previous well known models. The National Battery Co., Buffalo, N. Y., has a tastefully arranged display of their storage batteries.

The Briscoe Mfg. Co., Detroit, Mich., has gotten out a new film tube radiator, made up of thin copper tubes, 3½ inch by 1-16 inch, without fins, in which the water circulation is vertical. They have also added the hinge type hood and have designed a new malleable iron fender fastener. The factory has been equipped to make the popular concave curved metal dashes and a metal box for runabouts is a newcomer. The Whitelock Coil Pipe Co. is showing a line of steel and aluminum hoods in addition to its line of radiators.

New grease cups and spring key cocks are shown by the Lunkenheimer Co., who have made many improvements upon their force feed lubricators.

By rounding off the ends of the side pieces of chains less friction is created and the tendency to jump the sprockets is reduced to the minimum. This has been done by the Whitney Mfg. Co. in all their larger size chains, and in addition they have made several new chains—the No. 3, ¾ inch pitch; No. 7, 1 inch pitch; No. 12, 1¼ inch pitch, and No. 17, 1½ inch pitch. Other chains shown are the diamond and Baldwin makes.

Col. James H. Sprague, Norwalk, Ohio,

Digitized by Google

has improved his tops by creating new styles, the fundamental principles remaining unchanged. Tops and bodies are also shown by the Springfield Metal Body Co. of Springfield, Mass.

American Darracq Co., New York City.—Darracq gasolene cars; three four-cylinder touring cars.

Apperson Bros. Automobile Co., Kokomo. Ind.—Apperson gasolene cars; four-cylinder chassis, four-cylinder limousine and four-cylinder touring car.

Auto Import Co., New York City.—Rochet-Schneider gasolene cars; two four-cycle touring cars, two four-cylinder limousines, four-cylinder chassis.

Autocar Co., Ardmore, Pa.—Autocars, gasolene; four-cylinder chassis; four-cylinder limousine, four-cylinder touring car, two-cylinder chassis, two-cylinder runabout.

Bowman Automobile Co., Sidney B., New York City.—Clement-Bayard gasolene cars; two four-cylinder chassis, four-cylinder touring car, four-cylinder limousine, one limousine body and one touring car body.

Babcock Electric Carriage Co., Buffalo, N. Y.—Four electric carriages.

Buick Motor Co., Jackson, Mich.—Buick gasolene cars; two-cylinder runabout and four-cylinder touring car.

Cadillac Motor Car Co., Detroit, Mich.—Cadillac gasolene cars; four-cylinder chassis, four-cylinder limousine, two four-cylinder touring cars, single cylinder runabout, single cylinder tonneau.

Cantano Electric Tractor Co., New York City.—One electric bus and one electric brougham.

Columbus Buggy Co., Columbus, Ohio.—Electric runabout and two-seated carriage.

Decauville Automobile Co., New York City.—Decauville gasolene cars; four-cylinder limousine, four-cylinder touring car, four-cylinder cab.

Dietrich Importing Co., New York City.—Dietrich gasolene cars; one four-cylinder chassis.

Electric Vehicle Co., Hartford, Conn.—Columbia electric and gasolene cars; two four-cylinder chassis, four-cylinder limousine, four-cylinder semi-limousine, four-cylinder touring car, four-cylinder landaulet, two electric trucks and two electric delivery wagons, closed bus, brougham, small victoria, large victoria and two-seated hansom.

Elmore Mfg. Co., Clyde, Ohio.—Elmore two-cycle gasolene cars; two-cylinder tonneau, four-cylinder chassis and four-cylinder touring car.

Franklin Mfg. Co., H. H., Syracuse, N. Y.—Franklin air-cooled cars; four-cylinder chassis, four-cylinder runabout, six-cylinder touring car and two four-cylinder touring cars, and four-cylinder light truck.

Gallia Electric Carriage Co., New York City.—One electric runabout and one electric hansom cab.

Haynes Automobile Co., Kokomo, Ind.—Haynes Gasolene cars; four-cylinder chassis, three-cylinder limousine, four-cylinder touring car, two-cylinder runabout, two-cylinder chassis, and two-cylinder touring car.

Hewitt Motor Co., New York City.—Hewitt gasolene cars; one-cylinder delivery wagon, two one-cylinder chassis, two four-cylinder chassis, one-cylinder runabout, one-cylinder limousine.

Hollander & Tangeman, New York City.—F. I. A. T. gasolene cars; four-cylinder chassis, four-cylinder touring car and two four-cylinder limousines.

Knox Automobile Co., Springfield, Mass.—Knox gasolene cars; two-cylinder truck, two two-cylinder busses, one-cylinder delivery wagon, four-cylinder chassis, two-cylinder tonneau, two four-cylinder touring cars, four-cylinder limousine and two-cylinder runabout.

Locomobile Co. of America, Bridgeport, Conn.—Locomobile gasolene cars; four-cylinder racing car, two four-cylinder touring cars, four-cylinder limousine, four-cylinder chassis.

Matheson Motor Car Co., Wilkesbarre, Pa.—Matheson gasolene cars; four-cylinder model engine.

Northern Mfg. Co., Detroit, Mich.—Northern gasolene cars; two-cylinder chassis, one-cylinder runabout, four-cylinder touring car, two-cylinder touring car and four-cylinder chassis.

Olds Motor Works, Detroit, Mich.—Olds gasolene cars; two-cylinder chassis, two-cylinder delivery wagon, two-cylinder truck, two-cylinder touring car, two one-cylinder runabouts, four-cylinder touring car, four-cylinder runabout, four-cylinder chassis.

Packard Motor Car Co., Detroit, Mich.—Packard gasolene cars; two-cylinder truck, four-cylinder chassis, four-cylinder limousine, four-cylinder chassis, four-cylinder runabout.

Peerless Motor Car Co., Cleveland, Ohio. Peerless gasolene cars; four-cylinder chassis, four-cylinder runabout, four-cylinder touring car, four-cylinder limousine.

Pierce Co., George N., Buffalo, N. Y.—chassis, four-cylinder limousine, four-cylinder touring car (limousine attachment) and four-cylinder touring car.

Pope Mfg. Co., Hartford, Conn.—Pope, Pope-Hartford and Pope-Tribune gasolene cars; two-cylinder runabout, two-cylinder tonneau, two-cylinder chassis, two-cylinder touring car and four-cylinder touring car, two-cylinder truck.

Pope Motor Car Co., Toledo, Ohio.—Pope-Toledo gasolene and Pope-Waverly electric cars; four-cylinder chassis, three-cylinder touring cars, four-cylinder limousine; two electric trucks, two delivery wagons, one electric chassis, three electric runabouts, one electric brougham and an electric two-seated wagon.

Royal Motor Car Co., Cleveland, Ohio.—Royal gasolene cars; four-cylinder chassis, four-cylinder touring car, and two four-cylinder limousines.

Smith & Mabley, Inc., New York City.—Mercedes, Panhard and Renault gasolene cars; three four-cylinder limousines, four-cylinder touring car, two-cylinder chassis and two-cylinder bus.

Smith & Mabley Mfg. Co., New York City.—S. & M. Simplex gasolene cars; four-cylinder chassis, two four-cylinder touring cars, four-cylinder theatre bus.

Stearns Co., The F. B., Cleveland, Ohio.—Stearns gasolene cars; two four-cylinder touring cars, four-cylinder chassis.

Stevens Arms and Tool Co., Chicopee Falls, Mass.—Stevens Duryea gasolene cars; four-cylinder chassis, four-cylinder limousine, four-cylinder touring car and two-cylinder runabout, six-cylinder touring car.

Studebaker Automobile Co., South Bend, Ind.—Studebaker gasolene and electric cars; four-cylinder chassis, two four-cylinder touring cars, two four-cylinder limousines; three electric trucks, three electric delivery wagons and four electric runabouts.

Thomas Motor Co., E. R., Buffalo, N. Y.—Thomas gasolene cars; four-cylinder chassis, two-cylinder touring cars and two four-cylinder limousines.

Vehicle Equipment Co., Long Island City, N. Y.—Electric vehicles, four trucks, two delivery wagons and two theatre busses.

Waltham Mfg. Co., Waltham, Mass.—Waltham-Orient gasolene cars; two four-

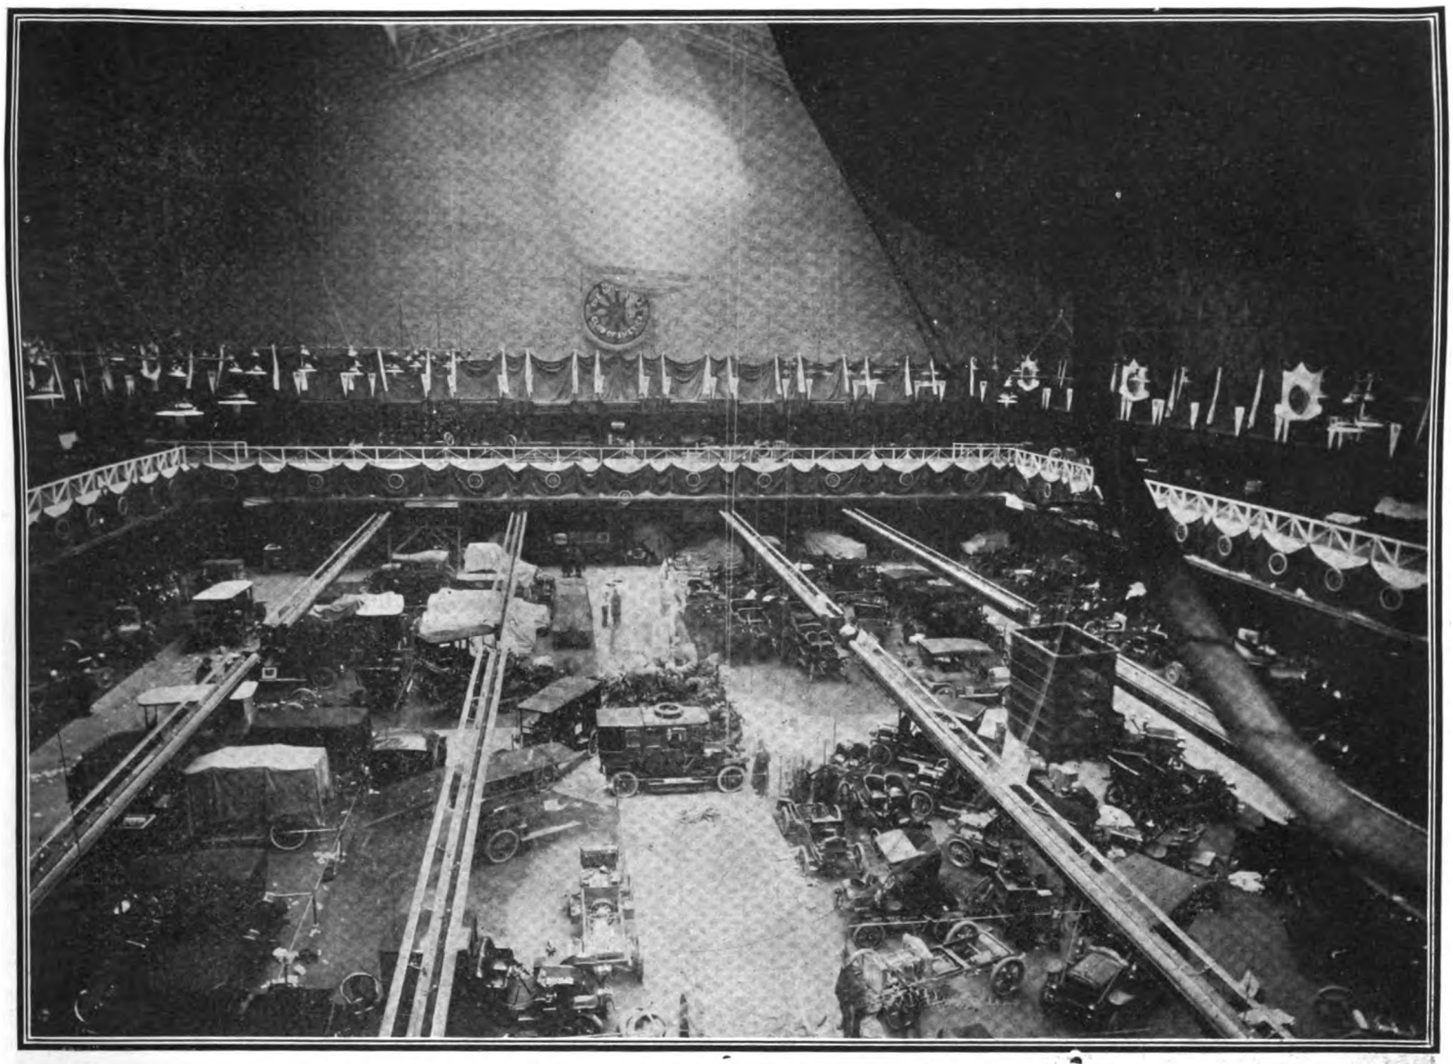
The Show Handsome, Likewise Instructive



"I fancy that it will surprise a few people," was the remark of one of those connected with it when the armory show was under discussion a day or two before it opened. It is fair to add that the armory show has done that very thing. Surprise—agreeable surprise—was almost general.

Generally speaking, chiefly from the spectacular standpoint, the show is more rugged than the one "across the way," but it does not suffer greatly by comparison. The Automobile Club of America has accomplished wonders with the Sixty-ninth Regiment's building, which, at least so far as the main floor and gallery are concerned, is admirably adapted to exhibition purposes. The decorations are simple but effective, and being in harmony the effectiveness is heightened. All signs and trappings are of dark green and gold and the general good effect has been heightened by the generous spaces allotted to the exhibitors on the main floor. As a result, the cars are not packed into place like sardines and there is none of the overcrowding observable elsewhere.

The armory show has a statue, too—a heroic white figure of Mercury arising from the bullrushes, or rather a plot of shrubbery. Merc occupies the very centre of the hall and is a distinct addition, as he was an unexpected one. The A. C. A. also has its emblem reproduced in giant's size in electric bulbs and pinned to the bare brick wall over the archway. The walls, because of their size and commanding position, might have been made the groundwork of a strikingly impressive picture of some sort. There are a couple of huge airships suspended from the ceiling and a remarkably complete display of such aerial vehicles and photographs thereof in the gymnasium upstairs. But it's a soldier's job to climb these stairs, so steep are they. And, strange to say, there is surprisingly little curiosity displayed in the airship display. The spec-

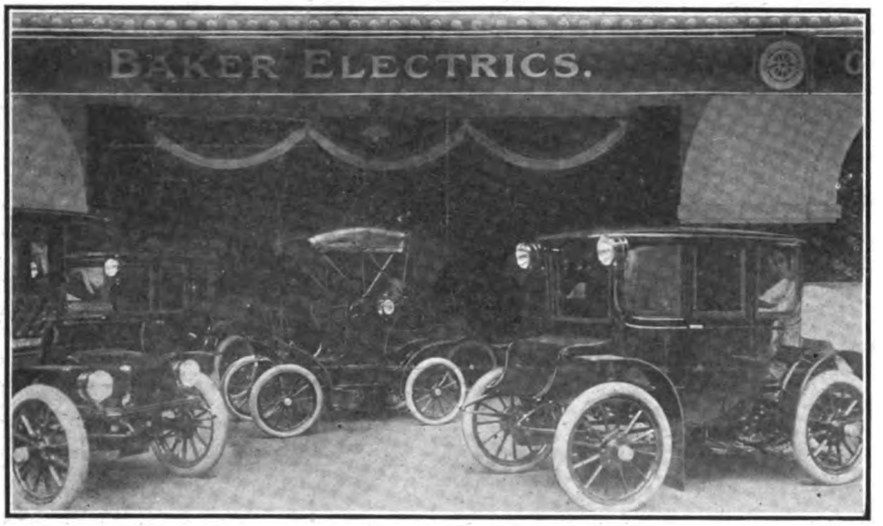
Digitized by Google

GENERAL VIEW OF THE ARMORY SHOW FROM THE EAST GALLERY.

tators apparently come to see the cars and have eyes for little else.

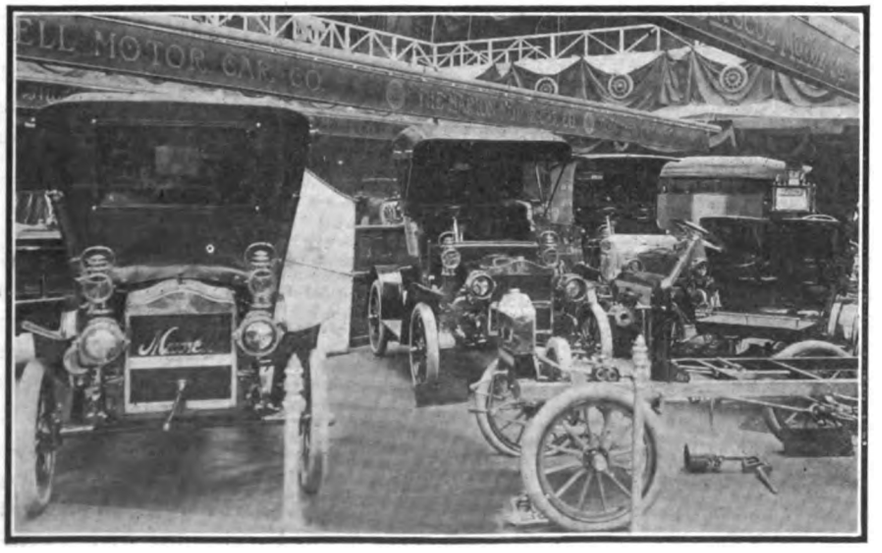
To tell the whole truth, however, there has been no little grumbling on the part of some of the exhibitors. Not the ones on the main floor or the gallery, however. They are as happy as larks at sunup. But once off away from these favored locations and phew! it is equivalent to entering a mystic maze.

Upstairs and down and around corners there are rooms, more rooms, and still more rooms—rooms to the right and to the left and in every other direction. The exhibitors in the furthermost or most snugly hidden of the rooms are the men who are growling. It would require a guide to find them, and as guides are not supplied many people weary of the task before locating their objective. It is almost like a game of hide and seek—out of one room and into another. On the other hand, in the more favorably located rooms, the crowd is packed so closely that it is akin to a football rush to get into them or out of them once one is inside. Some of the grumblers grumbled so loudly that finally they were permitted to remove their exhibits into the hallways.



The crowds that have attended have been large and interested, and even the casual visitor has found things to cause him to pause. The highly polished chassis catch his eye, and of the many that displayed by the Ford Motor Co. has made him rub his eyes so beautifully finished is it. It is as bright as a newly minted dollar. Of the other extreme is the Areo chassis. It is all black which means that it is not showy. It looks strong and essentially businesslike. It is distinctive because of its blackness. At the Reo booth is a four-passenger car which never fails to stop every passerby. The "Baby Reo" they call it and baby in size it certainly is. It stands on a small table, but at that it weighs 200 pounds. Despite its tininess it is as complete as the Reo itself in every detail, motor, spark plugs, clutch and everything else, and though toylike, the Reo folk say it acts perfectly and develops no mean speed.

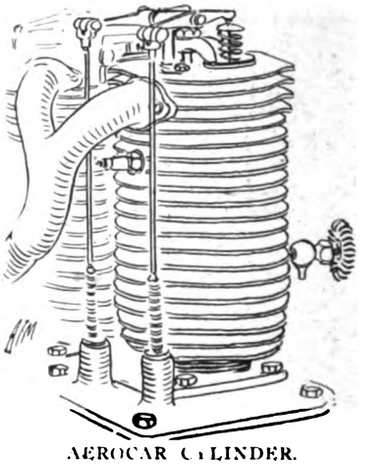
On Tuesday, the four-cylinder $500 Ford runabout put in an appearance at that stand, which since has been fairly mobbed by the great crowds that fairly fall over each other in their eagerness to see the new comer. The interest in this popular priced car is intense and far greater than ever the prophets anticipated and the Ford attendants are busy writing orders every moment of the day.



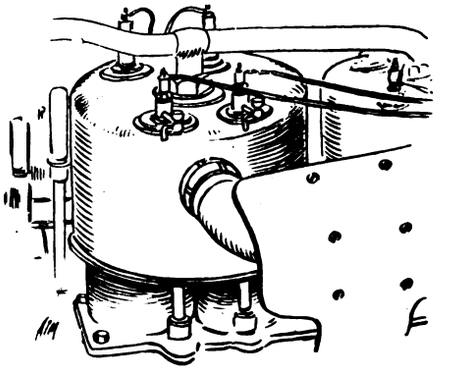
THE CARS REVIEWED.

All automobiles look alike to some people and the same may be said of all shows to the same class of individuals. In a general way, of course, the show held in the Armory resembles that in the Garden, when considered solely from the point of view of the cars staged. The same general tendencies are in evidence, but, as there is a large showing of Western cars, in fact the

Digitized by Google



largest aggregation of Western makers who have ever come together in New York, it was to be expected that considerable independence of thought and breeziness of design would await the visitor in their productions. Another distinctive feature of the Armory Show lay in the fact that so many of the cars were marked at a figure to appeal to a great number of buyers—the medium and low-priced cars that are within the capacity of pocket of the masses.

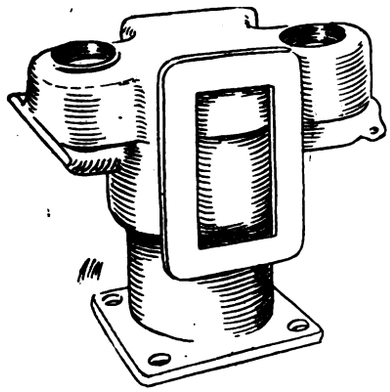


Motors.

There are several points about the motor which are of considerable interest to the

AEROCAR CYLINDER.

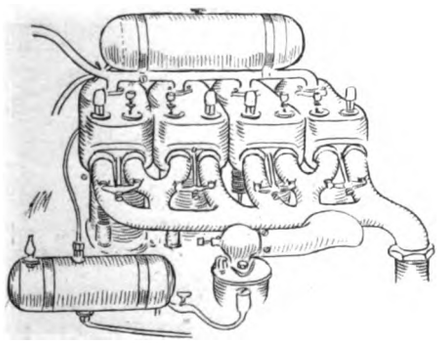
unbiased observer, and a comparison brings out the good points of both in every instance. Predictions as to the greater prevalence of the practice of casting cylinders independently find their fulfillment in no less than seventeen different instances, such as on the striking new chassis of the Ford six-cylinder, the National six-cylinder, all the new and business like members of



CHADWICK SEPARATE COPPER WATER JACKET.

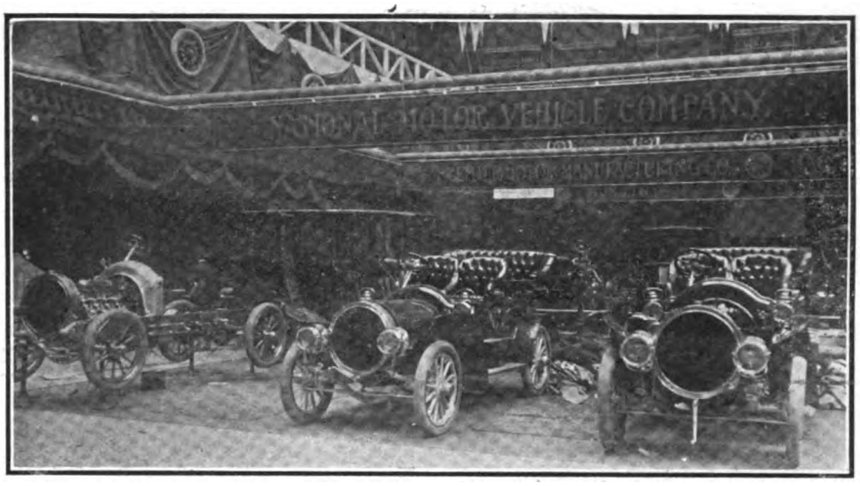
the Rambler four-cylinder family, the Iroquois and the three new Mitchells, including the 10 horsepower two-cylinder runabout that makes a very favorable impression, particularly when its extremely low price is considered. The Acme, Berkshire and the new four-cylinder Maxwell embody the same practice, as do also the Stoddard-Dayton, the Crawford, the York and the Grout. A particularly novel feature of the York cylinders consists in

Digitized by Google

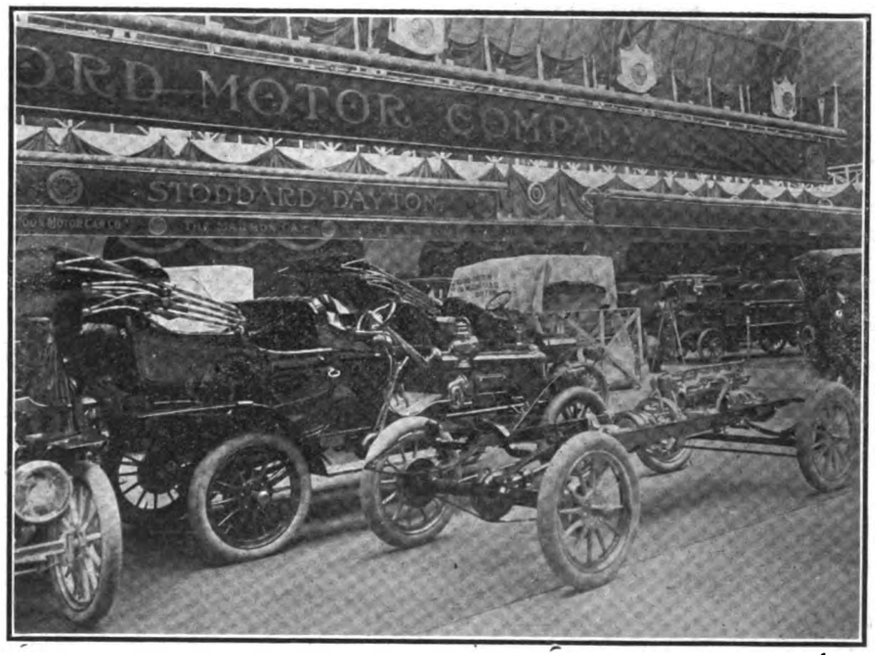


casting them with the jackets open on the side on which they abut. These openings, which are rectangular and extend practically the height of the jacket, are flanged so that when two cylinders come together they are easily bolted one to the other thus making a continuous water jacket and giving the rigidity of a single casting, the joints being covered with polished brass which makes a neat effect. A novel departure is to be found on the Lambert, in which case all the cylinders are made in one casting – a method that produces a very solid and clean appearing motor. Among those employing twin castings are the Lozier, the Cleveland, the St. Louis, the Dolson, the Reo, Moline, Jackson, all the Wayne four-

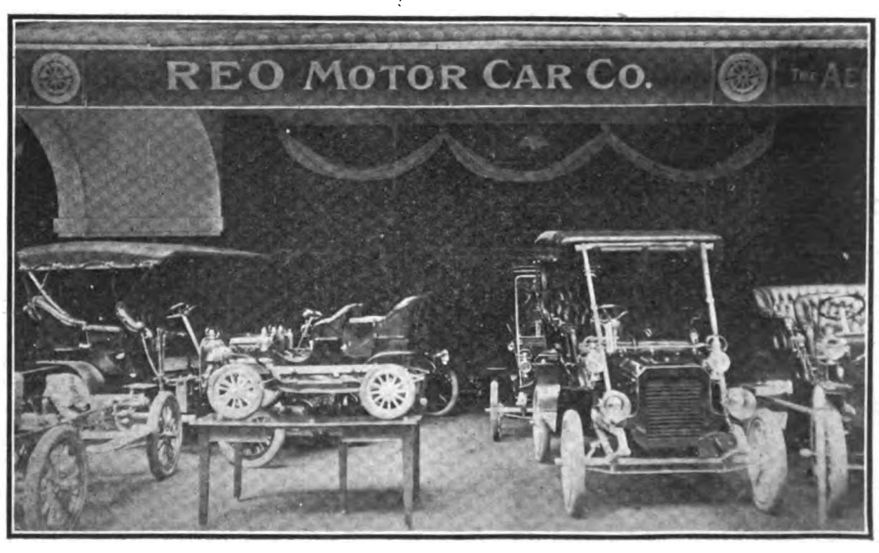
YORK-PULLMAN CYLINDER CASTING.



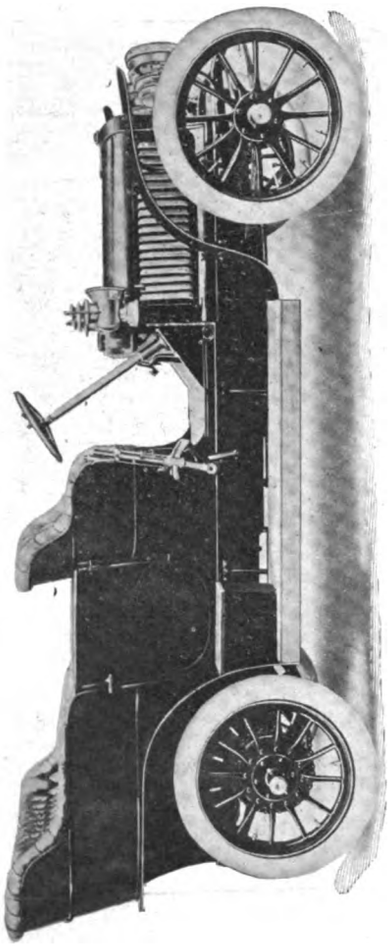
cylinder models, the new Dorris, the Westinghouse, Windsor, and last, but far from least, the new Ford runabout, the striking appearance of the latter's motor arousing no small amount of admiration from the spectators who were piled several deep about it all the time.



Air cooling is considerably more in evidence than ever before, and has now



NATIONAL AUXILIARY GASOLENE TANK AND OIL TANK.



reached a position where no handicaps are asked of any rival. It has reached a stage where all thought of experimentation or uncertainty of success is a thing of the past There is an addition to the ranks in the shape of the Aerocar, the appearance of which attracted considerable attention, while the Premier, the Marmon, the Marion and the Corbin were well represented and the Frayer-Miller, which has so thoroughly established its reputation was a center of attraction owing to the exhibition of the

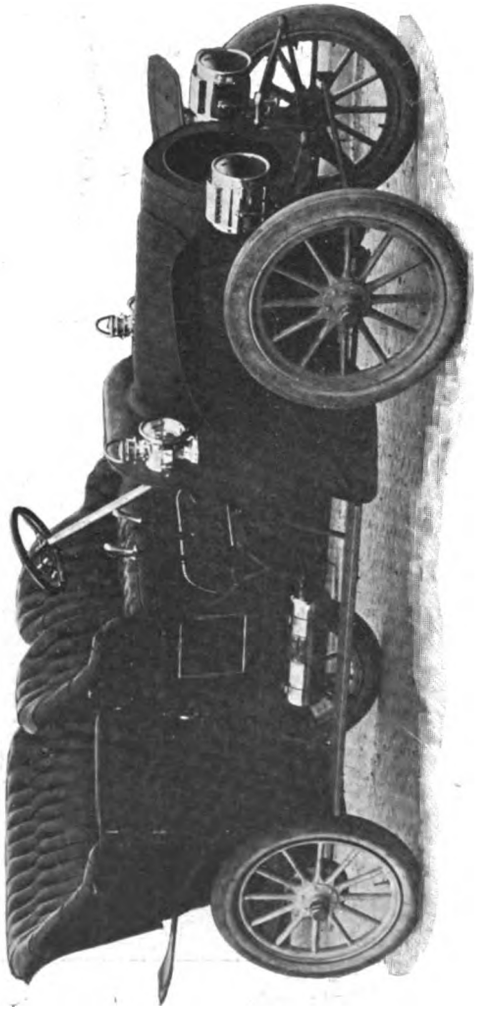
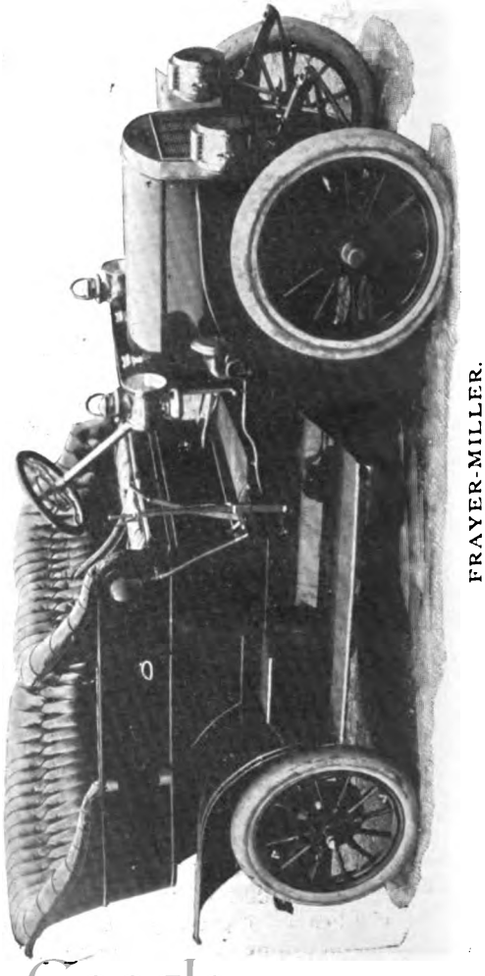
LOZIER.



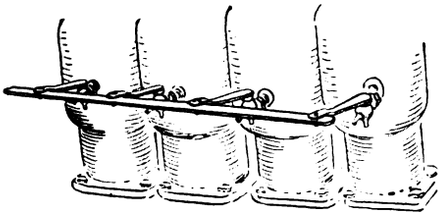
LANSDEN (Electric).



CORBIN.

NATIONAL.

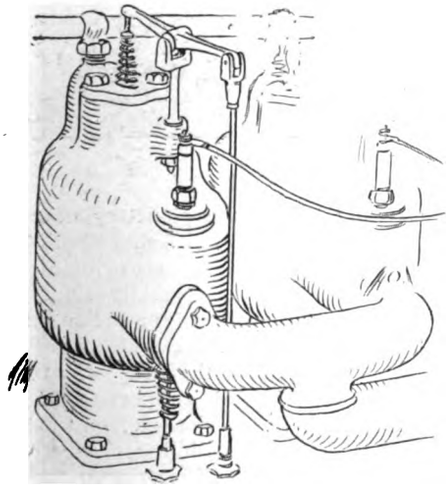
PREMIER.



FRAYER-MILLER.

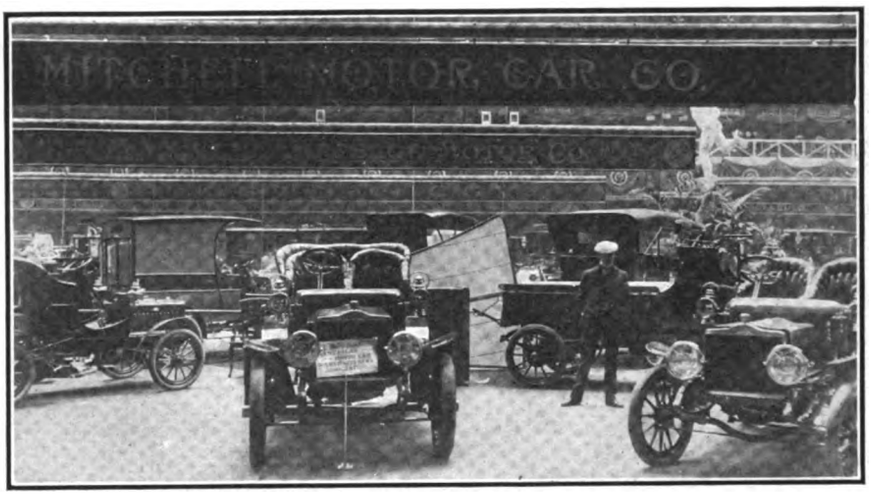
Digitized by Google

new six-cylinder model, which presented a strikingly business-like appearance. In all these cases, of course, the cylinders are cast independently.



Valves.

Considerable difference of opinion on the part of designers as regards valve placing was freely predicted, and those who looked for diverging standards were not disappointed. Out of 46 cars, each one the product of a different maker, 15 or prac-



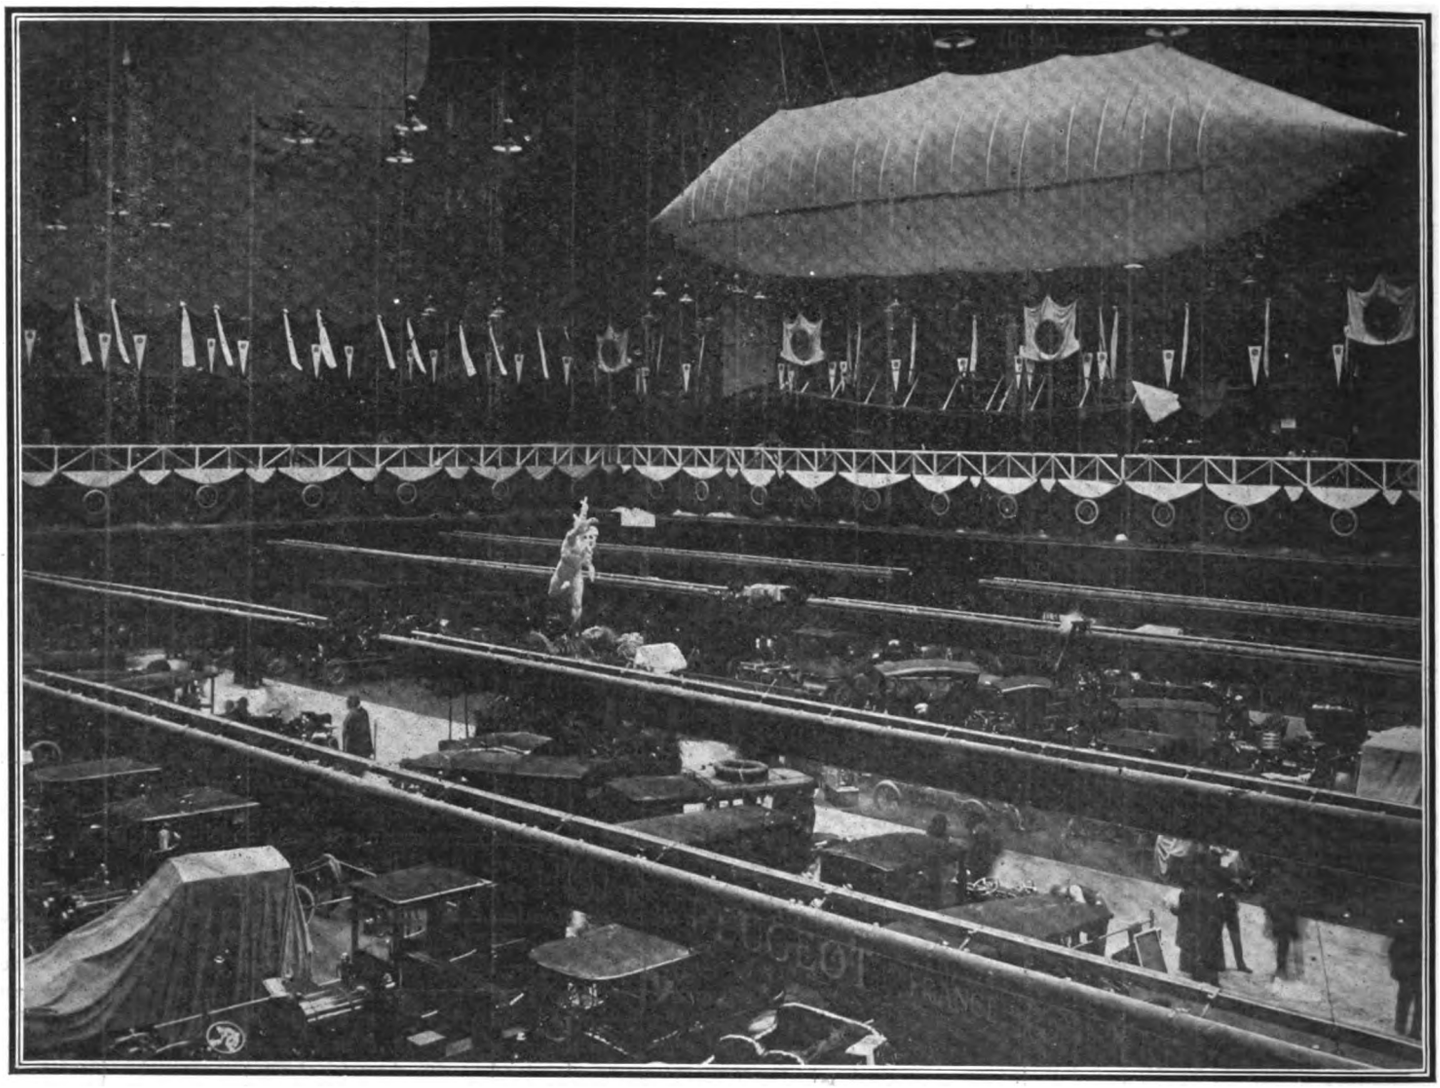
GLIDE COMPRESSION RELEASE.

tically a third favored opposite disposition, as in the case of the new four-cylinder Waynes, the Viqueot, Bliss, Maxwell; Lozier, Cleveland and the new American Berliet. It was also noticeable that the advocates of placing the valves in the head have increased considerably, one of the most striking instances being that of the Dorris motor, which is without doubt one of the most interesting of the new arrivals in the field. The Dorris motor, as a whole, is a piece of finished work that throws great

MITCHELL VALVE ARRANGEMENT.

credit on its designers and builders, and is one to catch the eye and hold the attention of the mechanical sharp. In air-cooled practice the head valve has come to be considered standard. One of the notable instances in which the superimposed valves are well worked out is that of the newcomers to the Rambler family in which both inlet and exhaust are in the head, while in the Mitchell runabout both are on the same side, as is also the case with the Ford runabout and the Ford six-cylinder model. The Queen National, St. Louis, Stoddard, Dayton and

the new Moon have both valves on the same side.

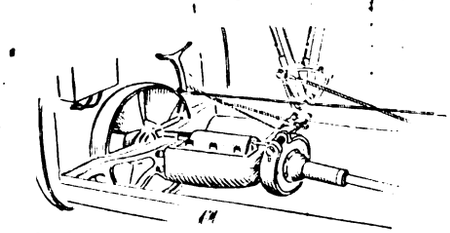


Lubricating Systems

On the vital essential of lubrication makers seem to be pretty well agreed, and in the case of the majority of the Western makers, as well as others for that matter, they have favored a home product by making the Hill Precision oiler the standard equipment in this respect, as they have also done in the matter of carburation by adopting the Schebler—the number of both these items that are in evidence on cars at the armory making it appear that the adoption of these two accessories was very general indeed. Certainty of lubrication is insured on the Lozier by the use of no less than three sources of supply, a pressure feed through hollow cranks, scoops on the connecting rods and a supplementary wick feed on the main bearings with splash for the piston and wrist pin. In the matter of cylinder dimensions there is not a great deal to be said. Practice has become so well settled on this point that motors of the same dimensions will in the majority of instances be found to have the same rating, as, for instance, in the case of the new leader of the Ramblers, measuring 5x5½ inches and rated at 45-horsepower, is found to be the same as the Maxwell in proportion, the latter being 5x5, with a rating of 40, or even as compared with some of the foreign cars measuring 5⅛x5⅝ approximately, and rated at 45 horsepower.

The expedient of offsetting the cylinders in order to counteract the thrust is a thing that has been advocated abroad as well as by some makers of special designs here, such as the Duryea, and while an advantage it is something that does not gain ground rapidly, the Upton, which is a particularly well thought out car throughout being one of its new converts for the present year. In steamers, the White, which easily holds the

Digitized by Google



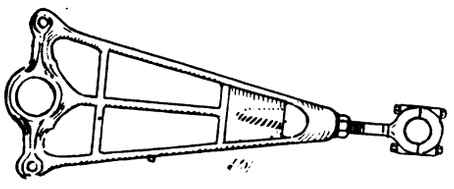
VIEW OF ARMORY SHOW FROM NORTHWEST GALLERY.

title of place, has been increased in horsepower from 15 to 18, with a corresponding increase in the steaming capacity of the generator.

Transmissions.

Of course, the sliding pinion type of change gear has come into very general use this year, its application to machines which a year ago would have been equipped with planetary gears, being one of the features of the show. In design there has been a marked improvement in the method of laying out the gears, and in the method of securing the changes. The gear boxes are now of neat and accessible construction, and the gears themselves are cut of large pitch from most excellent stock, and have well beveled ends to insure smooth engagement. The use of anti-friction bearings has been increased to a very great extent, and the general appearance of the transmission group as a whole has been vastly improved. Planetary gearing is used to a limited extent, and the type of individual clutch which had several exponents a year or two ago has fallen into disuse. Indeed, the only car which still adheres to it is the Welch, which appears this year with some slight improvement.

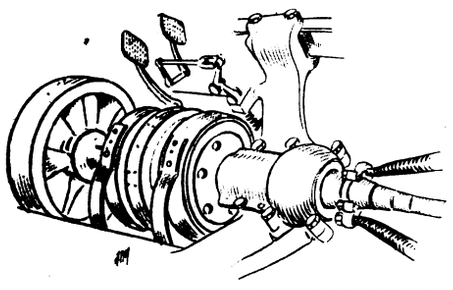
A census of the exhibits reveals the fact that 80 per cent. of the cars are fitted with the sliding gear transmission, 75 per cent. of these having three speeds besides the reverse and 22 per cent. having four forward speeds. On the Logan touring cars and trucks is found an exception in the shape of a two-speed sliding gear arrangement, which gives a direct connection on the higher arrangement. Something like 6 per cent. of the entire number are fitted with the planetary type of transmission, most of these, naturally enough, being of the lower priced class. The great exception, which proves the rule in this case, is found on the Ford stand, where the planetary usage is carried throughout, even being applied in an improved form to the six-cylinder machine which is thereby greatly simplified, both in construction and operation. Presumably in this case the extreme flexibility of the motor renders the need of a transmission practically nil, and hence the use of the low gears would be confined to starting and semi-occasional hill work where the grade was excessive. The friction type of transmission is fitted by three different makers, namely, the Crown, Windsor and Lambert.



DORRIS CLUTCH AND TRANSMISSION SUSPENSION.

In the construction of master clutches the greater number of the makers still hold to the cone type, many of them inverting the driven member and enclosing it, as is done very neatly on the Corbin car, and others, using the ordinary arrangement, but making the spring self contained and very easily adjustable, as in the case of the Lozier. Over 50 per cent. of the cars have cone clutches of one sort or another. Of these a few are made to run with metal to metal, and member being closed up and run in oil, but the majority still use the leather facing, with relieving springs placed

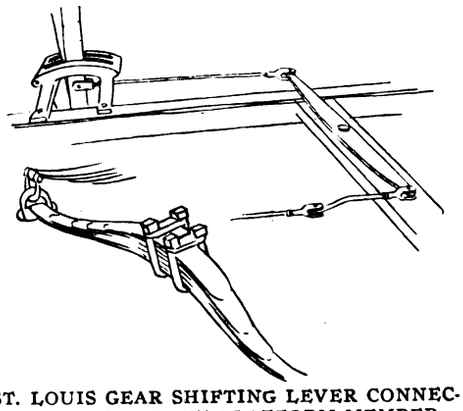
Digitized by Google



beneath it to lessen the tendency to sudden gripping when the pedal is released. There is a great deal of variety to be seen in the precise method of application, and also in the matter of size, in which the makers do not seem to have agreed upon any rule as to the amount of area properly required per unit of motor power. One of the neatest arrangements to be seen is on the Frayer-Miller, where the inverted clutch seat is bolted to the flywheel by means of a series of offset arms which allow for the placing of the driven member between it and the flywheel, together with the spring, and at

VIQUEOT CAST DISTANCE ROD.

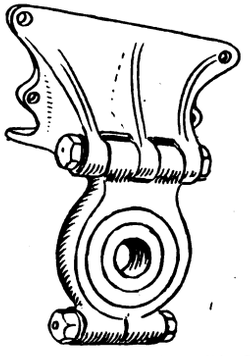
the same time furnishes a perfectly light, though rigid, construction. The arrangement is a decided improvement over that of last year, and provides for the removal of the clutch in its entirety without interfering with the gear box.



Perhaps a quarter of the cars are fitted with clutches of the multiple disc order, the greater number of these being of the heavier type. The tidiest of these devices is seen on the Welch car, which though having no master clutch yet serves as an illustration of what is possible in the construction of the multiple disc type. The member in question is composed of nine elements, consist-

TRANSMISSION SIX-CYLINDER FORD.

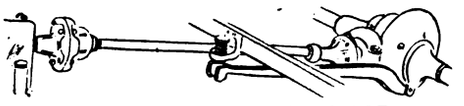
ing of alternate bronze and steel plates, and it is but six inches in diameter by one and a quarter long. The application of the power is made through the medium of a pair of small dogs, and the whole arrangement is so small and compact as to appear totally inadequate for its purpose, yet its capacity is far in excess of any possible demand. Among the makers who have applied this type with apparent success for the first time this season are the Premier Motor Car Co., the St. Louis Motor Car Co. and the makers of the Upton, Wayne and Dorris cars—the latter in particularly commendable fashion. Several of the large foreign-American machines, like that product of an all-comprehensive industrial group, the Westinghouse, also use the multiple disc type to advantage.



On a very few machines are to be seen a form of expanding ring clutch, the idea being particularly well brought out in the case of the York Pullman, in which a single dog is made to expand a two-part ring by means of a short toggle movement. Riding

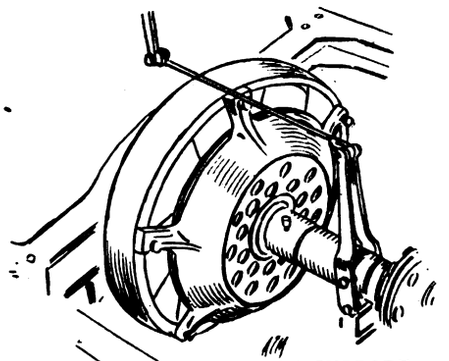
ST. LOUIS GEAR SHIFTING LEVER CONNECTION AND FRONT PLATFORM MEMBER REAR SUSPENSION.

upon the driven member is a bronze friction ring, the functions of which are to furnish a bearing surface between the expanding ring and the flywheel, and to give a certain amount of desirable yieldability during the period of early engagement as a preventative of fierceness. It is a noteworthy fact that with clutches of this general type, the force requisite to secure and maintain the engagement of the working surfaces is so slight that but a comparatively weak spring is necessary, and also that on this account the provision of a special thrust bearing to take up the reaction of the mechanism when out of engagement becomes comparatively insignificant.



In the method of connection between the clutch and the gear box, is seen this year more than ever before, a tendency to the use of the universal joint. Nearly every car has some provision of this sort, most commonly placed directly in front of the gear box. In one or two cars, notably the Bollee, this joint is placed directly in the

CRAWFORD COUNTERSHAFT HANGER.



clutch member, which, in such cases is of the simple cone type. An instance of the use of this idea on an American can is seen in the Chadwick. The benefit from this is two-fold, since it provides against any springing or binding in the shaft from distortion or disalignment, and also ensures the uniform seating of the clutch at all points in its periphery. The increased usage in this respect marks a decided step in the making of the ideal car, in that it is a recognition of the practicable impossibility of maintaining a rigid alignment between the different organs of the machine under all conditions, except in the case of a comparatively small car where the complete unit construction is possible.

The latter idea has been well carried out in the case of the smaller Maxwell, in which the gear case is made a continuation of the motor housing, and is perfectly rigid with it. The same principle is applied as well in an exceptional case in the new Dorris car, which in many ways shows the stamp of originality. Here, the gear case

CORBIN SPRING TORSION ROD.

is mounted entirely free of the frame, at the side and rear, being bolted to the flywheel housing which is constructed in the form of a cross member of the frame just in front of the dash, and also serves a purpose in the support of the engine. Within the enclosure of this framework which is extended in tapering form, is the multiple disc clutch and directly behind it, the gear changing mechanism in which the shafts are arranged in a vertical plane. There is but a single sliding member, and the shaft runs continuously even on the direct drive, when it is idle. By driving it at half the speed of the motor it is claimed that no

FRAYER-MILLER CLUTCH SUPPORT.

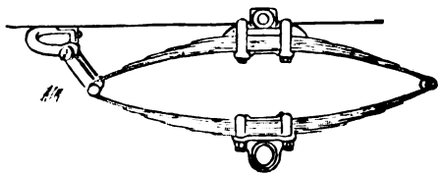
harm can result from this practice, as there is no load on the gears. This argument is upheld by several other of the makers who use the direct connection without disconnecting the lay shaft.

In the matter of the mounting of the gear box in the chassis, practice varies considerable, the three point principle obtained by hanging the rear portion of the case on the counter shaft bearings or in sleeves which enclose the counter shaft is rather popular in the chain drive cars, while the plain four area arm mounting from the frame, or in less frequent instances, from the fast disappearing subframe.

In connection with the use of the selective system of gear changing, some very pretty pieces of design are seen on one or

Digitized by Google

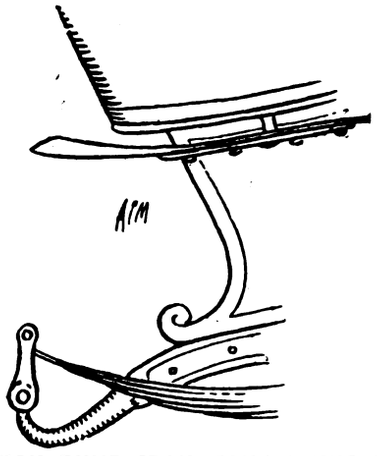
two of the cars. The Westinghouse, for instance, in which three sliding sets are employed, has the selective, or pick-up mechanism for the shifting bars in a case which is entirely independent of the gear case. A cam plate provided with a single depression in its face, is made to slide traversely of the machine by the motion of the shifting lever when passing from one train to another, thereby allowing one of three spring actuated fingers to fall. Upon the lower ends of these finger arms are a second set of fingers which fall into notches in the shifting bars under the action of the springs, thereby holding them in the neutral position. Within the casing proper, into which the ends of the shifting rods extend, are the traverse shaft of the shifting lever and an arm carried by it, which is adapted to engage with one or another of the rods according to its position. Thus, when the shifting lever is brought into one of the slots in the gridiron, the arm picks up the proper shifting bar, while the cam releases the rod and permits it to be moved.



Quite in contrast to this, is the shifiting mechanism of the American Berliet, which is enclosed entirely, and from which three rods run back to the gear case proper, these and the clutch shaft comprising the whole of the exposed mechanism, and thus leaving the chassis quite the plainest to be seen at the Armory.

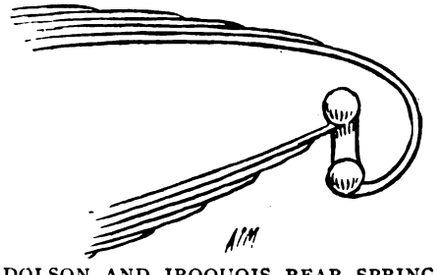
In those machines which are driven by double chains, the differential is almost universally placed in the gear box, a separate compartment usually being reserved for it. The construction of the differentials which are included in those cars which have live axles is universally neat and efficient to all appearances. In by far the greater majority of the cars, the bevel gear type is used, the spur pattern being regulated to machines of inferior quality in most cases.

Springs.



Although to the eye of the uninitiated, there is nothing radically new to be seen in the way of the spring mounting of the cars nor the general structure of the parts of the suspension, still the fact that there has been a very general lengthening out of these most important factors in the life and service of the machine, indicates to the close observer that the general run of the designers have come to recognize the beneficial results of cradling the chassis on long and easy springs of comparatively slow oscillation, and of coupling them to the frame in a manner which shall ensure to them a much greater degree of immunity from the annoying failure of through bolts and shackles, which has been a somewhat prevalent weakness in the past. Far from showing anything distinctly radical, the trend of design in that respect may be described as being a continuation of the tendencies of last year, carried out to a degree which the experience of that period would no have sanctioned.

In accordance with the extension in length of the springs, the number of leaves has been increased in many cases to give the necessary degree of strength. In one or two instances, this has been carried out to a remarkable extent, as for instance, the



CROWN FRONT SUSPENSION.

Viqueot, in which is a most remarkable spring equipment. The front springs are 46 inches in length, and eight leaved, while those in the rear are 54 inches long, and made up of twelve leaves. By this means, the oscillations of the car when passing over rough roads are made extremely slow and

UPTON DUMB IRON CONFORMING TO BODY CURVES.

easy, and at the same time the strength which is requisite in so heavy a car, is provided. In the American Berliet, is also to be seen a very long spring equipment, the rear members having ten leaves. In the six-cylinder National, too, very liberal springs are provided, the length between

DOLSON AND IROQUOIS REAR SPRING SHACKLE.

the centers being no less than 50 inches.

From extremes such as these which are to be seen in the very heavy machines, there is a fairly uniform gradation in length to an average of possibly 40 inches on a typical two thousand pound car, as in the largest of the Mitchell cars, and the Model 15 Rambler. The number of leaves used varies as well, but not to a remarkable extent, the eight leaf type being predominant. It is noticeable that many of the makers have placed the springs off centre, at the rear of the car—a practice which though offensive to the eye in point of symmetry, yet possesses the advantage of throwing the axle well to the rear without necessitating the use of outwardly extending dummy irons. Just how general this practice has become is not of material interest, but it is by no means unusual. In at least one instance the same usage is extended to the front springs, thereby placing the forward axle well in advance of the motor.

The use of the semi-elliptic spring is still continued to a very great extent, the proportion of the whole being somewhat in the neighborhood of 65 per cent. Of the remainder, some 11 per cent. use a combination system in which the rear springs are of the full elliptic type, while those in front are semi-elliptic. The use of the platform construction in the rear, which seemed a year ago to be coming into vogue, has been but little altered, those of the foreign makers who adopted it at that time still adhering to it, such of the more substantial American machines as the Lozier, continuing to use it. The fact that its use does not seem to have increased to any great extent, by no means brands it as not being an improvement over the semi-elliptical type, since it has not been discarded by such of the reputable makers as already have taken it up. On the Austin, is to be seen the "demi-pincette" type of spring, or three-quarter elliptic.

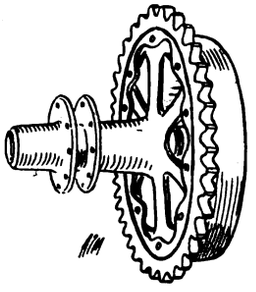
Considering the amount of stir that has been made by the constructors of the various shock absorbers which are crowding into the market, it seems rather surprising that the manufacturers themselves are not taking hold of them and fitting them as a part of the regular equipment of the car. In the case of the Austin, indeed, a device of the sort is fitted—an original arrangement—resembling the Truffault-Hartford Suspension, which, in connection with the unusual method of suspension just cited, renders the car particularly easy riding. The imported machines are fitted with the Truffault type in several instances, though the practice is by no means universal. On the Premier, an adjustable coupling at the rear end of the full elliptic spring is provided, which may be set up to give the same general effect. In one case only are supplementary springs used, that of the Upton car, and there they are of the spiral type, and attached both to the axle and the frame. On one or two of the commercial vehicles, indeed, the use of a buffer spring is to be seen, but its purpose in such cases is simply to guard the axle from the shock caused by the blow of an overloaded body.

Brakes.

Another factor in motor car construction which is strongly marked at the Show, is the decided trend toward an increase in size and area of braking surfaces. This increase has been supplied to all the cars

Digitized by Google

shown but possibly one or two exceptions, and in some cases has been carried to what is seemingly a degree of exaggeration, when considered in the light of what was called good practice a year or two ago. The most startling illustration of this is seen in the Viqueot, which all the way through manifests its designers' determination to sacrifice nothing to serviceability. Here, the emergency brakes are of the prevalent internal expansion type, setting up in drums of pressed steel, of which the driving sprockets form a part. The drums themselves are cup shaped and are 5 inches wide, the diameter being 16 inches. The braking force is applied through levers which in themselves are fully 10 inches long, so that the aggregate equalized effort on the wheels is far beyond the need of any possible emergency.



In lesser degree, the same idea—that of providing sufficient brake area so that the brakes cannot fail to hold even when in the worst conceivable condition—is manifest on a great number of machines. Among these are the National, Ranier, and the Rambler, on which latter the foot brake is enclosed within the gear case. For the emergency brakes, the internal expansion type, with complete enclosure of the working parts is largely to be found on the better class of machines. The foot brakes, on the other hand, are as a matter of structural convenience, made of the contracting type. In every case, the levers and connection are made stronger than heretofore to cope with the general increase in all around substantiality. On several of the very large machines, like the Westinghouse, two-foot brakes are fitted, both being water cooled. In some cases the water cooling effect is either accomplished by simply allowing a small quantity of water to trickle down the inner side of the rim of the brake drum inwardly turned, flanges being adapted to form a trough to retain it. In others, the brake shoe itself is jacketed, and water is caused to circulate through it, flexible connections of rubber being used for the purpose.

On many of the cars some sort of an equalizing device is used for the emergency group, the provision of a short beam linked to the lever at its center, and to the rocker-arms which actuate the two rear brakes, at either end, as in the Frayer-Miller, is particularly noticeable for its neatness of design. Another arrangement which is found on the Viqueot car is that of a cable and pulley scheme, a single tension rod running down the center of the chassis and ending in a pulley through which is reeved a cable hitched at either end to the two brake lever arms, which are bent inwardly at an angle in order to bring them into the line of tension of the rod and cable. It is a curious looking arrangement, but essentially simple and effective.

On even the very cheapest of the cars, well drawn braking devices are used, although several of the makers still persist in the use of some sort of belting as a facing for the contracting band type, and many more adhere to the use of a leather facing. There is, however, a decided leaning toward the metal to metal construction, and its general adoption, except in the flimsiest of runabouts, is to be looked for another year.

Wheels and Wheel Bases.

An an illustration of the prevailing tendency toward the use of what a couple of years ago would have been an extended wheel base, it is noteworthy that some 80 per cent. of the cars have a wheel base of 100 inches or more, and but a ragged minority of 2 per cent. fall inside that limit, they being in every case, cars of the cheaper order and classed as runabouts. In fact, as further showing the trend toward longer machines, it may be said that about half of the cars have 105-inch base or over, the lead being taken by the

CRAWFORD REAR WHEEL CONSTRUCTION.

National six-cylinder car, which thus is given an added distinguishment. Next in order of length, comes the Westinghouse, which is in every other way a massive affair, its wheels being placed 120 inches apart on centres. The American Napier, the Lozier, and the Welch, also have very long bases, while the marvelous sextuple Ford stands on a 114-inch base.

This lengthening of the base has been brought about apparently by a combination of a lengthened chassis and springs set off-centre, the former alteration being accepted by the designers in nearly every case for the provision of a more liberal amount of foot room than ever before was brought into use in any of the most pretentious of machines. Nor is this extension of the foot-board confined solely to the rearward portion of the car, but is distributed over the machine in such a way that the affect of roominess which was sacrificed, when the transition from animal to mechanical traction was made, is completely restored. Fortunately, the increase in the length of the frame has not been made so great that any increase in the number of components has become necessary, for it has enabled the designer to continue the use of a very simple structure, only using heavier members in some cases to give the added strength which is necessary. Also, the increasing use of first-class materials of construction in frame building has enabled the maker to produce chassis which are wonderfully simple considering the complexity of the duty which they have to perform. Thus, among the heavier machines, the Berliet is particularly noteworthy, while among those of more American derivation, the Ranier, and the Dorris are deserving of mention, while the six-cylinder Ford, with its arch at the rear to allow clearance for the Cardan shaft, is most unique.

Few examples of frame trussing are to be seen, one of the exceptions to the rule being the Logan touring car, to which a rather ingenious method of bracing has been applied.

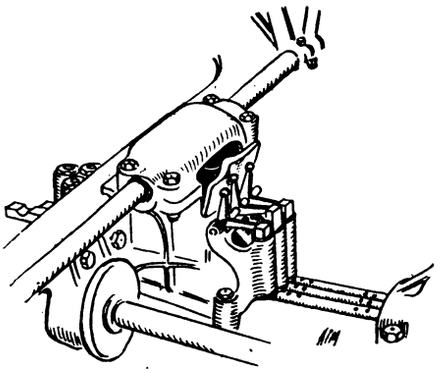
A somewhat general tendency to increase the size of the wheels is to be seen, some 38 per cent. of the cars shown having 34-inch wheels, while 34 per cent. or so run on 32-inch wheels. Of the former, such machines as the brand new Aerocar, the Mitchell and the National are examples, while the Maxwell, Grout, Reo and Corbin still adhere to the smaller size. Some 10 per cent. of the makers are disciples of the big wheel, the Lozier, Austin, Welch, and Berkshire using 36-inch wheels, while the American Napier stands almost alone in the use of wheels of different size in front and rear. As has been predicted, there is a general tendency to an increase in the size of the tires used, something like 52 per cent. of the makers fitting 4-inch pneumatics to their machines, and 18 per cent. using 4½-inch tires, while a minority of 16 per cent. use 3½-inch, and only about 8 per cent. the 3-inch size, the latter being, of course, applied to runabouts. The change is very marked, giving the wheels a more formidable, albeit no less substantial, aspect. Of course, the larger sizes are more commonly applied to the types of limousine body which are so frequently to be seen at the Show, and in certain cases the more ordinary touring equipment is made lighter, but the general trend is toward a greater volume of compressed air between the wheel and the ground, take it the exhibit around.

Drive.

This is a part of the car on which change has been inticipated by the increasing adoption of the cardan shaft, and the recent accessions to the ranks of the advocates of the propeller shaft would appear to bear this sort to some extent. There are on the other hand, however, quite a few who still adhere to the double chain and so far as service is concerned there is little to differentiate between them. It is noticeable that cars of medium power, such as the Grout, rated at 28-30 horse-power, have adopted the double side chain, the Berkshire on their 24 and 35 horse-power. On the last named car is to be seen one of the fer attempts ever made to protect the chains from mud. It takes the form of a removable leather case filled with grease. The St. Louis and the Lambert, as well as the Bliss, rated at 34, 36 and 30 horse-power, respectively, also employ the double chain. In the higher powered cars such as the Viqueot, Westinghouse, the Berliet, the Chadwick and the Acme, all of which top the 45 horse-power mark, the use of the

Digitized by Google

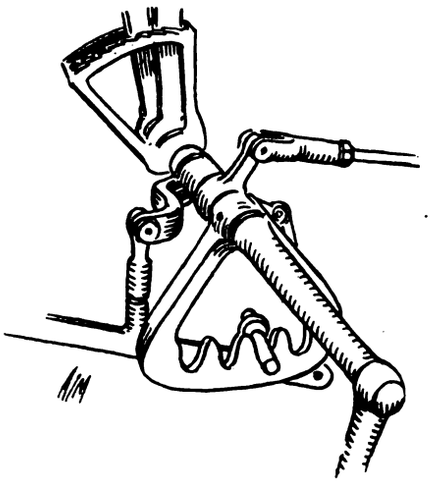
double chain is, of course, still general. There are, however, cars the rating of which forms an approach to this mark which use the cardan shaft, such as the Frayer-Miller, National and Ford six-cylinder models.



Among the air-cooled cars the shaft drive is practically universal such as the Premier, Marmon, Aero and Corbin. The use of compensated tension rods has become more general, this being well worked out in the Premier and the Corbin by suspending the inner end of the rod from a vertical piece attached to the cross member of the frame and upon which it may move up or down, controlled by a strong helical spring placed on either side of it. The universal joint is likewise a feature that has been multiplied in proportion to the increased use of the shaft although an additional use has been found for it between the clutch and gear box where it is of great value in preserving the alignment of the former whether it be of the multiple disc or cone type.

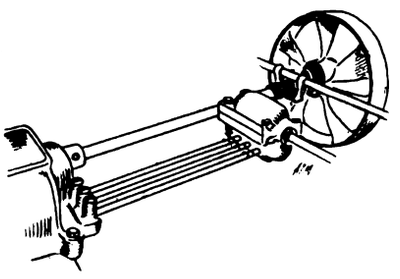
Then there are the gears of special design, such as the Lambert and the Windsor in which the chief feature of the transmission is the use of friction, the final drive in both being with double side chains.

Safety Devices.



It is noticeable that an increased number of makers have borne the novice in mind in adding those final touches to the operating mechanism that mean so much to the comfort of the driver, whether he be inexperienced or otherwise. The Mitchell, National and Reo, as well as the Moon, employ a gear locking device interconnected with the clutch so that the latter cannot be engaged between gears, while one or two, notably the Lozier, the Acme and the Napier, are provided with sprags, this being a feature that is well worked out in the Lozier. The sprag is of the ratchet in the case type and is thrown by hand with a small lever located next to the emergency brake. It is automatically released by throwing in the reverse so that there is no danger of attempting to run backward with it on. The latter is also true of the Acme.

There is one item in this connection the settlement of which appears to be as distant now as ever and that is whether the pedal brake should throw the clutch. There are so many upholders of each side of the question that there is not much to choose between them in the way of advantages; it is a matter of personal preference which shall be fitted in the majority of instances. One radical as well as quite novel departure which is in fact, but one feature of a very cleverly designed car in every particular, is the expedient employed on the Dorris. It may be termed the single pedal control, both clutch and brake being connected to the same pedal. Pushing the latter a certain distance disengages the clutch and further movement in the same direction applies the foot brake. The emergency brake on this car sets all the brakes simultaneously. The Stoddard Dayton also employs interconnected pedal control by hitching the throttle to the pedal brake—when the latter is depressed the engine is throttled down, the clutch also being interconnected with the



WESTINGHOUSE GEAR INTERLOCKING DEVICE.

governor, thus effectually preventing racing when the clutch is out. This is likewise a feature of the Iroquois car.

NATIONAL GEAR CHANGE INTERLOCKER.

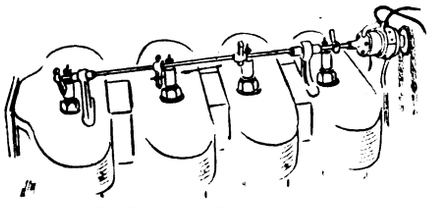
But the diversity of opinion as to brake and clutch interconnection does not extend to the emergency, which is with rare exception, made to release the clutch. One of the cars upon which every operation is carried out independently is the Upton. On the Mitchell two-cylinder runabout, the pedal brake and clutch are interconected as also on the Cleveland, the Premier, Jackson and Bliss, all these four having both brakes interconnected.

AM. BERLIET GEAR INTERLOCKER.

Ignition.

In the matter of ignition there seems to be a tendency on the part of builders of cars, the price of which allows liberal leeway for experimenting, to regard this as a feature of the car which is far from settled—that it will henceforth be a struggle for supremacy between the renaissance of the low tension system and the high tension which is at present now so universal. But to particularize—to get down to the cars shown in the Armory, the reverse is found to be true to an extent that makes the first statement appear to be entirely unfounded, for a close scrutiny of all the American cars staged there reveals as close an approach to uniformity in this respect as it is possible to attain; there always will be an occasional exception. American designers, as a rule, have considered this a matter best left to the care of those who have made it a specialty. How very prevalent this dependence upon the maker of electrical apparatus has become may be realized from the fact that in the minds of many of the attendants, the entire ignition system means nothing more than the name of the maker of the coil or some other part. A question as to the form now used rarely elicits anything more than "Splitdorf" coil, "Autocoil," "Connecticut" coils, or the like.

Contrasted with but a year there is a change to be noticed; there have been more accessions to the ranks in that time and they have tended to bring about a still greater degree of uniformity—one measured largely by price. Given any ten American cars of approximately the same price and few of them will differ in the slightest in this respect.



It may be wondered how the various idiosyncrasies of the individual purchaser are met by anything so closely approaching universal uniformity, but in this respect the manufacturer is open to any suggestions that do not entail revolutionizing the system entirely. In numerous instances he is perfectly willing to give the buyer his choice of the small direct generator, dry cells or accumulators and in the case of the National car in both the four and six-cylinder models, he gets all three anyway. The improved Apple igniter and storage plant are employed, the same as last year, but the location of the dynamo as well as its drive have been changed for the better. The machine is mounted in a vertical position on the face of the dash-board with its friction wheel bearing against a specially beveled face of the flywheel. This location brings the commutator casing just above the level of the foot-board which permits of ready inspection. Electric side and tail lights are employed and two sets of accumulators are provided on both the four and the six-cylinder models.

This matter of giving the purchaser his choice in this regard, while nothing particularly new, though now much more general than previously, brings out another thing very strikingly and that is the manner in which the popularity of the accumulator

Digitized by Google

for ignition purposes has increased. But two years ago it was viewed askance even by a great many to whom the increased cost did not figure as a detriment. They evidently seem to have come to it in the interim, for now it is apparently a matter of indifference to the maker which he employs and on the cars of the touring type the accumulator is predominant. For instance, out of 39 cars that may be termed purely American, that is, designed and built in this country, more than 20 include accumulators, many using two sets, the Acme, National and a number of others, while the remainder are, in the majority of instances, willing to include them if the new owner of the car wishes to so specify.

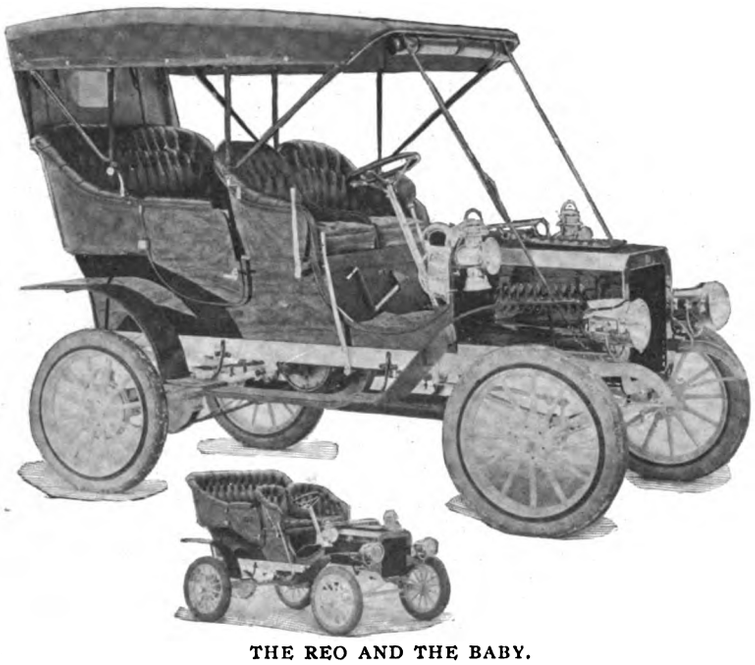
Despite the many predictions as to the coming of the magneto on the lower priced car, it is remarkable to note that on the 39 American cars in question the progress made represents but a very insignificant fraction of the whole. Of this number but five or less than 15 per cent. of the total have declared themselves in favor of the alternating current generator, which is with one exception of the high tension order. One of this number, the Frayer-Miller, does not include a magneto as a standard part of their equipment, but it is made optional on the six-cylinder model. The six-cylinder Ford is simplified to a great extent by the adoption of the Holley magneto. The Holley magneto is also a feature of the Grout car. The single exception to the prevalence of the high tension advocates is represented by the Cleveland, employing the Simms-Bosch low tension with make and break igniters. The La Coste high tension is fitted on the Lozier and the Rainier employs the same make as the Cleveland but of the high tension system, while the Austin carries the Remy. Both of the latter use accumulators with multiple coil in addition. On cars that may be termed of "foreign extraction," such as the Bliss, the American Berliet and the Napier, or which are built abroad by American capital such as the Viqueot and the Westinghouse, the use of the magneto is universal. In the case of the Viqueot this is the Eisemann high tension, while on the American Berliet the low tension with make and break is adhered to; the La Coste of the high tension type is used on the Bliss, while the Westinghouse employs the Simms-Bosch high tension. In passing it must be remarked that some of the much lauded features of but a year or two since have all but passed away unmourned. One of these was the placing of the commutator or distributor on the dash-board where it would be plainly visible. Of the 39 cars but one has this feature and it is an entirely new entrant into the fold. As a means of simplifying the wiring as much as possible, it was noticeable last year that many had placed this essential at the top of a vertical shaft level with the upper ends of the cylinders, with the drive taken from the cam shaft through a bevel gear. This is now almost universal and the commutator is placed generally at the rear of the motor except in those cases where some special feature of the design of the motor makes a change result in improvement, as in the Mitchell, where it rises at an angle from the side of the motor about six inches or so to within easy reaching distance and makes it very accessible, or in the six-cylinder Frayer-Miller, where, owing to the length of the engine, the purpose intended has been fulfilled by placing it at the side about the center of the motor. It is also vertical in this instance, but owing to the special design of the air-cooling jackets is only carried a few inches above the level of the cam shaft, which renders it both easy of access and convenient to wire. The Berkshire is one of these exceptions, but differs only in having the distributor lying horizontally. A feature of interest in this connection that should not be overlooked is the use of this vertical spark timer shaft to carry the governor acting on the ignition, a method of procedure very cleverly worked out on the National on which it is an exclusive feature.

YORK PULLMAN IGNITION SYSTEM.

Another of the features of which a great deal was expected a few years ago was the use of but a single coil on the four-cylinder motor with a commutator on the low tension side and a distributor on the high. That experience would seem to have decided against this form except where there are other controlling circumstances, would appear self-evident when it is stated that out of 39 cars, but five now use it, and, as already stated, its adoption is dictated by convenience or where this forms but an auxiliary, as in the case of the Grout as a standby to the magneto. Such cars as the four-cylinder Maxwell, the Rambler and the Reo, of the same type, the Aerocar, the St. Louis, the Premier, Stoddard-Dayton, Queen and Wayne, employ the multiple coil which has the great advantage of making it easy to get home on two or three cylinders, should one or more of the coils break down simultaneously, or where a spare unit is carried as is often the case, of making light of an accident to one coil.

On one or two cars, such as the National and the Upton, it is convenient to ascertain the condition of the battery at any time by merely pressing a button which puts the cells in circuit with a small voltmeter mounted on the dash.

To sum up the situation briefly, the American maker of the medium priced car is determined to stick to his recognized standard—the high tension system with multiple coil and batteries, something what he can employ in the highest grade manufactured without paying a disproportionate price, instead of experimenting with the more expensive methods that may or may not prove superior.



Without doubt the most novel form of ignition was found on the York car, or York Pullman, which is its full title. This is a most ingenuous arrangement, very cleverly worked out. The plugs are centered in the heads of the cylinders and merely terminate in a point projecting slightly above the ordinary binding post. There are no wires or any connection whatever visible. Just above the four plugs in line, and slightly to one side, is a light horizontal shaft carrying four brass fingers, so spaced that each one comes opposite its corresponding plug when the cylinder is to fire. This shaft is rotated by sprocket and chain from the cam shaft, and also carries on its end a four-point distributor in circuit with the coil and battery, thus making the system particularly simple. The contacts in the distributor also correspond with the brass fingers on the shaft so that as the latter come opposite the plugs in turn the current passes. A slight gap is left between the finger and post of the plug, which obviates wear.

Something that conduces to certainty of getting home in case of accident to the ignition, is the provision of two independent sets of plugs with wiring on the Austin, one set being run from the magneto and the other in circuit with the accumulators and multiple coil. Such little refinements as this and the others already dwelt upon are, of course, more in the nature of auxiliary standbys and their value is not fully appreciated until the occasion arises. These and the little conveniences here and there which reveal the amount of attention devoted to making his product as complete as it is impossible to do so by the manufacturer, may be taken as an indication of the close study that is made of the owner's wants.

Details.

It is interesting for the critical observer to closely study the various cars with an eye to detecting the presence of those added refinements, some of which are pure utilities and others a matter of comfort or at most increased convenience. On the Frayer-Miller and the National, they take the form of a voltmeter placed on the dash in order to make it easy to ascertain the condition of the batteries at a glance by merely pushing a button. On the National also there is a feature that should prove a convenience on all cars with a gravity feed and that is a small auxiliary tank, in close promixity to and slightly above the level of the carburetter. This contains sufficient fuel for ten miles running so that there is no possibility of being stalled on the steepest hill, no matter how low the fuel level in the main tank may be. Another feature of the same car is the greatly added convenience brought about by the adoption of an improved method of fastening the pan beneath the car. In the first place this is so formed that it does not cover the bot-

Digitized by Google

THE REO AND THE BABY.

tom of the crank case of the engine, and the latter may accordingly be removed without disturbing the pan. When necessary to examine further back it is only necessary to unclip six springs instead of as formerly, by extracting numerous bolts.

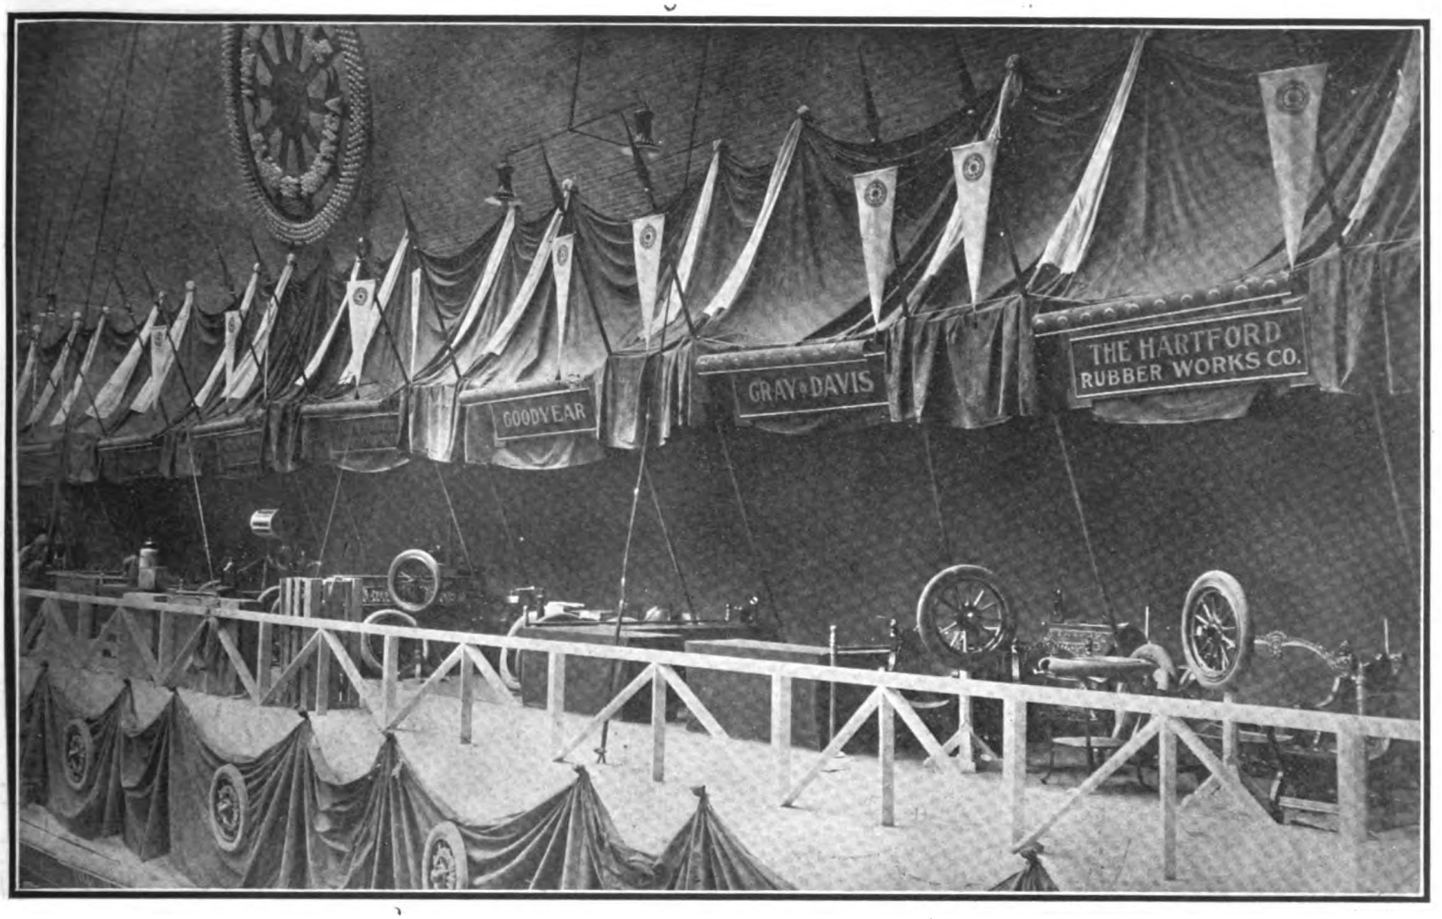
To facilitate starting it is noticeable that a compression release has been provided in several instances, such as on the Glide, the Moon and the National. This also greatly lessens the amount of labor necessary when the engine refuses to start on the first turn or so.

Electrics.

Electric vehicles, whether for pleasure or commercial purposes, were not expected to form a very large part of the Armory Show, but it was not only noticeable that they punctuated the rows of stands of gasolene cars here and there, but that they were productive of several novelties. Without doubt as complete a showing of electric pleasure cars for winter use to be found under either of the roofs that has been sheltering the aggregations this week, was to be found at the Baker stand. Here were to be seen the most complete and luxurious types of the electric Imperial, the Stanhope, surrey, brougham and station wagon as well as the runabout. With their luxurious appointments that include the last word of refinement in detail of everything that can conduce to the comfort of the passenger, they form an exhibit that appeals very strongly to those seeking a vehicle for purely city work. Where the passenger is at the sametime the driver, he is catered to by having the control inside and nothing could be more snug or comfortable in bad weather. The shaft drive has been more generally adopted, this together with other improvements in mechanical detail as well as a better distribution of the weight conducing to increased efficiency.

As a matter of fact, the electrics provided one of the surprises of the Show in the shape of the Lansden runabout, the appearance of which attracted a great deal of attention. This car is unique in more ways than one. It is not only the first high-speed electric to be placed on the market as a stock article, but is also the first pleasure car to use the improved Edison cells as the source of motive power. Sixty cells of 110-ampere hours capacity, or the same battery as is employed in the one-ton Lansden electric truck.

The weight has been extremely well distributed by placing the battery under a long and slightly sloping deck in front, with the motor and divided seat at the extreme rear. The motor, which is nominally of three horse-power has an overload capacity in excess of 20 horse-power, drives to a countershaft about midway of the body, from which long side chains are taken to the rear wheels in accordance with estab-



Co., and which is found to give very satisfactory service on commercial vehicles. The batteries are guaranteed to give 60 miles on one charge at an average speed of 25 miles an hour, which represents the top notch in this respect. A wrinkle that will be appreciated by the driver who suffers from cold hands is the provision of electrical hand warmers on the steering wheel. These may be turned on or off at will by pressing a button. Equipped with four-inch pneumatics shod on the rear wheels with steel studded non-skid bands this car sells for $1,800. The same concern also shows one of its electric trucks of the type adopted by several large concerns and used in number with great success.

Probably the greatest misfortune that ever falls to the lot of the exhibitor came to the makers of the Pittsburg electric delivery wagons. After engaging the space and paying the freight and other expenses incidental to bringing a heavy electric delivery wagon all the way from Pittsburg, it was found that it lacked but a few inches of being low enough to pass down the runway to the basement. As the top was a permanent one, there was no alternative but to ship it back. This firm's exhibit accordingly was confined to a light delivery wagon with a capacity of 800 pounds, equipped with 24 cells of 11 M V Exide battery and a 3 horsepower Westinghouse motor driving to the rear axle through a single chain.

Another exhibit of electrical vehicles in the basement was that of Rauch & Lang, who show a runabout, a depot carriage and a surrey. The runabout is equipped with 24 cells of the Willard battery of 108 ampere hour capacity in connection with a Hertner type A, one horsepower motor. The power from the latter is transmitted to the rear axle by chain. Three brakes are provided, one of which is electric. On the depot wagon a Hertner motor of the same type but of 2½ horsepower is employed. The same battery equipment is used on all

Digitized by Google

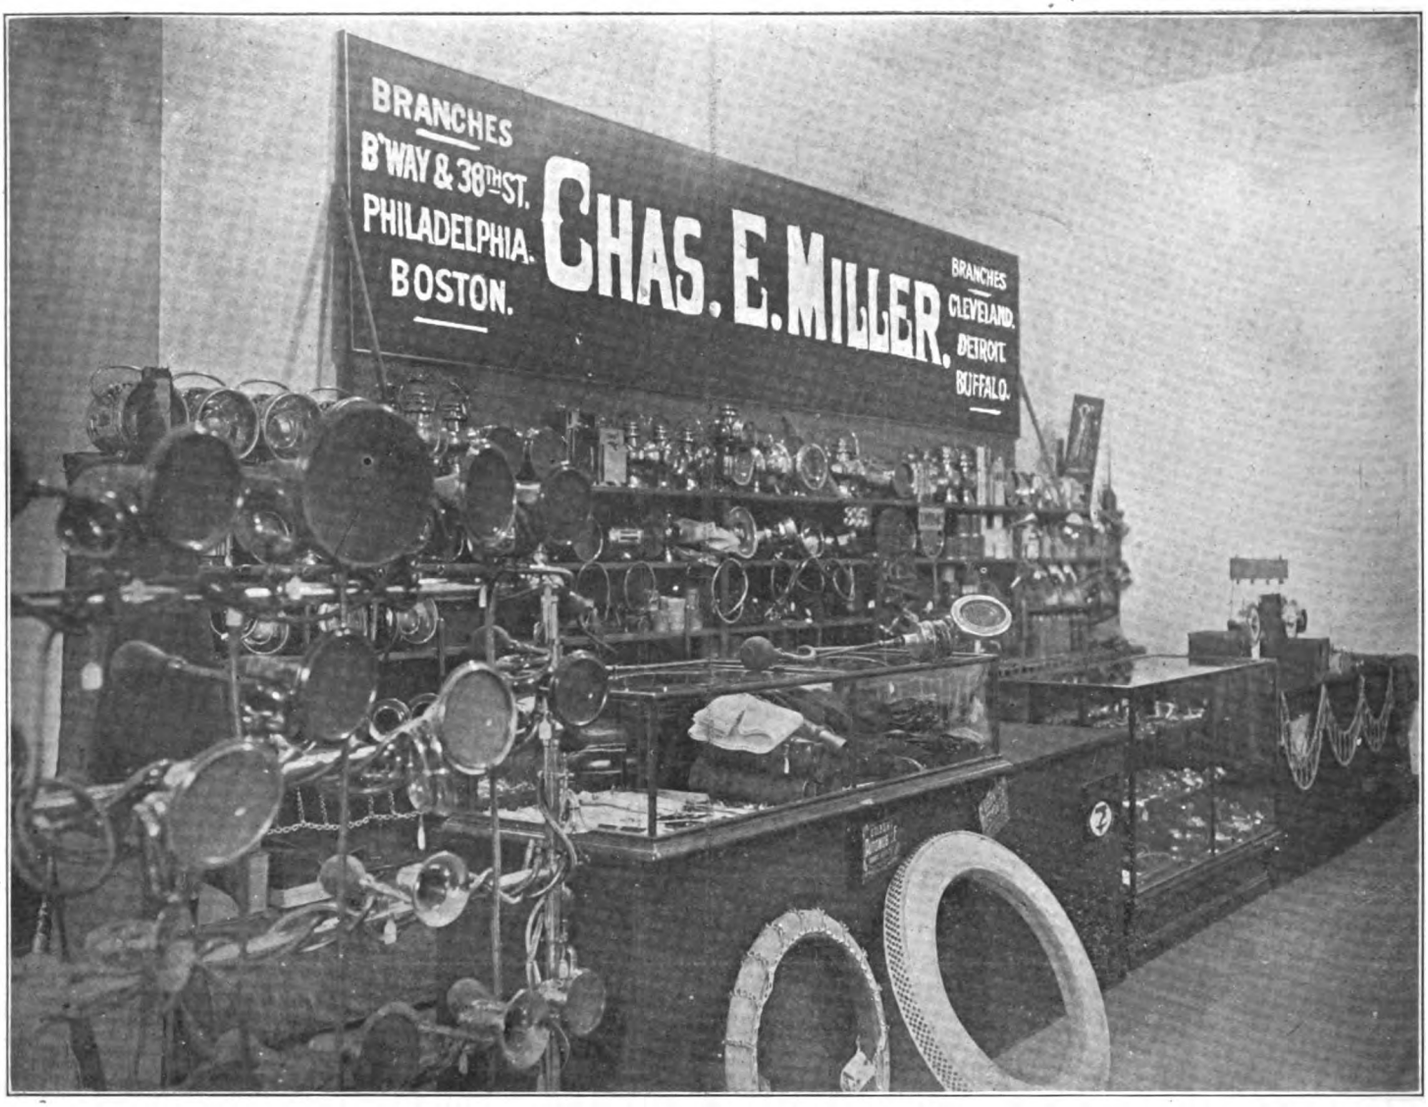
"ACCESSORY ROW" ON THE GALLERY.

three types the volume and intensity of the current being altered in order to vary the speed by commutating the battery instead of employing resistances, thus preventing any waste of current through the latter source.

SUNDRIES

To give a complete résumé of the sundries display in the Armory would be to repeat the story of the same display in the Garden, for most of the accessory makers found it advantageous to display their wares at both shows. With but few exceptions, and these not of a noted character, the same houses are represented in both places.

A visit to the display of Charles E. Miller, the official sundry purveyor to the Automobile Club of America, in Room B, in the balcony, who here has a more ostentatious display than at the Garden, is equivalent to "doing the round" of accessory booths. Here the visitor may see almost everything devised for the motor car and save himself miles of walking, besides burdening himself with an endless accumulation of literature, for Miller's catalogue, enclosed in an envelope for convenience's sake, contains a fund of information for the prospective buyer. There are just two electric horns on exhibition, and one of these is shown by Miller. It is useful as well as novel, as buttons can be attached to any part and the horn sounded by any one in the car. It is an application of the principle of the telephone transmitter, the electric current from a dry battery furnishing the power to sound the microphone. The other horn is shown by the Hutchinson Electric Horn Co., of New York City. There is another novelty in the way of a siren horn which is shown by Miller, the Dac Automobile Supply Co., the Uncas Specialty Co. and the Motor Car Equipment Co., all of New York City.



A new shock absorber is on the stand of the Dac Automobile Supply Co., but whether it can be called original or not is doubtful, for it is but one of the many various methods of employing friction for this purpose. A contracting band on one arm which goes around the hub of another arm and which is held in place by a helical spring, furnishes the resistance. The ends of the arms are attached, respectively, to the spring and the chassis of the car. Another absorber in which compressed air furnishes the cushion is being exploited by the Sheddan Mfg. Co., of Baltimore.

A little machine that has attracted more than passing interest is a combination tool, the product of the Detroit Tool Co. It is designed for those who would do their own repairing and also for small garages. It comprises a forge, with geared rotary blower, anvil, vise, pipe vise, emery wheel, drill press, vise clamps, anvil hardy, crucible holder, twist drill and tongs, and it is sold at a remarkably low figure.

The well known line of Excelsior lubricants is on the stand of Wm. P. Miller's Sons, and the R. M. Hollingshead Co., of Camden, N. J., is a newcomer in the lubricant field. The "B" line of motor oilers is shown by the Randall-Faichney Co., of Boston, Mass., and the Gleason-Peters Air Pump Co., of New York City is exhibiting its line of famous tire pumps. Although not a new firm, the Kinsey Mfg. Co., of Dayton, Ohio, has several new sundries on show, among them being an ingenious water and dirt filter and gasolene indicator to be put in the gasolene tank. The firm also has a new radiator with flat vertical tubes, the fins being of copper; and a mechanical force feed oiler, all these being made under the Kehoe patents.

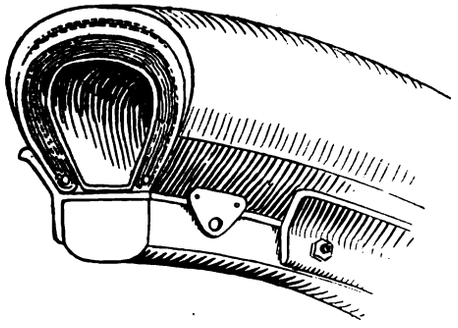
There seems to be an overabundance of devices designed to protect the motor car owner from the meddling hands. F. A. Goebel, Marietta, Ohio, has the "Snap-It" lock switch which work with two keys; when the current is turned off the switch is locked. The Lock Switch Mfg. Co. is showing a device upon somewhat the same lines. This also has an ingenious tire pressure regulator, 2½ inches long, to measure the exact pressure in a tire, whether applied after inflation or during the operation, and enables the operator to determine the precise pressure the tires are to receive. To

Digitized by Google

MILLER'S OWN ACCESSORY SHOW IN ROOM B.

obtain a desired pressure during inflation the pressure regulator is set by the scale to the pressure wanted, then placed in position between the valve stem and pump nozzle, permitting the air to enter the tire. The controlling valve operates to check the inflowing air and permits the blow off valve to open when the predetermined pressure is obtained. If it is desired to ascertain the correct pressure after inflation the instrument is screwed to the valve stem, after the regulator is set, the escape valve mechanically opening if the tires are too hard, allowing the air to escape until the correct pressure is attained, when the valve mechanically closes. A safety device which locks the bonnet and circuit at the same time is displayed by the Auto Lock Plug Co., of New York City. The company is showing a single lock plug which can be attached to any Splitdorf plug. All the devices are fitted with Yale locks and keys.

Stevens & Co., of New York City, are showing an imported speedometer—the Esco, which is hardly likely to become very popular by reason of its clumsiness. A new speedometer to make its debut to the public is the Hoffecker, manufactured by the Rollins Mfg. Co., of Boston. It gives the miles per hour, the miles per trip and the total mileage. It is operated by a flexible shaft attached to the front wheel of the car. The Hicks speedometer is exhibited by its makers, the Hicks Speed Indicator Co., of Brooklyn.



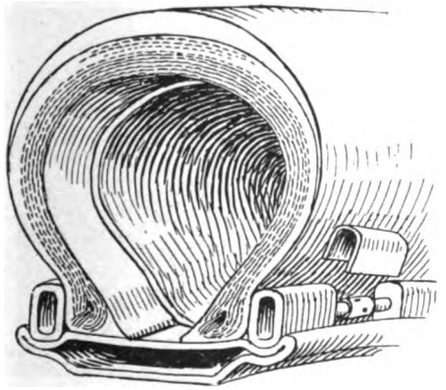
A new style of goggle is shown by the Mills Mfg. Co., New York. Last year goggles were made for persons with defective eyesight, the lenses being made in the goggle to suit the needs of the wearer. Mills comes forward with a theory that the lenses fitted this way tend to injure rather than help the eyesight, and his method is to fit the magnifying or reducing lens, as the case may be, into the plain glass mirror of the goggle, the lenses being set close to the nose bridge.

Among the other sundry dealers who are showing at the armory and who are not represented at the other show are the following: Scott Muffler Co., neck mufflers; William M. Poz, waterproof garments; Carbondale Chemical Co., non-freezing solution; Survey Map Co., maps; Robinson Fur Co., furs; Teel Mfg. Co., wind shields, tire covers and monograms; Theodore Audel & Co., technical instruction books; John Boyle & Co., leather hampers; William Hiram Brown, dust shields; Hill Mfg. Co., tops; Cook's Railway Appliance Co., standard jacks; Belden Automobile Transmission, gears; Gearless Transmission Co., friction transmissions; Bullard Automatic Wrench Co., wrenches; Le Nonpareil Muffler Co., mufflers; Safety Electric Elevator Co., elevators for garages; Crouse-Hinds Co., communicator and distributor; Never-Miss Spark Plug Co., spark plugs; Duplex ignition Co., spark plugs; Electric Storage Battery Co., exide batteries; Francois Richard, automatic combination alcohol, kerosene and gasolene carburetters; B. Morgan, carburetters; Kirkham Motor Mfg. Co., motors; Aster Co., motors, chassis, carburetters and ignition outfits; the Westinghouse Companies, Cooper-Hewitt mercury arc rectifiers, and automatic compressed air outfits for garages.

Digitized by Google

TIRES.

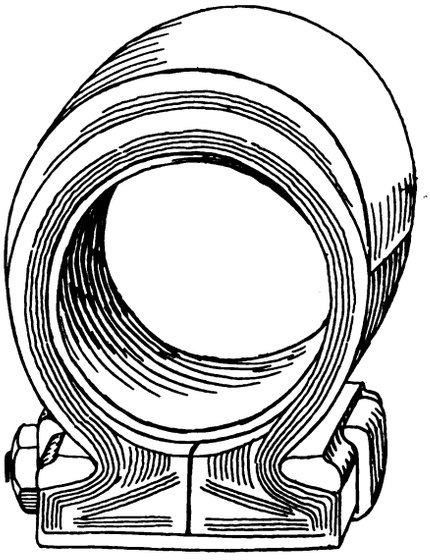
It goes without saying that the tire manufacturers did not "play favorites." They were in force at both shows. There was but one tire of moment absent, and it was awaited with unusual interest, and almost certainly would have been at the Armory only—the Ajax. That



FIRESTONE.

tire, for which so many of the "independents" are standing sponsor, was not quite ready for showing.

The one brand new pneumatic tire that made its appearance was the Firestone; the one new solid tire, the Diamond, with its wire mesh base; and never were manufacturers more earnestly enthusiastic over their new wares, and, curiously enough, the makers of the Firestone long have been famous for their solid tire, and the makers of the Diamond equally famed for their pneumatic.



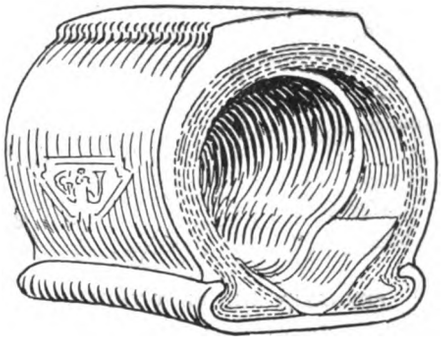
The Firestone follows the now popular trend, that is to say, it employs a mechanical fastening, which is a notable addition to the fund of ingenuity that has been centered on that form of tire facility. The tire itself is formed of successive layers of fabric and rubber. A wire cable is inserted in each edge of the tire and the layers of fabric pass around these cables. This insures holding the tire rig-

M. & W. DUNLOP.

idly in place at all times. Non-corrosive "ears" or clips are riveted to the tire at regular intervals with rivets which have large, smooth heads. The felloe bolts pass through these clips as well as through the wood felloe and steel side flanges, insuring utmost rigidity when the tire is in place. The tire is detached simply by removing the nuts from the bolt and withdrawing the bolt itself. The rim and flanges being narrower than the tire itself, are claimed to make for better behavior of the tire in sand or mud, while the fact that the flanges may be applied to any standard wheel is a point of which the most is made, as also is the case of the outward flare of the flange, which is insurance against rim cutting.

While the clincher type of tire is still deeply rooted the trend toward mechanically attached tires is, of course, and has been, apparent during recent months, unmistakable. Only the Diamond, the Pennsylvania and the International, of the American tires, and the Michelin, of the French tires that are in evidence absolutely "remain true to Poll," that is, to the clincher fastening. The Fisk and the Goodyear were earliest in the new field; the show of 1905 saw the Hartford with a removable ring, and during the year Goodrich, G. & J. and Morgan & Wright, if they have not entirely crossed the divide, have so placed themselves that they may at will travel on either side of it, while Firestone crossed it at the first bound.

FISK.

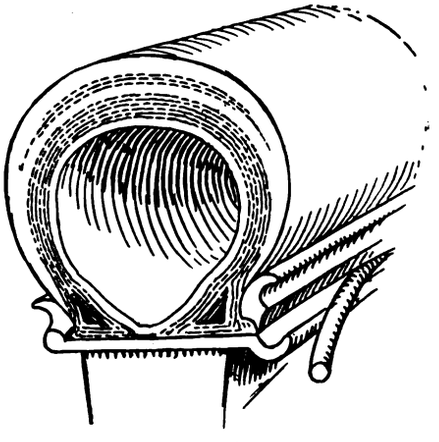


In the face of such accumulated evidence the mechanical fastening easily may be reckoned the development of the year.

The B. F. Goodrich Company's fastening is a development of the last three months, and was seen by very many at the show for the first time. It consists essentially of a rim with a removable and split flange or locking rim having two lugs, which engage in a bayonet lock slot in the rim. No bolts or nuts whatsoever are employed, and removing the rim and the tire is merely a matter of seconds.

The Hartford Rubber Works Company's fastening is a fastening "full grown." It was one of the sensations of the show of 1905, but that most crucial test, the test of time and extended usage, showed how it could be bettered, and the perfected Hartford-Dunlop fastening, or rather rim, is the result.

The principle of the new rim is the same as the 1905 Dunlop, with the exception that the turnbuckle works from the under side, the groove or channel in which the bead rests being cut out at one point to allow the turnbuckle to slightly protrude, as can be seen by the drawing. The channels themselves are made a trifle deeper than heretofore, which affords a more positive adjustment of the beads. This, however, does not tell the whole story, nor convey a true idea of how far the improvement reaches, for, as a matter of fact, it permits any clincher tire to be applied to the rim merely by reversing the beads in the channel—a factor of interchangability that is not to be minimized.

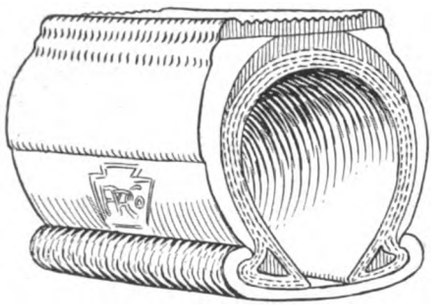


Another new and novel feature of the Hart-

G & J CLINCHER.

ford-Dunlop is the floating ring, an endless band made of light metal heavily coated with zinc to prevent rusting. This band has sufficient allowance over the diameter of the rim at the tire seat to insure ease in placing the tire and floating ring on the rim in one operation, the ring being practically part of the tire. When the tire is in place its inside edges bear against the outside edges of the floating ring. Then when the metal bead is drawn down into the gutter by means of the turnbuckle it wedges against the outer wall of the casing and prevents water entering the tire. In addition to sealing the tire, this floating ring is in effect an endless lug without the latter's drawbacks. It is a positive non-creeping device.

While most of the clincher tire makers advocate the use of lugs, the G. & J. Tire Co. continues to make their clincher with a flap and to urge its use without lugs or clamps of any sort. They are also presenting for the first

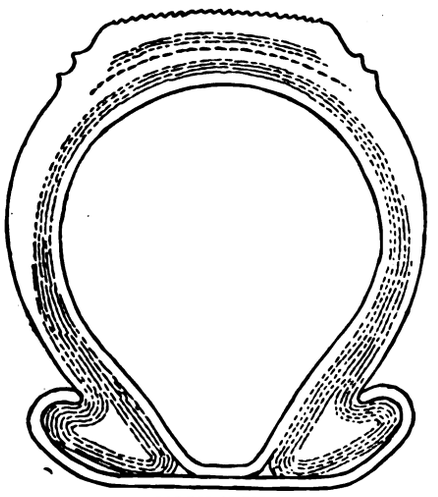


GOODYEAR.

time the Indianapolis Dunlop tire, which incorporates the perfected Dunlop mechanical fastening. Both tires are termed wrapped tires, in contradistinction to the wrapped tread construction which they employed last year. The tires are cured in open steam in one operation, which makes for greater durability. Tires with

Digitized by Google

flat treads are also being offered for the first time; likewise a complete line of sundries, such as protectors for spare tires, tube bags, horn bulbs, etc., in addition to the usual repair outfits.

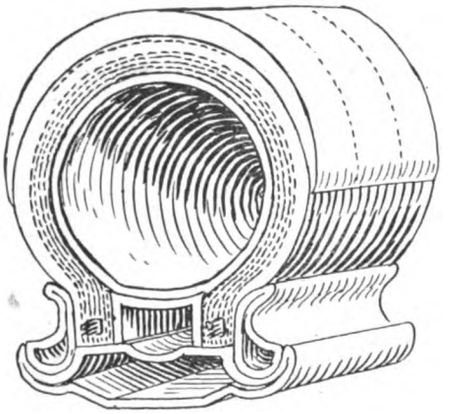


Morgan & Wright, like G. & J., are branches of the same family tree that shelters the Hartford tires, and, like them, are making not only

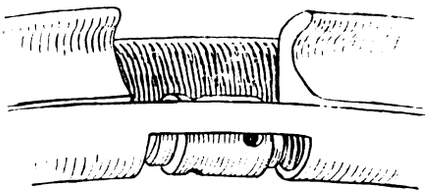
PENNSYLVANIA FLAT TREAD.

clincher tires, but Perfected Dunlop mechanically fastened tires as well. There is a deal of keenest rivalry between the three plants in respect to producing the best tires, and in the matter of comparison it is trade talk that Morgan & Wright do not suffer.

Aside from the Fisk mechanically fastened tire, a smile of satisfaction and significance is the chief exhibit at the Fisk booth. The Fisk Rubber Co. were the first people to seriously and strenuously take up and advocate the mechanically fastened tire, and the rush in that direction during the past year has caused them to acquire a smile that shows no signs of wearing off. "Changes? Improvements? We made ours a year ago," is the way J. W. Bowman, of the Fisk staff, answers those questions when they are put to him; and then he resumes his



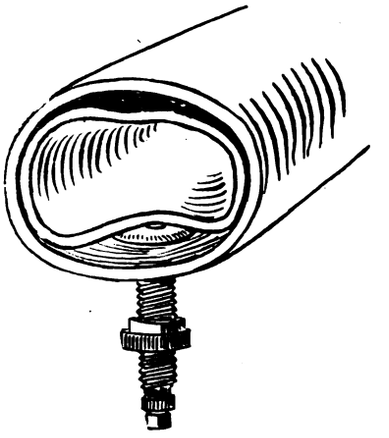
MICHELIN.



smile. There is, however, something new in the Fisk exhibit—a red inner tube, which is claimed to be the last word in respect to quality.

The Diamond Rubber Co. are now furnishing their famous wrapped tread tire with a flat tread, when it is desired, but it is in the matter of inner tubes that they have made a striking departure. They present at the show for the first time their new diaphragm tube, which is essentially a tube within a tube, the interior tube being for emergency use. It is secured to the outer one for about six inches and lays deflated within it when not in use. There is a separate valve for each tube, placed on opposite sides of the tire, and in case of puncture to the tube in use the pump is applied to the valve of the inner tube and it is inflated without the usual stop for repairs. The idea of the tube is not wholly new, but its adoption by a concern of such wide reputation as the Diamond Rubber Co. will give it a standing none of its kindred of bicycle days ever attained.

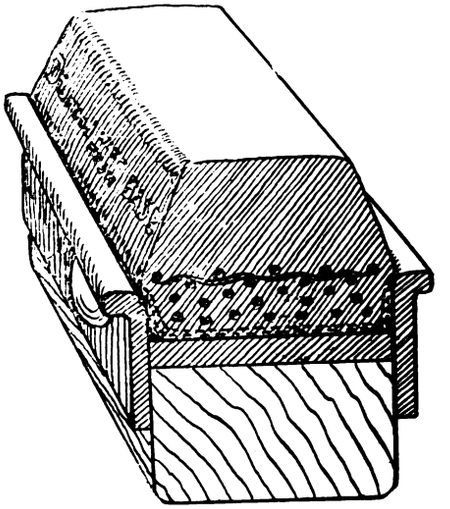
The new Diamond solid tire, with its wire mesh base, is, however, a distinct novelty, which its makers believe cannot fail of extended use. The wire mesh is moulded into the



HARTFORD DUNLOP.

base of the tire and absolutely holds it and all of it in the rim without any tendency to "curl" up at the sides and leave the rim, as the Diamond people say is the case with sidewire tures.

Further perfection of the fastening of the Goodyear mechanically attached tire also has been made. It may be a stretch of the imagination to term it a perfection, for it is one of those little alterations which in themselves are comparatively insignificant, yet it is by no means to be overlooked on that account. It consists of the placing of a little nib on the end of the locking ring of the universal rim in such a way that it is now impossible to apply it except in the proper way, with the ends at the valve stem. An addition the Goodyear Co. has added to its line is the Heine Non-Skid Tread, which has just been brought out. It consists of a heavy rubber tread, in which are a series of cup-shaped depressions, spaced equally about the centre of the tread. In these are circular metallic caps and washers, topped by nuts, which bind them in place by means of studs, to which they are secured and which extend through the tread to anchor pieces, also of metal, arranged beneath, but out of contact with the tread. The construction is such that it may be adapted to any type of shoe by a simple process of re-treading.



The International clincher tires are put out this year in a new section, in which the layers of fabric are interspersed with layers of pure gum in the form of a skim coat. Between the skeleton and the tread is a similar layer of

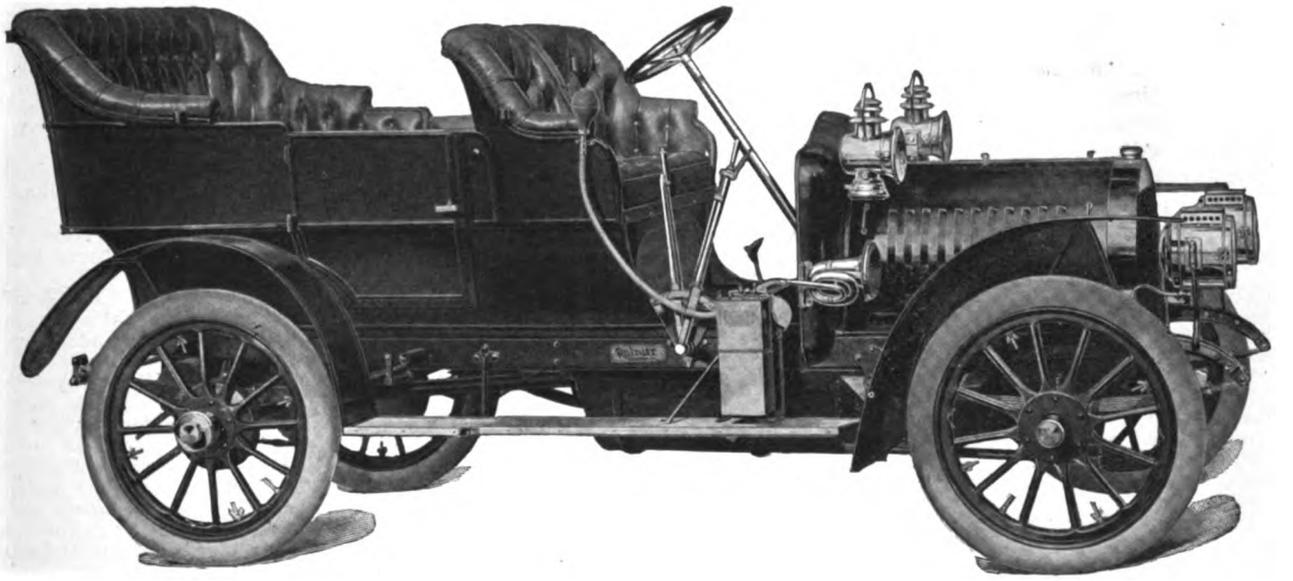
DIAMOND DIAPHRAGM TUBE.

pure rubber fully an eighth of an inch in thickness. This construction prevents the layers from separating and the tread from peeling off under heavy usage. The International tires are now made in the round shape for the first time, on account of which the liability to rim cutting is reduced to a minimum. The clincher bead is made exceptionally large, and the shoe completely fills the space beneath the tube and over the rim, thus thoroughly protecting the tube at all points.

The Pennsylvania Co.'s clincher tires remain unaltered; the nearest approach to innovation

NEW DIAMOND SOLID.

is a flat tread racing tire with a corrugated surface.



The Michelin tire is, of course, very much in evidence. The Continental is also to be found, likewise the Swinehart and Motz, the latter two of which are solid tires of the clincher type. There is also the Sampson leather tire and the usual number of leather treads and anti-skids which are rarely seen or heard of outside of the shows.

Rainier

The Pullman of Motor Cars

1906 Catalogue and Cars Now Ready.

1906 MODEL B, 30-35 H. P. PRICE, $4,000.

GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

During 1905 the Rainier was the hit of the season in New York, the most critical of markets. Not a single dissatisfied customer, only favorable comments everywhere, and orders galore for the new model from former users. Before you decide, investigate the Rainier, carrying the world's broadest automobile guarantee.

Make and break spark. Simms-Bosch Magneto. Bevel gear drive.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Chicago Branch: 1253-1255 Michigan Ave. (after January 15th).

Boston Agents: MORRISON-TYLER MOTOR CO., 121 Massachusetts Ave.

Good Agents wanted in unassigned territory.

The Rainier Car will be exhibited at the Armory Show in Chicago.

Acme Motor Car Co., Reading, Pa.—Acme gasolene cars, 4-cylinder chassis, 4-cylinder touring car, and 4-cylinder limousine.

Aerocar Co., Detroit, Mich.—Aerocar, gasolene, air-cooled 4-cylinder chassis and 4-cylinder touring car.

American Locomotive Automobile Co., New York City—Berliet gasolene cars, 4-cylinder chassis, 4-cylinder touring car and 4-cylinder limousine.

American Peugeot Automobile Co., Passaic, N. J.—Peugeot gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars.

Andrews Douglas Co., New York—Berkshire gasolene cars, 4-cylinder chassis, 4-cylinder touring car. Also Bliss cars, 4-cylinder chassis and 4-cylinder touring car.

Archer & Co., New York City.—Hotchkiss and Deleon gasolene cars, 4-cylinder chassis.

Ardsley Motor Car Co., Yonkers, N. Y.—Ardsley gasolene cars, 4-cylinder chassis and 4-cylinder touring car.

Ariel Motor Car Co., Boston, Mass.—Ariel gasolene cars, 4-cylinder chassis, 4-cylinder touring car.

Aster Motor Co., New York City—Aster gasolene cars, 4-cylinder limousine, 2-cylinder runabout.

Austin Automobile Co., Grand Rapids, Mich.—Austin gasolene cars, 4-cylinder runabout, 4-cylinder touring car and 4-cylinder limousine.

Auto-Car Equipment Co., Buffalo, N. Y.—Hotel 'bus.

Baker Motor Vehicle Co., New York City.—Baker electric vehicles, one runabout and three closed carriages.

Bartholomew Co., Peoria, Ill.—Glide gasolene cars, 4-cylinder touring car, 2-cylinder touring car.

Bertelli & Co., New York City—Zust gasolene cars, 4-cylinder chassis.

Blomstrom Motor Co., C. H., Detroit, Mich.—Queen gasolene cars, three 4-cylinder touring cars.

Buckeye Mfg. Co., Anderson, Ind.—Lambert gasolene cars, two 4-cylinder touring cars, 2-cylinder touring car and 2-cylinder chassis.

Carey Motor Co., New York City—Carey gasolene car, 5-rotating cylinder runabout.

Chadwick Motor Car Co., New York City—Chadwick gasolene care, one 4-cylinder limousine.

Charron, Girradot & Voigt, New York City—C. G. V. gasolene cars, four 4-cylinder limousines, 4-cylinder touring cars, two 4-cylinder chassis.

Cleveland Motor Car Co., Cleveland, Ohio—Cleveland gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars.

Commercial Motor Car Co., New York City—Gasolene commercial vehicles, one 4-cylinder truck.

Corbin Motor Vehicle Corporation, New Britain, Conn.—Corbin air-cooled cars, 4-cylinder chassis, two 4-cylinder touring cars.

Crawford Automobile Co., Hagerstown, Md.—Crawford gasolene cars, 2-cylinder runabout, 4-cylinder touring car.

Cryder & Co., New York City—Leon Bollee gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars.

Central Park Automobile Storage Co., New York—1 Spyker 4-cylinder touring car.

Daimler Mfg. Co., Long Island City, N. Y.—American Mercedes gasolene cars, 4-cylinder chassis, 4-cylinder limousine.

Dayton Motor Car Co., Dayton, Ohio.—Stoddard Dayton gasolene cars, 4-cylinder chassis, 4-cylinder touring car, 4-cylinder limousine.

Detroit Auto Vehicle Co., Detroit, Mich.—Crown gasolene cars, 2-cylinder delivery wagon, 2-cylinder runabout.

Dolson Automobile Co., Charlotte, Mich.—Dolson gasolene cars, two 4-cylinder touring cars.

Dorris Motor Car Co., St. Louis, Mo.—Dorris gasolene cars, 4-cylinder chassis, 4-cylinder touring car.

Duryea Power Co., Reading, Pa.—Duryea gasolene cars, 3-cylinder touring car, 3-cylinder runabout.

E. H. V. Co., Middletown, Conn.—Compound gasolene cars, 3-cylinder touring car, 3-cylinder doctor's runabout, 3-cylinder light delivery wagon, 3-cylinder Victoria.

English Daimler Co., New York City—Daimler gasolene cars, 4-cylinder chassis, 4-cylinder touring car and 4-cylinder limousine.

Ford Motor Car Co., Detroit, Mich.—Ford gasolene cars, 6-cylinder chassis, 6-cylinder touring car, 2-cylinder touring car, 4-cylinder touring car and 4-cylinder runabout.

Gallaher, E. B., New York City—Brasier and Cleveland gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars, 4-cylinder limousine.

Grout Bros. Automobile Co., Orange, Mass.—Grout gasolene cars, 4-cylinder runabout, 4-cylinder chassis, 4-cylinder touring car.

Iroquois Motor Car Co., Seneca Falls, N. Y. Iroquois gasolene cars, two 4-cylinder touring cars.

Iroquois Iron Works, Buffalo, N. Y.—Iroquois trucks, 4-cylinder passenger 'bus.

Jackson Automobile Co., Jackson, Mich.—Jackson gasolene cars, 4-cylinder touring car, two 2-cylinder touring cars.

Jeffery & Co., Thos. B., Kenosha, Wis.—Rambler gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars, two 2-cylinder touring cars.

Johnson Service Co., New York City—Johnson steam cars, two limousines.

Knox Motor Truck Co., Springfield, Mass.—Atlas gasolene trucks, one 2-cylinder truck.

Lane Motor Vehicle Co., Poughkeepsie, N. Y.—Lane steam cars, 2-cylinder chassis, 2-cylinder touring car.

Lansden Co., Newark, N. J.—Lansden electric vehicles, one truck, one runabout.

Lear Automobile Co., Oscar, Columbus, Ohio.—Frayer Miller air-cooled cars; 4-cylinder chassis, two 4-cylinder limousines.

Logan Construction Co., Chillicothe, Ohio—Logan gasolene cars, two 2-cylinder touring cars, 2-cylinder runabout, 2-cylinder truck, 2-cylinder limousine.

Lozier Motor Co., New York City—Lozier gasolene cars, 4-cylinder chassis, 4-cylinder touring car and 4-cylinder limousine.

Marion Motor Car Co., Indianapolis, Ind.—Marion air-cooled cars, 4-cylinder chassis, 4-cylinder touring car.

Maxwell Briscoe Motor Co., Tarrytown, N. Y.—Maxwell gasolene cars, two 2-cylinder chassis, three 2-cylinder runabouts, 2-cylinder touring car, 2-cylinder delivery wagon.

Mason, Norris N., New York City—Leon Bollee gasolene cars, 4-cylinder chassis, two 4-cylinder limousines.

Mendel, Dale & Co., New York City—Upton gasolene cars, 4-cylinder touring car.

Mercedes Import Co., New York—Mercedes cars, 4-cylinder chassis.

Mitchell Motor Car Co., Racine, Wis.—Mitchell gasolene cars, 4-cylinder runabout, 4-cylinder touring car, 2-cylinder runabout, 2-cylinder truck.

Moline Automobile Co., Moline, Ill.—Moline gasolene cars, 4-cylinder touring car, 4-cylinder limousine.

Moon Motor Car Co., St. Louis, Mo.—Moon gasolene cars, 4-cylinder chassis, 4-cylinder touring car.

Mors Automobile Co., New York City—Mors gasolene cars, three 4-cylinder limousines.

McCrea Motor Truck Co., Cleveland, Ohio.—McCrea commercial gas vehicles, 2-cylinder runabout, 4-cylinder touring car, 4-cylinder limousine.

Napier Motor Car Co., of America, Boston, Mass.—Napier gasolene cars, 4-cylinder runabout, 4-cylinder touring car, 4-cylinder limousine.

National Motor Vehicle Co., Indianapolis, Ind.—National gasolene cars, 4-cylinder chassis, 6-cylinder touring car and 6-cylinder limousine and 4-cylinder touring car.

Nordyke & Marmon Co., Indianapolis, Ind.—Marmon gasolene cars, 4-cylinder chassis, two 4-cylinder touring cars.

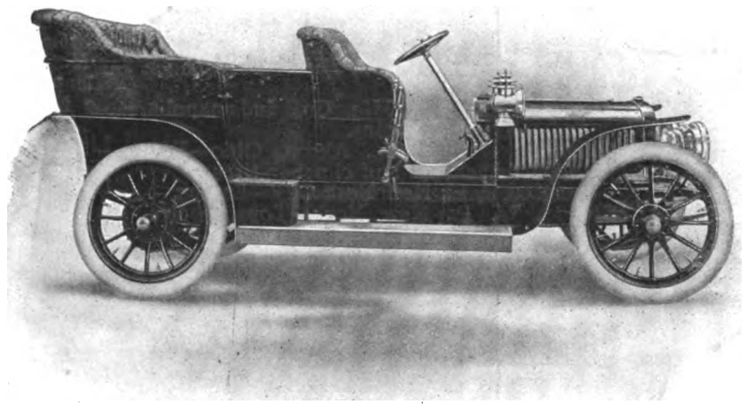
Palais D'Lautomobile, New York City—Renault, Panhard and Delauney Belleville gasolene cars, two 4-cylinder chassis, two 4-cylinder touring cars, two 4-cylinder limousines.

Palmer & Christie, New York City—Martini gasolene cars, 4-cylinder chassis, 4-cylinder touring car and 4-cylinder limousine.

Panhard & Levassor, New York City—Panhard gasolene cars, four 4-cylinder limousines, two 4-cylinder touring cars.

Pittsburg Motor Vehicle Co., Pittsburg, Pa.—Electric commercial vehicles, electric delivery wagon.

Premier Motor Mfg. Co., Indianapolis, Ind.—Premier air cooled cars, 4-cylinder chassis, 4-cylinder touring car, 4-cylinder runabout, 4-cylinder limousine.



Pungs-Finch Automobile Co., Detroit, Mich.—Pungs-Finch gasolene cars; 4-cylinder chassis, 4-cylinder touring car.

Ranier Co., New York City—Ranier gasolene cars, 4-cylinder chassis, 4-cylinder runabout, 4-cylinder limousine and 4-cylinder touring car.

Rapid Motor Vehicle Co., Pontiac, Mich.—

LOZIER 1906 MODEL, TYPE D, 40 H. P. CAR

IF THE SATISFIED customer is the best advertisement, the LOZIER MOTOR CAR enjoys a most unique position. Every customer is a satisfied customer, and the fact that each is, in addition an owner with large Automobile experience, makes his expression of satisfaction with THE LOZIER MOTOR CAR an advertisement of the VERY BEST—Ask one of them—and then see our line of Limousines, Landaulets and Touring Cars.

The Lozier Motor Car is a high-grade product with years of Motor building experience back of it—the name of "LOZIER" being a guarantee of all that is best in high-class construction.

Our new 1906 MODEL TYPE D, 40-H. P. TOURING CAR, is shown above, and it is a most beautiful car. The price is $5,500, and among its features of construction may be mentioned the long wheel-base, 117"— 36" wheels —4"-4½" tires —55" tread —10" clearance. Platform-spring suspension. Weldless I-beam nickel-steel forged axles. Dust-proof irreversible steering column. Ball-bearing steering knuckles—nickel-steel forgings. Large ball-bearing wheel hubs. Noiseless sliding gear transmission gear slides of nickel-steel—gears ground to gauge. Self-contained annular ball-bearings in thrust, transmission and differentials. Speeds—selective type—four forward and reverse —one lever for all. Dog-and-ratchet back-stop on differential shaft. Noiseless exhaust. Dust-proof internal expanding emergency hand brakes. Powerful foot brake on differential shaft. High power motor. Annealed pistons. Interchangeable valves and parts. Webbed crank-shafts. Crank-shaft bearings hardened and ground on own centers. Combination bronze and babbitt crank and crank-shaft bearing boxes. High tension magneto. Positive force-feed lubricator. Large radiator. Automatic carburetor with balanced throttle controlled by governor. Speed controls on stationary quadrant at top of steering-wheel. Automatic disengaging cam on starting crank. Self-contained, large face, cone clutch—simple adjustments. Dust-proof aluminum case under motor and entire transmission. Noiseless fiber cam-shaft driving gears. Cottered nuts throughout. Small oilers for chassis springs. Camshafts of crucible steel—cams integral. Nickel-steel clutch shaft—double universal joints. Cylinders bored and ground. Chain adjustments. DESCRIPTIVE CATALOGUE NOW READY. SEND FOR IT.

PIERCE

This is the Great Arrow Victoria Tonneau, 40-45 H. P. with semi-enclosed top. Price without top, $5,000. Semi-enclosed top, $350 extra. Cape top, $200 extra. Folding glass front, $50 extra.

One convincing proof of the excellence of Pierce cars is the fa that they appeal most to the most mechanical minds. An automobile is a machine. The more a man understands about the principles of mechanics, the better he appreciates the way in which the Pierce Arrow is made.

The initial cost of a Pierce Arrow is greater than that of any automobile made in this country, but the price seems low when compared, not only with the small cost of maintaining, but with the long time of service given.

Pierce Arrows are never out of date as far as effective service is concerned.

Catalogue and descriptions mailed on request.

The Autocar

TYPE XII
$2,600

Guidance and speed-regulation are simultaneous. Spark and throttle are controlled by grips in rim of steering wheel.

Write for the Autocar Book, descriptive of the **standardized** Autocar Runabout (Type X) and of Touring-car Type XII.

Motor.—24 James Watt horse power; (26 H. P. on test). Four vertical water-cooled cylinders. Cylinders cast separately. Bore 4 inches, stroke 4½ inches. Cylinders and pistons ground to size. Crank shaft oil tempered. All bearings ground to size. Inlet and exhaust valves mechanically operated; fully adjustable.
Rear Drive.—Two drop-forged hardened steel bevel gears, with bevel gear differential. Roller bearings throughout.
Tires.—Fisk "Heavy Car" type tires—32 inch by 4 inch.
Transmission.—Sliding gear type. Drop forged hardened steel gears of ample strength, their shafts carried on large Hyatt roller bearings. Splash lubrication. Three forward speeds and reverse.
Tread and Wheel Base.—56-inch tread. 100-inch wheel base.
Vaporizer.—Holley vaporizer, Autocar type, at side of crank case.
Wheels.—Twelve spoke Midgley steel artillery wheels.
Axles.—Front axle, seamless tubing. Rear live axle of steel, ground bearings, with squared ends at the wheels, obviating the use of keys at that point. Seamless tubing, dust-proof case.
Brakes.—Internal and external hub brakes. A foot lever controls the external; side hand lever the internal brakes, the hand lever first throwing out the clutch.
Control.—Right-hand wheel steer with bevel gear and sector. Spark and throttle control grips in the rim of the wheel. A foot-operated clutch (left foot).
Cooling System.—Coil fin radiator with fan and centrifugal (gear driven) circulating water pump.
Frame.—Wood, continuous pressed steel channel reinforcement.
Ignition.—Large three-cell storage battery, four-point coil, gear driven spark timer on left side of crank case. Jump spark plugs.
Lubrication.—Crank shaft bearings are oiled directly. Cam shaft bearings oiled by continuous force feed of oil from mechanical (gear driven) oiler, as well as by splash. Force-feed oiler is positive throughout. There is no dependence on gravity.

"Firestone"

Pneumatic Tires

are designed to do away with all the objectionable features which have existed to so great an extent in pneumatic tires heretofore made.

We well knew of the existence of these objections and laid our plans for the making of a pneumatic tire which should contain none of them.

Our success has been demonstrated and proven in the severest of continued road tests and it is with the utmost confidence in their thorough worth that we recommend FIRESTONE TIRES and stand back of them.

The body of the FIRESTONE TIRE is unusually sturdy in its make-up. The fabric used is the best Sea Island Cotton, carefully selected for purity and strength. The rubber is the choicest Up-River Para so scientifically compounded as to give it the greatest possible wear-resisting quality.

The tire is attached so securely that it cannot possibly come off, inflated or deflated, no matter how severe the service.

The union of the tire and flange is extremely close to prevent moisture from penetrating to the inner surface to the detriment of tubeor casing.

The removal and replacement of a FIRESTONE PNEUMATIC TIRE is accomplished with the utmost ease and in the shortest possible time.

Any novice can with an ordinary wrench secure access to his inner tube or remove the tire complete in less than 2 minutes. The tube may be replaced and the tire refastened in the same time.

There is no prying or pulling on the tire, and consequently no possibility of causing injury, such as frequently occurs from the use of old-fashioned tire tools.

Remember, we particularly recommend FIRESTONE TIRES to any one who appreciates the best the market affords. We know they are supremely good and will give better and more lasting service than any tire you ever used.

FIRESTONE SIDE WIRE SOLID TIRES for commercial vehicles have been on the market for years and have proven the excellence of our methods of construction.

To-day more than 80% of all such tires in use in this country are FIRESTONE TIRES.

We invite correspondence and will be pleased to furnish full information and advertising literature upon request.

Then Why Not "Firestone?"

THE FIRESTONE TIRE & RUBBER CO., - Akron, Ohio.

The Model F
30-35
Horse Power

Cleveland

THE CAR WITHOUT A WEAK SPOT

SHOWING THE CLEVELAND MODEL F, EQUIPPED WITH THE TULIP BODY. PRICE, $3500.

SPECIFICATIONS.

4-cylinder 30-35 H. P.
Imported Simms-Bosch Magneto—automatic make and break spark.
Direct drive. Nickel steel I-beam front axle.
34x4-inch wheels. Ball bearings. Wheel base, 104 inches.
Simplest control, 5 to 55 miles on high gear.
Absolutely noiseless.
Body option Victoria or Tulip, as illustrated.

All the little improvements—all the claims for speed—are nothing to the surety that **YOU WON'T BREAK DOWN.**

In Cleveland construction every part is designed and put in to stay. The parts that don't require strength will stand the strain they **MAY** get. The parts that must stand the strain, are made of nickel steel forgings of the highest known tensile strength and toughness. The brains and experience of the Garford Company—the largest manufacturers of exclusively high grade automobile parts and chassis in this country—who make the entire chassis, and all the experiences of the maker are concentrated in the Cleveland. It is designed and made so well that **REPAIRS** will not figure in its cost of maintenance. The average cost of repairs of the 1905 car averaged less than $4.00, including time.

IT IS THE CAR WITHOUT A WEAK SPOT. We guarantee you against them—and it is a year ahead of other American automobile construction.

The Cleveland ignition follows the best foreign practice and the Simms-Bosch low tension magneto with automatic make and break spark is used—doing away with jump spark troubles—short circuiting—batteries—curls and commutators. The spark is automatically controlled by the speed of the engine and is out of the operator's hands.

This Simms-Bosch magneto ignition was used on the first seven cars in the last Gordon-Bennett cup race.

The carburetor is an advanced and perfected type of our own construction. It is automatic—requires no adjustment—and will not flood.

The muffler lays the dust and keeps it out of the car.

SHOWING THE CLEVELAND MODEL F, EQUIPPED WITH THE VICTORIA BODY. PRICE $3500.

Price, $3,500.00 to $5,000.00, depending upon Body Equipment. The 20-H. P. Model D will be continued without change. Price, $2,800.00. Both models guaranteed for one year. Catalogue and full information on request.

NEW YORK AUTOMOBILE SHOW, SIXTY-NINTH REGIMENT ARMORY, SPACE E-2.

THE

GROUT 4 CYLINDER

30-35 H. P.

PRICE, $2,500

Read the following specifications and then think it over:

30-35 H. P., 4 cylinder, balanced motor, high tension ignition, using one coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse, actuated by single lever.
Wheels, 32-inch, wood artillery, ball bearings, 4-inch tires.
Armored frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication: Mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.
Top and headlight, with generator.

America's Most Famous Car.

THE ROYAL TOURIST

All parts produced in the greatly enlarged factory of

THE ROYAL MOTOR CAR COMPANY

Cleveland, Ohio.

ROYAL

40 H. P.—four cylinder—5 inch bore by 5½ inch stroke—bronze bearings throughout engine — commutator easy of access on top of engine—conical leather faced clutch of large diameter—flat springs placed under leather makes starting of car progressive—no adjustment ever necessary—sliding gear transmission—high grade bearings throughout—direct drive on high gear—all gears bolted to g flanges, so that no dependence is placed on keys or set screws that hold gears in place. Universal joints and propeller shaft exceptionally robust, and all wearing parts of same are hardened. Entire rear axle equipped with roller bearings; front wheels also run on roller bearings; steering gear is of worm and segment type, and is very easy in its action; pressed steel frame with drop forged spring hangers; positive feed oiler; fan draws air through entire radiating surface, of cellular type radiator; wheel base, 110 inches; gasoline capacity, 22 gallons.

The entire car is built from the best materials that money can buy. It is designed by America's leading motor car engineer. Produced by competent mechanics, on precision machinery.

This is the reason why the car was able to beat the special built racing machines in the Vanderbilt Elimination Trials, after turning a somersault that would have put any other car in the world out of the race. This is also the reason why all of the owners of Royal Tourists are so well satisfied and have such good service from their cars. From all of the data that we have been able to secure, the cost for repairs in running a Royal Tourist averages less than $25.00 each for an entire season. If you want to know how good a Royal Tourist is, ask some of your friends who are fortunate enough to own one.

THE MARMON

"A MECHANICAL MASTERPIECE"

THE ONLY CAR WITH DOUBLE THREE POINT SUSPENSION.

DOUBLE THREE POINT SUSPENSION must not be confused with fixed THREE POINT SUSPENSION; it is the ONLY CAR which has a PIVOTAL THREE POINT SUSPENSION for both frames.

Solid cast aluminum body on one frame, power plant on another, each suspended on THREE PIVOTAL POINTS.

This eliminates the binding and twisting strains inevitable in rigid suspension of all other cars.

Also permits the use of a rigid shaft drive without the use of cardan joints.

Every part is manufactured under one roof excepting tires and lamps.

The easiest riding car in America, without any exception.

Automatic force lubrication in engine, with constant and uniform flow through a hollow crank shaft directly into engine bearings, crank and piston pin bearings. Allows a distance of 500 to 1000 miles on less than on gallon of oil for the engine.

Model C, 24 H. P., $2,500. **Model D, 32 H. P., $3,000.**

ALSO chassis and solid cast aluminum body parts. All patented features will be thoroughly explained and demonstrated at any time during the show by

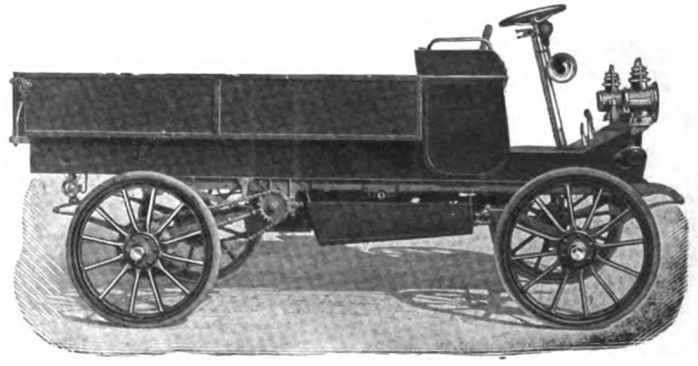
The Rapid Motor Commercial Vehicles

We Deliver the Goods.

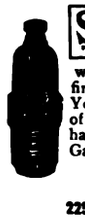
Our entire organization has from the very first been devoted exclusively to the building of Commercial Vehicles.

The success of "Rapid" motor wagons is due to the fact that they are built with the idea of giving heavy continuous service, and carrying heavy loads.

The wagon illustrated weighs 2230 lbs. and carries 3000 lbs. easily. Rear Wheel measures 34 inches; front wheel 32 inches; solid tires. The double side chain drive insures a maximum of power delivered to the 2-inch solid steel axles. The cut illustrates only one of our many bodies. Size and style of body furnished to meet your requirements.



One Ton, $1,400; 1 1-2 Ton, $1,800.



GUARANTEED FOR ONE YEAR.

Agents can secure territory by writing me now, before all choice allotments are gone. Our new factory is a guarantee of prompt delivery.

1906 MODELS FORD MOTOR CARS

6 CYLINDER TOURING CAR, PRICE $2500

40 h. p., 114-inch wheel base. No foreign or American Car at any price can surpass this superb machine for control, comfort, power and general serviceability. Do not buy a touring car until you have examined every detail of this car and had a thorough demonstration of its wonderful possibilities.

4 CYLINDER RUNABOUT, PRICE $500

15 h. p., 84-inch wheel base. This car is built in greater quantities than the combined Runabout output of all American factories.

Early in the history of the Automobile industry Henry Ford took the position that there should be no restriction in the price of the automobile. The automobile was of such stupendous possibilities, and so necessary, that nothing should hinder its development, restrict its output, or hold up a fictious value, and the Ford Company has elected to make its own price on its product, and would not become a member of a price restricting association.

So in making the price on the Ford output, the question was not "how much can we get for this car?" but "how low can we sell it and make a small margin on each one, how many cars must be turned out to get the lowest cost per car, and will the demand absorb this tremendous output?"

These have been mighty questions.

To build the number necessary to sell a six-cylinder car of this class for $2500 and a four-cylinder high-grade Runabout for $500 was a proposition that staggered every man in the automobile industry, and was doubted and even ridiculed. BUT IT HAS BEEN DONE.

SEE THESE CARS AT THE BIG CHICAGO SHOW.

FORD MOTOR COMPANY, Detroit, Mich.

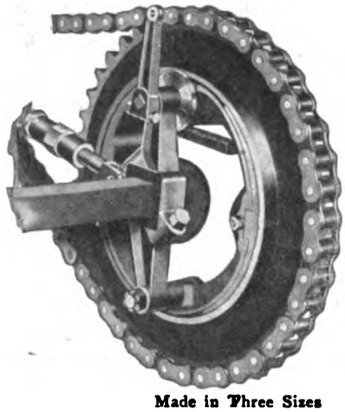
Garford Parts

We are not exhibiting at the automobile shows. All our customers, however, are displaying cars in which a few, many, or all of the Garford products can be seen. Our absence, therefore, will hardly be noticed.

Months ago the product of our factories was sold—sold exclusively to makers of high grade cars. We cannot accept further orders just now. But a more extensive factory equipment will enable us to increase our capacity for 1906-07.

MOTOR WAGON PARTS



We can promptly execute orders for steering gears, brakes, sprockets, motor hangers and other parts for motor wagons.

Also Pinion and Sector Type

They are suitable for all classes of commercial power vehicles, from the lightest to the heaviest.

They are not "freak" components of a wonder working vehicle.

Made in Three Sizes

They enjoy the rare distinction of having been thoroughly tested for some years past in the most varied and severe kind of commercial service.

Circulars 2, 3, 5, 10 and 11 give information concerning them.

THE GARFORD CO.

ELYRIA, O.

Sales Manager: Hayden Eames, Cleveland, O.

New JONES Combination

SPEEDOMETER - ODOMETER

For the dashboard of your automobile. Indicates the speed with positive accuracy. Registers the Season mileage traveled in miles and tenths to 10,000 miles. Registers the Trip mileage in miles and tenths to 100 miles. The mile figures are black; fractional miles, red. The Trip register has a stop-watch instantaneous resetting stem. Speed is indicated and mileage cumulatively recorded whether the car go forward or backward.

THE DASH BRACKET is adjustable to permit the instrument being set at any desirable angle.

THE SHAFT CONNECTION is adjustable and permits the passing of the shaft through the floor and through or around either end of the car.

The principle and general construction of our new instruments remain essentially the same as in previous models—for the reason that the feature of compactness and durability are made possible in their highest form.

Complete catalog upon request.

New York exhibit Madison Square Garden only—January 13-20.

The universal praise given **The Goodrich Quick Detachable Tire and Rim** is today the most noteworthy fact in connection with the automobile tire industry.

No other quick detachable construction is so simple in its workings or admits of such quick and easy handling of the tire in detaching and attaching.

No lugs, no clips, no pinching of the inner tube, no possibility of the tire working loose, no bolts, screws or turnbuckles of any sort.

Please write for special booklet.

BRISCOE RADIATORS

ALWAYS IN FRONT

We are in the midst of our most prosperous season and are proud of the popularity of our product as evidenced by its general adoption.

Briscoe construction has won out through its merits, both of design and construction. Both of our plants are busy with orders from the most representative car builders. We have shown our ability to provide the best results for those wishing either tubular or honeycomb radiators. We have also enlarged our line of products to embrace all the sheet metal parts required on both water and air cooled automobiles.

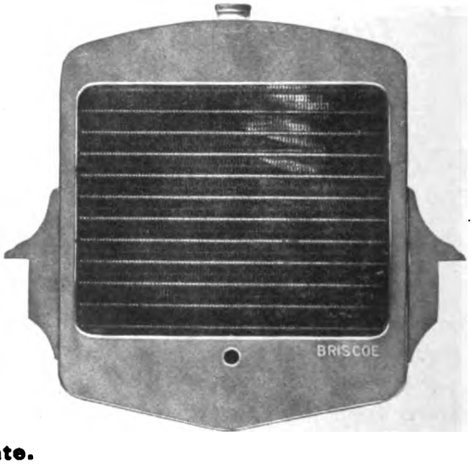
Our exhibits at all the shows will be well worth visiting by automobile manufacturers and assemblers. We will have on exhibition the latest designs in which we have made up our several styles of trustworthy radiators as well as of samples of new methods of water circulation developed by us in our experimental department. We may be found at the Garden in Section 72, Elevated Platform, at the Armory in Section 15 Gallery, at the Coliseum in Section 134 and at the Detroit Armory in Section 27 Gallery.

Our two plants bring BRISCOE PARTS within reach of all automobile builders and our workmanship remains—*the very best.*

WE ARE MAKERS OF

Both Honeycomb and Tubular RADIATORS.

Iron and Aluminum HOODS AND FENDERS.



Sheet metal DECK BOXES, SEATS AND MUFFLERS.

Ornamental HOOD FRONTS for air cooled cars.

Galvanized iron and copper Gasoline and Water TANKS.

Plain and ball bearing DISC FANS.

Concave Sheet Metal DASHES.

Write to our nearest office for estimate.

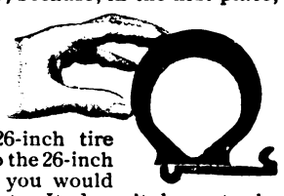
Why Goodyear Auto Tires Won't Creep

DID you ever try to force an inch tube over an inch and a quarter bar—or to put a pair of No. 7 gloves on a No. 8 hand?

You wouldn't be so foolish, would you?

But that's to all intents and purposes what the Automobile Man has to do every time he puts an ordinary tire on an ordinary rim. It's



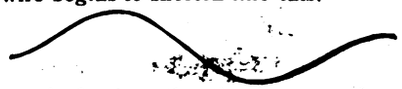
about as hard work as breaking into a bank, and he goes at it the same way, with a "jimmy" and other burglar's tools. Because a 26-inch wheel (for example) is really *27 inches* in diameter, when you consider the flange. So a 26-inch tire has to be forced over a 27-inch rim every time you put on a tire, or take it off.

It's a heart breaking job, even for a strong man, and it takes from half an hour to an hour each time you do it.

And after you have removed such a tire a few times, the base of the tire becomes stretched, and the fabric (used to strengthen it) becomes broken in places, until this tie becomes 27 inches in diameter instead of 26, a full inch larger that the face of your wheel. So you have to bolt it down, or it will creep, tear the valve out and cause all kinds of trouble. And even then you have to keep it pumped up continually as hard as it will stand.

Now the Goodyear Detachable Auto Tire can't creep, because, in the first place, it doesn't have to be *forced* on (if you use the Goodyear Universal Rim). The 26-inch tire slides right on to the 26-inch rim as easily as you would put on your hat. It doesn't have to be pried over a 27-inch flange.

And next, at the first stroke of the pump, the tire begins to grip the rim like grim death, because there is a mesh or tape of piano wire vulcanized clear around the tire on each side of the base.



When the tire is flat these wires are like this:

And each single wire like this:

The instant you begin to pump, this wire begins to shorten like this:

And when the tire is pumped up hard, the wire mesh is like this:

If you put a Goodyear Auto Tire on a wood rim, and pump it up hard, the pressure will be so great that the base will squeeze a ridge in the wood.

So the Goodyear Auto Tire need be only *half* inflated, and it will still have a firmer grip on the rim than it is possible to secure with plates and bolts. This, however, is only *just one* of the good points of this trouble-saving tire.

You will find other points in our "Good News Book." It is vitally interesting to every manufacturer, dealer or user, for it shows the way to perfect relief from Tire Troubles. It's FREE. Ask for it.

THE GOODYEAR TIRE & RUBBER COMPANY - Grove Street, AKRON, O.

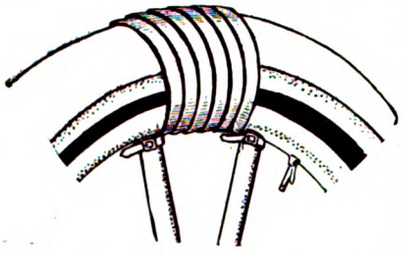
Woodworth Detachable Tread

FOR 1906

Is perfect in every detail. Our new construction making a partially flat tread, has the effect of increasing the wearing surface, and making the studded strip maintain its position exactly on the middle of the tire, even when the tire is flat. Our new wire side-ropes can be very quickly and easily adjusted, making it possible to apply the tread in less than 15 minutes, and with very little effort. The tread prevents punctures, skidding and wear. Suitable for any make of pneumatic tire, old, or new. Does not rot the fabric like a vulcanized tread. Adds to the appearance of the machine.



Compare our prices with others which do not give one-half the value.

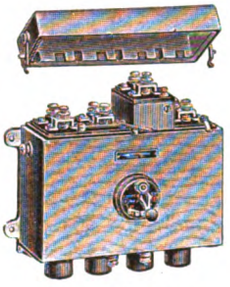
PITTSFIELD IGNITION SPECIALTIES



For 1906

Single Cylinder
Dash Coil

Two Cylinder
Dash Coil

Four Cylinder
Dash Coil

Pittsfield Spark Coils

are as nearly perfect as it is possible to make them. The insulation is of the best and we guarantee that it cannot be punctured or ruptured. It has an extremely fast vibrator, and all adjustments are by lock nuts. Made for one, two, three four and six cylinders, dash type; and one, two, three and four cylinder box type. Smallest and most efficient American Coil made.

The 1906 Jewel Spark Plug

is of the same excellency of manufacture that has made this plug so popular throughout the country, the difference being that it is much shorter, the core being ground on a taper into the shell, which makes it easy to remove and clean, and it is also made with a novel connection which does away with the binding nut and also obviates the trouble of twisting the core by a person using a wrench or plyers for fastening the nut. The advantage of a plug of this kind can readily be seen. We are daily receiving large orders for them.

The 1906 Pittsfield Timer and Switch are now ready

The CELEBRATED BRAMPTON CHAINS Made from Self-Hardening Steel

SCIENTIFIC AMERICAN

MUNN & CO.

361 Broadway, New York

May 22, 1905.

Chas. E. Miller,
97 Reade St.,
New York City.

Dear Sir:-

I wish to express my appreciation of the Brampton chain, one of which I have recently given a severe test on a single cylinder touneau, the chain for which is small for the power it has to transmit. Last season I tried three kinds of the best domestic chains with the result, that each one was worn out at the end of about 500 miles. Owing to a quick-gripping clutch, I was constantly experiencing a broken chain.

As soon as I was able to procure a Brampton chain of the proper size, I equipped my machine with it. I recently made a 250 mile trip through the Berkshire region of Massachusetts, cutting directly across country from Northampton to Adams, over some very hilly and rough roads. During this trip the chain was submitted many times to terrific jerks when pulling the car out of mud holes and starting it on hills, these jerks being much greater than would ordinarily be experienced owing to a fiercely-gripping clutch; throughout all this severe test the chain never failed me. At the end of the trip, and after running it altogether something over 500 miles, an examination showed only a slight wear on the inside of the rollers, causing a very little play of these on their bushings. The chain otherwise looked as new. Best of all however, is the fact that I can now go motoring without the constant dread of a broken chain, the repair of which is the direst of all jobs that the automobilist has to encounter.

Yours very truly,
J. H. Bach.
Auto. Editor of the Scientific American.

Note Heavy Chamferred Side Plates. — All Parts of this Chain Polished. — Fits Sprockets Without Friction

TWO PAIRS OF CHAINS IN 75,000 MILES

BRAMPTON BROS., Ltd.

EALING, LONDON, February 13, 1905.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, running daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

CAN BE AND WILL BE FITTED WITH THE CELEBRATED BRAMPTON CHAIN IF YOU ORDER IT THAT WAY, AND IT WON'T COST YOU OR THE MANUFACTURER ANY MORE THAN AN INFERIOR CHAIN. ALL STANDARD SIZES IN STOCK TO FIT AMERICAN AND FOREIGN CARS.

We are Sole United States Agents for this Line of Chains, and are ready to Quote Manufacturers Interesting Prices on American Standard Sizes. *Catalog Mailed on Request*

DIAMOND CHAINS

The structural variations in automobile chains are much more striking and important than is commonly supposed. The indispensable elements in the manufacture of a high-class chain are first-class materials and workmanship. It is easier to pretend that these elements have been combined than it is to prove it.

No chain factory uses as good stock as ours. "Diamond" rivets are made from nickel steel—that's their distinguishing characteristic. Their tensile and shearing strength is from 50 to 100 per cent. higher than in the case of rivets made from inferior stock. "Diamond" side links are also made from special analysis carbon stock, and all holes are reamed to size and pitch—exclusive advantages we boast for our product. We test every pound of stock before it passes from our warehouse to our factory.

Good workmanship is not associated with poor factory equipment. The physical condition of our plant is unrivaled—in fact, it is not even approached. Making nothing but chains, we are necessarily specialists in every branch of such manufacture. The degree of attention we pay to our business is shown in the many little refinements of practice which are to be observed only in our establishment. This attention to details may not serve to explain the superiority of "Diamond" chains, but it is certainly very suggestive of it.

"Diamond" chains fit any standard sprocket. They are unrivalled for accuracy of manufacture, strength and durability.

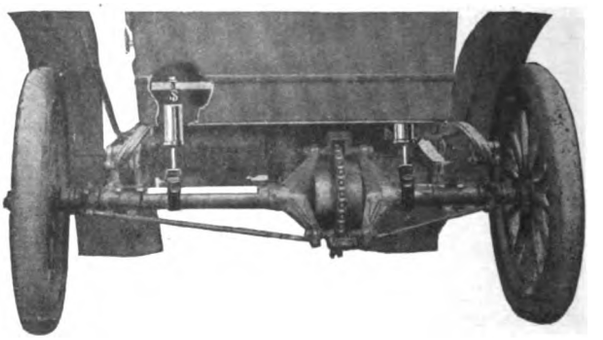
A Spring Recoil Check

(HOUSE PATENT)

An automatic, frictional device perfectly controlling the recoil of the springs

Its attachment to the body and axle of the car is easily made and so arranged that it is flexible, so that any oscillating or lateral movement of the car or running gear cannot strain or break its parts, and no oiling or adjusting is required.



A protection against broken springs.

Prevents the quick recoil over rough places which lifts the rider from the seat and makes travel fatiguing.

Permits the free action of the springs over smooth roads, but steadies the movement of the car over rough places and to a large degree relieves the weight from the tires when striking severe obstructions in the road.

Makes fast riding, with comfort and safety, possible.

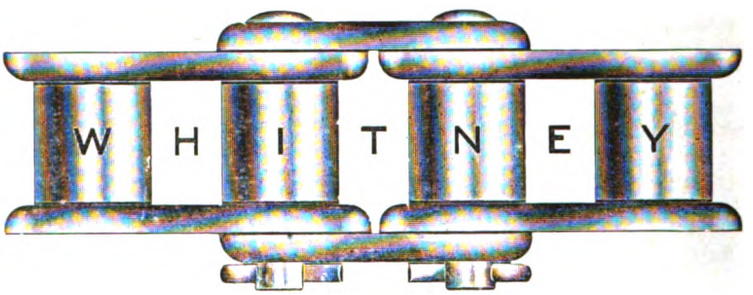
At the Automobile Shows notice the great number of cars equipped with "Whitney" Chains.



DETACHABLE TYPE—PATENTED.

SECTION OF SPROCKET TEETH THROUGH LINE Z-Z.
B—Shows Correct Section for "WHITNEY" Chain No. 7.

CHAIN No. 7. FULL SIZE.

Thousands of Chains have been damaged by interferences and unfavorable conditions.

In designing your car se'ect the chain you consider right and leave plenty of space for a wider and larger chain.

Are your Sprockets cut to the correct bottom diameter with cutters correct in form?

Are your Sprocket teeth too wide and too straight on the sides?

Have the sharp corners of your sprocket teeth been removed after cutting?

Are your sprockets in line?

As a manufacturer do you inspect every sprocket by comparing it with a correct model or do you accept anything so long as it has the right number of teeth?

THE WHITNEY MFG. CO., Hartford, Conn.

A CANDID TALK WITH YOU.

We have been laying awake nights a good deal of late trying to figure out where the profit comes in to *you* because a certain tire was (said to) run some fifty thousand miles with no punctures or accidents or any apparent wear, unless the tires *used by you* will do somewhere near as well.

In other words, it strikes us as being pretty slim consolation to know that tires of the same brand you are using have at some time or other made good to *somebody*.

We have been simple enough to believe that *you* were *specially* concerned in the tires used by *you*. But of course human nature varies, and we *may* be wrong.

However, in the manufacture of

MORGAN & WRIGHT TIRES

every tire is made just as good as we know how to make it. You are bound to get our *best-made* tire if you get *any*.

And because or this every-tire-a-good-tire method, the automobilist who *begins* using Morgan & Wright tires *continues* to use them because they make good *to him*.

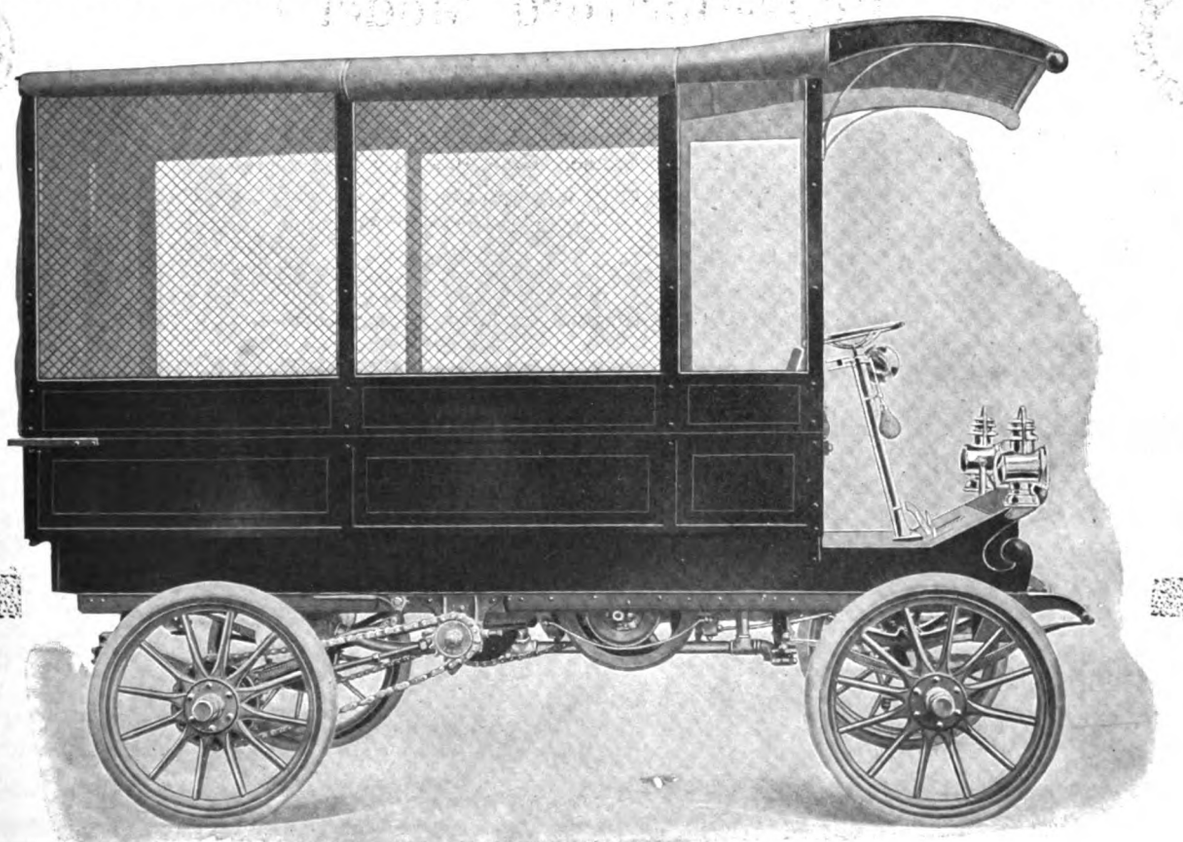
The Rapid Motor Commercial Vehicles

We Deliver the Goods.

Our entire organization has from the very first been devoted exclusively to the building of Commercial Vehicles.

The success of rapid motor wagons is due to the fact that they are built with the idea of giving heavy continuous service and carrying heavy loads.



The wagon illustrated weighs 2230 lbs. and carries 3000 lbs. easily. Rear wheel measures 34 inches; front wheel 32 inches; solid tires. The double side chain drive insures a maximum of power delivered tc the 2-inch solid steel axles. The cut illustrates only one of our many bodies. Size and style of body furnished to meet your requirements.

One Ton, $1,400; 1 1-2 Ton, $1,800.
GUARANTEED FOR ONE YEAR.

Agents can secure territory by writing me now, before all choice allotments are gone. Our new factory is a guarantee of prompt delivery.

Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA."

15-20 H. P., $3,000. **30-35 H. P., $5,000.**

Both with complete touring equipment.

TYPE H. LOCOMOBILE 30-35 H. P. $5,000.
Top and Luggage Carrier extra.

"It was hardly to be expected that the 1906 product of the Locomobile Company of America, manufacturing in Bridgeport, Conn., would incorporate any very marked departures from previous practice. To have done so would have been somewhat in the nature of gilding refined gold. By the early adoption and subsequent perfection of such advanced constructional features as four cylinder vertical motors, enclosed timing gears, automatic carburation, sliding gear transmission, yielding a direct drive on the highest speed, and solidly forged axles, it produced a car that was a credit to the makers and to those who used it. This being the case, the designers have been at liberty to confine their attention to the improvement of the minor details from year to year, the absence of distinctly radical changes in the make-up of the machine allowing opportunity for a process of evolution and elimination in the lesser parts which has worked out a most excellent result."

(From a recent issue of THE MOTOR WORLD.)

For 12c in stamps we will mail 12 souvenir postal cards showing various views ot the LOCOMOBILE in the Vanderbilt Cup Race, making the best showing of any American car in any international contest. For 10c in stamps we will mail a five-color poster showing the LOCOMOBILE finishing the race. Printed matter of 1906 cars on application.

The Waltham-Orient is an Air-Cooled Car.

And the advantages of air-cooling in cars of certain power-rating are manifold, each advantage being a conclusive argument in itself.

1. There is a great reduction in weight, owing to the absence of radiator, water-jackets, pumps and plumbing, and of the water supply itself.
2. This permits lighter proportionate construction throughout, and does not require such large tires, which are more expensive to renew.
3. It reduces wear on the motor and all bearings, cuts down the expense of repairs, replacements and tire bills.
4. It eliminates completely the complicated mechanism of water radiation with its constant tendency to leak.
5. It increases power and speed of the same comparative horse-power proportionate to the decrease in weight.
6. The weight reduction increases the elasticity and responsiveness of the car.
7. Its extreme simplicity and accessibility make it possible for each owner to adjust and tune his own car without assistance from an expert but expensive repairer.
8. A woman can drive it with ease because of the absence of confusing complications of control.
9. It will run 365 days in the year. It matters not if the thermometer registers 40 degrees below zero; there is nothing to freeze.
10. It is equally immaterial if the temperature is one hundred in the shade—the Waltham-Orient system of radiation, assisted by a powerful fan, keeps a uniformly cool engine, entirely free from over-heating or pre-ignition. When it is considered that the explosion in the cylinders equals 1600 degrees Fahrenheit, it is apparent that the ordinary range of external temperature is not an important factor.

Our catalogue will be sent free upon request, and will tell the entire Waltham-Orient story. We are always ready for good live agents in unassigned territory. Write for proposition.

OLDSMOBILE

Palace Touring Car, Model S. Price, $2,250.

With complete lamp and horn equipment.

From Boulogne to Paris—202 miles in 7 hours is going some. That's the record made during the recent Paris show by Dwight Huss, of Oldsmobile Transcontinental race fame, and F. K. Folberth, driving the first Oldsmobile Four-cylinder Palace Touring Car sent abroad. This particular car was one of the first of the new models turned out by the factory, and was equipped with a motor developing barely 24 h. p.—the same model as now built is equipped with motor developing fully 28 h. p. In making the run good French roads helped—but 7 hours is as fast time as that particular course is ever run by the most powerful European cars.

That's pretty strong testimony on the subject of Model S Speed. We can give you equally convincing testimony on its Style and Stability. Send today for Model S booklet. It's good reading.

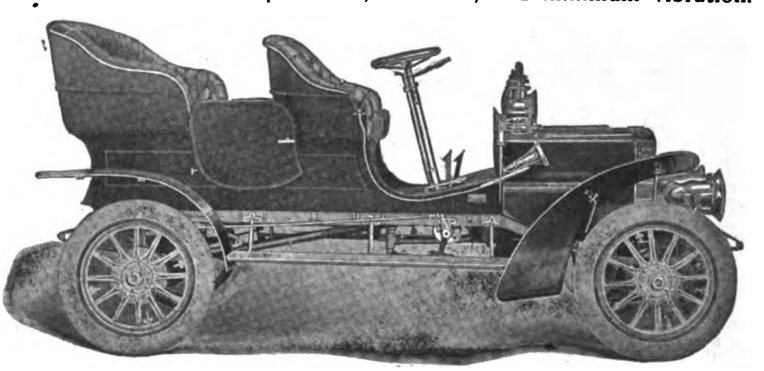
NORTHERN



"The Silent, Dustless Car"

The Silent Northern Touring Car fills a place among touring cars all its own. It has all the style, elegance and luxuriousness of the highest priced four-cylinder car, combined with a mechanism which for simplicity, compactness, and ease of control is absolutely unrivalled by any car at any price. All changes made from steering column and conveniently placed pedals. No side levers, no belts, no chains, gaskets, truss rods or strut rods. No complications, no noise, and minimum vibration.

1906 Medels

To be exhibited at Chicago, Feb. 3d to 10th

Sturdy Northern Runabout, 7 h. p,, with oil lamp equipment,	$650
Silent Northern Touring Car, 20 h. p., double opposed motor, with gas and oil lamp equipment,	1800
Silent Northern Limousine, 20 h. p., with gas and oil lamp equipment,	2800
Model K, 30 h. p , four-cylinder car, **air controlled,** and **air brakes,** with gas and oil lamp equipment,	3000

Double opposed motor Five passengers. Tire, 30x4, fully equipped. $1,800. F. o. b., Detroit.

The Autocar

Type X, $1000. 12 Horse Power.

Standardized

The superiority of The Autocar Runabout is established by its performance of past seasons. In power, in speed, in strength, in safety, in control,—in all of the qualities whose sum is *reliability*, it has far surpassed its class. And no other two-passenger car rides so smoothly, runs so quietly; it is so free from road-difficulties, so accessible, and so easy to care for.

Its position of leadership is made unassailable by an increase of power in the 1906 model, and adoption of the characteristic Autocar Control—right-hand wheel-steer with spark, and throttle-control grips in rim of wheel.

The Autocar (Type X) Runabout is the highest development in accessibility control and reliability—and is distinguished as the only motor-car in the world which is standardized throughout.

AXLES.—Front axle, seamless tubing. Rear live axle, steel; ground bearings. Squared end drive, no wheel keys necessary. Dust-proof case.
BRAKES.—Band hub brakes on each wheel operated by foot pedal; and brake on driving shaft, operated by side lever.
CONTROL.—Right-hand wheel steer, with bevel gear and sector. Spark and throttle control grips in rim of wheel (a new feature on this car). Foot operated clutch, controlled by the left foot. Caster knuckles.
COOLING.—Centrifugal water pump, gear driven. Coil radiator in front under the frame.
IGNITION.—Two batteries of three dry cells each. Rotary spark timer; double spark coil; jump spark plugs.
LUBRICATION.—A few parts only are oiled directly, such as steering knuckles, steering post and gears. Motor oiled by mechanical (gear-driven) oiler and splash. Transmission and rear construction run in dust-proof cases in bath of oil, the splash from the gears lubricating all bearings and gears.
MOTOR.—Water cooled. Two balanced, horizontal-opposed cylinders, in front under the hood. Four-inch bore, four-inch stroke. Mechanical exhaust and automatic inlet valves. Drop-forged steel connecting rods. Drop-forged steel crank shaft; oil tempered. Bronze bearings; all bearings ground to size.
REAR DRIVE.—Two hardened-steel bevel gears and bevel-gear differential. Driving shaft ball bearing. Axles, Hyatt roller bearings, with ample ball thrust bearings.
TIRES.—Fisk "Heavy-Car" type, 28-inch by 3-inch.
TRANSMISSION.—Well known sliding gear, or French type. Drop-forged, hardened-steel gears. Shafts run on ball bearings. Splash lubrication. Three forward speeds and reverse.
TREAD AND WHEEL BASE.—Fifty-four-inch tread. Seventy-six-inch wheel base.
VAPORIZER.—Holley vaporizer. Autocar type, in front of motor.
WHEELS.—Twelve spoke Midgley all-steel artillery wheels; reinforced construction. Roller bearings.

THE AUTOCAR TOURING TYPE XII. $2600
Double side entrance. Five passengers, 24 h. p. 4-cylinder vertical motor. Shaft drive. Sliding gear transmission. Three speeds and reverse.

EXPERT COMMENT

ON THE

EXHIBIT OF WHITES

AT THE

NEW YORK SHOW

"No use to declare anything bad or good about these great car builders. They stand everywhere high above critics, and I simply will say that I should like to own one of their splendid 18 H. P. touring cars at $2,800. "The generator, with its eleven helical coils of tubing, is certainly the smallest and most perfect apparatus of that kind known up to now and the fact of obtaining 'all speed' with a single lever is not the least point that has recently converted hundreds of sportsmen to steam automobling"—*George Dupuy, of L'Auto, Paris, in New York American.*

"The engine, the generator and the transmission mechanism are identical with those in the 1905 model, these features having been brought to a high state of perfection."—*New York Herald.*

"The old reliable White steamer, now entering its sixth year of service, is shown in eight distinct types. While the makers of gasolene machines are many, and their notions of automobile construction quite as diverse, the White people unaided have developed a steam car which is considered by its friends to be the nearest approach to automobile perfection. Its noiselessness, wonderful control and unique construction, that make it safe and speedy, put the White in a class by itself."—*New York Globe.*

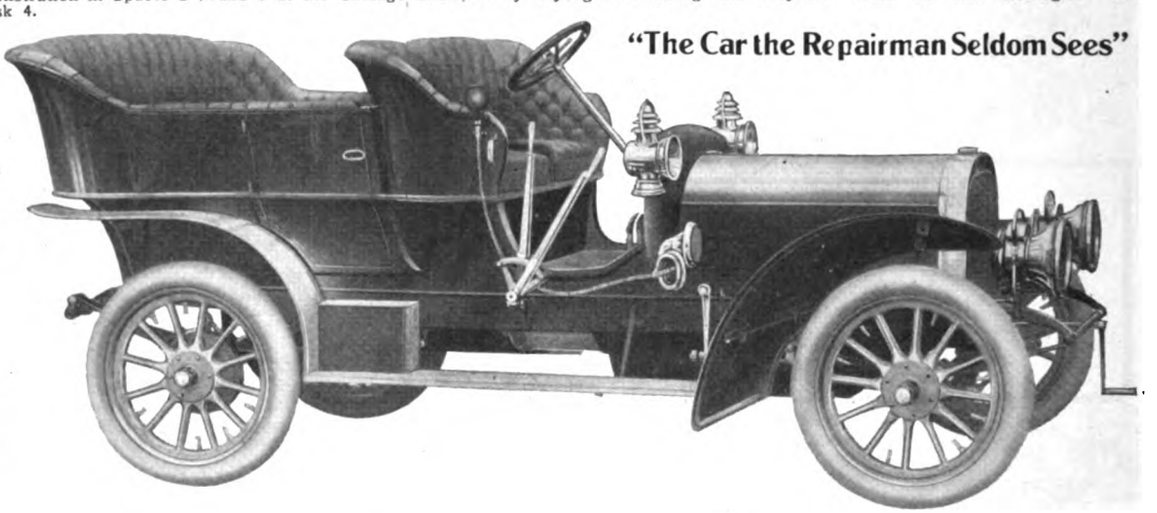
HAYNES A CAR OF STYLE

The body used on Models "O" and "R"—1906 Haynes, was designed by a famous Parisian bodymaker. When the two cars were in New York, Boston and Philadelphia, last fall, they were frequently mistaken for foreign-built machines.

The only two models offered for this year have all the little details that add so much to beauty, convenience and luxury. Nothing is found wanting. The lines are graceful and the finish is as rich as it is possible to produce.



But in addition to being a car of great beauty, it is also a car of great comfort, endurance and reliability. It is as dependable as the old family horse, rarely out of order and always easy to manage.

Haynes care in construction, in selection of materials and finish, is responsible for this and make it the car of small cost for repairs and up-keep. These points can be proved by demonstration in Spaces S 7 and 8 at the Chicago Show, or by any agent handling the Haynes. Send for new catalogue. For prompt attention address Desk 4.

MODEL "R" FOUR CYLINDER TOURING CAR

Vertical roller-bearing engines. Cylinders cast separately, 5⅛ x 6 inches, 50 h. p. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master Clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller-bearings throughout. 108-inch wheel base, 54-inch tonneau, seating five people. Four to 60 miles an hour on high gear. Weight, 2750 pounds. Price, $3,500, f. o. b. Kokomo. Full equipment.

THE "Maxwell"

Perfectly Simple Simply Perfect

The Evolution of the Maxwell Doctrine—Maxwell Cars

The Doctrine:

FIRST—A cylinder of five-inch bore, with five inch stroke is ideal for a double opposed gasoline motor.
SECOND—A double opposed motor, 5 in. x 5 in. when properly made develops about twenty actual horse-power.
THIRD—To use four cylinders for motors of twenty or less horse-power is unnecessary because thereby the number of wearing parts is unnecessarily increased.
FOURTH—Twenty actual horse-power, not momentum or fly-wheel horse-power, is enough for every requirement except excessive speed or extreme fashion. Therefore a two-cylinder, 5 in. x 5 in., double opposed motor is the best, and it is as evenly balanced as four-cylinder construction, is very much less complicated and much more reliable. It would take four 4 in. x 4 in. cylinders to develop the same power as two 5 in. x 5 in. cylinders, properly made.
FIFTH—Four cylinder cars appeal largely to "Fad and Fancy" only; two-cylinder cars produce reliable service.
The unprecedented successful record of the Maxwell cars during the season of 1905 prove the wisdom of the above written doctrine.

Reasons for the Success of the Maxwell

Common Sense was the motive of its construction, not the impulse of "fad and fancy."

A 5 in. x 5 in. horizontal double opposed motor for a touring car and a 4 in. x 4 in. for a tourabout have been proved the ideal types for service and reliability.

Maxwell horse-power is demonstrated by the actual continual test, not by the flash system of testing which includes that resulting from the inertia of the fly-wheel. Therefore, Maxwell horse-power is actual horse-power.

Maxwell Cars are Splendidly Made as Well as Perfectly Designed—Maxwell Features:

Multiple Disc Clutch — Bevel gear Drive — Three-Point Suspension
No Pump — Great Reliability and Economy — Metal Bodies

Maxwell cars are sold under the positive guarantee that as good a car cannot be sold at a lower price.

ST. LOUIS
1906
"RIGS THAT RUN"

TYPE XVI
32-36 ACTUAL H. P.—$2500.

Every AUTOMOBILE, no matter what the PRICE, STYLE or CONSTRUCTION, contains some individuality which, in its builders' estimation places it above its competitors. Every manufacturer strives to have the best, and undoubtedly some one HAS THE BEST, but a fair verdict cannot be rendered by any one man. ONE exclusive feature does not constitute an entire MOTOR CAR no more than one individual constitutes a MILLION DOLLAR ORGANIZATION. An engine may be absolutely perfect, but if the power is not transmitted correctly to the rear wheels the car is a FAILURE, and vice-versa. To build a successful car, the manufacturer must give as much attention to the smallest details as the largest. THE ST. LOUIS MOTOR CAR COMPANY are the Pioneer Automobile Manufacturers of the UNITED STATES. FOURTEEN YEARS of BUILDING EXPERIENCE has taught us CONSIDERABLE. We know the material and style of construction best adapted for AMERICAN roads and CONDITIONS. We know how to manufacture intelligently and economically. WE KNOW that TYPE XVI is equal to any AUTOMOBILE built in America. Our claim is not based upon any ONE exclusive feature. It's "RIGHT" all the way. Compare our specifications with cars listing from $3000.00 up, then make arrangements for demonstration at any of the coming shows. We still have some valuable territory at our disposal and our AGENCY PROPOSITION is just as thorough as our car.

AGENTS who have already contracted for over two-thirds of our '06 product tell us that "TYPE XVI" will be the car of the year. We KNEW this four months back. If you are INTERESTED, it will be a pleasure to tell you WHY.

ENGINE. 32-36 ACTUAL H. P. 4 cylinder water cooled.
IGNITION. Jump spark. Splitdorf coil. Pitsfield timer. Storage battery and dry cells.
TRANSMISSION. Sliding train. Three forward and reverse.
REAR AXLE. Floating type, bevel, Timkem roller bearings throughout.
FRONT AXLE. I section, drop forged, roller bearings.
FRAME. Cold rolled pressed steel, special stock, channel section, full pan in under hood covering entire engine.
WHEEL BASE. 110 inches.
WHEELS. Superior quality; second growth hickory.
TIRES. 32 by 4 inches; optional.
VALVES. Mechanically operated; all interchangeable.
CARBURETTER. Float feed; automatic governor requiring no adjustment.
BRAKES. Transmission, foot and emergency lever, 5 in number.
BODY. Exceptionally roomy; will carry seven people; upholstering, general appearance and workmanship unsurpassed.
EQUIPMENT. Two brass side lights, one tail light, two head lights, full tool equipment, baggage haul, etc.

Commander of Strenuous Service.

We do not offer you the 1906 Thomas simply on the strength of its supremacy among American cars. We ask you to consider it upon its ability to out-point in all around excellence and efficiency the finest car made anywhere else in the world.

It will "stand up" under any and all conditions. It is staunch, strong, rugged, powerful and the most beautiful car in the world.

In describing the Thomas Motor, we will only touch on a few of the points which are of vital importance for motor perfection. Cylinders 5½ x 5½ inches and develop 50 h. p. They have forged nickle-steel connecting rods with five large bearings. The cam gears for operating all the valves are of the combination type, with wide face and coarse pitch, thus making them strong and noiseless. There is no satisfaction to the motorist like that of knowing the engine is reliable, and there is even a greater satisfaction in the knowledge that every special feature of the New Thomas is absolutely essential to comfort and happiness.

We have already brought to your attention The Thomas Safety Device, which positively renders accidents from backing an impossibilty.

THE 50 HORSEPOWER THOMAS FLYER

has many new improvements, that are so essential to comfort and satisfaction in motoring, that it is only possible to point out a few of these mechanical advantages at a time. Watch our coming announcements in this magazine, in which will be described in detail:

The most effective metallic three disc clutch in operation. Gears that may be changed between high and low without passing through intermediate gears. Hill climbing—will carry five passengers up a 14% grade at the rate of 40 miles an hour. Practical use of chain drive. New dustless body—dust suction entirely eliminated. A guaranteed speed of from six to 60 miles per hour on the high gear, always running quietly, smoothly and without rock or jar.

In order that you may have a complete understanding of the All-American Car, which at last surpasses the finest foreign product, besides giving you a true and accurate description of many of its special features in this magazine every issue, we want to send you our illustrated catalogue and special Thomas literature.

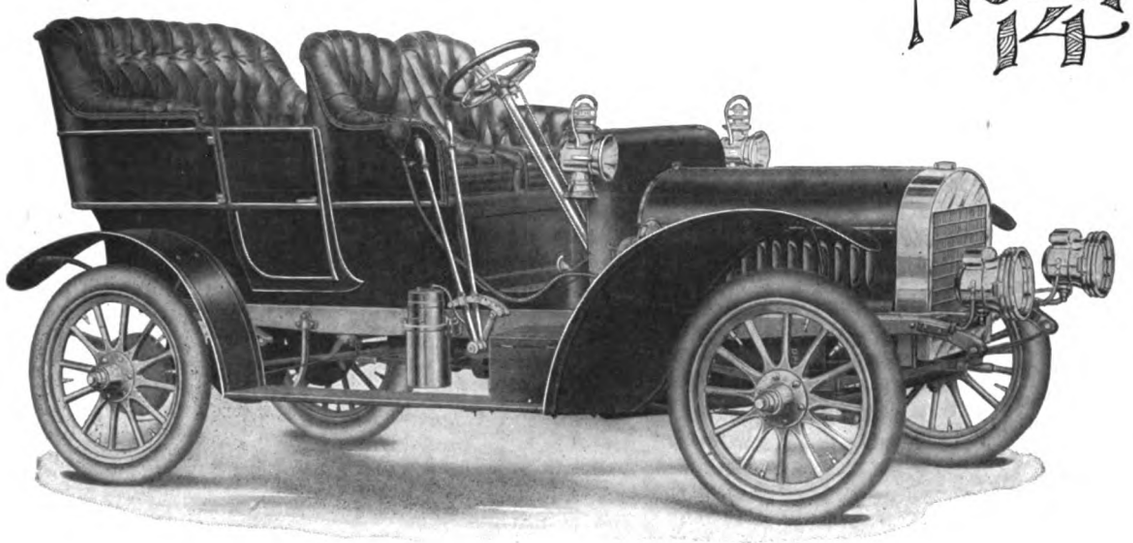
MICHELIN TIRES

(It is considered "Chic" to have Michelin Tires on your car, even in France).

Mr. E. D. Winans begs to announce that a new and large company has just been incorporated consisting of American and French capital to control the output of Michelin Tires and products in the United States under the name of Michelin Products Selling Company, Inc., 31–33 West 31st Street, New York.

All orders and inquiries for agencies and goods should be sent at once to



E. D. WINANS,
Gen'l Manager.

Mr. Winans is no longer connected with any other company or organization who claim to have American agency for 1906. The only representatives in the United States are the MICHELIN PRODUCTS SELLING CO., Inc., of 31-33 West 31st Street, New York.

Rambler

Model 14

THE CAR WITH A REPUTATION

But few purchasers are able, from even the most minute examination, to judge the real working qualities of a car.

It is, therefore, well to consider the opinions of those who have had practical experience with the car in question, and we confidently refer you to the vast army of Rambler users, particularly those who, having started with the more modest types, are now using the most elaborate models of the Rambler line.

The freely expressed opinions of hundreds of these satisfied owners are at your service.

Model 14, shown above, marks the culmination of years of development in the line of utility, power and service. It is equipped with a four-cylinder vertical motor, 20-25 horse-power, sliding gear transmission and shaft drive. Price, $1,750.

Our catalogue, giving full details, will be mailed upon request.

One of six models to be seen at the Chicago Automobile Show.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, January 25, 1906. No. 18

ALL DEALERS NOW WELCOME

N. A. A. D. Throws Open its Doors and Takes a Few "Flings" at Manufacturers.

The National Association of Automobile Dealers has invited the independent or unlicensed dealers to walk into their parlor and to join hands with them.

This was the most surprising development of the meeting of that organization, which was held on Wednesday of last week in Hotel Victoria, New York. Despite the importance of the adoption of this "open door" policy which was in view previous to the session, little was known or said of the meeting, either before or after it; indeed, there still seems a disinclination to talk of the proceedings or to discuss details.

In the words of one of those who was present, three things were done: viz., the door was opened to all dealers, the dues were increased from $25 per year to $10 per quarter or $40 per annum, and "thirdly," to quote the Motor World's informant, "it was agreed to forget that there is any particular manufacturer in existence."

From all that can be learned, it is plain that in the dealers' association there is a number of members who are distinctly "sore"; no other word seems to express their feelings. It will be recalled that when the organization was formed last summer, the membership was restricted to agents handling licensed cars. They had certain grievances or suggestions which it was desired to submit to the Association of Licensed Automobile Manufacturers. A committee was appointed for the purpose, but a net result was that the dealers were tactfully informed that the A. L. A. M. could do nothing as a body, the alleged grievances properly being matters for settlement between each individual agent and the particular manufacturer whom he represented.

It was learned that at last week's meeting of the dealers' association that there was a general disposition to consider that the manufacturers were not inclined to meet their agents half way and that the importance of the dealer is being underrated. Some genuine bitterness was manifested in discussing the matter, the upshot being the resolution to cast aside all restrictions and make the membership open to all.

"If the manufacturers won't meet us half way, we will build up our organization and ultimately they may find it advantageous to come to us. We are their bread-winners, even if they don't realize it"—this is said to have been the substance of one speech at the meeting which met with the heartiest applause and which best defines the dealers' attitude and sentiments.

There was no election of officers, so far as can be learned, that matter being wholly in the hands of the board of directors.

Rearranging the Michelin Lines.

With the Michelin rights secure in his possession, E. D. Winans has lost no time in locating the new Michelin Products Selling Co. He has leased the pretentious premises, 31-33 West Thirty-first street, New York, and engaged practically all the former staff of the Michelin Tire American Agency, including Joseph A. Straus, his first assistant when he managed the agency.

Winans has also placed the Western representation of Michelin tires with Dan Canary, of Chicago, who is forming a selling company to handle the famous French product in that section of the country.

Marks Returning with Diamond Ideas.

After spending some time abroad, A. W. Marks, superintendent of the Diamond Rubber Co., is due to reach New York to-day. While absent, Mr. Marks has visited practically every tire plant of note on the "other side," and, it is understood, effected arrangements or exchanges of information or processes that will have a marked bearing on the Diamond tires of the future.

St. Louis Supply House in Straits.

Bankruptcy proceedings have been commenced against the A. L. Dyke Automobile Supply Co., of St. Louis, Mo., of which the Brittons—Robert F. and Roy F. are respectively, president-manager and secretary-treasurer. The petitioners and their claims are the Commercial Electric Supply Co., $449; Security Printing Co., $1,000; Norvell-Shapleigh Hardware Co., $60.

ALCOHOL GAINS ADHERENTS

Bills in Congress Assume Importance—Public Hearings to be Held.

Since the introduction of the bill to exempt denatured alcohol from taxation by Representative Calderhead, a few weeks since, the question has assumed a degree of importance that bids fair to make it a matter not easily sidetracked. There are quite a number of bills to the same effect now before the House, though none of them is considered satisfactory. Either they provide for free tax industrial alcohol only in those industries which use the alcohol on the premises in the industrial process in which it is employed, or they make insufficient provision for the control of the alcohol exempted from taxation, or are defective in some other respects.

Members of the House Ways and Means Committee are engaged in making ready a plan of hearings to be held in behalf of the proposed legislation and are quoted as saying that there is little doubt that these hearings will be the most complete and thorough of their kind that have ever been had by Congress. It is expected that the automobile and kindred industries, the varnish, paint and explosive manufacturers, the electrical and other industries, all of which are vitally interested, will be well represented.

It is now confidentently expected that since hearings are assured, a number of other bills will be introduced, one or more of which are likely to be very thorough measures. As Chairman Payne, of the Ways and Means Committee is pledged to the support of the proposed legislation and is said to very strongly favor it, there is little doubt that a bill will be reported to the House, but even the strongest advocates of the plan are unable to predict the outcome, although they consider the prospect unusually bright. Opponents of the plan are understood to be making preparations to shelve it, and in order to give them as little opportunity as possible it has been practically decided to consider no bill that involves any change in the system of taxing beverage alcohol, or any that applies to anything except domestic alcohol.

College Point, N. Y.—Ray Car, Motor Boat and Machine Co., under New York laws, with $50,000 capital. Corporators—Erasmus B. Raynor, Joseph Laughlin and James Dunne.

Brooklyn, N. Y.—Plaza Automobile Co., under New York laws, with $10,000 capital; to manufacture motors, etc. Corporators—Howard B. Sands, Abraham Adelberg and Mary H. Sands.

Corning, N. Y.—Corning Automobile Co., under New York laws, with $5,000 capital; to manufacture automobiles. Corporators—George T. Wolcott, Samuel K. Wolcott and William W. Cowan.

New York City, N. Y.—Graham & Goodman, Inc., under New York laws, with $10,000 capital; to make automobiles. Corporators—C. W. Graham, J. M. Graham and F. T. Goodman.

Massillon, Ohio.—Forest City Motor Car Co., under Ohio laws, with $50,000 capital; to make automobiles. Corporators—H. A. Croxton, W. E. Stone, W. E. N. Hemperly, F. F. Taggart and I. A. Koons.

Trenton, N. J.—Philadelphia Portable Store Co., under New Jersey laws, with $150,000 capital; to sell groceries in automobiles. Corporators—H. A. Illman, Frank I. Richardson and Wilfred B. Wolcott.

Trenton, N. J.—Empire Automobile Tire Co., under New Jersey laws, with $50,000 capital; to make automobile tires. Corporators—C. Edward Murray, Charles H. Baker and A. Boyd Cornell.

Groton, Conn.—Thames Motor Co., under Connecticut laws, with $10,000 capital. Corporators—Gurdon Pendleton, Thomas W. Avery, Charles E. White, Belton A. Copp and Courtland E. Colver.

New York City, N. Y.—Duplex Ignition Co., under New York laws, with $3,450 capital; to manufacture and sell electric sparkplugs and automobile supplies. Corporators—Fritz Lowenstein, William T. Hoofnagle and Ludwig Speigel.

Portsmouth, N. H.—Consolidated Automobile Co., under Maine laws, with $1,000 capital; to deal in automobiles. Corporators and officers—H. Mitchell, Kittery; S. J. Morrison, Portsmouth.

Alameda, Cal.—Alameda Garage, under California laws, with $20,000 capital; to deal in automobiles and supplies. Corporators—Paul K. Buckley, Frank Smith, E. K. Taylor, William E. Keene, and John F. Buttrick.

Croesus Coming from Kansas City.

Two new cars, the Croesus four-cylinder touring car and the Croesus single-cylinder runabout, are scheduled to make their appearance from Kansas City, Mo., the Croesus Motor Car Co., with G. W. Curtis and W. I. Bell its leading spirits, having been formed for that purpose. Scant details have been given out, but Curtiss, the inventor, says that the company has taken quarters at First and Main streets, that city, and will turn out twenty-five cars this season. The touring car will have four cylinders, developing 40 horse-power and sell for about $4,000. It will weigh 2,390 pounds. Its conspicuous feature will be that no brass trimmings will be used, all the metal parts being silver plated. The runabout will be a single cylinder affair, developing 22 horse-power, it is claimed.

Palmer Completes Organization.

At least one new car will make its appearance at the Cleveland, Ohio, show, to be held next month. It will be a runabout, employing a 9 horse-power single-cylinder two-cycle engine, and will sell for $400 without tires, or $500 complete. The Palmer Automobile Mfg. Co. has been incorporated at Ashtabula, Ohio, for the purpose and has a model car nearly completed. A sales depot will be established at 731 Schofield avenue, Cleveland. These officers were elected last week: President and superintendent of construction, H. R. Palmer, of Cleveland; vice president, R. Conrad, Ashtabula; treasurer and general manager, A. P. Fisk, Ashtabula; secretary and sales manager, G. Cathcart, Cleveland.

Independent Makers at Breakfast.

While luncheons, noon and midnight, and dinners were the rule during New York show week, the American Motor Car Manufacturers' Association varied the usual order by giving a breakfast on Friday last at the Imperial Hotel. Its purpose was chiefly to acquaint the newer members with the old ones.

At the breakfast it was announced that the annual meeting of the association would be held in Chicago, Friday, February 9th. Two applications for membership, at least, will be acted on, those of the Crawford Automobile Co., Hagerstown, Md., and the Dorris Motor Car Co., St. Louis, Mo.

Part the Weather Plays.

"The weather plays a bigger part in this business than many people imagine," remarked J. Elmer Pratt, of the Cadillac staff, one day last week. "In the hight of the season it is not at all unusual for us to receive 15 or 20 telegrams per day reporting unfavorable weather and requesting that shipments specified for that particular date be held until a later date. When a factory like ours, that is producing 40 cars per day, each due on a specified day, receives such messages, it requires rapid calculation and intimate kuowledge of the country and weather conditions to satisfactorily readjust the shipments."

New Orleans Negotiates for Factory.

According to advices from New Orleans, La., W. L. Judson, of Chicago, who says his sons are owners of the Continental Motor Works, is endeavoring to raise $100,000 capital to start an automobile factory in the Southern metropolis. The New Orleans Picayune states that automobiles of the "Mud King" variety will be manufactured in addition to gasolene engines for multiple uses. Forty-eight thousand dollars of the required amount has been subscribed.

Toronto Sets Show Dates.

March 31 and April 2 to 7 are the dates which finally have been selected for Canada's automobile show, which will be held in Granite Rink, Toronto. Space amounting to 24,000 square feet in all is at the disposal of the "International Motor Show," as it is styled.

Ohioans Dickering for Owosso Plant.

It is reported from Owosso, Mich., that the Detroit Trust Co., trustees of the bankrupt estate of M. I. Stewart & Co., is negotiating with an Ohio firm for the sale of the Stewart carriage factory there for $50,000. The intending purchasers, it is said, will manufacture automobiles.

Willis Gets Amazon Tires.

The Amazon Rubber Co., Jamestown, N. Y., who recently embarked in the manufacture of automobile tires, have placed the Eastern sales agency for their product with the E. J. Willis Co., New York.

Digitized by Google

In the Retail World.

The Western Motor Co., of Los Angeles, Cal., has lengthened its line. It has taken on the Buick.

Smith & Walker have started a garage in Ottawa, Ill. They are located in the Large Building.

The Napier Motor Car Co., of Boston, has established a branch in New York, at Broadway and Fiftieth street.

The Morrison-Tyler Motor Co., of Boston, agents for the Maxwell and Ranier cars, have taken on the Marion.

The Mosehart & Kelly Co., Houston, Texas, have purchased a plot of ground, 50 x 150 feet, at Caroline street. Upon it they will build a garage.

Doolittle Brothers, who have a garage at 59 Broadway, New Haven, Conn., have belied their name. A brick addition is now under process of construction.

The Torbenson Motor Car Co., which recently established itself in Bloomfield, N. J., has taken the Northern New Jersey territory for the Frayer-Miller car.

A. Fenneman is erecting a garage to be operated in connection with the Suburban Hotel, on Park Heights avenue, Baltimore, Md. The structure will measure 100 x 300 feet.

The Covley & Clark Motor Car Co., Portland, Ore., is erecting a one-story garage, 100 x 150 feet, at Fifteenth and Washington streets. It will be completed about March 1st.

A new machine shop, 40 x 65 feet, is being added to the garage of the Palace Automobile Station Co., at 348 Trumbull street, Hartford, Conn. For 1906 the company has taken the agency for the Thomas and Haynes cars.

The White steam cars will hereafter be represented in Kansas City, Mo., by the Missouri Valley Automobile Co., at Fifteenth and Troost avenue. Henry C. Merrill, who formerly had the agency, is retiring from business.

With J. W. Reichley as the leading spirit, a company under the name of the Southern Pennsylvania Automobile Co., will shortly begin business at 23-29 Beaver street, York, Pa. A general garage business will be done.

The George W. Worthing Automobile Co. has been organized in Fond du Lac, Wis., and on March 1st a salesroom will be opened in the Haas building, at Second and Mary streets. The company will also conduct a garage and motor livery.

J. A. Clairmonte, of Los Angeles, has taken the agency for Southern California for both the English and the American Napier cars. In furtherance of the business a warehouse and garage, 60 x 160 feet, is to be erected at Spring and Seventh streets, in that city.

The Standard Automobile Co., of Pittsburg, will move February 1 to that city's "row," having leased the corner store of the new building at Woodward and Alexandrine avenues. The Standard line for 1906 will comprise the Packard, Peerless and Autocar.

The Midland Automobile and Bicycle Supply Co. has established itself at 1454 Market street, San Francisco, Cal. Henry Ephriam, of the Ephriam Bros., Buffalo, N. Y., who made such a picturesque failure some time ago, is one of the partners. Benj. Stacy is mentioned as the other.

The Taylor Automobile Co., Albany, N. Y., is having its garage on Orange street renovated. The entire rear section of the old building has been razed and re-erected, which gives a much needed increase of room. Concrete floors and metal ceilings are some of the improvements.

A. W. Gump, who was widely known in the bicycle boom days, because of his establishment in Dayton, Ohio, has started in business at 1118 and 1120 South Main street, Los Angeles, Cal., as the A. W. Gump Automobile Co., with $25,000 capital. He will do a general automobile business.

L. H. Elmer, Hartford, Conn., who, under his own name, has been handling the Rambler and Ford cars, is about to convert his business into the Elmer Automobile Co., capitalized at $15,000. He has leased new quarters at 1100 Main street, which will be conducted solely as a salesroom without a garage annex.

Ambrose West and Laning Harvey have purchased the controlling interest in the Auto Machine and Repair Co., on North Washington street, Wilkes-Barre, Pa., and will make improvements adequate to care for that city's growing business, this being the only garage in Wilkes-Barre. The Thomas, Peerless and Locomobile lines will be carried.

Henry J. Ullman has sold his interest in the Pardee-Ullman Co., Chicago, to Fred J. Pardee, Dr. W. P. Johnson and E. S. Hamill. Pardee and Johnson have been identified with the company for a long time, but Hamill is a newcomer. The name and style of the company will soon be changed. The firm will continue to handle the Packard and Franklin cars.

The Flint Motor Car Company, of Providence, R. I., which is the agent of the Packard automobile in that city, has installed a repair and adjustment shop for work on the Packard cars owned in that State. Elliott Flint, the head of the company, recently secured a lease of a building on Pitman street, in which, until a short time ago, motors for boats were manufactured, and has fitted up the shop in a thorough manner. The building is 25 x 70 feet.

The McKinley Motor Car Co., Rochester, N. Y., agents for the Mitchell and National cars, are erecting a substantial new salesroom and garage at Main and University streets, which, when completed, will enable them to properly care for a large and growing trade. A. H. Sowers, secretary and general manager, was one of the live agents in attendance at the New York shows and declared himself as more enthusiastic than ever over the Mitchell and National lines after comparing them with everything else he had seen exhibited. His one concern was that he might not be able to obtain enough of them.

Dealers Refuse to Pay Garage Tax.

Whether the city ordinances levying a special tax of $60 a month upon automobile garages in Los Angeles, is constitutional or not is the problem the Southern California Dealers' Association is trying to solve. The ordinance was passed several months ago, but as the garage was only one part of the law, the dealers failed to discover the existence of the ordinance until an effort was made to collect the tax. Then W. K. Cowan, the energetic president of the association, immediately called a special meeting, which resulted in an unanimous resolution to stand pat upon the position taken by several dealers and not pay the price of "unjust discrimination." Just what the city authorities will do has not yet been made plain.

Mexican Notables Buy Northerns.

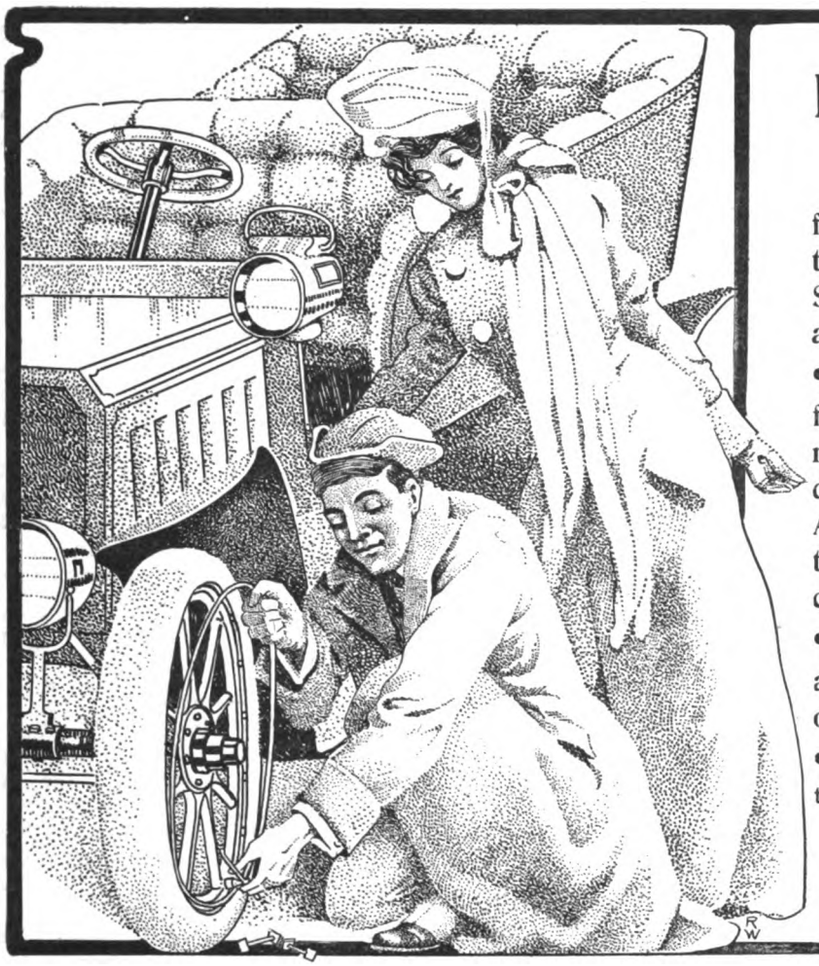
M. W. Walker, of Mexico City, one of the many Northern agents at the show, proudly announced that he had sold the wife of President Diaz, of Mexico, a Northern car, and followed up the good work by selling another one to the Mayor of Mexico City. Business prospects in the capital city of the neighboring republic are exceedingly bright, according to Mr. Walker.

Hartford Brings Home Gobron-Brille.

While attending the Paris Show, E. V. Hartford, president of the Hartford Suspension Co., of New York City, secured the American agency for the Gobron-Brille car, samples of which are already in evidence. The car employs a 35 horse-power four-cylinder motor, the feature being that each cylinder contains two pistons.

Fire Destroys Drop Forge Works.

Fire on Tuesday night almost totally destroyed the plant of the Union Drop Forge Warks, Chicago, Ill. The concern made forgings for a number of automobile manufacturers, whom the fire may embarrass considerably.



Lexington Sees a Factory Coming.

Lexington, Ky., has visions of an automobile factory "in its midst." If some unnamed persons can obtain a site, the new company, composed entirely of foreign capital, will put "about $75,000" into the enterprise, and Thomas R. Dewhurst, the local dealer, will be made resident manager.

Buckboards Going Abroad.

Orders for five Orient buckboards from far-off Tasmania and seven more from New Zealand in one week, give an indication of the way the little machine is catching on in foreign lands.

Fisk Tires are Remarkable

for the Simplicity and Ease with which they can be repaired, for their Positively Safe Rim Attachment, their Comfort, and their Long Service Qualities.

¶ Fisks cannot roll on the rim. It is so firmly secured that there is absolutely no chance for it to creep—as other tires do. Its inner tube cannot get pinched. All the air in a Fisk is entirely above the rim, making the one perfect wheel cushion.

¶ They are now recognized everywhere as The Standard for Sterling Excellence of Design, Material and Construction.

¶ We would like to send you an article on the subject of different tire constructions.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK JANUARY 25, 1906.

"Shaking Down" the Motorist.

It is very evident that, considering the automobilist a "good thing," those Honorables, the Messrs. L'Hommedieu and Freylinghuysen, the one of the New York legislature, the other of the New Jersey law factory, mean that he shall be thoroughly "plucked" and "shaken down." Their respective bills which seek to impose a per horsepower tax on motor cars make this quite plain. So far as Mr. L'Hommedieu is concerned he is not wholly to blame. A few enthusiastic souls who own automobiles and who are blessed with the world's goods, have undertaken to give assurances that automobilists generally are simply itching to pay more taxes if the revenue is but applied to road improvement. It was very nice of those enthusiastic souls to do that sort of thing, but the hundreds who have invested their savings in 10 or 15 horsepower cars for the family's sake, scarcely will relish the kindness. Ten or fifteen dollars represents 1,000 or 1,500 cents to them, which they will not pick up in Wall street or a pool room. These less fortunately situated individuals may also be given to wondering why their rubber-tired cars are singled out for special taxation, while the steel-tired carriage or the heavily loaded farmer's wagon, which do far more injury to the highways, are permitted to escape.

Unfair as is the New York measure it is little more than comparable with the New Jersey bill, which, so far as non-residents of the State are concerned, would give substance to the old joke regarding New Jersey being a foreign country. It certainly is "the limit." To first tax the car according to the horse-power rating and then impose an additional tax on the operator on the same basis, while making his use of his property and the public roads, subject to the whim of any magistrate, is akin to wringing blood money from the residents, while to exact a fee from a non-resident each time he enters the State, is carrying the squeezing process to its logical conclusion.

If imitation is flattery, Russia and Massachusetts should be flattered by the New Jersey bill. It is as disgraceful a measure as ever was proposed. It is nothing more or less than an effort to make "grafting" by the State legitimate—an effort to "shake down" a certain class of American citizens. The old cry regarding making the roads safe is being used to cloak the grab for the motorist's pelf.

Suppression of the Noise.

Apart from all consideration of the improvements in mechanical detail that have brought it about, it must be generally conceded that the elimination of the noise made by the car in operation has been one of the advances that means most to the general public. And if the great extent to which this had been accomplished in 1905 was then a matter of general congratulation, how much more so is it now?

With exceptions that are so few in number that they may be said to be only sufficient to bear out the time honored statement of proving the rule, the cars of 1906 are more silent than any other user of the highway, or of the permanent way either, for that matter, for there is now less noise of moving parts than is produced by the best of locomotives. Probably the only exceptions to the rule are to be found in the ranks of the single and two-cylindered cars, particularly of the horizontal type. This is true to a greater extent in the case of the first named for obvious reasons. It is difficult to take care of the intermittent power strokes of a cylinder of such large capacity in an adequate manner without unduly increasing the size of the muffler, although it is to be noted that great advances have been made in this direction even here.

The single cylinder car is no longer the noisy object it was, and the same is true of the horizontal opposed motor to a much greater extent than formerly, although there is still an occasional offender in this respect. Even the up-to-date car with a motor of the standard four-cylinder type is not entirely blameless, for it is noticeable in the case of some of them, that while decorously silent at all speeds when new, they begin to wheeze and grunt in a manner akin to that of their predecessors a few years previous, after a little service.

Many causes have contributed to bringing the modern gasolene car on a par with the steam and electric vehicles, which have always been held up as models and long though unapproachable in the matter of quiet operation. The muffler was at one time considered the root of all evil in this respect, and while this preventative of noise has been wonderfully improved, it is noticeable that it has been but a factor in bringing about the result. The adoption of multiple cylinders has had considerable to do with it, while means of silencing the suction in the carburetter and the use of improved forms of drive have been largely instrumental, but more than all these has been the improved efficiency of the engine itself. The expansion of the burning gases is now taken advantage of to such a degree that the average racing motor without a muffler makes but little more noise than its silenced predecessors of a few years back.

To the constant rotational velocity of the four-cylinder motor is due the elimination of the rattling and hammering caused by the intermittent impulses of the single-cylinder motor, which became more and more noticeable as the effect of wear showed itself in loose parts and joints, adding their quota to the general din made by these old-timers. A long step toward gaining the confidence of the prospective buyer was made when all unnecessary noise was suppressed.

Opening of the Shop.

Probably no other symptom can be taken as better illustrative of the growth and progress of an industry in point of breadth and general scope than the development of the atmosphere of the open shop. Not the

Digitized by Google

"open shop" against which forces of organized labor are concentrating their activities, but the open shop in which secret process are unknown—the shop to which all may have access, even though they be vitally interested in the work of a rival concern. True, the question of the value of the really secret process or method of attaining some specific end, still remains, as it always has been, a moot point with certain classes of trade, but waving aside all discussion of the right of the thing, it is a fact that the greatest manufacturing concerns in most lines of work are thoroughly accessible to all who care to visit them so long as they be honest in their intentions.

As a result of the sentiment, which breeds this state of affairs, the manufacturers abate their natural rivalry to a sufficient extent so that they can work together in the forwarding of such interests as are common to them, and each profits by the experience of the other. As a result of this, in turn, makers' associations are formed, engineers' clinics are held, and the good of the cause is advanced at an immensely more rapid rate than otherwise would be possible.

While the automobile industry was in its swaddling clothes, the rivalry between maker and maker was of the harsh sort that breeds the closed shop. The draughting room and the model room of the factory were as the holy of holies to the common mechanic, while the mere outsider might count himself as being truly privileged if he ever got beyond the confines of the business office. In those days one or two of the less independent makers even went to the expense of purchasing a car of another maker and then, with great pretense of secrecy, tearing it apart and measuring it up for future reference. Happily, however, for the welfare of the industry, such firms soon went to the wall, while those who from the first worked along independent lines, coming to the conventional standards of design only with a great show of reluctance, and maintaining their originality most rigidly, are the ones which to-day are most successful—not, perhaps, as a result of their independence, so much as a result of the amount of intelligent and thoughtful effort which they infused into their work.

But in contrast to this state of affairs, behold, to-day, the spectacle of a maker inviting his customers to come to his plant not as casual visitors, but to tarry and labor with the regular force until they have mastered the details of construction of the car, and at the same time, as must inevitably be the case, the shop methods as well. And this, not in a single instance, but in several, while in other cases, the makers are sending out literature to their customers which, a year or two ago, would have been considered as suicidal to the interests of the concern. More than this, behold the case of a maker offering to loan one of his cars to any fellow maker for trial purposes, in order that the advantages of a particular method of construction which he particularly favors may be studied to advantage, and behold another maker, offering to reciprocate by loaning him one of his own cars in return for it! Two years ago both of these men would have been considered nothing less than lunatics, while to-day, they stand forth as men of modern enterprise. Each is bound to benefit from the example of the other's work, and that possibly to the loss of a certain amount of prestige on the part of the one; but each, realizing that his dependence is on the market, which is only to be courted by progress along the lines which most need it, is willing to contribute to the advancement of the whole cause, trusting to his own business ability to secure for him the toll which is his due, and which he has earned.

The time has passed when all that is contained under the hood and beneath the chassis of the car is as a sealed book, only to be opened and read by factory experts. The representative owner is coming more and more to understand the workings and the failings of the mechanism which is under him, and, as time goes on, he will tend to learn more and more of its needs and capability. The function of the chauffeur is coming to be that of a hireling who performs the tasks which the owner has not the time nor inclination to do—not what he could not do if he chose. That being the case, once a car has passed out of the hands of the dealer, it is open for inspection to anyone who chooses to investigate its construction. More than that, it is open for reproduction by anyone except insofar as it is covered by patents, and those rights cover it in the shop as well as out of it. Hence practically nothing is to be gained by guarding it as some sort of priceless treasure which would lose its value on sight by the profane eye. Hence, too, all the secret methods of the closed shop of a few years ago count for naught, especially as the employment of spies and gobetweens, as practiced in those days, brings all of the labor of secrecy to naught and a lot of worry goes to waste.

LICENSES ARE AGAIN UPHELD

Motorists Lose Second Round in Unwin Test Case—Appeal to be Filed.

"Second blood" has been drawn by the State of New Jersey in the case brought by the National Association of Automobile Manufacturers to test the constitutionality of the various state license and tag laws. The official title of the case is the State of New Jersey vs. Unwin, and it will be recalled that in June last, Harry Unwin invaded the State "across the river" without a license number and invited arrest. He was duly fined $10 by Judge Higgins in the First District Criminal Court in Jersey City, which he refused to pay.

The anticipations of the defense have been fully realized in that the appeal has been decided adversely to their interests by Judge Blair of the Common Pleas Court, whose opinion sustains the conviction. This decision does not accordingly carry much weight as it is but a step in the process, the next move in which will be an appeal to the Supreme Court of New Jersey, then to the Court of Errors and appeals, Jersey's court of last resort, and from there to the Supreme Court of the United States.

The reasons given by Judge Blair in his opinion are as follows:

First—The requirement of the statute that every person should procure a certificate, at a fee of $1, is not the imposition of an additional tax upon such vehicle.

Second—That the filing of a certificate and the $1 fee is a license fee, and its exaction is the exercise of the legitimate police power of the State.

Third—That the exaction of this fee is not the creation of a new and distinct class among those entitled to the use of the public highways.

Fourth—That a distinction may be legally made in the matter of a license fee between the manufacturer of motor vehicles and owners who use them for pleasure.

Fifth—That the law in question, though it may not accomplish the whole purpose of its enactment, to wit, the complete identity of the owner of the vehicle, does accomplish that object in a measure and is therefore valid.

Virginia Also to Regulate Licenses.

Virginia even is delving into motor politics. Delegate R. E. Byrd, of Winchester, has drafted a bill which he will introduce into the legislature, the peculiar chief feature of which is the requirement of a license or permit to operate in Frederick county, from when the Delegate hails. As no other counties are mentioned, other senators and delegates are imploring Mr. Byrd to include their counties under its provisions. Another important section is that which gives to anyone the power to arrest any automobilist violating the law, without the formality of procuring a warrant. Of course, heavy fines are provided for any infractions.

NEW JERSEY'S HOGLIKE GRAB

Bill Offered to Wring More Money from Motorists—Admission Fee for Tourists.

On the supposition that class legislation—whereby automobilists are made by laws to pay for the undoubted privilege of every free-born American citizen—is just, a few of the provisions of the new automobile bill introduced in the Senate of the New Jersey legislature, Tuesday of this week, by Senator Joseph S. Freylinghuysen, of Somerset, are equally reasonable; but those few are so over-balanced by the totally unjust provisions that the good points of the bill are overwhelmed by the incongruity of the bad. While it masquerades as a measure for the public safety, it is none the less a hog-like grab for the money of a particular class.

The bill which the honorable gentleman from Somerset, who, by the way, owns an automobile, would have become a law, proposes to make the State of New Jersey a circus tent and its inhabitants the clowns, by charging a dollar admission to non-residents to get within its sacred confines and in view of its exhibits behind the shelter of goggles; to make residents pay so much per horse-power of their cars for licenses and additional fees upon the same basis for the privilege of operating them; gives power to make arrests without warrants and power to any and all motorphobic corn-fed magistrates to revoke licenses; provides for a "commissioner of automobiles" whose sole duty will consist of drawing the fat salary of $3,000 per year, to be paid by the unfortunate persons who have been allowed to make use of their property upon the public roads of the State.

Summarized, the provisions of Mr. Frelinghuysen's iniquitous measure are:

1. Provides for a commissioner of motor vehicles to be attached to the secretary of State's office, and for as many inspectors as may be necessary, who shall have power of arrest and who are charged with the duty of detecting violations and obtaining evidence of violations.

2. Gives commissioner authority to authorize chiefs of police to give certificates of registration and licenses to operators and require all persons operating a vehicle to be licensed.

3. Provides for an examination of all persons before they are licensed to run motor vehicles.

4. The commissioner shall keep a record of his official acts and shall make an annual report to the Governor with recommendations regarding the use of motor vehicles.

5. Provides for an annual registration fee of fifty cents per horsepower for all vehicles, and twenty-five cents per horsepower for all drivers.

6. Provides for a "Short Time Tourist Registration" of $1 per day.

7. Limits the number of machines to be run under manufacturers' registration to five and the number of days which a person can have a dealer's machine on dealer's registration number to five.

8. Limited the age of drivers to eighteen years.

9. Driver's photograph must be attached to his license.

10. Provides that the official numbers on the machine shall be kept clean and free from dust.

11. Provides for a rate of a mile in seven minutes in built up portions of towns, and cities, at crossings of country roads, and while passing other vehicles of any kind; elsewhere at the rate of a mile in three minutes, but at no time so as to endanger life, limb or property of any person, and no speed regulations shall be held to relieve any driver of the consequences of his negligence.

12. Power to arrest without warrants for any violation.

13. Warrants issued shall be good throughout the State.

14. Any person convicted of violating any of the provisions of this act shall be subject to a fine of not more than $500 and imprisonment in the county jail for a period of not more than sixty days.

15. Any magistrate may revoke a driver's license, but the commissioner may for good cause restore it.

16. All moneys derived from any source under this act shall become a part of the State road fund.

17. Part of this State road fund shall be used by the State road commissioner to place suitable signboards at road intersections and to provide and maintain lights at dangerous points at night.

New York to Tax Horsepower, Too.

It has appeared again—Senator Erving L'Hommieudieu's measure to tax automobiles one dollar per horse-power—and it's coming was not totally unexpected, in view of the fact that the New York State Automobile Association, last week, as much as said that New York automobilists would not mind being taxed should the proceeds be devoted to the maintenance and care of State highways.

The gentleman from Orleans county introduced a bill in the Senate Monday night. It proposes to mulct automobilists one dollar per horse-power of their cars, the tax thus imposed being made a lien on the vehicle, but the owner is made exempt from all other taxes, general or local, to which motor vehicles as personal property may be subject under the laws of the State of New York. It is provided that the tax be paid before the registration of the machine. Motorcycles are exempted.

Payment of the tax must be made to the secretary of State, who is charged with the enforcement of the provisions of the act. The proceeds of the tax are to be applied by the State engineer to the construction or repair of the State highways in accordance with the provisions of the Good Roads act.

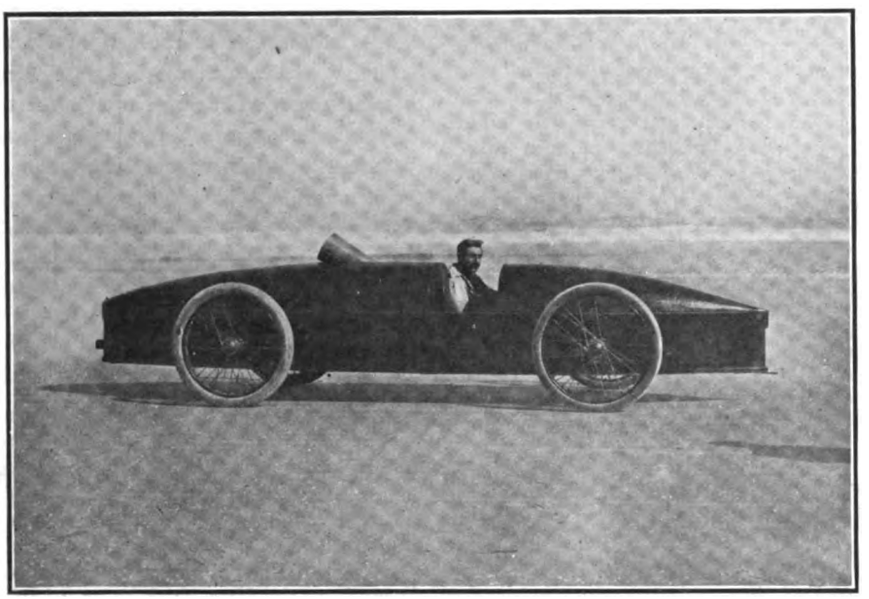
STANLEY SWEEPS BEACH

Little American Steamer Spreadeagles Foreign Monsters and Shatters Records in Every Event—Small Crowd at the Carnival.

Ormond, Florida, Jan. 23.—Today a wheeled vehicle traveled faster than any wheeled vehicle ever traveled before—a mile in 31⅘ seconds, or at the rate of 113 miles per hour. It was Stanley's steam "beetle" that did the traveling and to tell the truth, its performance was a mighty good thing for the Florida speed carnival, as on this, the inaugural day, the weather, the crowds and pretty much all else was decidedly dull.

At 10 o'clock, when the first race was due to be started, the beach and the ocean were enshrouded in fog and rain was falling. It looked like a case of "no race." An hour later, however, the fog lifted, the rain slackened to a sprinkle and the competitors were called out and the hotels notified. Despite advance reports of overcrowded houses, there is room to spare in the hotels here, the number of guests being smaller than last year. Most of them are interested visitors, too. They are either trades people direct from the New York show, or officials connected with the carnival. To-night some one suggested that it looked almost as if a Glidden tour gathering had been dropped into Ormond. Many of them were not so interested, however, that they cared to stand on the beach in the rain. The hotel was far more comfortable. As a result, comparatively few persons witnessed the "beetle's" wonderful flight.

"Society" is conspicuously absent—not even Mrs. Howard Gould and husband are here and in previous years they always constituted a feature. In fact, Mrs. Gould grew so enthusiastic last January that in the presence of the dutiful Howard she avowed that there would be two or three Gould racers on the beach on this occasion. But alas! they are missing.



Albert G. Vanderbilt is here, however, but he and his party do not mingle with the "common herd" at the hotel. They remain close to their private railway coach in which they are abiding. Vanderbilt's much touted eight-cylinder, 250 horse-power monster also is here, which is about all that may be said of it. It has done a lot of groaning and snorting, but all the Italians and Frenchmen on the ground have not been able to make it move. To-day it is said that the trouble has been located in the clutch and this may be the case. However, seeing is believing. When the Vanderbilt "mastadon" runs the fact will be freely acknowledged.

It is a good thing for the credit of America also that the Stanley "beetle" is here this year, else it would appear very much like a foreign meet. It was the only American production that competed in to-day's events and it won the two in which

Digitized by Google

it was started in hollow fashion. It was not eligible to the other one, which was won by Vincenzo Lancia, the dashing Italian and the "hero" of the Vanderbilt cup race.

Auguste Hemery, the Frenchman, who captured that cup in October last, is here with a string of high-strung Darracq cars and to-day gave evidence that while he has acquired a bit more style in the interim, the surliness which his face reflects, is of the same undiluted brand. When one of his cars proved over-weight, he promptly "boiled over" and announced that he would not race at all. He towed the three Darracqs to the stable and his sour face grew sourer. C. D. Cooke, of the American Darracq Co., immediately got busy. He did not bow down to Hemery, but instead went about effecting arrangements with Basle to drive the cars. When Hemery discovered the trend of things, a change came over him and he will drive after all.

THE CAR THAT DID—THE STANLEY "BEETLE."

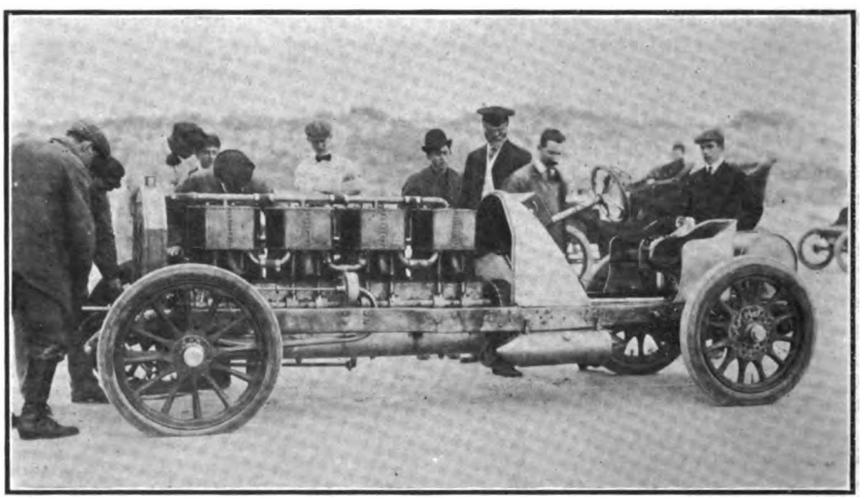
The Stanley, which was driven by F. H. Marriott, of Newton, Mass., made its phenomenal flight in the most unimportant race of the day, the one-mile for steam cars, and the race was made possible only by entering two other Stanleys to "keep up appearances." They were, of course, hopelessly outclassed by the "beetle" and description is unnecessary. The little racer simply skimmed the one mile of marble-like sand in time that almost staggers comprehension and that is all there is to it. Earlier in the day, however, it had met "foemen" that appeared worthy of its steam—the 110 horse-power Italian racer, driven by H. W. Fletcher, and the 100 horse-power Napier, piloted by Clifford Earp, of London. They met the little 30 horse-power Stanley, guided by Marriott, in the first heat of the mile race for the Dewar trophy, popularly dubbed the "Scotch High Ball Cup." In this, as in the other event, the Stanley simply spreadeagled the big foreigners. It ran away from them with ridiculous ease, doing the mile in 32⅕ seconds, which stood as the world's record for a short time only. Earp was nearest to it, 7⅕ seconds behind. Lancia, driving the 110 horse-power car, which was the sensation of the Vanderbilt cup race, won the second heat in 37⅗ seconds, but he had trouble with his machine and could not get it going in time to meet the Stanley in the final in which the "beetle" again finished far in front, in 33 seconds. Each of its performances to-day was better than the old record of 34⅗ seconds, made on the beach last year by McDonald, the Englishman. The beach was wet and heavy, making it seem plain that with more favorable conditions, the little car will do the mile in 30 seconds or better—the long sought two miles a minute—beyond shadow of doubt.

It goes without saying that F. E. Stanley, of Newton, Mass., who built the new speed marvel, is happy beyond expression. His hand is limp from the shaking it has received, but his generous beard is still parted by a smile that hardly will wear off. There's another man who is doing a heap of smiling and he has no hair on his full face to hide it—Herbert Githens, of the G & J Tire Co. It is enough to say that the Stanley is shod with G & J's.

The summaries:

One Mile International, for the Sir Thomas Dewar trophy.—First Heat—Won by Marriott (30 h. p. Stanley), 32⅕ seconds; Earp (100 h. p. Napier), second, 40 seconds; Fletcher (110 h. p. Fiat), third.

Second Heat—Won by Lancia (110 h. p. Fiat), 37⅗ seconds; Cedrino (110 h. p. Fiat), second, 38⅕ seconds.



Final Heat—Won by Marriott (Stanley), in 33 seconds; Cerdino (Fiat), second, 38 seconds. Lancia did not start.

One Mile Heavyweight Championship.—First Heat—Won by Cedrino (Fiat), in 37⅗ seconds; Fletcher (Fiat), second, 39⅘ seconds.

Second Heat.—Won by Lancia (Fiat), in 42 seconds; Earp (Napier), second, 43⅗ seconds; Downey (90 h. p. Diamler), third.

Final Heat.—Won by Lancia, 37 seconds; a new competition record for gasolene cars; Fletcher, second, in 37⅗ seconds; Cedrino, third.

One Mile Steam Championship.—Won by Marriott (Stanley), 31⅘ seconds. Two smaller Stanley cars started in order to qualify the entry of the Stanley racer.

THE CAR THAT DIDN'T—THE VANDERBILT "MASTADON."

Ormond, Florida, Jan. 24.—Again were Marriott and his Stanley "beetle" and the acrid Frenchman—Hemery—the sensations of the carnival. Marriott drove the steamer five miles in 2 minutes 47 seconds, cutting a slice of thirty seconds from the former record. The sour visaged son of France who yesterday acted in a not unexpected childish manner, to-day let his stubbornness explode with a bang, which resulted in his ultimate suspension from participation in the remaining Florida events and the quick dispatch of a cablegram to the Automobile Club of France, asking for his permanent suspension.

Digitized by Google

Although wet, the atmosphere was so balmy on Tuesday that the male spectators were comfortable without vests, and several "helpers" divested themselves of coats and strutted around with shirt sleeves rolled up to their elbows. To-day, however, the changed weather conditions made fur coats a luxury, and several parties built huge bonfires on the beach in the effort to get warm. The strong northwest wind was chilly, but was favorable to record-breaking—the lone three events being run from Ormond towards Daytona, to take advantage of it.

Several long delays, tiresome and tedious to spectators and contestants alike, materially shortened the program. To begin with the start was made an hour late by not having the timing apparatus in readiness and then Hemery's sulks caused more delay and friction. There were only three events and and the day's racing was called off when the tide was still out because there were not enough cars to line up, five of them having been discommissioned.

Lancia of Italy, and Earp of England, came together in the first heat of the five-mile open championship. The English driver led until the four mile mark when he was forced to slow down to avoid colliding with a touring car which had been allowed to get on the course—Lancia went past with a rush, Earp slowing up and stopping a few yards from the tape. The Stanley "Beetle's" wonderful flight occurred in the second heat and when the result—five miles in 2:47—was announced, no one moved an eyelash. Records are now expected of it every time it starts. Fletcher, in a 110 horse-power Fiat, was Marriott's opponent, but at no time did he have a ghost of a chance. Marriott's time works out to an average of a mile in 33⅗ seconds, or 107 miles an hour. The "beetle" had a fine chance for another pinch in the final heat, but a burned hole in the burner made Marriott coast the last mile. He was passed by Lancia and Fletcher, who finished in this order. The former's time was 3:01⅗.

It was in the second heat of this race that the trouble with the sour-visaged Hemery occurred. In making the turn for the rolling start Fletcher and Hemery rounded short and left the steamer behind. The flag signalled "no go," but Fletcher and Hemery continued. When the officials called a restart, Hemery, who has more than once disgraced himself by his dogged stubbornness, flatly refused to run again and told the judges that if he started again it would be in the final heat. The officials spent a painful half hour trying to explain the rules and G. D. Cook, the Darracq's American rperesentative, wrestled in vain with Hemery. The Frenchman fumed and swore, in his native tongue, of course, and finally the A. A. A. representatives got tired of arguing and suspended him on the spot. Two quick cablegrams were sent to France—one asking that the Automobile Club of France suspend Hemery for good and all, and the other from Cook to the Darracq firm, asking permission to substitute another driver to take charge of the stud of Darracq cars. So it is probable that the 200 horse-power double engine monster may yet compete. Fletcher, who is now without a car, is the most probable applicant.

A pitiable exhibition was the middle-weight championship at five miles, Emanuel Cedrino in the 24 horse-power Fiat and "Deacon" Holmes at the wheel of a 40 horse-power Wayne being the only starters. The latter refused to respond to its master's touch and the Italian won the race in runaway fashion in 3:53⅗. Holmes was more than a mile behind.

Two of the big racing cars went down and out in the five-mile heavy-weight championship. They were Lancia's Fiat, whose transmission went wrong, and Fletcher's Fiat, which broke a piston and the crank case. Lancia's car may be repaired in a day or two, but the other is hopelessly eliminated. This event was run off in one heat and resulted in an easy victory for Earp (Napier) over "Joe" Downey (Mercedes), Lancia retiring at two miles and his teammate at three and one-half.

Frank Kulick had the Ford racer on the course early this morning for a practice spin, but it did not run satisfactorily and was taken back to the garage. Louis Chevrolet attempted also to take the Christie down the beach, but it broke down a mile from Ormond and at 4 o'clock this afternoon the Americanized Frenchman was still coaxing it to mote. A force of mechanics are working industriously on the monstrous Vanderbilt car, but their labor seems to have been in vain. It is doubtful if the much touted "250" will be seen in any of the events, and will not occasion much surprise if Alfred G. shakes the sand of Florida from his shoes and hies back to Manhattan before the week passes.

The summary of to-day's racing follows:

Five mile open championship.—First heat—Vincenzo Lancia, 110 h. p. F. I. A. T., first; Clifford Earp, 100 h. p. Napier, second. Time, 2:45⅗. Second heat—Fred Marriott, 20-30 h. p. Stanley, first; F. W. Fletcher, 110 h. p. Fiat, second. Time, 2:47 and 3:02. Final heat—Lancia, first; Fletcher, second; Marriott, third. Times, 3:01⅕, 3:02, 3:03.

Five-mile heavy-weight championship.—Clifford Earp, 100 h. p. Napier, first; Joe Downey, 90 h. p. Mercedes, second. Times, 2:56 and 3:29½. Also ran—Lancia, 110 h. p. Fiat, and Fletcher, 110 h. p. Fiat.

Five-mile middle-weight championship—Emanuel Cedrino, 24 h. p. Fiat, first; D. D. Holmes, 50 h. p. Wayne, second. Times, 3:53⅗ and 5:46.

Ormond, Florida, Jan. 22.—Somehow the preliminary "breathers" at Ormond this year have been far less interesting than in 1905. The Stanley steamer has been cutting an unofficial swath, but the gasolene cars have been laying low. In fact, the fool kite, commonly called an aero-plane has attracted more attention than all the motors. Air navigation, in a simple form, at least, is clearly to be a part of the winter program along the East Coast hereafter.

At this writing it seems certain that the new Richard-Sartori car of Alfred Vanderbilt's will cut no sort of figure in the speed meeting, whatever it may be able to accomplish eventually. It arrived here late Saturday night and Sunday was towed a couple of miles up the beach. Its power, as arranged at present, is so great as to cause excessive vibration which fairly shakes the machine even into hard sand. Its weight, too, as has been rumored all along, is about 200 pounds over the limit, with nothing in sight that can be taken off. "Haste has made waste" in this instance, but it is very possible that ultimately this racer of giant power will accomplish wonders. Its long bonnet is the distinguishing feature. Time has foolishly been spent upon details of the finish, while vital parts of the mechanism have been so slighted as to put the vehicle at a serious disadvantage. Vanderbilt was a long time working his horses into the blue ribbon class and there is nothing to indicate that the story will be different when it comes to steeds of steel and aluminum.

Earp has been making fast time within a week in the Napier racer that came out so near the top of the gasolene cars last year, but as under McDonald the green flyer has a pesky habit of throwing its shoes at a critical moment. It lost a rear tire on Friday and another on Saturday while tearing along at a hundred mile pace. Lancia has not yet accomplished much with his 110 h. p. Fiat, owing to minor accidents, although he has demonstrated that he is the easiest, if not the most fearless driver of the lot. Emanuel Cedrino and the plucky Mrs. Cedrino, who rides almost side-saddle on the Junior, along with Henry W. Fletcher, George W. Young's chauffeur, have fairly been leading the Fiat team when it comes to smooth, regular work. Walter Christie has been having more hard luck with his own special racer, owing to defective cylinder castings which make his chances appear dubious. Henry Ford's Detroit racer did not reach here until so late that it has not yet had a chance to give an account of itself. H. L. Bowden and J. R. Harding, the two Bostonians, who with Alfred Vanderbilt, represent the society contingent, are not seriously in the struggle and so do not call for serious consideration. Whether the society contingent is out of Florida racing for good cannot be told for another year, but it certainly looks that way. A manufacturers' meeting will lack the flourish of a society affair, but it is likely to prove far more thrilling. With the first day's contest only a few hours away it looks as if Hemery, with the 200 h. p. Darracq, and the Stanley steamer, which to-day unofficially shaved the kilometer mark, in spite of a cracked cylinder, would prove the stellar attractions. The steamer is certainly the fastest thing ever seen here for short distances

Digitized by Google

and gets away with even more readiness and ease than distinguished the famous Ross "tea kettle" of 1905. The beach has been in good condition for a week past and only good weather seems necessary to carry the annual race gathering of the Florida East Coast Association to success. But this Florida weather is fickle and furs may prove more comfortable than linen.

Ormond, Florida, Jan. 22.—Although Tourist Agent Stratton was aboard the Seaboard line's "automobile special" that left New York at noon on Sunday and did his utmost to make things agreeable, the passengers "had their troubles." There were about 75 of them, nearly all identified with the trade and fresh, or rather tired, from the New York Show. A cylinder head blew out near Fairfax, S. C., occasioning delay, and when the train reached St. Augustine the Flagler minions refused to let it run over the Flagler tracks to Ormond. It made a change of cars necessary. While the crowd growled, the growls were relieved by smiles at the misery of the "other fellow." Manager Kull, of the Wayne Automobile Co.'s New York agency, had to engage a special car on the Southern Railway for a Wayne party; it left New York 14 hours before the other train and reached here too late Monday night to make connections for Ormond.

While waiting at St. Augustine a fearful thunder storm prevailed, making it impossible to obtain food, of which there was not enough to go around in the railway restaurant. Everyone agreed that unless there are enough trains in future years, the Florida carnival at Ormond will see them no more.

Among those who came down on the Seaboard train were: A. L. Riker, W. D. Gash, A. G. Batchelder, J. C. Kerrison, W. H. Hoops, Jr. (Cadillac Co. of Chicago), W. J. Hart, Jas. Couzens, Peter Streenstrup, Benj. Briscoe, J. D. Maxwell, C. A. McQueston, John Van Benschoten, Herbert Githens, Frank L. G. Martin, George P. Tangeman, O. J. Mulford, John S. King and party of five, John M. Young and two, F. J. Regan, A. W. Church, Guy Vaughn, H. B. Joy, H. E. Dodge, E. H. Brandt, Mr. and Mrs. Henry Ford, Ed. Demar, E. W. Sutphen, A. J. Cooke, Oscar Lewisohn and H. S. Smith and wife.

Glidden Cup Route to be Changed.

It has been practically decided to make a change in the Glidden tour route as selected by the Cup Commission a short time ago. Numerous protests have come to the committee regarding the poor roads through Canada, and the Canadian section has been eliminated. Just what the exact route will now be has not been definitely determined, but the committee will meet within a short time to plan a more satisfactory trip. It had been decided to start from Buffalo, but this plan may also be altered.

A. C. A. AGAIN AT WALDORF

Five Hundred and Fifty Attend Annual Banquet—Novel Effects in Evidence.

In an atmosphere which suggested the perfume of a conservatory and in which there was not the slightest perceptible scent of gasolene, members of the Automobile Club of America and their guests, five hundred and fifty strong, sat down to the seventh annual banquet of that organization in the banquet hall of the Waldorf-Astoria Hotel, New York City, last Saturday night, 20th inst. The dinner and the speeches following were so long that many of the guests who started from Jersey City at midnight on the special train for the Florida races, had not time to divest themselves of dinner clothes.

The decorations were lavish and the committee on entertainment made good use of the generous appropriation set apart for this purpose. The great ball-room of the hotel was transformed into a veritable flower garden. Walls, pillars and columns had entirely disappeared under the banks and masses of forsythia, Southern smilax, Sybodian fern, potted palms and pine. From the topmost gallery to the floor and back of the guests' table were solid banks of the green decoration pierced with electric lights through which the American flag shone, surmounted by the insignia of the Automobile Club of America. In the two tiers of boxes extending around the balconies sat the feminine guests.

It was ten o'clock when the procession of the ices was started and there the apex of gorgeousness in banquets was reached. When the head of the long line of waiters rounded the screens that shut off the hall leading to the pantry room from the banquet hall, a big cheer went up, for the head waiter carried a red automobile two feet long and filled with ices. Then came other automobiles in many colors and sizes, horns, caps and goggles—in "life size." The piece de resistance was a large 1906 model car with a wonged female figure, typifying speed, standing in the tonneau. All over the hall were headlights freighted with ices. The menu cards were enclosed in a leather card case, with the club monogram on the outside and the name of the guest inside.

President and toastmaster Dave Hennen Morris was the first speaker. After strewing a few bouquets of thanks all around he touched upon the question of governmental support as regards automobile shows and races. Among other things he said:

"The King of England thinks it an honor to open an automobile show in London; his Imperial Majesty the German Emperor thinks it a great honor for him to do the same in Berlin; the French Republic takes pleasure in mobolizing 100,000 men to guard the course of the international race in France. We are now assuming proportions in America in regard to the development of the automobile which justifies us in hoping and in asking the national government and all the state governments to do something of the same kind in this country. I do not wish you to understand me as believing and advocating road racing. I think there is a very large element of danger in road racing, and I think every committee in every country which has had road racing feels the same way about it. The only safe and proper way is to have an automobile speedway, entirely safeguarded from any intrusion, and I hope that we shall soon see not only one but a dozen such speedways in the different states, East, West and South.

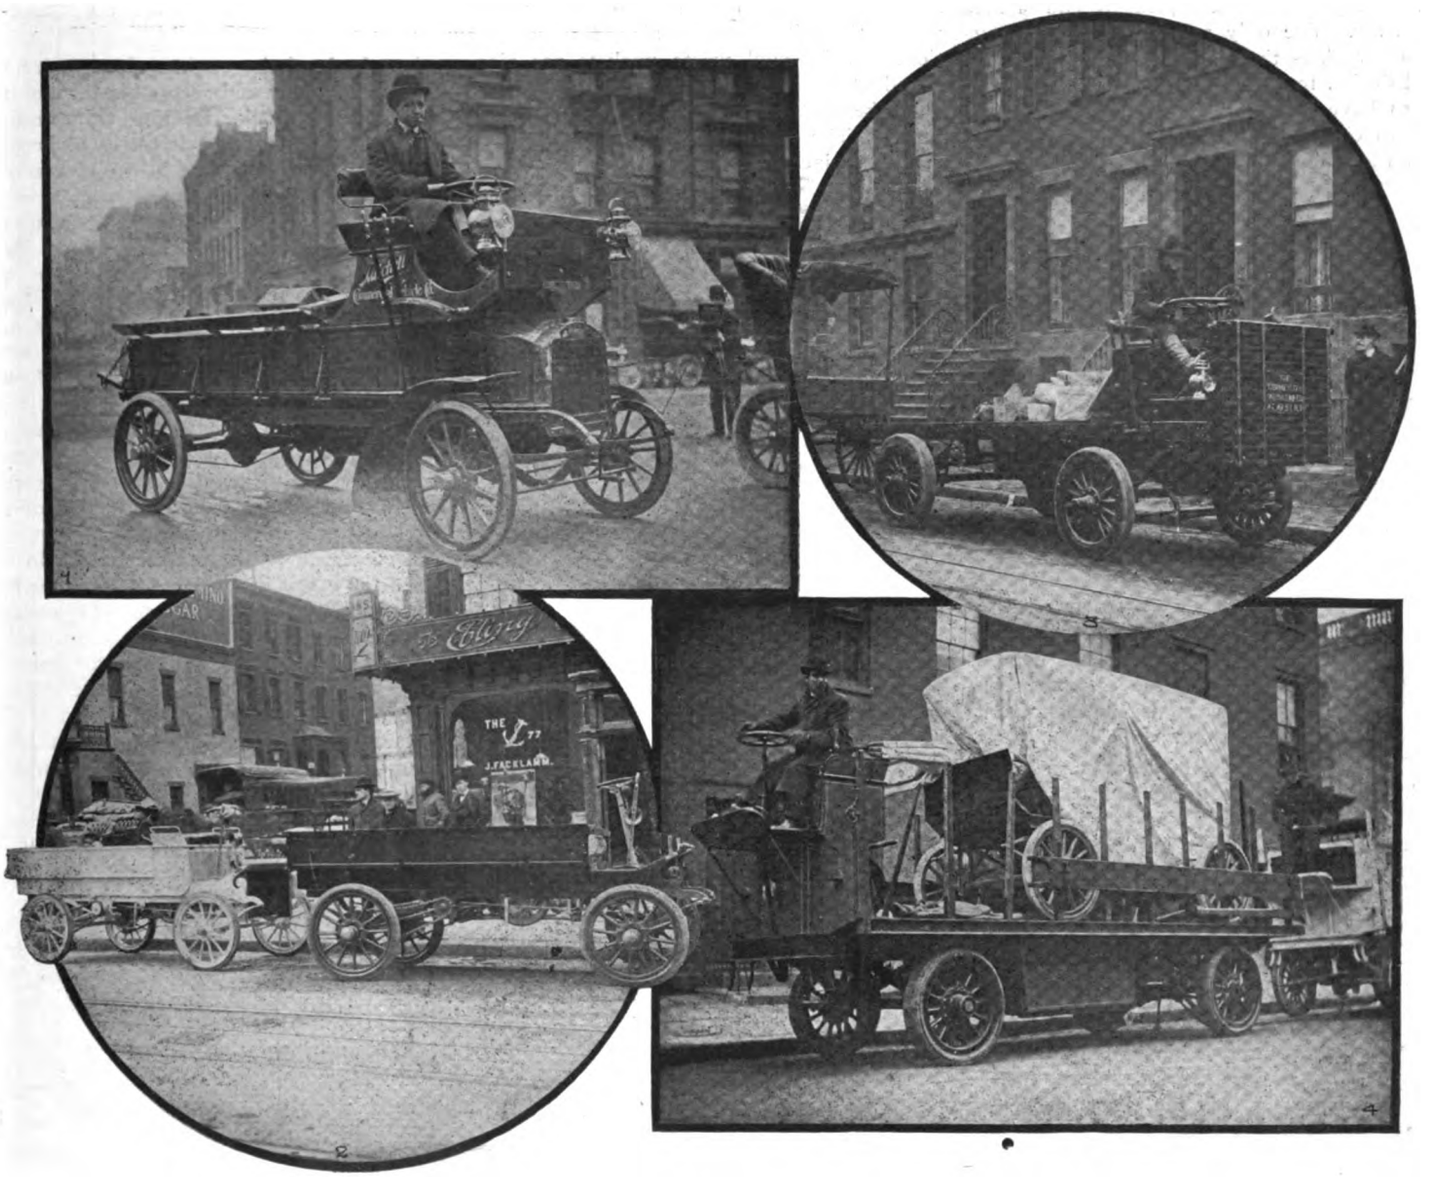
Mr. Morris introduced Alexander Graham Bell, who, however, spoke at length of aerial locomotion. Only once did he comment upon the rapid development of the motor vehicle. The eminent scientist won applause from the galleries when he compared the banquet hall as "a fairyland with the angels in the clouds." The other speakers were Henry D. Esterbrook, a lawyer, and Henry Duncan, a carriage manufacturer.

At the main table on President Morris's right, was Dr. Bell and on the left Colonel John Jacob Astor. To the right of Mr. Bell sat Henry M. Duncan, Jefferson Seligman, Henry C. Rouse, Colgate Hoyt, Milton J. Budlong and Samuel H. Valentine. To the left of Colonel Astor were Henry D. Esterbrook, William H. McElroy, General George Moore Smith, Winthrop E. Scaritt and John Brisben Walker.

Los Angeles Hill Climb in February.

Los Angeles, Cal., will have its hill climb, this having been decided at the last meeting of the Dealers' Association. Passadena Hill has been selected and the event set for February 22. Six classes are provided for, as follows: For runabouts costing less than $1,000; for runabouts costing less than $1,500; for all classes of runabouts; for touring cars costing less than $1,500; for touring cars costing less than $2,500 and for touring cars costing more than $2,500. All cars must carry loaded weight equal to their complement of passengers.

Austins Choose Their Officers.



At the annual meeting of the Austin Automobile Club, of Chicago, Ill., these officers were elected: President, J. H. Francis; first vice-president, C. E. Ingalls; second vice-president, J. E. Plew; secretary, C. E. Westwood; treasurer, John S. Wayman; surgeon, Dr. M. B. McBirney.

Club Formed in Erie.

The Erie Auto Club, of Erie, Pa., has been organized with the following officers: President, F. H. Payne; secretary, H. N. Fleming; governors, F. H. Payne, Frederick Densmore, Dr. E. F. Gifford and H. N. Fleming.

The Business Vehicles at the Shows

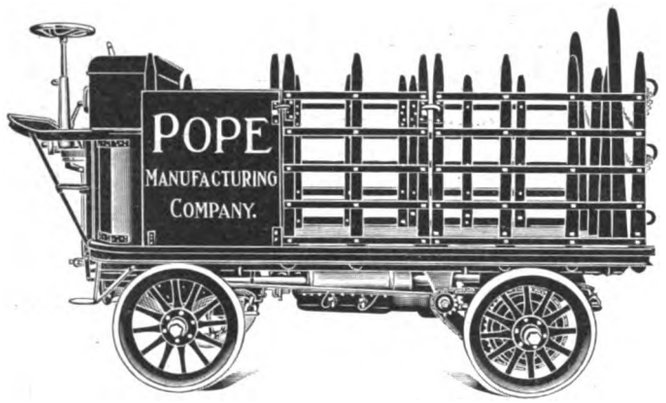
1. MITCHELL. 2. RAPIDS. 3. COMMERCIAL. 4. COLUMBIA.

Although during the automobile shows, the commercial vehicles attracted comparatively little attention, when the shows closed on Saturday night last, those vehicles demonstrated practically how great has been their progress and really gave an open air show of their own.

Never before were half so many motor wagons and trucks employed to cart away the cars and other goods that had been on exhibition. The vicinities of both Madison Square Garden and the 69th Regiment Armory—the latter in particular—were almost "alive" with them and hardly two of them were of the same type. It was probably the largest and most assorted gathering of commercial vehicles in practical use ever seen in New York.

In this connection one of the best and timeliest demonstrations of practicability was given before the show by the Knox trucks. Each of the Knox pleasure cars staged in the Garden had been loaded on a Knox truck at Springfield, Mass., and transported to New York over the common roads, and although the latter were in miserable shape, the mud being hub-deep in places, the journey of 140 miles was made without trouble.

The vehicles displayed at both shows indicate that the pleasure car is still their foundation. In fact, one or two were shown that are nothing more or less than pleasure cars having in place of a bonnet over the engine, an elevated seat such as is found on horse-drawn trucks and electrical trucks of established design.



Take, for example, the Franklin light delivery wagon, one thousand pounds capacity. If the seat were stripped from it and the structure that goes to uphold the seat, a regular pleasure chassis would be left with the engine in the usual position for a pleasure vehicle.

And this comment is not in the nature of criticism, because there is no reason why this should not be so, but it will make plain to the one who has not seen the truck just how such a light delivery wagon is evolving from the pleasure type. The Mitchell light delivery wagon is another instance of the conversion of a pleasure vehicle into a commercial vehicle. The two-cylinder vertical engine and its transmission is applied to a running gear that is heavy enough to do the work on solid tires, the seat being mounted over and above where the bonnet usually is, in fact, some of the bonnet, as ordinarily used for pleasure cars, is in evidence.

As a contrast with this gradual evolution from the pleasure to the commercial motor car, the Pope-Hartford 2500-pound capacity

Digitized by Google

motor truck serves as an example. It was shown for the first time at the Garden. This truck has been built from beginning to end regardless of the pleasure end of the industry. The only relation it has to any other truck is that of resemblance in style and design to the horse drawn truck. Features have been retained that seem essential to either horse or motor drawn truck. Yet the efficiency of the mechanical design

POPE—HARTFORD GASOLENE TRUCK.

has not been sacrificed. There has been a very happy blending of the essential features of a good truck as we understand it to-day and a good motor vehicle.

This truck is worthy of description in detail. As stated, its capacity is 2500 pounds, but the proportions of the truck are such that there is no doubt but what a much greater load could be safely carried and have the ill effects felt by the tires only. The seat is high in front, very nearly as found in the best electric trucks of large capacity. The axles and wheels are heavy, the wheel bearings rolling on Timken roller bearings. Although the weight of the truck is 5500 pounds, it moves with a slight push on a smooth surface. The frame of the truck is of the best accepted form—4-inch beam, I beams with wooden cross members, all mounted on regulation truck springs.

The motive power is a two-cylinder opposed engine horizontally placed crosswise on the truck, so that the crank shaft of the engine is in line the length of the truck. The motor is hung on a subframe built for the purpose and hanging from it by four bolts, the removal of which permits the lowering of the motor free of the truck altogether and replacing it with another in case of temporary disablement or in case repairs become necessary. This is a particularly good feature in any commercial car. The motor consists of two 5½ x 4½ inch cylinders with all valves mechanically operated. The ignition is by high tension current and spark plugs, the current being furnished by dry batteries, 20 in number, coupled in series of multiples of four. With this system of supply for ignition purposes no thought need be given to the batteries for four or five months at a time if they are kept dry.

The lubrication of the engine has been given a great deal of attention. Wool waste boxes surround the main bearings, a system has been found to give the best results in connection with the electric truck proposition; it requiring almost no attention. Little wool waste pockets are also found at the top side of the cylinders, so that the piston rubs on them at every stroke. The oil in these wool waste pock ets is replaced continuously by a tank situated high up under the seat and having plenty of gravity flow, and also having pressure from the crank case as an additional force for insuring constant oiling. The cranks in revolving pick up oil with scoops from the crank case, each having its own pocket to collect the oil.

The cooling system requires no pumping, the water circulating by thermo-siphon to a large coiled pipe radiator with corrugated fins located under the footboard and covering nearly the entire front of the truck below the footboard. Naturally circulation to this radiator will be very rapid and thorough, all pipe connections being large and the bends easy. The elevation of the radiator gives a strong natural current.

The gasolene supply tank is up under the seat and of 24 gallons capacity, surely enough to run all day long without replenishment. The commutator is attached to the front side of the engine within easy reach from the front of the truck and of the Pope-Toledo type.

Just back of the engine, close under the floor of the body and accessible through the floor of the truck, is the transmission, which is a feature and is likely to become a very prominent feature in the commercial truck. It is a new adaptation of a series of magnetic clutches. With four speeds ahead and a reverse and all gears in mesh all the time and magnetic clutches for each gear, the combination is controlled by a lever exactly as an electric truck is controlled. The power to operate these magnets is furnished by a small General Electric motor driven through a shaft leading from the transmission and kept at a constant speed by the governor. This current is carried to the controller and by the controller returned at will to any one of the six clutches within the transmission.

Some three of these clutches are in use when the car is in motion and in order that there shall be no drag to the residual magnetism in changing from one gear to another, the magnets are so arranged that when a change is made from one gear to another the application of a magnet to a new gear positively removes the magnet from contact with the gear last in use.

CHAMPION—McCREA ELECTRIC TRUCK.

This whole combination runs in oil and will require no attention whatever.

By means of bevel gears the sprocket shaft is driven, carrying a sprocket at either end and by chains to the hub of each of the rear wheels.

The brakes are of the internal expanding type on the hubs of the rear wheels, being applied by foot lever sticking up through the footboard.

There are two levers on top of the steering wheel, one controlling the ignition and the other the throttle, no governor being used. By a small foot pedal resistance is

Digitized by Google

AFTER THE SHOW WAS OVER.

thrown into the magnetic field making possible the slip of the clutches, delicate, careful and slow movement of the truck being thus rendered possible.

The steering mechanism is very powerful, of very generous proportions, the motion being transmitted from the footboard by levers to the rear of the engine and thence to the steering knuckles.

Description of the Knox commercial wagon seems somewhat superfluous as it is so well known and so largely used in a certain field of operation.

The form of engine used by the Knox people is their regular two-cylinder, air-cooled, opposed under the body, the crank shaft at right angles to the length of the body, the same as has been in use on their other vehicles for some years. It lends itself particularly well to medium weight truck work in the arrangement of its parts. The control is exceedingly simple, in fact the whole motor is simple.

The transmission is of the planetary system and is also simple and adapted to the work for which the Knox truck is built.

The different forms of body supplied with the Knox trucks are numerous; light delivery wagons, open express wagons and finally and not the least important, large passenger wagons seating from fifteen to thirty. Most of these forms are very familiar sights about the streets of our large cities and have all become a factor in delivery service for dry goods houses and provision dealers, not to mention express companies and similar uses.

In the Olds commercial exhibit was found light delivery wagons especially built for business purposes and well considered. The motor is of the two-cylinder vertical type, under the seat with crank shaft across the chasm, the power being transmitted from the crank shaft to the engine by means of a Morse silent chain to a countershaft two or three feet towards the rear axle, the countershaft being parallel with the rear axle. On this countershaft is found the planetary transmission system transmitting its power to the rear axle by double chain. The transmission gives two speeds ahead and reverse.

The motor is water cooled with a radiator in front under the footboard, circulating the cooling liquid by means of a pump.

Some of the other details in connection with the wagon are as follows: The cranks are set at 180 degrees, therefore balancing well and easily. The motor is 5 x 5 inches in dimensions, and is so geared as to give the wagon a maximum speed of 18 miles per hour. The gasolene is high above the motor in a tank at the rear of the dash, just over the footboard. The lubrication is supplied by force feed from individual pumps to each point of lubrication. The battery consists of dry cells, also storage battery. The ignition is high tension through spark-plugs. The means for starting guards against accident because of advanced spark. Before the crank can be attached a sector with a hole in it must be moved into a given position, which retards the spark and releases the compression. As soon as the crank is withdrawn the spark returns to any point where it may have been left and the compression becomes full and operative. This makes starting exceedingly easy and safe, no matter how careless the operator may be.

There are two types of trucks furnished by the Olds works, one heavier than described, geared to only 12½ miles an hour. It is furnished with the same motor and transmission, the gearing and running gear being changed to suit the increased weight.

The Packard Motor Car Company exhibited several trucks equipped with a two-cylinder vertical motor, sliding gear transmission and other details resembling those of the Packard touring car, the chassis and running gear being, however, built solid

Digitized by Google

and heavy, and well adapted for the intended purpose.

The Hewitt Motor Company exhibited a very heavy and strongly constructed three-ton truck and a light one thousand pound delivery wagon.

The large Hewitt truck is supplied with the now familiar type of marine, four-cylinder gas engine with open cranks, which is lubricated by a gear pump of special design, forcing oil to every bearing in positive quantities.

The power is transmitted from the engine to a transmission of the planetary type, but of special design, peculiar to the Hewitt design, and through the transmission to the shaft and cardan and universal joints of massive size to the sprocket-shaft and double chains to the rear wheels.

wagons. The product of this company also is widely known in all the larger cities. Their large five-ton truck has an auxiliary hoisting plant under the front seat, making it a most valuable machine for heavy trucking of large machinery that has to be hoisted. The running gear of the equipment supplied by this company is peculiar in the fact that full elliptical springs are used on both front and rear axles, and that a thrust pedestal is necessarily supplied to guide the axles and keep the springs in their proper position. Solid rubber tires are used on all these electric wagons and trucks without exception. On some of its trucks the Vehicle Equipment Co. employs the spur gear drive and on others the chain drive, in accordance with the type of wagon.

and exhaust mechanically operated. The motor shows 24 horse-power at 800 revolutions per minute.

The truck rolls upon large Timken roller bearings, heavy wheels and solid rubber tires. Eight dry cells furnish the electricity for jump spark ignition. In the matter of control, a new feature is introduced in the fact that the ignition is retarded upon the application of the brakes. The power between motor and axle is transmitted by a leather-faced cone clutch upon one end of the crank, the fly-wheel being on the other end.

A large part of one side of the wide main entrance of the Armory was monopolized by the Iroquois gasolene sight-seeing 'bus, the very massiveness of which did not permit it to be overlooked. This is a ponder-

THE KNOX TRUCKS LOADED WITH THE KNOX SHOW CARS.

The rear tires are of the double type and mounted on exceedingly strong wheels. The control is all worked by foot and is of an interlocking kind. If it is attempted to apply any one gear, it can not be done without releasing the gear already in use, thus absolutely preventing the crossing of gears. Ignition is supplied by a low tension magneto with make and break spark.

The light delivery wagon is driven by a single cylinder motor under the body with ignition from high tension magneto, and the power transmitted through a planetary gear system to the rear axle by a chain. The same foot control with safety device is used.

A full line of electric trucks was shown by the Pope-Waverly factory in sizes from one thousand pounds up to three tons. A line covering the whole range of demand for delivery purposes.

The Electric Vehicle Company staged a line of electric trucks and wagons, from one thousand pounds capacity up to 1, 2, 3 and 5 tons capacity, this last size not being shown, however. The product of this company is so well known that description is scarcely necessary.

The Vehicle Equipment Company displayed a full line of electric trucks and

The Atlas truck of three tons capacity, which was shown in the Armory, is massive in the extreme. The motor arrangement is totally unlike anything else to be found at the present time. It consists of a pair of twin cylinders horizontal with the heads pointing forward. On the crank shaft is a gear driving to the countershaft with a reduction of about five to one. The gears on this countershaft mesh with gears on the axle, all of the spur type.

The change gear mechanism is of the sliding kind with three speeds ahead and reverse, the gears being tremendous in size and yet operating freely when manipulated by the change lever at the right hand side of the operator.

The motor is hung upon a sub-frame supported at the front end by a trunnion carrying the load upward by means of a heavy forging to the body and thereby bringing the weight on the front end of the sub-frame and on to the springs and independent of the front axle in front, the rear end of the sub-frame being upon the rear axle.

A large radiator is under the center of the body, also supported on this sub-frame. Some of the details of the motor comprise a piston oil pump, inlet valves

ous specimen of construction in every respect and serves as an illustration of what the gasolene motor is capable. It is the product of the Iroquois Iron Works and is designed throughout in a manner that argues well for its durability in the hands of drivers accustomed to handling heavy trucks with horses. The engine is of the standard four-cylinder vertical pattern, placed tandem, the final drive being by side chains. It is in brief a very much enlarged edition of the touring car type, except that the motor is mounted much higher than usual owing to the requirements of the frame. It should give an excellent account of itself.

Shunted off into one of the cell like compartments that subdivided the basement into a bewildering maze, were the trucks of the Rapid Motor Vehicle Co. This firm's exhibit comprised a large 'bus in addition to one and one and a half ton wagons, all employing the two-cylinder horizontal opposed engine as motive power—a type well adapted to this class of work. The same firm also exhibited a delivery wagon body without chassis.

The Logan Construction Co. exhibited quite an array of commercial wagons, ranging from the light delivery wagon up. These,

Digitized by Google

including a medium capacity platform truck and a heavy delivery wagon, were all equipped with the standard Logan chassis, consisting of two-cylinder horizontal opposed motors with a planetary gear on the light wagon and a two-speed sliding gear on the heavier types. In addition to other improvements made on this line of vehicles, the heavier sizes embody the Logan truss frame—a light and powerful type of construction that should form an ample guarantee against trouble in this direction.

The Crown light delivery wagon, which was a neat specimen of the wagon builder's art that bore such a close resemblance to the standard horse-driven type that it seemed as if only the shafts were missing, was installed in another corner of the basement. It is the product of the Detroit Auto Vehicle Co., and incorporates the friction drive exploited by this firm. A feature of the latter lies in its giving direct through drive on the high speed when the friction surfaces are idle and out of engagement. Another exhibitor in the basement was the Pittsburg Electric Vehicle Co., which had the trouble of bringing the major part of its exhibit on from Pittsburg only to be compelled to ship it back again without being able to show it, as the runway to the basement did not permit its entrance. Their exhibit was confined in consequence to a single electric delivery wagon of 800 pounds capacity.

The Auto-Car Equipment staged an electric hotel 'bus which was promptly bought up by an Atlantic City boniface.

Eisenhuth Creditors Again Make Trouble.

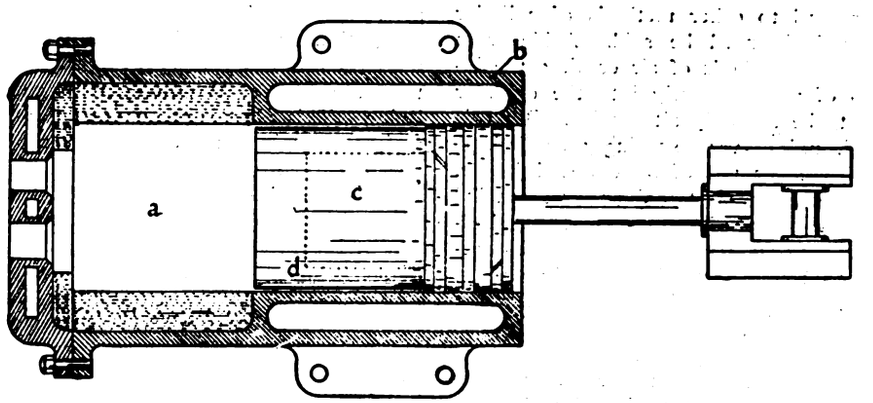
It appears that the attachments levied on the Eisenhuth Horseless Vehicle Co.'s Compound cars, which were intercepted while en route from the factory at Middletown, Conn., to the New York Show, also included everything in the factory, in which keepers were installed.

The actions were brought by Mary James and Marian J. Read, both of Brooklyn, N. Y. The former seeks to recover $100,000, and the latter $50,000, money which they claim was borrowed on notes by the company. The proceedings brought out that I. E. Gates, of New York City, is president of the Eisenhuth company.

The suit is returnable to the superior court of Middlesex county the first Thursday in February.

New Company to Build Big Cars.

The Huntingdon Automobile Co., has leased the Underhill Building, in Huntington, L. I., and is making ready to produce six-cylinder touring cars. August Heckscher, of the zinc trust, is said to be largely interested in the company, of which Ralph P. Kinney, of Cleveland, O., is president; F. A. Berthold, of New York, secretary and treasurer, and J. J. MacMulkin, superintendent. The latter previously was connected with the Mercedes establishment and so "knows his book."



NEW SYSTEM OF COOLING

Radical Departure Suggested and Explained —Advantages Claimed for it.

It is a matter of common observation in gas-engine practice, that an air-cooled cylinder will develop somewhat more power, than could be secured from a water-jacketed motor of equal size, and under otherwise equivalent conditions, says S. M. Howell in the Scientific American. In other words, the engine without water cooling is the superior in point of economical performance. This experience agrees perfectly with the well-known simple theory upon which the production of power is dependent in all forms of the internal-combustion motor.

The gas engine is a heat motor, pure and simple, producing power solely by the development and conservation of a high degree of heat. The working fluid is a mixture of air and certain inflammable gases, and the whole is violently expanded by the instantaneous burning of the contained gas and the intense heat thus generated. It must follow, therefore, that a water jacket or any device which operates to dissipate the heat of combustion, prior to the moment of exhaust, will also lower the pressure and curtail the power of the engine in a corresponding degree. In the case of the water-jacketed engine, the cylinder walls have a comparatively low temperature and rapidly abstract heat from the burning charge, thereby reducing the pressure and diminishing the power of the stroke. But the so-called air-cooled engine, having a much higher temperature, will therefore, develop a higher pressure, and for a time at least, or until the cylinder becomes excessively hot, will produce more power. The amount of heat lost through the walls of a gas-engine cylinder by the use of a water-jacket varies with the conditions. A high piston speed and high compression are factors which have a marked effect in reducing this loss; for the reason that in such cases the cylinder is smaller than would otherwise be required to develop the same power. This reduces the extent of water-cooled surface with which the ignited gases are in contact; and also, by reason of the quicker stroke, shortens the time of such contact.

The amount of heat absorbed by a water-jacket may readily be determined in any given case by a simple calorimetric test of the water used, taking note of its volume, and its temperature as it enters and as it leaves the jacket. But I have observed, in making experiments of this kind, that the figured result does not always account for the deficiency which exists in the power of the engine, as compared with the heat which should theoretically be developed, and that too after making allowance for all other apparent losses. In explanation of this it may be urged that the full temperature and the total amount of heat generated by the complete burning of the fuel, is not, in the case of a gas-engine cylinder, fully developed. The combustion is more or less imperfect by reason of contact with an extended metallic surface at at a comparatively low temperature. If this is true, then we have also an indirect loss caused by incomplete combustion, and chargeable to the use of water cooling.

The hydro-carbon liquids or gases, which are the usual fuel of gas engines, consist essentially of hydrogen and carbon. The hydrogen is readily inflammable, and under ordinary circumstances is capable of but one reaction, resulting in the formation of the vapor of water. The elastic force of this vapor, powerfully compressed within the confines of the cylinder by the heat of combustion, forms a large part of the working fluid on the pressure of which the piston is driven. The trouble would seem to arise from a deficiency in the burning of the carbon burning element. Carbon in burning may form either of two combinations—carbon dioxide or carbon monoxide. The former is always the result under fairly favorable conditions, but in some cases, notably those in which the flame is confined within narrow limits and in close contact with metallic surfaces, the heat is so rapidly withdrawn that the temperature falls, and the process degenerates into incomplete union with the oxygen of the air, and the formation of carbon monoxide, the difference being that the amount of heat liberated by this degenerate reaction is less than

Digitized by Google

one-third that which would result from perfect combustion of the carbon and the formation of carbon dioxide. A familiar instance of this defective form of combustion is seen in the attempt to pass a gas flame through a sheet of gauze or cloth made of fine metallic wires, or to conduct a flame through small metal tubes. In these cases, the cross-sectional area of the passages is very small, and the extent of cold metal comparatively large, with the result that the temperature falls below the kindling point, and the flame is extinguished or reduced to the monoxide reaction described above. That these instances have a parallel in the conditions which exist in gas engine practice, seems probable. It is obvious, however, that such an effect must be more marked in the case of small engines than in those having large cylinders, and could easily be determined in any case by a careful analysis of the exhaust.

In regard to other methods of cylinder cooling, little need be said. Aside from the various methods of air cooling, the injection of water directly into the cylinder seems to be the only alternative. But this method, unless very sparingly applied, is worse than the use of an external jacket. It was one of the first cooling systems tried in the early days of the gas engine; and although modern designers sometimes attempt to revive it, is has usually proven unsatisfactory. This is evidently for the reason that the water in direct contact with the burning charge must greatly modify its temperature, while the cylinder walls would be only indirectly affected, and might still be insufficiently cooled. Then, too, the introduction of too large an amount of water into the cylinder of a gas engine, resulting, of course, in the immediate production of a body of steam, antagonizes combustion, and renders the ignition more difficult, and in the case of a four-cycle engine, has a tendency to destroy the vacuum produced by the retreat of the piston, filling the cylinder with steam on the suction stroke, and thus interfering with the inspiration of the charge. And still it is true that a small quantity of water, if properly regulated, may be injected into the cylinder of an air-cooled motor with much advantage. In this case it moderates the excessive heat of the contact surfaces, and assists lubrication by saponifying the oil and loosening any carbon deposit, which may otherwise adhere to the cylinder walls.

But after demonstrating the disadvantages of water cooling, the fact still remains that red-hot metal surfaces can not be continuously worked under heavy pressure in air-tight contact. Some means must be adopted whereby the destructive effects of heat on the cylinder and piston may be obviated. Thus it seems that in the present state of the art, the efforts of the gas engine designer are opposed by a conflict of natural conditions, and that he must so construct his engine that durability will be secured at the sacrifice of economy.

In the figure which accompanies this article there is shown the high-pressure cylinder and piston which has for its object the utilization of the greatest possible amount of available heat in a cheap liquid fuel, viz., crude or partly refined mineral oil. It may be noticed that this cylinder consists of two external parts, viz., the combustion chamber a, the internal walls of which are protected from the heat by a lining of refractory material, indicated by the dotted surfaces; b is the cylinder proper, wherein the piston and rings work in air-tight contact. This part of the cylinder is water-jacketed in the usual manner. The admission and exhaust valves are located in the head of the combustion chamber, this member being also partly jacketed to protect the valves. The piston c is of the elongated type, that is, of somewhat more than the usual length, and having the rings near the forward or open end, the other end being covered by a thick cap d, of the above-mentioned refractory material. The elongation or extended part of the piston, with its refractory cap, is slightly smaller than the bore of the combustion chamber lining. This allows the elongated part to reciprocate within the combustion chamber, and to effect the necessary displacement without actual contact. Leakage past the piston is stopped by the rings at the opposite end which works within the cool part of the cylinder proper. The exhaust passes into a second and larger cylinder on the same shaft, where it delivers its remaining power in the well-known manner common to all compound engines. The cycle may be either two or four, but in either case, pure air alone will be admitted on the charging stroke. This air is compressed on the return stroke to a very high degree—300 to 500 pounds per square inch. The oil begins to enter (forced in by a pump) at the commencement of the power stroke, and without the use of any igniting device whatever, is instantly fired by the heat of compression, maintaining the required pressure throughout the stroke, in the manner of those engines which operate upon the well-known continuous combustion system.

A gas engine constructed upon these lines would possess the following advantages: It would be perfectly adapted to the use of the cheapest liquid fuel known. The injurious effects of heat upon the working faces of the cylinder and piston would be avoided. The losses incident to the use of the water jacket would be totally eliminated. The conflicting requirements encountered in the present methods of design would be obviated. The engine would be as durable as any other, and its thermal efficiency would be the highest possible in a heat motor.

Concerning the advantages of compounding, it should be observed that the exhaust from an engine operating upon the above system has a very high pressure (100 pounds per square inch) and the gain by this means would therefore be considerable.

Regarding the character of this proposition for a new gas engine, it is virtually a composition of at least three expired patents, and its value therefore does not consist in the novelty of its elements, but in the peculiarity of their combination. Certain other known devices might also be involved in its final construction, but this would depend upon the mechanical details of the arrangement by which the oil was delivered to the cylinder, rather than to the operative principle of the engine.

The temperature of the linings and piston cap—owing to the constant inspiration of fresh air through the inlet valve—would never exceed a dull red heat, and the valves would not become much hotter than is ordinarily the case in any gas engine.

The drawing shows the piston at the extreme end of its outward stroke, the length of which is in this case, about equal to the cylinder bore.

It is not essential that the compression pressure should be as high as 500 lbs. (mentioned above), as the charge would be self-igniting at a point considerably below this figure.

The Coming of Springs.

Dr. R. Lovell Edgeworth, an old time writer, writing in the year 1678, wrote an essay on the construction of roads and carriages, which appeared in a printed form in 1817 brought out by a London publisher, says the Carriage Monthly. The writer demonstrated that springs were as advantageous to the horse as to the passengers and he built a vehicle for the society of English arts and manufacturers, which awarded him three gold medals for his success. In this conveyance the axle trees were divided and the motion of each wheel was relieved by a spring. During the 18th century 12 patents were taken out for springs.

A subsequent writer, a Mr. Thrupp, in his History of Coaches, says "that under springs were invented in 1818 by a Mr. Windus with a view of easier riding and to afford greater relief to the under carriage from direct concussion." The elliptic spring was invented by Obadiah Elliott in 1805. For this improvement he received a gold medal from the Society of Arts. The elliptic plates were almost straight and were conected by a shackle coupling at each end.

The drawing accompanying the patent specifications shows two plates only, but the specifications provided for more if necessary. The patentee said his invention consisted in building any four wheeled carriage without a perch or crane. As soon as the invention proved to be all that was claimed for it, the construction of heavy C springs declined. C springs were again revived in the '60's, but since 1870 they have been on the decline and have almost ceased to be made for two and four wheeled carriages. The invention of the elliptic spring has influenced carriage building and, in time the design of the automobile, more than any other invention in that department.

HUDDY TALKS OF LAWS

"Too Much Horse Sense in Most of Them," he Says—Subject Well Handled.

"One of the most interesting things connected with automobiling is the legal status of the motor car on the highway," said Winthrop E. Scarrit, in introducing Xenophon P. Huddy, who delivered a lecture on "The Legal Aspect of Motoring," before the Automobile Club of America, on Tuesday evening, last. "We know that the horse was here a thousand years ago," he continued, "but the automobile will be here a thousand years after the horse has gone."

Prof. Huddy confessed to an utter lack of knowledge regarding the automobile itself and also held himself willing to correct his legal knowledge of it, should any of his audience think fit.

"It is hardly necessary to mention that the automobile constitutes personal property and the fact that it is property, affords to its owner protection from legislative and official oppression," he said. "Speaking generally, the automobile is a vehicle and it is to be classified with other vehicles such as the carriage and the street car. The highest courts of several States, in considering that the automobile is propelled by a power within itself, is of unusual shape and form, capable of high speed and produces more or less puffing, have declared that these features make such a horseless vehicle a source of danger to pedestrians and persons in horse-drawn vehicles.

"It is particularly noticeable, however, that up to the present time, no court has decided or stated that the automobile itself is a dangerous machine. Whatever language the courts have used, apparently condemning motoring, has been directed against the careless or reckless chauffeur or operator—not against the machine. One who operates an automobile should possess something more than expert knowledge of the machine's construction, or the best mode of operating to obtain the highest speed. The hazard to which the safety of pedestrians and persons with horses may be exposed, results from the personal part played in motoring, rather than from the nature of the vehicle. It is evident, therefore, that the manner of driving the machine and that alone, threatens the safety of the public.

"It cannot be disputed that the false notion that the automobile is a dangerous machine has no standing and that it is the liability of dangerous operation that is at the foundation of all the present adverse automobile legislation. Eliminate the liability and a good part of the enactments on the statute books of the various States must fall. The motor, in addition to its other advantages, is the most sanitary vehicle that travels the streets, yet it is subjected to the most rigid legislative regulations—all because of the so-called dangerous element in automobiling.

"In almost every legal controversy there is a question as to the significance of words, so also the language of legislative enactments is often the cause of litigation. The automobile or "self moving" carriage has not yet been judicially defined, though many of the courts have attempted to describe the motor car. The only definition extant appears to be that of a law dictionary which states that the term means "all motor traction vehicles capable of being propelled on ordinary roads." Many of the automobile acts expressly define the terms automobile and motor car and it is quite generally provided that the terms shall include all vehicles propelled by power other than muscular, excepting, of course, motor vehicles running on tracks and steam rollers. But it has been emphatically laid down that an automobile is a carriage. It has also been announced that the courts will assume judicial knowledge of the motor and its characteristics, power of speed and the consequences of its use.

"In the District of Columbia, it has been held that a statute imposing a tax upon proprietors of hacks, cabs, omnibuses and other vehicles for the transportation of passengers for hire, did not include an electric automobile, as such was not known nor in use when the law was passed. In Pennsylvania there is a decision in apaprent conflict with this case.

"Turning to the rights of the motor car on the public highways, we must bear in mind that the purposes of the public ways contemplate all lawful means of transportation. The use to which the public way may be put comprehends all modern means of carrying, including the motor car. A recent Indiana case correctly states that 'in all human activities the law keeps up with improvements and progress brought about by discovery and invention, and if the introduction of a new contrivance for transportation, conducted with due care, is made with inconvenience and even incidental injury to those using the ordinary modes, there can be no recovery, provided the contrivance is compatible with the general use and safety of the road. It is, therefore, the adaptation and the use, rather than the form or kind of contrivance that concerns the courts.'

"The rights of the automobile on the public ways are equal to the rights of the pedestrians and horse drawn vehicles. This has been judicially declared a number of times by various courts in the United States. But it seems according to a Pennsylvania decision that a turnpike company has the power to exclude motor vehicles from its road because of the danger caused by their use.

"Owing to the alleged dangerous element of motoring, many of the State legislatures have passed enactments requiring the registration of motor vehicles and the licensing of owners or operators. This, of course, the State has authority to do under its police power, which authorizes it to enact laws for the safety and general welfare of the people, provided that the legislation does not transcend the provisions of the State or Federal constitution. A license to operate an automobile is merely a privilege; it is not a contract and may be revoked for cause. And the license is only a protection within the jurisdiction of the authorities granting it, though this rule is inapplicable where non-resident licensed operators are made exempt by statute.

"Many interesting test cases in reference to automobile legislation have been decided. As a general rule the regulations have been upheld by the courts where the contention was against their constitutionality on the ground of class or special legislation, discriminating against motor cars and placing upon them restrictions and burdens not imposed upon other vehicles. Not only is it necessary that people generally should be educated to appreciate the automobile, but some of our legislators and judges need a little 'automobile sense' drummed into and much 'horse sense' drummed out of their heads. We have a horse-crazy court in California which recently distinguished itself by protecting the farmer traveling at night. The Board of County Supervisors of Marin County, Cal., passed an ordinance providing that 'No person shall run an automobile on any highway of Marin County between the hours of sunset of any day and of sunrise of the day following.' A violation was made punishable by fine and imprisonment.

"A gentleman prisoner convicted under this law, not wishing to remain in prison, brought habeas corpus proceedings, claiming that the ordinance was unconstitutional and his incarceration therefore illegal. The Supreme Court of California, however, in the administration of its 'horse sense' law, decided that the ordinance constituted a reasonable and valid regulation. It is interesting to note what the court said in this case: 'If the use of the automobile gradually becomes more common, there may come a time when an ordinance like the one here in question would be unreasonable.'

"California is not the only State that has contributed rich legal literature in the form of judicial utterances concerning motoring. An automobilist was fined $25 for exceeding the speed limit in Columbus, Ohio, the statute prohibiting more than 7 miles an hour. The contention was that the ordinance discriminated against the motorist, because the street cars were allowed to run faster. The court held such discrimination proper because the street cars are confined to their tracks and can easily be avoided, whereas automobiles have no certain course and are, on that account, more dangerous to the pedestrian.' The absurdity of the proposition is apparent on its face, and it does not take a lawyer to discover its fallacy.

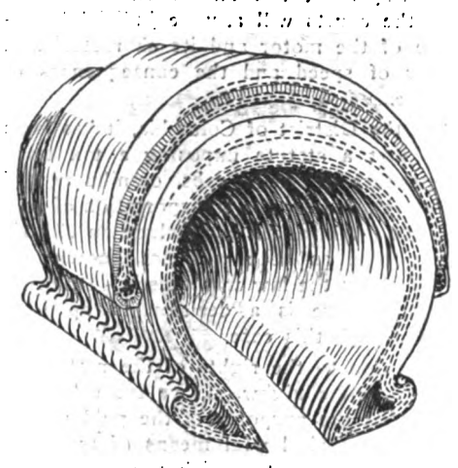
"How soothing to the motorist as compared with the instances just mentioned, is

Digitized by Google

the judicial utterance of the Appellate Court of Illinois, which held that Chicago had no power to require by ordinance the taking out of a license, examination and payment of a license fee. In this case an injunction was granted prohibiting the city authorities from enforcing the regulation. This is the strongest case decided in this country, but with fairness to all concerned, I believe that the principle of this decision is wrong. The law making power of a State or municipality, undoubtedly has the power to require the registering and licensing of motor vehicles.

"An important part of the legal aspect of motoring surrounds the chauffeur. The term in legal significance may be said to mean any person operating a motor vehicle as a mechanic, employe, or for hire. This is the specification of the New York act as well as those of other States. The relation is that of master and servant, to which attaches all the rights and liabilities connected therewith regardless of the form of employment.

"The statutory requirements are not all the operator must understand. The courts have commenced to lay down rules in reference to operating motor vehicles and these are as binding as legislative regulations. An instance of this in New York is the decision that the motorist is obliged to stop when passing a fractious horse whether a signal be given or not. The duty to stop under such circumstances is independent of statute and it has been expressly so held by the Illinois courts as well as those of other States. Nor is the operator exempt from liability for a collision merely by showing that he was not exceeding the legal limit at the time.



"The law, however, is not all against the automobilist and in favor of others. If he has complied with the law, his rights on the road are equal to those of all others. He has the right to assume and to act upon the assumption that every person he meets will also exercise the ordinary care and caution in leaving the machine unattended. It is not necessary, as stated in a New York case, to chain the machine or to fasten it to a post."

Prof. Huddy concluded with a lengthy comparison of the merits of the English "Light Locomotive Act" and the "Motor Car Act" which is an amendment of it, with American legislation, and to the detriment of the latter.

According to a recent cable report, Charles J. Glidden has completed his first section of the second instalment of his "several times around the world tour," by arriving at Calcutta. This first section comprised 4,405 miles as well as the longest automobile tour of India ever made. His total mileage is now 29,505. The next spot on the globe to be explored is Burmah, another fraction of the British Empire of about 175,000 square miles area, forming the northwestern part of the Siamese Peninsular.

Here's a Removable Tread.

Having reached the practical limit to which a tire tread may be built up without danger of disintregation through service on the road, the only available method of further protecting the tire from damage of any nature arising externally, would appear to be an auxiliary, or superimposed tread of similar construction, and this in effect is the principle followed by the Diamond Rubber Co., in the design of their new Burnham tire protector. There is little that can be said of its construction that does not apply to Diamond tires themselves, or for that matter to the automobile tire in general, for it is composed of several layers of rubber impregnated fabric surmounted by a thick layer of pure gum which is in turn covered with two strips of fabric and upon which the tread proper rests.

These various plies of material are accordingly vulcanized together in the same order as in the outer shoe itself, and with the exception of the foundation of fabric do not differe greatly in thickness from those of the latter. While slightly thicker at its outside edges which are reinforced with side wires surrounded by the layers of the fabric foundation, it cannot be said to embody anything in the nature of a bead. The method of fastening it purely constructive, the protector merely being slipped over the tire itself and while inflation naturally tends to make it grip tighter it is said that extended experiment has shown no tendency to creep even when deflated. The relative proportions of the tread as compared with those of the tire itself, as well as the manner of placing it will be clear at a glance from the accompanying sketch showing a section of each in perspective.

The Burnham tire protector will be supplied in four different treads; smooth, of the regulation Diamond wrapped tread construction as illustrated, with Bailey non-slip beads, Samson steel studded leather tread, or the Bar Traction tread, which consists of rubber bars extending diagonally across the face of the shoe and parallel with each other around its entire circumference. No prices have been made public as yet, but it is stated that the cost will approximate two-thirds that of a complete tire.

Mending a Spring Plate.

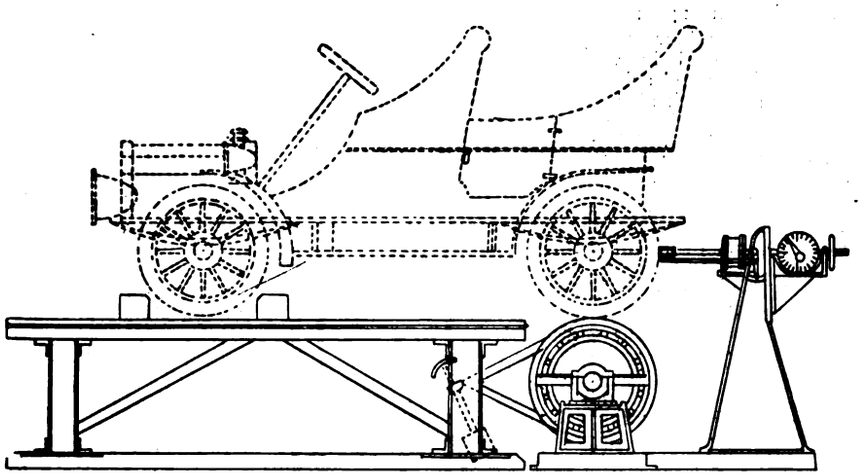
Some workmen doubt whether a broken spring plate can be welded and tempered and made as good as new. Blacksmiths question whether a broken spring plate can be made to stand the test of a new plate. The general conclusion is that it can be done by an experienced workman. The broken ends should be dovetailed, i. e., the ends should be split open half an inch and thinned down and placed on each other and then heated and welded. The heat should be as short as possible in order to not injure the temper in the other part of the plate. The parts should be hammered on the anvil until the united pieces become cold. Care should be taken not to permit the welded part to be hammered any lighter than the rest. If there is too much hammering it leaves a place where a break is liable to occur again.

Increase of Motor Cabs.

As has been the case in other cities so have automobile cabs become a necessity in Berlin since their introduction two or three years ago. They are in such strong demand that from 10 o'clock in the morning until 4 o'clock the next morning the three stands assigned to them in the metropolis are always almost vacant. Apart from the fact that the police authorities are about to sanction the establishment of new stands, the necessity of an increase in the number of Berlin cabs has been felt for a long time past, and has resulted in the formation of numerous cab companies. There are at present 140 of these licensed cabs in Berlin, and their number will be raised shortly to 270.

Direct Drive Discovered Again.

Probably the most interesting outcome of the agitation following the claim of a basic patent on the direct drive by Renault Freres, has been the uncovering of a steam car built by F. Lamplugh, an Englishman, in 1896. The original propeller shaft and back axle are still in use and not only embody the direct bevel gear drive on a balanced gear, but the propeller shaft has the usual universal joint at each end as well as a telescopic joint, thus making it in every respect as advanced a piece of construction as is employed to-day. The date of its origin anticipates the Renault patents by fully two years.



The Auto Mechanics' Club, an organization to provide a place for social entertainment for the men working at the automobile trade and for the study of the technical points and care of cars and to promote careful driving of autombiles, has been formed in Denver, Col. The officers elected for the first term are: President, E. S. Crawford; vice president, Lou Sanford; secretary and treasurer, L. E. Allmon.

PURDUE'S TESTING PLANT

Methods and Machinery Used by the Western University in Trying-Out Cars.

Purdue University's much talked of automobile testing plant, which is a pioneer of its kind, has recently been completed and it is proposed during the present winter to determine the output of power under various conditions or running of a considerable number of typical machines. It is, of course, a part of the university property at Lafayette, Ind. The plant follows lines similar to those of Purdue's locomotive testing plant, the design having been worked out under the general direction of W. F. Goss, Dean of the Schools of Engineering.

As will be seen from the accompanying elevation, it constitutes a mechanism upon which any automobile of any type, whether steam, gasolene or electric, may be mounted and driven. When mounted for operation the driving wheels of the car are carried by the supporting wheels of the plant. The latter are mounted upon an axle revolving in fixed bearings. Thus set up, the car is then connected with the traction dynamometer shown just behind it and which serves to keep it from running away.

The energy developed by the machine is absorbed by a water cooled friction brake of the familiar Prony type, while a motor driven pressure blower delivers air through adjustable piping for cooling the radiators of steam and gasolene machines and a motor driven exhauster draws air from a point in close proximity to the exhaust of the machine, thereby freeing the laboratory from any noxious gases.

Concerning the theory of action, a glance at the illustration will make clear the fact that if the supporting wheels were blocked so that they could not turn, the car would, if started, tend to move forward with its full tractive power even to the extent of slipping its wheels on the supporting wheels. This tendency will, of course, be registered as a pull on the dynamometer. If, on the other hand, the supporting wheels are frictionless, then the turning of the wheels of the automobile by its motor will not result in any pull on the dynamometer, for if frictionless, the supporting wheel can offer no reaction for such a pull.

The supporting wheels are in fact neither blocked nor frictionless, but the design is to have them turn against a resistance the value of which may be varied at will. The arrangement is such that whatever this resistance may be it appears as a stress on the draw-bar. The resistance is regulated by means of a friction brake to which reference has already been made. By its adjustment the automobile may be made to pull little or much upon the dynamometer, that is, it may run under a light or a heavy load as may be desired. In all cases, the energy delivered by the automobile is the product of the pull exerted at the drawbar, into the distance passed over by the tread of the driving wheel. Thus, the horse-power delivered is equal to the pull on the dynamometer in pounds, multiplied by the space passed over in one minute by the automobile driving wheel, divided by 33,000. The space passed over is most conveniently found by determining the number of revolutions of the supporting wheel since the latter is of fixed diameter; that is, the determination is based upon the length of the path traveled, rather than by the revolution of the driver. This also provides means for determining transmission losses.

Thompson on Japanese Conditions.

J. W. Thompson, who has just returned to New York after a three years' residence in Japan, was the first man to introduce the motor car into the Mikado's Empire, having used an automobile there in 1900. He says the roads in Japan are excellent for automobiling, but that few, very few cars have been imported owing to the very high duty. His greatest difficulty was in teaching the natives the mechanical construction of the car so as to make them capable chauffeurs and repairers. He made straight for the Garden and invested in a 30-35 Locomobile before leaving.

RESOLUTIONS OF WELCOME

First Motor Car Due, a Mining Town Takes Official and Jocular Action.

Local automobile regulations have been a source of mingled anger and sorrow to users of cars ever since self-propelled vehicles came into use in this country. Out in Newberry, Mich., which is a small mining town in the upper peninsular of the Wolverine State, there is a village board of trustees who have not taken the advent of the automobile so seriously as have the city fathers of some larger places. So when a citizen of that place purchased an automobile, the first to be brought into the town, the trustees formulated the following regulations for its use:

"Whereas this village will soon be startled by an automobile under the charge of an unexperienced chauffeur, which said automobile has been fully warranted to shin telegraph poles, scale the sides of buildings, and climb fences with neatness and dispatch, and has a distinct and determined taste for human gore; and

"Whereas said automobile is a deadly weapon, dangerous to the good health, happiness and morals of the owner thereof; and

"Whereas it is the desire of this council that the children of the community shall retain certain fundamental privileges guaranteed to them by the Constitution of the United States, the Constitution of this State and the charter of the Village of Newberry, the most important of these being the right to live;

"Resolved, That the owner of said automobile be and is hereby instructed not to run said machine at a rate exceeding three miles an hour while in the village limits;

"Resolved, further, that all the provisions of the ordinance relative to pounds and impounding beasts be and the same are hereby extended to and include said automobile, and that the health officer be instructed to enforce all ordinances relative to nuisances and noxious smells.

"Resolved, That all parents be and are instructed to keep their children off the streets at all hours of the day and night including Sundays and election days.

"Resolved, That the Board of Education of McMillan township be requested to close the schools of this village for a period of three days after the arrival of said automobile, at the end of which time it is estimated that said automobile will be thoroughly broken and will stand without tying.

"Resolved, further, that these resolutions be spread upon the minutes of this board, that a copy be sent to the sorrowing friends of the owner of said automobile and that a copy be printed in the official newspaper."

Paul Azbill, of Columbia, Ky., has established an automobile stage line between that place and Campbellsville. The bus employed carries 18 passengers and makes two trips daily.

Cars not Exempt in Kentucky.

In Kentucky, an automobile is neither a horse, team of oxen, dray nor spinning wheel, and incidentally cannot be held immune from levy for debt under the statute of household exemptions. This point was settled last week by Judge Thomas R. Gordon, of Louisville, who handed down an opinion sustaining a demurrer to the amended answer in the suit of George E. Cross against C. E. Price, involving a debt of $300 on a note.

Cross levied an attachment on the automobile of the defendant, alleging it to be worth $300, and the motor car was seized by the Sheriff. Price alleged that he was an employe of a mercantile agency, and needed his auto in his business, which necessitated his getting rapidly from place to place.

The defendant's attorney argued that the old law, passed in pioneer days which exempts from levy for debt certain household articles and names them, including a dray, a yoke of oxen, a horse or mule, a spinning wheel, one shovel, and so on, required for the carrying on of the farm, that representing the only business interest of the time. Although nothing is said as to automobiles, the attorney claimed that the intent of the statute covers such a case.

Judge Gordon says the courts have greatly extended the operation of this act, but that this is a case where its application would be an exaggeration, since if a man can hold a $300 car safe from levy he can also hold the most elaborate and expensive automobile, representing several thousands dollars of value, equally free from attachment.

"Automaniacs," Shouts the Agriculturist.

"Automaniacs and modern juggernauts" were the terms hurled at the motorist and his car at the annual meeting of the Minnesota Agricultural Society at its recent session in Minneapolis. Most of the hurling was done by the sadly afflicted M. T. Grattan, of Preston, who performed the same service a year ago. As a result of it the society probably will ask the Legislature to "do things."

Mayor Jones, of Minneapolis, who welcomed the agriculturists, said "me, too," but in saner fashion. He told them that there was no justice in barring automobiles from the highways, but he advised "no mercy toward the reckless chauffeurs who imperil lives, and promised that the best minded owners of automobiles would assist in any mevoment to control the insane speeding of men who bring the automobilists in general into disrepute."

To Open Denmark's Roads.

Denmark is growing restless beneath the yoke of its antiquated motor laws, and several prominent sportsmen have founded a society for the furtherance of automobilism in the kingdom. One of the first steps the society intends to undertake is to harry the authorities until they are convinced of the necessity of forming new and more moderate regulations. Only the chief high roads are open to motorists throughout Denmark, and with the exception of Copenhagen, all the parochial roads are entirely closed, and even where the motorists may venture by day they must not be caught out after sundown! Denmark is well suited for motoring, and its scenery would be most attractive to all lovers of the sport, were it not for these absurd legislative measures, which, it is to be hoped, will be speedily removed.

The Editor's Car is For Sale.

The soil in North Dakota is so rich that the editor of the Litchville Bulletin has bought a new automobile and is trying to sell his old machine. This is how he goes about it in his own paper:

I have a bay Rambler automobile I want to sell. It is sound in wind and limb, young, docile, is a good driver and can go a mile in 2.20. I drove it all last summer and fall while the other fellows who owned automobiles were patronizing the livery stables or walking. There isn't a blemish on it; no spavins, ringbones or heaves troubles it and its appetite is healthy. I feed it gasolene and can go twenty-five miles on a gallon, or less than one cent a mile.

The machine cost new $850 and $40 freight, but I will sell it for much less than that because I have bought a much larger car for 1906. Or I will trade it for sound farm horses from 5 to 10 years of age, weighing 1,200 to 1,400 pounds. I am willing to trade for horses because I am going to farm 1,000 acres with hired help this year and need a lot of horses and good wishes if I am to pull out of it in a sane and safe condition.

I will guarantee to teach any man who wears pants how to run the Rambler machine inside of two hours so that he can steer clear of telephone poles and miss most fence posts. Come in and look at it. You don't know anything about automobiles, but then I don't know anvthing about horses, and wouln't know a case of string-halt if I saw it; so it ought to be easy to trade, and my word ought to be as good as a horse trader's.

—The Editor.

Angell Suggests Whipping Posts.

George T. Angell, the Dumb Animals gentleman of Boston, who in his day probably has had to skip quickly out of the way of more than one street car and horse drawn vehicle, recently had to dodge an automobile and thinks if his "guardian angel had not been particularly active we should have probably lost our life." As a result, it seems to Mr. Angell "that the whipping post would be the most appropriate reward for the rascal who came so near killing us."

To Regulate 'Em in Washington.

A bill regulating the speed of automobiles in the District of Columbia has been introduced in the House by Representative Simms, of Tennessee, a member of the District committee. Twelve miles an hour is the maximum speed allowed within the city limits and five miles at street crossings, four miles an hour around curves and four miles on certain business streets.

What He Gave Without Charge.

Types of all kinds of grafters were to be seen at the shows last week, each working after his own peculiar fashion and each of whom, no doubt, slipped in unbeknown to the management and set his trap for the unwary by laying out folders in odd corners or playing the more hazardous game of personal canvass among the motorwise and dollar-foolish visitors.

Probably for sheer unvarnished gall, even surpassing that of the alleged storage company which, up among the airships in the armory gymnasium, carelessly scattered around ochre-colored slips with the inquiry "What the —— do you know about automobiles?" and ending with the admonition not to pay two prices to see the automobile shows when the alleged storage company's colossal exhibit could be seen for nothing, at such and such an address, was that of the haggard, amateurish individual who passed out the following card:

"Notice
"For your benefit,

"If you Do not wish to be skined, do Not try to buy a car without a practical man. If you want to get your money's worth, write or call for me, I am a constructor of automobiles and practical Chauffer, with knowledge of all gas machines, and being able to advise and Explain To you every advantage of all make of automobiles, have me to protect you and you get all That is coming to you for less money than without me. i secure testing rides and everything to make a complete automobile Without you having Any trouble.

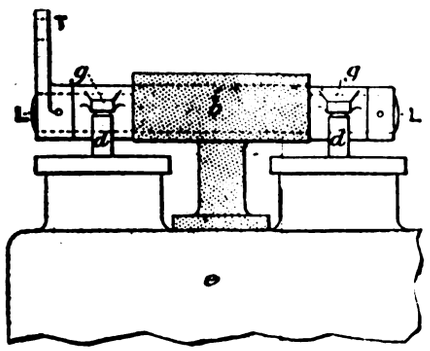
"All this free Of charge.
"I am respectfully,
"_____ _____."

List to the "Motor Poet."

One of those misguided human beings called "motor poets," whom the muses would not inspire, was at his wit's end for a rhyme to "magneto ignition" and "calcium carbide," and wrote to his paper for suggestions. It is now a 100 to 1 shot that he wishes he had thought it out for himself. One correspondent suggested that "eternal perdition" would rhyme nicely with "magneto ignition." Another overcomes the rhyme for magneto ignition as follows:

"Magneto ignition, if fixed with precision, is so neat an addition, that I tell of its worth without asking commission." He also has the modesty to add: "For the rot that I've written on magneto ignition, I must own that I'm feeling some pangs of contrition." This is how he rhymes calcium carbide: "You'll sit on my near side—oh! halycon car ride, 'Mid the effulgence of calcium carbide."

One of Hearst's "Fine Frenzies."



"How many human sacrifices will be made to the God of Go-Fast on the sandy altar of the Florida beach this winter?" This is one of the choice spasms from one of Hearst's papers on the Pacific Coast.

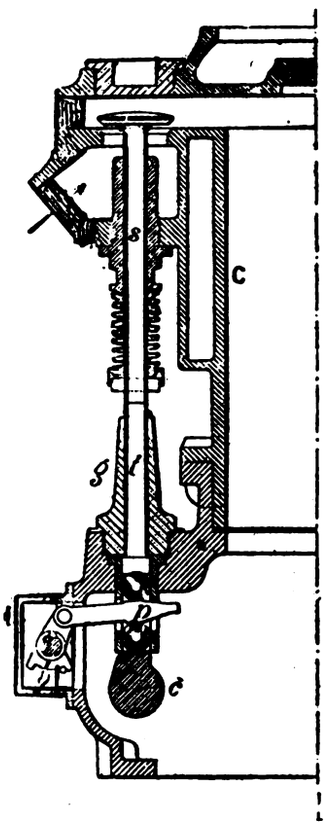
VARIABLE INLET VALVES

Two of the Latest Developments of the Sort that Have Appeared Abroad.

Evidences of the growing vogue of the variable inlet as a means of controlling the speed and power of the motor were not wanting at the Paris Salon and it is interesting to note some of the various methods by which different builders have attained this object. In the Lambert, of which there are several models ranging from nine horse-power upward, all of which were equipped in this manner, this is accomplished by the insertion of an adjustable piece p, inserted between the cam and the lower end of the valve lifter. As will be plain upon reference to the illustration, this piece is joined to a smaller rocker arm at



MOTOBLOC VALVE.

its outer end, the latter being arranged so as to be controlled from the driver's seat.

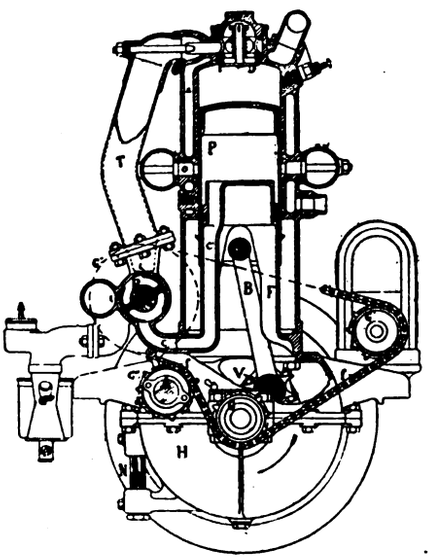
One of these tapering pieces is located at each valve, the separate rocker arms all being fastened to a light shaft just below and parallel with the cam shaft. In addition to being led to the lever on the wheel for hand control this rocker shaft is also connected up with the governor, the influence of the latter being cut out by the hand lever when desired. By the rotation of the shaft referred to, b, the wedge-shaped piece p may be either inserted further or withdrawn more from between the cam and lifter, the height to which the valve itself then rises being correspondingly regulated.

On the several four-cylinder models of the Motobloc cars of varying power, this is likewise a new feature, though the engine of this car is in fact, representative of departures of various sorts from standard practise in almost every respect. Its name for instance, which is literally "motor-block," is meant to convey the impression that both the engine and the change speed gear box are integral, but one chamber being provided for the reception of the crank shaft and the change speed gear shafts. The cylinders are cast in pairs and in the low powered types the fly-wheel is sandwiched in between two pairs of cylinders. The valves are all mechanically actuated from the same cam shaft, the induction valves being located in the cylinder heads and are operated by rocking levers and tappets. These rocking arms are all mounted on an eccentric shaft extending over the tops of the cylinders for their entire length and is arranged so as to be controlled by a small lever on the steering-wheel in the same manner as is customarily employed for spark and throttle control. By revolving this rod more or less the height of the rocker arms may be varied,

LAMBERT VALVE.

thus imparting a correspondingly different lift to the inlet valves.

What the East Indians Want.



The motor cars and motorcycles have been noticeable in Bombay, Calcutta and Madras during the last two years, writes the French Consul General at the former place. Moreover, in various parts of India several schemes have been put forward for motor services to link up important centers and to connect health resorts with the nearest railway. There are now garages established in Bombay where automobiles can be hired by the hour; these appear to be well patronized.

Natives attach no importance to speed when purchasing a car, preference being given to a strong and trustworthy article. A voiturette, light enough to be carried by bearers across the fords, which have so often to be traversed in India, with wheels as high as possible, in order to be able to cross the more shallow fords unassisted, retailed at a price not exceeding $930, should command a ready sale.

EMPLOYS A ROTARY VALVE

Ingenious Innovation Incorporated in an Ingenious Two-Cycle Motor.

In view of the greatly increased amount of attention that the tyo-cycle engine has come in for of late through recent developments, it is interesting to note that the single system which has been in practical use on the other side embodies a radical departure from what is regarded as current practise in this country, not alone on the few representatives of this type of engine used on the car, but on the thousands which have been in constant use for years past in other fields.

LEGROS MOTOR.

This is the Legros which made its debut at Paris a year ago, causing more or less of a sensation at the time, as it was the first of its kind to be taken up seriously in a land where designers are universally pledged to the four-cycle. As a matter of fact, this engine cannot be compared with any of the various differing arrangements that have been devised to take advantage of the two-cycle principle, in the majority of instances by the addition of some auxiliary apparatus to gain the necessary initial compression. It is in a class by itself. In place of utilizing the base chamber of the crank as a receptacle for the incoming charge there to be compressed by the downward stroke of the piston, as is customary, the Legros uses a very long hollow piston indicated by P in the accompanying sectional elevation. Within this and concentric with it is a piece of slightly smaller diameter, which may best be described as a fixed piston. This is indicated by F. This arrangement, of course, necessitates the use of outside connecting rods of which there are two to each cylinder, one on either side.

Since the engine was first designed a rather novel feature has been added. This was first shown at the recent Salon and con-

Digitized by Google

sists of a rotary valve, which acts both as an inlet and for the transfer of the mixture from the compression space to the combustion chambers. As the piston P rises a charge of mixture is drawn through the valve R and along the passage C into the compression space formed between the two pistons. On the descent of the piston P this charge is delivered through the rotary valve R to the induction pipe T and into the combustion chamber through the usual automatic valve.

On the compression stroke the space between the two pistons is again being charged with fresh mixture from the carburetter, and upon the explosion stroke a fresh charge enters at the top of the cylinder, the exhaust being gotten rid of in the usual manner, that is, by ports uncovered by the piston at the end of its downward stroke. The inlet valve is placed directly in the centre of the top of the cylinder head, the spark plug being located in the upper right hand corner. Ignition is by means of a high tension magneto chain driven from a sprocket on the main shaft which also actuates the pump and the rotary valve through the same medium.

Adaptability of the Motor Car.

Elmer M. Cooper, a progressive farmer near Cadiz, Ind., is emulating the example set by others of his fellow tillers of the soil by employing the gasolene engine as a labor saving device about the farm. But in addition, Cooper is what might be termed an automobile fancier: Last summer he gained considerable notoriety by owning seven different makes of cars. He purchased one and in a short time, becoming tired of it, bought another, finding each nearer to his conception of the ideal than the previous one.

Cooper has a gas engine which pumps water all over his farm. The other day this gas engine was disabled and refused to run. It meant either pump water by hand, get the engine fixed or choose some other way out of it. The resourceful Mr. Cooper backed his automobile up against the pumping apparatus, jacked up one rear wheel, transferred the belt and started his auto engine going. The pump worked admirably and the automobile pumped enough water all over the farm to water the stock. Before the engine could be repaired Cooper had to send away for some broken parts. It took some time, and in the meantime the hogs needed shelled corn. The sheller, of course, could have been operated by hand but it was too tiresome a process when one had been used to having it done by machinery, thought Cooper, so he hitched the automobile on to the sheller, and in less time than it would have taken the regular engine sixty bushels of corn were shelled.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

Apple's New Storage Cell.

In connection with the improved 1906 model of the Apple direct current generator and accumulator charger, the Dayton Electrical Mfg. Co. has brought forth an advanced type of storage cell for ignition purposes. Size and weight have been factors of prime importance in connection with the accumulator ever since it has been known and they are even more so when it is to be used for ignition purposes. In the latter field, the problem has been to keep down the size of the battery and still maintain the efficiency and output of one of much greater bulk.

As the result of considerable study and experiment with prevailing forms, the makers of the Apple have discarded the latter altogether and have done away with one of the plates by making the containing case of each cell in the shape of a lead bottle. This constitutes the negative element and

the positive is in the shape of a plate inserted in it and insulated therefrom by perforated rubber separators. The number of parts as well as the weight and size are thereby reduced to a minimum.

The inner surface of the bottle is dovetailed and the active material pressed into the recesses thus formed, while the positive plate is perforated with large square holes and treated in the same manner thus preventing the paste from dropping to the bottom of the cell.

In place of merely permitting any fumes generated to rise out of a vent hole, they are led off through small tubes from each cell to the bottom of the containing case and thus outside, preventing in this way any contact with the metal parts and avoiding the consequent corrosion.

Elaborate precautions have been taken to guard against short circuiting, the only projecting parts being the rubber corks in the filler holes and the end connections. Each bottle comprises a 30 ampere hour unit and any number desired will be supplied in neat japanned cases. The bottom of the case is made of hard rubber extending down half an inch farther than the metal while rubber separators are fitted between and around the cells. Once in place the units of a battery are covered with insulating composition applied in hot liquid form and become practically solid, in which shape they are well protected.

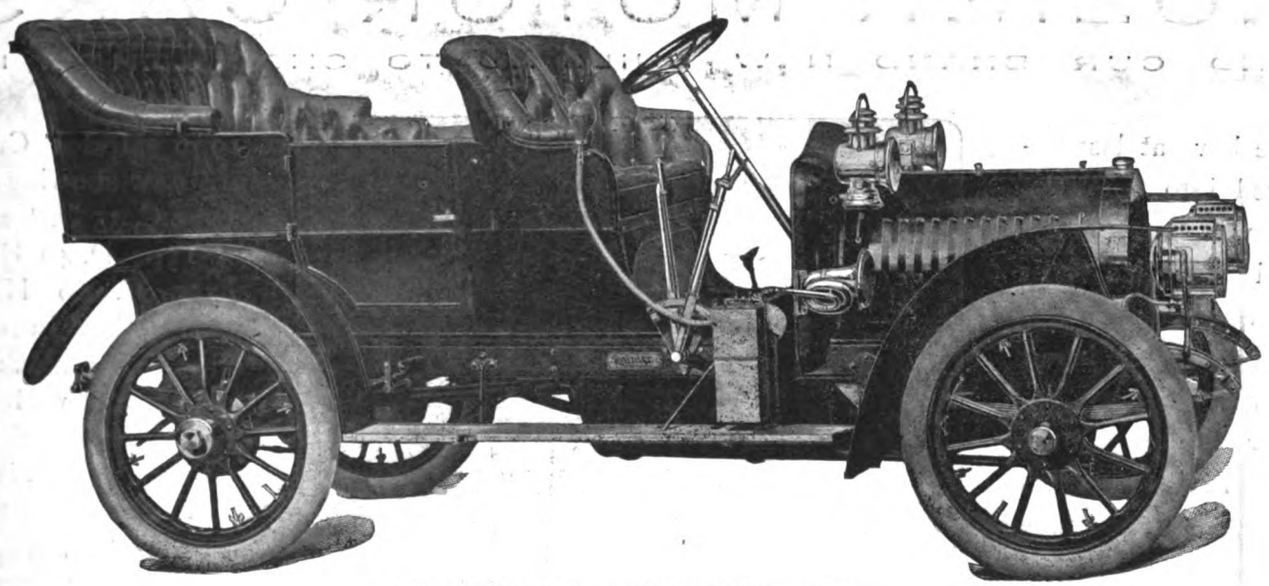
To Prevent "Racing" of Motors.

Single cylinder motors are particularly prone to race when relieved of the load and it is suggested that one efficient means of overcoming this objection without the necessity of having three hands to manipulate steering wheel, spark and gear changing lever, all at the same time, is to couple return it, once the clutch is re-engaged, that when the former is taken out in order to change the gear the spark is automatically retarded simultaneously. In order to return it once to the clutch is re-engaged, a spring should be fitted to ordinarily hold it in the advance position, thus not interfering with its control by hand. As the majority of single cylinder cars in this country are fitted with the planetary type of gear-changing mechanism—the rod from the contact breaker should be connected to the changing lever so that dropping out of high gear would actuate it. With such a device it would be necessary to guard against back-fires by carefully noting at every start whether the spring was holding the contact breaker in the extreme advanced position or not.

Here's the Motor Car-Boat.

Fournier, Edward, of Minneapolis, not Henry, of Paris, a scene painter by trade, and an inventor between jobs, has reached the climax of his life in the invention of an amphibiious motor-car-boat which looks something like a yawl on wheels, of course, and "runs equally well in land or sea." By an ingenious arrangement, the body, which in this case constitutes the hull, can be detached from the running gear, the driving mechanism connected with the propeller, and the rig is ready for deep sea cruising. Whether the running gear constitutes as much of an overload for the hull when the thing is in the water, as the hull does for the running gear when it is on land, no one seems to know just at present, but if it does, the name of Fournier is likely to be affixed to "sets" and "drops" for some time to come.

Springs in Universal Joints.



Among other features the new Siddely cars are equipped with an arrangement by which a spring in the universal joint on the cardan shaft keeps the inner member of the joint from hammering the back of the outer member, and prevents noise and wear. The outer member is a square box and the inner member is also square, bevelled edges permitting of a sliding but not a rotary motion, and it is between these two parts that the spring is fixed, keeping them apart, but allowing the joint to play in and out, as required by the spring of the frame. The introduction of springs appears to be a feature of this car, as it is further equipped in the same manner to prevent wear on the valve tappets.

Rainier

The Pullman of Motor Cars

1906 Catalogue and Cars Now Ready.

1906 MODEL B, 30-35 H. P. PRICE, $4,000.

GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

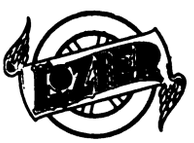
During 1905 the Rainier was the hit of the season in New York, the most critical of markets. Not a single dissatisfied customer, only favorable comments everywhere, and orders galore for the new model from former users. Before you decide, investigate the Rainier, carrying the world's broadest automobile guarantee.

Make and break spark. Simms-Bosch Magneto. Bevel gear drive.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Chicago Branch: 1253-1255 Michigan Ave. (after January 15th).

Boston Agents: MORRISON-TYLER MOTOR CO., 121 Massachusetts Ave.



Good Agents wanted in unassigned territory.

The Rainier Car will be exhibited at the Armory Show in Chicago.

LOZIER MOTOR CARS

AND OUR BRAND NEW BUILDING TO SHOW THEM IN

We have at last entered into our own. It was our move, and now it's your move—and there is plenty of space in our new showrooms to move all around the LOZIER CARS in order that they may be well investigated from every point of view. The entire building of four stories and basement will be devoted to the business of The Lozier Motor Company, with their fine line of High-grade Motor Cars, Motor Boats and Marine Motors.

1906 Model Cars are now showing in Type C, 35 H.P. and in Type D, 40 H.P. Type E, 60 H.P., will follow later. These are all beautiful cars, and we have in stock for immediate delivery, Touring Cars, Limousines and Landaulets, all of which are built in the usual Lozier high-grade manner. The prices of Types C, D and E range from $4,500 to $7,500, and our handsome Descriptive Catalogue treats upon the general features of Lozier construction. We would be very glad to send you a copy.

THE LOZIER MOTOR COMPANY, 55th St. and Broadway NEW YORK CITY

HAWKINS ON THE HORSE

Pittsburger Points Out Some Very Plain Truths and Talks of Bigotry.

Dr. John A. Hawkins, one of Pittsburg's prominent automobilists, is of the "right sort." In a recent address, he gave his townspeople some very plain facts and some very plain figures that should cause them to sit up and they are of just as much value outside of his vicinity as within it. Hear the doctor:

"The report of the coroner of Allegheny county for the year 1905 is particularly of interest to both automobilists and motorphobes, inasmuch as there are upwards of 1,200 automobiles in daily use within the county. The report shows that of the 2,119 inquests, death was due to: Railroads, 323 cases; mills, 158; falls, 156; street cars, 81; mines, 64; murders, 45; natural gas accidents, 15; run over by wagons, 13; kicked by horses, 6; crushed in elevators, 5; struck by missiles thrown, 4; thrown from carriage by runaway, 1; thrown from automobile, 1; run over by automobile, 1. One death in 1,000 due to automobiles or motor vehicles, 40 deaths in 1,000 due to horses or horse vehicles, 40 deaths in 1,000 due to street cars, 160 deaths in 1,000 due to railroads.

"Railroads have been inexistence more than 60 years; power-driven street cars about 20 years, and automobiles three years. When pedestrians become accustomed to look out when passing back of street cars and stepping off sidewalks, accidents from automobiles will be unheard of. The automobile can be stopped in one-twentieth the distance it takes to stop a horse going at the same speed, besides, the auto takes up less room on the street; does not soil the street; does not cut up the asphalt, or in any manner injure streets or roads; never shies at roadside objects; never runs away when driven by one who knows how, and need not be hitched. It is doubly taxed, abused, cartooned and condemned with its owner to eternal damnation by a bunch of evil-thinking, narrow-minded, selfish bigots, who would eagerly stop the wheels of progress by burning at the stake, as witches and wizards, all those who were not of the same mind in religion, politics and tastes.

"Automobile touring has become a God-send to small towns, opening up moss-grown hotels and bringing more money to villages than was ever dreamed of a few years ago. Millions are annually spent by tourists in France, not because they love France more, but because the Frenchman loves our money and is far-seeing, and instead of cursing the automobile he builds good roads, keeps good hotels and is accommodating; does not discriminate between horses and automobiles by unjust taxation.

"Munsey says: 'That it is estimated that there are more than 200,000 people employed in the automobile industry in France alone, and that the value of cars made in France has increased in the past seven years from $2,000,000 to $50,000,000.'

"Think of it! Think of what an industry bigots and malcontents are trying to throttle by unreasonable laws, legislative graft, and unjust taxation. If these bigots have no justice in them, surely their fathers instilled a bit of patriotism into them, or if not, their sense of greed should show them that they are simply trying to kill the goose that is laying the golden eggs. This class of so-called good citizens are not the ones who have spent their good money in agitating the building of good roads. It has been the bicyclist, and later the automobilist. Ask the thinking farmer along one of our macadamized roads how long it now takes to bring his produce to the city and he will tell you he can make the trip in fall, winter or spring in one-fourth to one-half the time it formerly took him when the roads were at their best in the summer.

"Reckless automobilists should be punished, as all other offenders against the rights of his fellow man, but pedestrians should not sleep when crossing streets, nor should a useful mode of travel, the result of progress, be condemned and all the users be classed as thugs and lawbreakers any more than a railroad company or its careful employes be condemned for the accidents of negligent or careless enginemen or motormen."

Up-State Chauffeurs Become Ambitious.

Binghampton, N. Y., now has a chauffeurs' training school, established in connection with the Binghampton Chauffeurs' Club. At a special meeting last week plans for the school were perfected and it will be formally opened Saturday, this week. Lectures on motors and motoring will be given each Saturday night and will be followed by a general round table discussion of the points brought out in the lecture. A committee was appointed to arrange the course of instruction and provide for a regular instructor.

Gasolene Chauffeurs Incorporate Club.

The Professional Chauffeurs' Club of America, which has its headquarters in New York City, is now a corporate body, papers having been taken out last week. According to them, it is formed to promote and elevate professional chauffeurs as applied exclusively to the drivers of gasolene engines, and to maintain a club house. Valentine Koch, Frederick W. Walsh, William H. Walter, Frederick Brevogel and Marten J. McGuire, all of New York City, are named as directors.

Nashville Taxes Hired Vehicles.

Nashville, Tenn., has passed an ordinance taxing automobiles "owned, maintained or operated for profit" $15 per annum. Automobiles used for omnibusses are assessed $420 per year.

"GUEST" GETS DAMAGES

Injured in an Accident he Sues and Wins—First Case of the Sort.

An apparent precedent has been established in Connecticut governing the liability of the driver of a car for injuries to passengers, received while in the car. By the decision of Judge Joel H. Reed, in Superior Court, Hartford, which will, however, likely be appealed, Walter G. Johnson, a chauffeur, of New York City, is entitled to recover damages in the sum of $2,500 from the Electric Vehicle Co., of Hartford, Conn., or rather from the Aetna Indemnity Co., as the automobile company held employers' liability insurance.

Johnson was a chauffeur employed by J. J. Welch, of New York City. When Welch purchased a touring car from the Electric Vehicle Co., Johnson was sent to Hartford to learn its operation. At his, Johnson's, request, he was sent out with John M. Sheehan, one of the testers of the company. While out with Sheehan, Johnson was injured in an accident by colliding with a team near Longmeadow, Mass. At the trial Johnson testified that at the time he realized that the car was traveling too fast for safety and implored Sheehan to slow down, but that the latter only laughed at his fears. In discussing some of the propositions of law set up by the defendant, Judge Reed, in a memorandum of decision, says:

"It is claimed by the defendant that since the plaintiff was permitted to ride on the testing car at his request, he was a mere licensee, and that the rule applies that there is no duty owing to a licensee by a licensor, except that he shall not willfully injure him. The cases cited in the defendant's brief on this point are all cases illustrating the rule that a licensee going upon the land of another must take the land as he finds it. No case has been cited where the distinction between the duty owed to a licensee and an invitee has been applied to a case like this, or to any case not involving an entry on land, or the use by the plaintiff of the defendant's premises."

The judge says that it seems to him that the doctrine of the liability of a licensee does not apply, and whether the plaintiff be considered as a licensee, invitee, passenger for hire, or whether the relation of master and servant existed, the defendant owed the plaintiff a duty not to injure him by gross carelessness. The negligence of Sheehan should not be imputed to the plaintiff. It would seem to come with more force when set up by a third party than when set up by the defendant.

The judge continues:

"If I take a person into my carriage voluntarily to ride with me, and injure him by my own negligence, why should I be allowed to say that he was guilty of negligence in riding with me? It is significant that no authority has been cited applying to circumstances like these."

The Week's Patents.

809,292. Gas Engine. William T. Fox, Rochester, N. Y. Filed August 17, 1904. Serial No. 221,051.

Claim.—1. In a gas engine, the cylinders having each a piston and arranged in four pairs, a rigid rod connecting the pistons of each pair, two crankshafts, one for each double pair, a main or driving shaft operatively connected in the crankshafts, and means for successively exploding gas in the cylinders to drive said main shaft at every quarter-rotation thereof.

809,295. Gas Producer. Jerome R. George, Worcester, Mass., Assignor to Morgan Construction Company, Worcester, Mass., a Corporation of Massachusetts. Filed July 10, 1903. Serial No. 164,934.

Claim.—1. In a gas producer the heating chamber having an opening at its top for the admission of fuel, of a fuel reservoir placed above said opening and having an opening in its bottom for the delivery of fuel to a distributer, a distributer between the opening in the heating chamber and the opening in the reservoir, said distributer consisting of a rotating shell smaller at its lower than at its upper end, with an opening at its upper end larger than the delivery opening of said reservoir and concentric with its axis of rotation, and with an opening at its lower and eccentric with its axis of rotation, and a disc inclosed in said distributer having its diameter larger than the diameter of the delivery opening in said reservoir, with an annular space around said disc for the passage of fuel.

809,331. Clutch Mechanism. Michele G. de Simone, London, England, Assignor of three-eighths to Domenico Robert de Simone and one-fourth to The Wilkinson Sword Company, Limited, both London, England. Filed April 14, 1905. Serial No. 255,529.

Claim.—1. In a liquid clutch, the combination of a rotary clutch member having a circular recess eccentric to the axis of rotation, a second clutch member formed with radiating cylinders, plungers in said cylinders the ends of which engage the inner face of said eccentric recess, a common liquid chamber in communication with all the cylinders, a separate valve between each cylinder and the common liquid chamber, and means for operating all the valves to allow the liquid to flow freely between the common liquid chamber and the cylinders and the plungers to reciprocate in the latter under the action of the eccentric surface of the second clutch member, whereby the clutch will run idle, said means also serving to operate all the valves to close communication between the common liquid chamber and the cylinders and lock the liquid therein and the plungers in rigid engagement with the eccentric surface of the second clutch member whereby both members are forced to rotate together.

809,341. Vehicle Brake. Bartholomew Viola, Brooklyn, N. Y. Filed March 20, 1905. Serial No. 250,912.

Claim.—1. The combination with a vehicle, of a member on a wheel thereof and having engageable devices thereon, a shaft, a member shiftable relatively to said shaft, and adapted to co-operate with said engageable devices, a hand brake attached to said member to prevent its rotation when the same co-operates with said engage devices, and levers adapted to effect the relative movement of said member.

809,333. Car Movement Explosive Engine. Philip K. Stern, New York, N. Y. Filed January 22, 1903. Serial No. 140,087.

Claim.—1. In a reciprocating explosive engine, wherein the motion of the reciprocating medium is adapted to be translated into a rotary motion at its flywheel, a kinematic connection between the flywheel and the reciprocating element located within the hub of the flywheel, for converting the motion of the reciprocating element into a relatively constant rotary motion of the flywheel and conversely for transforming a constant rotary motion of the flywheel into a periodic reciprocating motion of the reciprocating element, together with suitable valve mechanism for controlling the working fluid for said engine, actuated by said flywheel, substantially as described.

809,337. Power Transmitting Mechanism for Motor Vehicle. Robert Symonds, Jr., Kenosha, Wis., Assignor to Thomas B. Jeffery, Kenosha, Wis. Filed April 7, 1905. Serial No. 254,378.

Claim.—1. A power transmitting mechanism comprising a power shaft and power wheel thereon; a power transmitting wheel loose on the power shaft and disengageably engageable with the power wheel; a gear rigid with the power wheel and a speed reducing gear train therefrom to the power transmitting wheel; a frame for carrying the intermediate gear train which is mounted rotably about the power shaft, and means for holding such frame against rotation.

809,338. Power Transmitting Mechanism for Motor Vehicles. Robert Symonds, Jr., Kenosha, Wis., Assignor to Thomas B. Jeffery, Kenosha, Wis. Filed April 7, 1905. Serial No. 254,379.

Claim.—1. A power transmitting mechanism comprising a power shaft, a power transmitting wheel loose on such shaft; a driving gear rigid with the power shaft; a driven gear rigid with the power transmitting wheel; a gear frame and a gear frame therein having an initial wheel meshing with said driving gear and comprising two gears in different transverse planes connected in the train for opposite rotation and each adapted for meshing with the driven gear, said gear frame being movable along the power shaft and means for moving it back and forth.

809,372. Variable Speed Gear. Emil A. Hoefer, Freeport, Ill., Assignor to Hoefer Manufacturing Company, Freeport, Ill. Filed July 29, 1905. Serial No. 271,868.

Claim.—1. In mechanism of the class described, in combination, a shaft, a plurality of loose gear wheels, stepped and concentrically mounted thereon, and rotating means adapted to separately and interiorly engage and revolve said gear wheels, substantially as described.

809,400. Valve Mechanism for Internal Combustion Engines. William H. Schoonmaker, Montclair, N. J. Filed February 11, 1904. Serial No. 193,032.

Claim.—1. The combination of a valve stem mounted to reciprocate and to turn and having annular or part annular rack teeth thereon, and a pinion meshed with the rack teeth, to impart reciprocal movement thereto.

809,406. Variable Speed Gear. Morton C. Talcott, Hartford, Conn. Filed October 14, 1905. Serial No. 282,791.

Claim.—1. A gearing having a motor shaft, gears of different diameters on the motor shaft, a transmission shaft, gears of different diameters on the transmission shaft and meshing with the gears on the motor shaft, the gears on one shaft being keyed and the gears on the other shaft being loose, clutches adapted to connect the loose gears with their shaft, a reciprocatory bar, dogs carried by the bar and adapted when moved in one direction to cause the closing of the clutches successively, and a wedge bar arranged to cause a disengagement of the dogs and allow the clutches to successively release, substantially as specified.

809,409. Pneumatic Tire. Pardon W. Tillinghast, Edgewood R. I. Filed March 5, 1903. Serial No. 146,396.

Claim.—1. A pneumatic tire, having an air tube constructed of caoutchouc the surfaces of which are rendered non-viscous and unvulcanizing for the purpose of facilitating repairs.

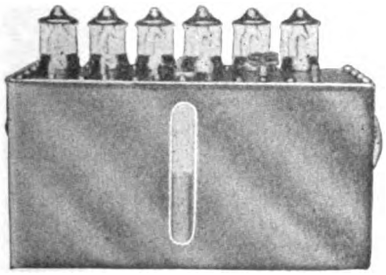
809,421. Expansible Sprocket. Arthur W. Boon, Brixton, England. Filed January 27, 1904. Serial No. 190,842.

Claim.—1. In a variable sprocket wheel the combination with a drum having a series of radically arranged slots, of a series of adjustable blocks forming a variable circumference to said drum, of teeth pivoted in recesses in said blocks, and of springs operating to retain said teeth in their operative positions but allowing them to give way when they are inoperative, as set forth.

809,451. Double Acting Explosive Engine. Joseph W. Kyle and John W. Hicks, Chicago, Ill., Assignors of one-third to Garfield G. Bennett, Chicago, Ill. Filed December 17, 1902. Serial No. 125,593.

Claim.—1. An explosive engine comprising a cylinder, simultaneously reciprocating pistons in each end thereof, a generating and mixing device, a pipe leading therefrom and opening into each end of the cylinder beyond the outermost travel of the pistons, an inlet port in open communication with the pipe and disposed between the pistons when at their outermost limit of movement, an exhaust port also opening between the pistons when so positioned, a sparker positioned to ignite the charge when the pistons are at their inward limit of movement, a transverse shaft intermediates the ends of the cylinder, a plurality of oppositely disposed cranks thereon and means connecting the outer ends of said pistons with said cranks and adapted to rotate said shaft.

809,475. Motor Vehicle. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., Assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine. Filed June 6, 1905. Serial No. 263,937.



Claim.—1. In a motor vehicle the combination with a vehicle frame comprising side beams, of an opposed cylinder engine frame arranged crosswise of said vehicle frame and forming a rigid transverse part of said vehicle frame, said engine frame being disposed between the front and rear axles of the vehicle and with the cylinder portions of said engine frame inside or between the outside parts of said side beams and approximately central, vertically, of the said side beams.

809,501. Antivibration Device for Vehicles. Georges Grillier, Chicago, Ill., Assignor to The Automobile Importing Company, Chicago, Ill., a Corporation. Filed April 26, 1905. Serial No. 257,495.

Claim.—1. An antivibration device for vehicles, comprising two arms pivoted

together and having respectively a casing and a friction ring in contact therebetween, the pivot bolt connecting the arms having a tapered sleeve-nut which fits in a tapered socket in one of the arms.

809,509. Motor Car. Frederick W. Lanchester, Edgbaston, Birmingham, England. Filed June 3, 1905. Serial No. 263,579.

Claim.—1. A motor vehicle in which the motor is situated in the leg space of the front seat and in proximity to the dashboard of the vehicle, substantially and for the purposes set forth.

809,525. Motor Vehicle. Albert Nunamaker, Cleveland, Ohio. Filed April 26, 1905. Serial No. 257,434.

Claim.—1. The combination, in a mechanism of the class stated, of an axle and a wheel spindle having non-circular recesses in their ends, and a universal joint between the same having connecting necks fitting in said recesses and having longitudinal movement therein.

809,530. Pneumatic Tire Cover. William A. Sankey, Sutton, England, Assignor to Frank Reddaway, Manchester, England. Filed January 24, 1905. Serial No. 242,544.

Claim.—1. A tire cover having beaded edges and a wire embedded in each of said edges, layers of canvas in such tire cover part of which are secured around the cores of the beaded edges and the remainder around the wires in such edges, substantially as described.

809,537. Tire for Wheeled Vehicles. Frank H. Sterling, London, England. Filed December 6, 1904. Serial No. 235,755.

Claim.—1. The combination, with a wheel rim of spiral springs secured around the said rim, bridge-pieces arranged around the said springs, pivotal connections between adjacent ends of the said bridge-pieces, and flexible connections arranged radially between the said wheel rim and bridge pieces and limiting the outward movements of the said bridge pieces.

809,540. Transmission Gearing. Morton C. Talcott, Hartford, Conn. Filed October 14, 1905. Serial No. 282,790.

Claim.—1. In a transmission gearing, a shaft, gears of different diameters loose on the shaft, clutches adapted to connect the gears with the shaft a bar bearing racks, pinions adapted to be successively rotated by the racks, and connections between the pinions and the clutches for operating the clutches, substantially as specified.

809,560. Combined Sparker and Governor for Gas Engines. David F. Graham and Frank A. Fox, Stamford, Conn., Assignors, by mesne assignments, to the Eisenhuth Horseless Vehicle Company, Middletown, Conn., a Corporation of Maine. Filed March 11, 1903. Serial No. 147,229.

Claim.—1. A combined sparker and governor for explosive engines, comprising a revoluble cam shaft; a spirally grooved sleeve mounted upon said shaft; a cam surrounding said sleeve and provided with projections entering the grooves of the sleeve and having an internally threaded recess at its upper end; ignition contact operated by said cam, and a governor comprising an upper head fixed to said shaft, a lower movable head having an externally threaded extension engaging the threaded recess in the cam and screwed partially home, toggle levers connecting said heads, and weights on said levers, whereby the cam is given both a reciprocatory and a rotary movement, substantially as set forth.

809,578. Sparking Plug. William Ottaway, Aurora, Ill. Assignor to Aurora Automatic Machinery Company, Aurora, Ill., a Corporation of Illinois. Filed February 15, 1904. Serial No. 193,606.

Claim.—A sparking plug comprising an insulating sleeve, a stem which passes through the sleeve and is provided with a head at its inner end, a packing interposed between said head and an opposing surface or shoulder on said sleeve, a cap applied to the outer end of said sleeve, a second cap which slides on the first named cap and the head of which is perforated for the passage of the said stem, a nut on the stem adapted to bear against said second cap, and a spring interposed between said caps and acting to exert endwise tension on said stem.

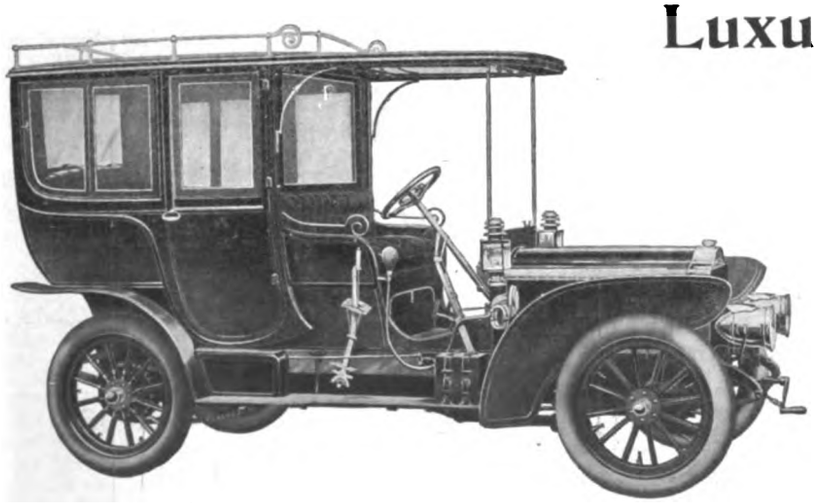
809,588. Racecourse for Automobiles. John B. Thomas and Jasper Lynch, Lakewood, N. J. Filed April 1, 1905. Serial No. 253,274.

Claim.—1. A racetrack for automobiles, comprising two straight portions crossing one another at different levels, each end of each straight portion being connected with each end of the other portion by means of loops.

809,614. Internal Combustion Engine. Henry C. Holloway, Gilroy, Cal., Assignor of one-half to William De Hart, Watsonville, Cal. Filed February 6, 1905. Serial No. 244,458.

Claim.—1. An internal combustion engine comprising a cylinder closed at both ends, a piston, a piston rod extending through the stuffing box in one head, connecting with the crosshead and crankshaft, inlet and outer passages contiguous to the lower cylinder head, automatically operating valves by which gas is admitted to the cylinder and transmitted therefrom, said valves operated by and during the movement of the single power piston, a receiver for the compressed gas, an independent combustion chamber intermediate between said receiver and the cylinder, and a valve controlling the transmission of gas from the received to the combustion chamber.

809,641. Vehicle Tire. James A. Swinehart, Akron, Ohio. Filed April 3, 1904. Serial No. 201,248.



Claim.—1. In vehicle tires, a metallic rim having opposite incurved edges about its periphery, in combination with a solid continuous rubber tire in said rim provided with side ribs engaged beneath said edges, a binding material interposed between said rim and tire and cemented to both, and cross wire extending transversely.

809,564. Exhaust Muffler. Louis T. Weiss, Brooklyn, N. Y. Filed August 18, 1905. Serial No. 274,742.

Claim.—1. An exhaust muffler, having an expansion chamber which receives the exhaust from the engine, said chamber having an outlet for the exhaust, and automatic means controlling said outlet and opening and closing the latter alternately.

809,656. Automobile Frame. Allie R. Welch and Fred S. Welch, Pontiac, Mich. Filed May 25, 1905. Serial No. 262,782.

Claim.—1. In a vehicle frame, the combination of a side piece bent inward for a portion of its length and a strip rigidly secured to the bent-in portion of said side piece, extending beyond said bent-in portion at a distance from said side piece and rigidly secured toward the end to said side piece.

PIERCE

This is the Great Arrow Victoria Tonneau, 40-45 H. P. with semi-enclosed top. Price without top, $5,000. Semi-enclosed top, $350 extra. Cape top, $200 extra. Folding glass front, $50 extra.

One convincing proof of the excellence of Pierce cars is the fact that they appeal most to the most mechanical minds. An automobile is a machine. The more a man understands about the principles of mechanics, the better he appreciates the way in which the Pierce Arrow is made.

The initial cost of a Pierce Arrow is greater than that of any automobile made in this country, but the price seems low when compared, not only with the small cost of maintaining, but with the long time of service given.

Pierce Arrows are never out of date as far as effective service is concerned.

Catalogue and descriptions mailed on request.

GET ACQUAINTED WITH THE GROUT.

The Car of Quality and Simplicity.

A Four-Cylinder Water-Cooled car of 30-35 H. P. with slide gear transmission, built on sound, sane principles, lacking not one of the accepted attributes of a high-class car, and listing at $2,500.

SPECIFICATIONS:

30-35 H P., 4 cylinder, balanced motor, high tension ignition using o e coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse actuated by single lever.
Wheels, 32 inch wood artillery, ball bearings, 4 inch tires.
Armored Frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication, mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.
Top and headlight with generator.

Weld Well
AND YOU WELD BY ELECTRICITY

Profit! More Profit. That's what we are all in business for. Every economical move means bigger dividends at the end of the year.

Auto makers—here's a lesson in economy.

Send us your welding. We can do it much better because our facilities are much greater. We can do it much cheaper because we have the equipment to produce in greater quantities, with less cost for labor.

We can do it much quicker because this department does nothing else, and the electric process saves much time.

We can do it better because machines have been perfected that greatly surpass the work of human hands.

PENNSYLVANIA CLINCHER

Should be classed among those Motor Car parts which have about reached perfection.

The racing type is the latest development in tire construction. A car shod with these tires, you may be sure, is capable of something out of the ordinary.

PENNSYLVANIA RUBBER CO.
JEANNETTE, PA.

Premier

Persistent and conscientious adherence to one idea—and that idea one which we have demonstrated to be the correct one—year after year has made the Premier Motors the efficient, dependable ones which we have always built.

This, in conjunction with our splendid construction throughout the car, makes the Premier, "The Quality Car," stand out boldly among its competitors, evidencing its worth in its pressed steel frame, 20-24 H. P. motor, selective type, three speeds forward and reverse sliding gear transmission, shaft drive, buoyant but firm full elliptic springs, I beam front axle efficient brakes, perfected lubricating system, light weight, high power, great speed, pleasing design, comfort and elegance of equipment. These features CAN'T HELP appealing to those interested in the subject of motor cars.

"Firestone"

Pneumatic Tires

are designed to do away with all the objectionable features which have existed to so great an extent in pneumatic tires heretofore made.

We well knew of the existence of these objections and laid our plans for the making of a pneumatic tire which should contain none of them.

Our success has been demonstrated and proven in the severest of continued road tests and it is with the utmost confidence in their thorough worth that we recommend FIRESTONE TIRES and stand back of them.

The body of the FIRESTONE TIRE is unusually sturdy in its make-up. The fabric used is the best Sea Island Cotton, carefully selected for purity and strength. The rubber is the choicest Up-River Para so scientifically compounded as to give it the greatest possible wear-resisting quality.

The tire is attached so securely that it cannot possibly come off, inflated or deflated, no matter how severe the service.

The union of the tire and flange is extremely close to prevent moisture from penetrating to the inner surface to the detriment of tube or casing.

The removal and replacement of a FIRESTONE PNEUMATIC TIRE is accomplished with the utmost ease and in the shortest possible time.

Any novice can with an ordinary wrench secure access to his inner tube or remove the tire complete in less than 2 minutes. The tube may be replaced and the tire refastened in the same time.

There is no prying or pulling on the tire, and consequently no possibility of causing injury, such as frequently occurs from the use of old-fashioned tire tools.

Remember, we particularly recommend FIRESTONE TIRES to any one who appreciates the best the market affords. We know they are supremely good and will give better and more lasting service than any tire you ever used.

FIRESTONE SIDE WIRE SOLID TIRES for commercial vehicles have been on the market for years and have proven the excellence of our methods of construction.

To-day more than 80% of all such tires in use in this country are FIRESTONE TIRES.

We invite correspondence and will be pleased to furnish full information and advertising literature upon request.

Then Why Not "Firestone?"

FIRESTONE TIRE & RUBBER CO., - Akron, Ohio.

ON GOOD ROADS—They Allow you to use and enjoy the full elasticity of EASY FLEXIBLE SPRINGS, OBSERVE we say "full elasticity."

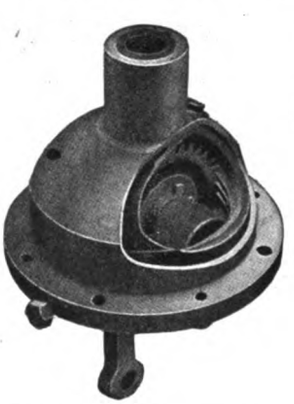
ON BAD, DANGEROUS ROADS—They control the too violent spring play BOTH UP AND DOWN, OBSERVE we say "both up and down."

THEY TRANSFER THE LOAD and strain from the springs to the axles.

THEY PREVENT spring distortion and breakage.

THEY LESSEN THE WEAR and tear on tires.

THERE ARE NO ADJUSTMENTS.



This should interest you because:—
It adds to your comfort and safety,
It effects a direct saving in "up-keep."

Write for full particulars.

Aerocar

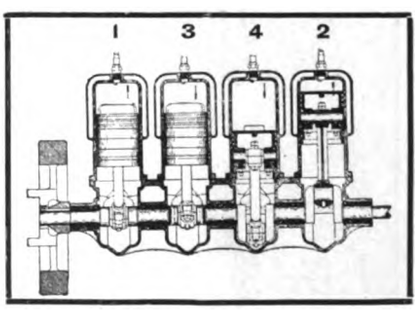
The Car for today, tomorrow and the years to come. .

—Built by practical men.—

A sensation at the Show in New York last week. Recognized by all as the one reliable air-cooled motor car. Admitted by all as a motor car of exceptional and especial artistic beauty in design and equipment.

Specifications: Aerocar, 1906. Model A. 24 H. P. Frame, pressed steel. Body, Side Entrance Tonneau (front doors easily detached and complete without them). Color, royal blue. Hollow steel dash. Four sight lubricator on dash. Tool box on running board. Five passengers. 45 miles an hour. Wheel base, 104 inches. Wheel tread, 56 inches. Tire dimensions, front and rear, 4x34. Steering, worm and nut. Brakes, two (rear hub) and transmission. Gasoline capacity, 20 gallons. Four cylinders arranged vertically in line. Air-cooled. Ignition, jump spark with storage battery. Drive, shaft, bevel gear. Transmission, sliding gear. Speeds, three forward and reverse. Leather-faced cone clutch. Road clearance, nine inches. Weight, 2,000 pounds. Price, fully equipped, ready for the road, including two large gas headlights, $2,800, f. o. b., Detroit.

Will be exhibited and demonstrated at the Chicago Show.
Some selling territory yet open. If interested write quickly. Illustrated descriptive literature mailed on request. If you inclose 10 cents we will send you a handsome gold-plated scarfpin.



THE AEROCAR COMPANY, Detroit, Mich.

THE TWO-CYCLE ELMORE

FOUR CYLINDERS CONSTANTLY HELPING ONE ANOTHER BEAR THE BURDEN OF EIGHT

With four impulses every revolution, the two-cycle Elmore engine produces a power that can only be equalled in the four-cycle type by the use of eight cylinders. The application of power is always uniform; the force of one explosion impelling the piston half way through the cylinder when another begins.

Note.—Cylinder No. 1 shows the piston half way down. The piston of cylinder No. 2 is at this point starting down from another explosion. Before the force of the explosion on this piston is exhausted the third cylinder will come into action, then the fourth and then No. 1 again, as long as gas is fed into the cylinder and there is a spark to fire it.

The Simplest Engine in the World

Actually fifty per cent. of the moving parts done away with. Up-keep reduced fully fifty per cent. Most successful self-starting engine made.

When you understand that the two-cycle Elmore engine does away with 18 to 20 parts on each cylinder, and absolutely eliminates all inlet and exhaust valves with their attendant mechanism, you'll agree with us that this is the simplest engine in the world. One, two or three cylinders may be cut out at will, both spark and gasoline. With one cylinder cut out the difference is impreceptible, except in speed; with two cut out—barely noticeable. Do you see the economy of this feature?

The fact is, there are so many mechanical advantages about the Two-Cycle Elmore that you should send for our catalogue and special literature, which explains everything fully.

The universal praise given **The Goodrich Quick Detachable Tire and Rim** is today the most noteworthy fact in connection with the automobile tire industry.

No other quick detachable construction is so simple in its workings or admits of such quick and easy handling of the tire in detaching and attaching.

No lugs, no clips, no pinching of the inner tube, no possibility of the tire working loose, no bolts, screws or turnbuckles of any sort.

Please write for special booklet.

A NEW AUTOMOBILE SPEEDOMETER

The "Springfield"

At last a thoroughly reliable Speed Indicator at a moderate price

Aside from its assistance in complying with speed laws and the requirements of public safety, there is no questioning the satisfaction, the real fascination, of knowing the speed at which your touring car is going, and there is no more satisfying way of knowing than by having a "Springfield" combination Speedometer and Odometer on your dashboard.

No instrument at any cost will tell you more or tell it with more accuracy.

Its mechanical construction is the most correct and most direct application of centrifugal force; no cams or other indirect movements. Every motion is balanced and almost frictionless. All internal parts are of steel and hardened where advantageous. All bearings are self-lubricating. It is absolutely water and dust proof.

An exclusive feature of this instrument is the steady movement of the pointer. No jolts can divert it from its true position.

Its accurate indication of speed from 1 mile to the capacity of the dial is guaranteed.

The Dial is made of luminous material, and emits sufficient light to show position of pointer after dark.

Another exclusive feature is the safety device on our Universal pinion attaching Bracket. It will not only adjust up or down, out or in, and pivot both ways so as to fit the steering knuckle of any American built car, but if the pinion should be thrown out of mesh with the gear by the lodging of any foreign substance, it will automatically return to the correct pitch line as soon as the gear clears itself.

For any sized Wheel with Jacketed Flexible Shaft, Correct Length for any make of Car

50 Mile Combination Speedometer and Odometer $45.00
50 Mile Speedometer without Odometer.. 35.00
80 Mile Combination Speedometer and Odometer $55.00
80 Mile Speedometer without Odometer.... 45.00

Patented in U. S. Oct. 10th, 1905. Patented in Canada, England and Europe. Other patents pending.

This AUTO TIRE is both DURABLE and LIVELY

When you buy an *ordinary* Auto Tire, you have to decide a difficult question.

Is it best to get a hard, inflexible tire, which will rack your bones and soon put your car out of business, but which will *last a season or more*

Or—

To get a soft, resilient, easy riding tire, which will go to pieces in a short time because it won't stand the wear and tear of the road?

Momentous question.

And either way you answer it—you lose.

Because if you decide on the *hard* tire, it means breakdowns on the road, and consequent liberal use of a farmer's team. It means constant repairs to your engine, a car always in the shop. Your aching joints are thrown in for good measure.

And if you select the *soft* tire, it means punctures, tire explosions and tire troubles generally. And you have to buy new tires every little while.

It's Money—Money—Money, either way.

You'll envy Rockefeller before you get through.

Now you can *dodge* this momentous question if you will.

Because the Goodyear Detachable Auto Tire has all the GOOD points of both the *hard* and the *soft* tire with the bad features of neither.

Dense, Tough Rubber — Soft, Springy Rubber

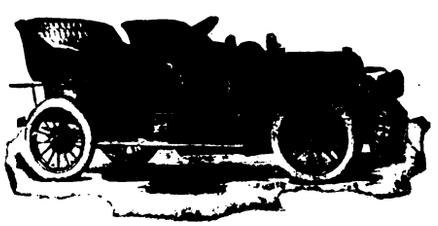
It's easy for anyone to understand WHY this is true. Read carefully, and see for yourself.

First, look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it. It's what the *hard* tire is made from.

Now right underneath this is the remainder of the outer tube (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be. It's the same as the seldom-used *soft* tire.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The dense rubber and the soft rubber together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.



Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

Timken-Lemoine Front Axle.

Much of the satisfaction resulting from the use of Timken Roller Bearings is due to the simplicity of construction,—few parts and every part a special feature.

We think this explains why it is easy to sell so many of them and why owners of machines demand them.

A good automobile is no stronger than its weakest part. Can you afford to have anything but Timken bearings?

Positive adjustment. No loose parts. Perfect end thrust and you can take up the wear.

All types front and rear axles, Lemoine or Elliott knuckles, direct and chain drive rear axles, truck axles, wheels, channel rims.

The Hartford Perfected Dunlop Tire.

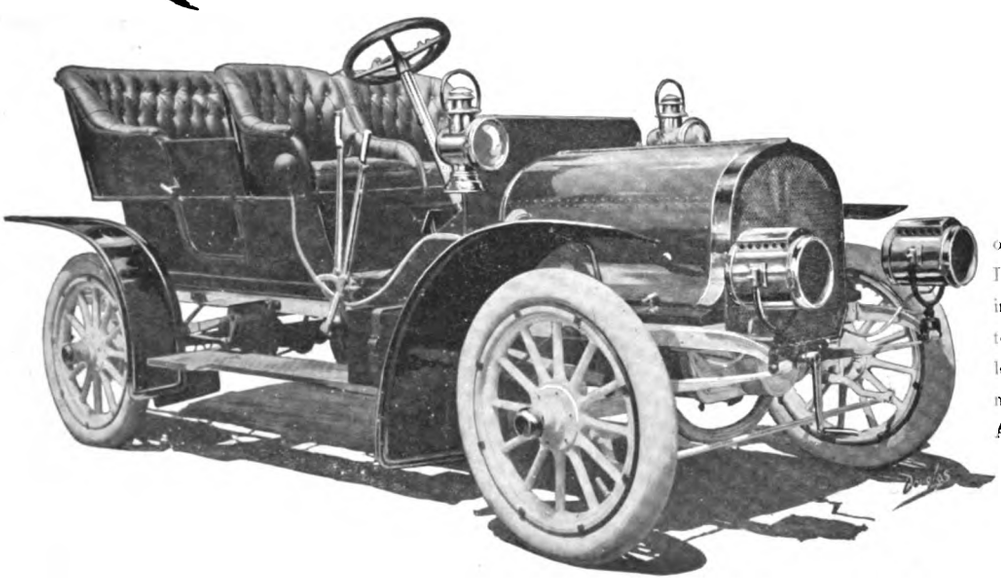
Paris, July 28, '05.

Dear Sirs:-

Postal No. 3.

We have arrived in Paris coming over the Route Nationale from Aix les Bains via Lyons and Nevers. The roads were exceedingly trying, very hard and a lot of "pave" or cobblestones. I had two punctures. These were the only mishaps in 2136 miles and the tires have stood the hard work without showing any other signs of wear and tear. People here consider this a very good record as many of the best foreign tires blow out from the heat.

Yours truly,



Walter Hale

Watch for others to follow.

Made by THE HARTFORD RUBBER WORKS COMPANY, Hartford, Connecticut.

CORBIN CARS

A stock 16 H.P. Model D made 2321.6 miles in the six day, non-stop contest at Long Branch, N. J. Duplicates of this car can be delivered promptly.

The performance of the Corbin 16 H. P. Air cooled motor in the non-stop contest has forever silenced the opponents of **practical Air Cooling.**

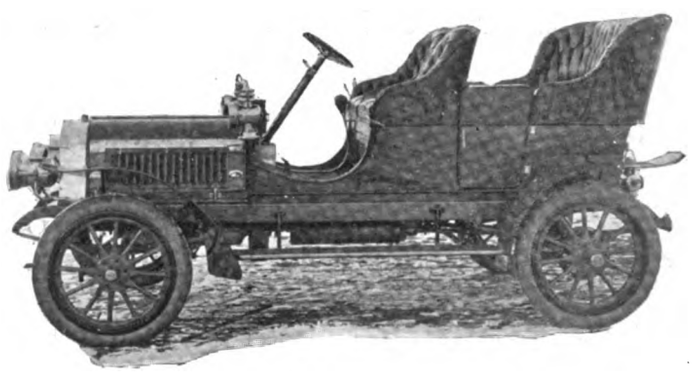
What You Get For Your Money



is more important than the price you pay.

That is one reason why our cars are so often referred to as

"Those Remarkable Mitchells"

MITCHELL LIGHT CAR, $750.

MITCHELL TOURING CAR, $1500.

They set up a new standard in price values.

At $750 and $1500 there is nothing that even begins to approach them.

Have you ever taken the trouble to "look into" the matter?

PUBLIC NOTICE

of just what may be expected of

1906

Diamond

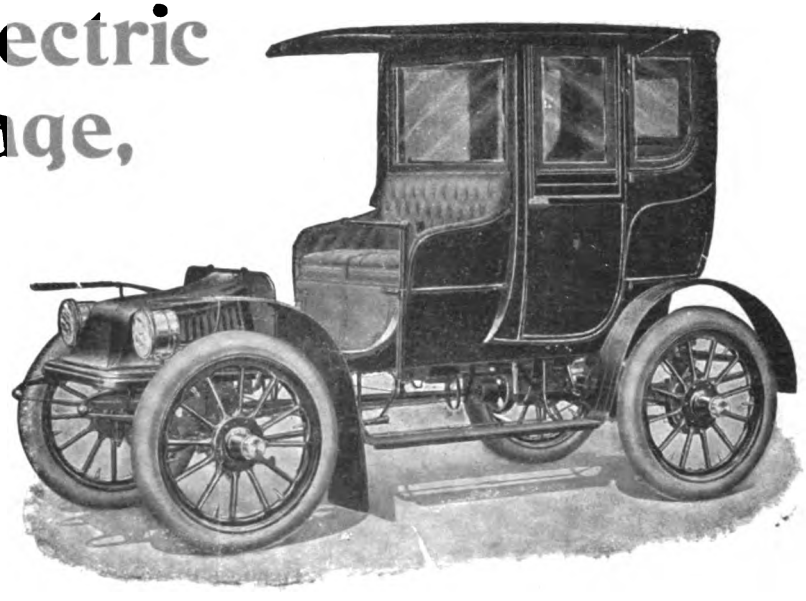
WRAPPED TREAD TIRES

Was given by the Vanderbilt Cup Trials.

Eight cars were equipped with Diamond Tires, and not a finger was touched to any Diamond Tire throughout the Race.

B. H. Dingley, driver of the Pope-Toledo, first to finish, said:
"They are the best tires in the world. I cannot say enough of the satisfaction I have had from them."

Joseph Tracy, who drove the Locomobile finishing second, said:
"My Diamond Tires gave me absolutely no trouble."



Robert Jardine, driver of the Royal, third in the trials, said:
"I cannot ask for better tires under any conditions."

Frank Nutt, the Haynes-Apperson driver, taking fourth place, said:
"From start to finish I had no occasion to give my tires a thought. Their record was perfect."

Columbia

construction for 1906 far surpasses the best work previously put into any motor cars, American or European. We tell all about it in our special illustrated booklets, "Columbia Chrome Nickel Steel," "Fashioning a Crank Shaft," "Transmission, Etc.," and "Consistent Differences." Each of these booklets will be found intensely interesting by all who follow the latest advances in automobile building. Mailed on application.

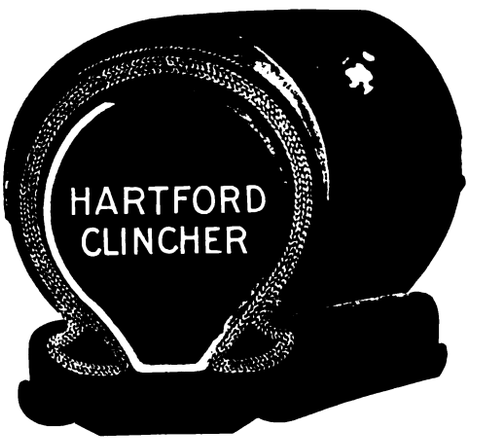
TIMES CHANGE.

AT THE 1905 SHOWS competitors belittled and decried

Our Dunlop Detachable Rim



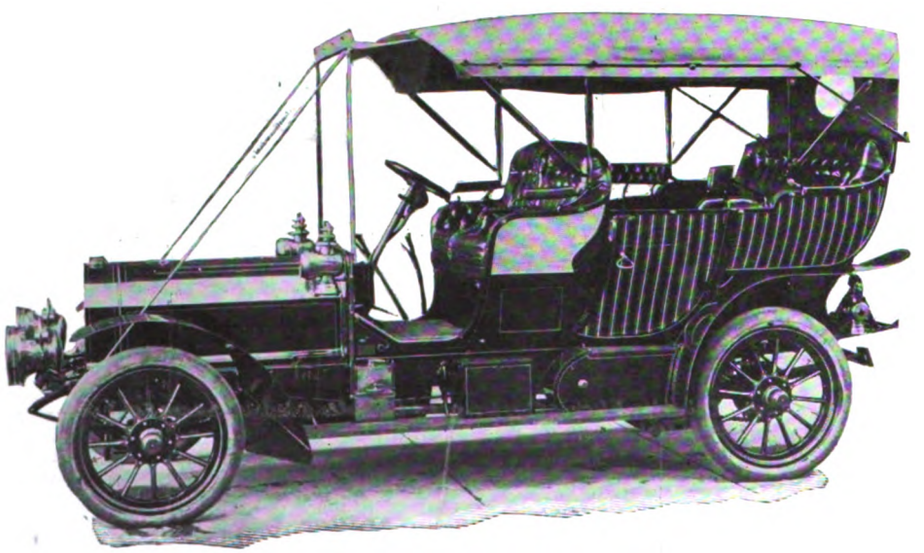
Notwithstanding it **SWEPT THE COUNTRY.**

This year they imitate, but **OUR IMPROVED RIM** which takes all makes of clincher as well as Hartford Dunlop and Hartford Clincher Tires is

"STILL A SEASON AHEAD" like our

"One Cure Wrapped Tread"

HARTFORD DUNLOP CLINCHER AUTO TIRES.



If Imitation is Real Flattery, we certainly feel its Sincerity.

WHY
the Strong Lead of
Diamond
1906
Wrapped Tread Tires.

45 sets of Diamond Wrapped Tread Tires on cars exhibited at Madison Square Graden; nearest competitor 35 sets.
85 sets of Diamond Wrapped Tread Tires on cars at the Garden and Armory Shows combined; nearest competitor 73 sets.
Solid Tires—Diamond Total for both Shows, 28 sets; nearest competitor 15 sets.
Grand total of Diamond Tires, 113 Sets. Next highest grand total, 73 sets.

The Ultimate Test is Service.

Show figures are worth nothing if the tires have no other recommendation.

THE DIAMOND RUBBER CO., - - Akron, Ohio

THE BAKER ELECTRIC STANHOPE

is, of all motor vehicles, the one most desirable from every standpoint for family and professional use.

For family use it is especially adapted by its extreme simplicity and ease of operation. Any man, woman or child can drive it after a few hours' practice. There is no troublesome cranking of a heavy motor, made doubly difficult in cold weather. No loading with gasoline, oil and water, no trouble with spark plugs, and on account of their light weight, the dangers of tire troubles, skidding, etc., is reduced to the minimum.

THE BAKER STANHOPE is always ready for use at a moment's notice. The user merely turns on an electric switch, operates the control lever and away he goes with as great speed as may be legally used.

BAKER STANHOPES being noiseless, free from grease and odor, and always immaculately clean, are ideal vehicles for the use of ladies when shopping, calling, or driving for pleasure, and they are so simple to operate that a chauffeur is an incumbrance. In addition, these

Aristocrats of Motordom

are so superbly finished in every minute detail as to make them eminently distinguished in appearance, their elegant refinement instantly appealing to the most casual observer.

These excellent features have enabled us to sell every machine we have made early in the season, and obliged us to refuse orders.

Our line of vehicles comprises Imperials, Stanhopes, Surreys, Station Wagons and Broughams (inside and outside driven), all superb vehicles, elegant and refined in every detail and with that high degree of mechanical excellence which has placed and keeps them in the front rank of the automobile procession.

We desire agents in a few important cities not yet covered.

THE BAKER MOTOR VEHICLE CO., - 22 Jessie St., Cleveland, O.
